

# GROUNDWATER AND SURFACE WATER MONITORING DATA RELEASE 2014 SAMPLING EVENT SHALLOW LAND DISPOSAL AREA FUSRAP SITE

U.S. Army Corps of Engineers  
Pittsburgh District

Building Strong®

**April 2015**

## **Formerly Utilized Sites Remedial Action Program (FUSRAP)**

FUSRAP was initiated in 1974 to identify, investigate, and if necessary, cleanup or control sites throughout the United States that were part of the Nation's early atomic weapons and energy programs during the 1940s, 1950s, and 1960s. When implementing FUSRAP, the United States Army Corps of Engineers (USACE) follows the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended, and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP).

The USACE is the lead federal agency under FUSRAP remediating the Shallow Land Disposal Area (SLDA) site.

## **Site Description**

The SLDA is located in Parks Township, Armstrong County, Pennsylvania, about 23 miles (37 kilometers) east-northeast of Pittsburgh, Pennsylvania (Figure 1). The 44-acre (18-hectare) site is predominantly an open field partially bordered by woodland. Ten (10) disposal trenches were excavated in the overburden soils and together encompass approximately 1.2 acres (0.49 hectares); the trenches are separated geographically into the Trench 1 through 9 area (or the upper trench area) and Trench 10 (the lower trench area). Site topography declines approximately 115 feet (35 meters) from the southeast to northwest, or from Trenches 1 through 9 toward Trench 10 (Figure 2). The depths of the upper trenches vary between 10 and 15 feet, whereas Trench 10 varies up to 20 feet in depth.

The upper trench area is underlain by up to 20 feet of native silty soils that blanket the following four groundwater bearing bedrock zones:

- First Shallow Bedrock - averages 13 feet in thickness between elevation 881 and 894 feet,
- Second Shallow Bedrock - averages 14-feet in thickness between elevation 856 and 870 feet,

- Upper Freeport Coal – averages 4 feet in thickness between elevations 832 and 836 feet and was subjected to room and pillar mining (now exhibits open-channel flow), and
- Deep Bedrock Zone - averages about 36 feet in thickness between elevations 757 and 793 feet.

In the Trench 10 area, the Freeport coal seam was strip mined and the general area backfilled with approximately 22 feet of shale rock spoils. Figure 3 presents a generalized northwest to southeast geologic cross section through the site to depict these site entities and groundwater zones.

Groundwater surrounding the upper trench area flows dominantly to the north in the soil layer (Figure 4), to the north-northeast in both the first and second shallow bedrock zones (Figures 5 and 6), to the south in the Freeport Coal (Figure 7), and to the west in the deep bedrock zone (Figure 8). Groundwater surrounding Trench 10 appears to enter the Upper Freeport Coal seam, which drains in a westerly to southerly direction (Figure 7).

The site is drained by a small ephemeral stream identified as Dry Run (Figure 2). A portion of the flow in Dry Run infiltrates into the coal mine spoils near Trench 10 and then the abandoned coal mines that underlie most of the site (see Figure 2-14 in USACE 2005). The balance of flow in Dry Run continues northwest into the Kiskiminetas River.

Land use surrounding the SLDA Site consists of medium-sized residential communities and individual rural residences, small farms with croplands and pastures, idle farmland, forestlands, and light industrial areas. The closest community is Kiskimere, which is adjacent to and to the south of the SLDA; some residences are located within several hundred feet of the SLDA.

## **Previous Groundwater Monitoring Results**

A series of non-USACE groundwater monitoring actions began in 1981 and led to a quarterly monitoring program that ceased in 2000; the USACE initiated site activities in 2002. The historical and USACE-generated data are summarized in the Remedial Investigation (RI) performed by the USACE (USACE 2005).

Groundwater sampling conducted by the USACE during the RI included a subset of the groundwater well inventory shown on Figure 9; these wells were sampled for the following radionuclides:

- Radium-228
- Uranium-234, -235, -238
- Thorium-228, -232
- Plutonium-239,-241
- Americium-241

In addition, 10% of the RI samples were analyzed for cesium-137, cobalt-60, thorium-230, radium-226, plutonium-238, -240, -242, and gross alpha and beta. The RI sampling of groundwater indicated that FUSRAP-related constituents were not a threat to human health and the environment (USACE 2005).

From April to December 2011 (during the remedial action), groundwater was sampled monthly at 14 locations to determine if the site excavation activities were affecting groundwater (Figure 10). This program sampled for isotopic uranium (U-234, -235, -238), isotopic thorium (Th-228, -232), radium-228, plutonium-239 and -241, americium-241, total uranium, target analyte list (TAL) metals plus molybdenum, anions, volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), total organic carbon, and total dissolved solids. The radiological and metals analyses include both unfiltered and filtered samples.

This sampling produced results consistent with the RI sampling (i.e., FUSRAP-related radiologic constituents are not a risk to groundwater at the SLDA). This monitoring effort was suspended in 2012 due to a remediation hiatus and will re-initiate once remediation recommences; the 2011 data are presented in the 2013 groundwater sampling report (USACE 2014).

## **Annual Sampling Program Purpose**

The groundwater monitoring plan that was developed in 2013 is used to guide annual sampling activities through the completion of the remedial action (USACE 2013). The overarching objective of the sampling effort is to ensure the protection of human health and the environment from FUSRAP-related constituents of concern at the SLDA site. The USACE plan delineated an optimal monitoring program to detect the potential for off-site migration, specifically towards the Kiskimere community.

The goals of the groundwater monitoring program include:

- Identify the locations to be sampled (Figure 11)
- Identify the frequency of sampling (i.e., annual sampling)
- Specify analytical parameters for collected samples (Table 1)

This sampling program has been developed in consultation with the U.S. Environmental Protection Agency (USEPA); the USEPA also samples groundwater at the SLDA and presents the findings under separate cover (see: [www.EPA.gov](http://www.EPA.gov)).

## **Sampling Scope**

Annual groundwater monitoring for 2014 at the SLDA was conducted from March 25<sup>th</sup> to 27<sup>th</sup>, 2014. Twenty-one (21) locations were sampled and generally lie between the 10 trenches and the neighboring residences (Figure 12). Eight (8) wells in the sampling plan either had minimal groundwater (i.e., extremely poor yield) or were dry. Alternatively, four (4) wells and one (1) surface-water location were substituted to best ensure the protection of human health and the environment. Table 1 lists the constituents analyzed and Table 2 lists the planned locations (and noted changes). The constituents listed in Table 1 are a subset of the analytes sampled during the RI and remedial action; this annual sampling program is focused on site contaminants specifically listed in the record of decision (ROD) (USACE 2007).

Static water levels from all site wells were recorded synchronously to the nearest 0.01 foot to determine whether adequate volumes were available for sampling and to confirm groundwater flow directions.

These measurements are listed in Table 3; wells omitted from this list were either decommissioned during remedial action or previously damaged (unreliable). Figures 4 through 8 graphically present the groundwater elevation data and inferred flow directions for the five water bearing zones underlying the SLDA.

Low-flow sampling techniques consistent with USEPA guidance (Puls and Barcelona, 1996) and the Department of Defense (DoD) (DoD, 2013) were utilized for the groundwater sampling. Prior to sampling, wells were purged until the following field parameters stabilized according to the sampling plan: temperature, pH, specific conductance, oxidation-reduction potential (ORP), turbidity, and dissolved oxygen. These data are listed in Table 4.

Both unfiltered (total fraction) and field-filtered (dissolved fraction) groundwater samples were obtained where well yield allowed. Filtered samples were collected by utilizing a disposable 0.45 micron in-line filter. Field duplicates provided quality control samples, which were collected at a rate of approximately one duplicate for every ten regular samples. Well MW-20 was sampled over a two-day period using a disposable bailer due to poor production; this unfiltered sample represents a time-composited sample.

Samples were packaged according to standard practices and shipped to DoD Environmental Laboratory Accreditation Program (ELAP) accredited laboratories. Laboratory data were reviewed and qualified per laboratory performance quality indicators, the applicable laboratory and method criteria, and the DoD Quality Systems Manual.

The sampling task produced investigation derived waste (IDW) that consisted of solids and liquids. The solid IDW was assessed for radioactivity and either disposed of as general trash or retained on site for disposition. The liquid IDW consisted of purge water that was containerized on site for future disposition.

## **Sampling Results**

Tables 5 and 6 list the unfiltered (total) and filtered (dissolved phase) analytical results for the 2014 monitoring event. Filtered data have a “-F” after the location name in the table. Table 7 presents a summary of the results, comparative drinking water standards, and up-gradient values for radionuclides derived during the USACE RI. Analytical results are consistent with past sampling and select wells exhibit unique values for some analytes relative to the overall dataset; these are discussed below.

### **Metals Data:**

Average values for aluminum, iron, and manganese exceed the primary or secondary drinking water standards due to the naturally low-oxygen or reducing conditions in the coal mine and deep zones.

- MW-39 is screened in the coal-mine near Trench 10 and exhibits distinct aluminum, beryllium, cobalt, iron, manganese, and zinc results, along with a sulfuric odor.
- MW-22 is screened in the deep groundwater zone and exhibits high arsenic, manganese, and iron due to geochemically reductive conditions at this location.
- MW-40 is screened in the deep groundwater zone and exhibits high sodium.

Figure 13 shows the locations of these wells.

#### Radionuclides:

- Plutonium-241 (Pu-241), thorium-228 (Th-228 as a surrogate for radium-228), uranium-234 (U-234), uranium-238 (U-238), and total elemental uranium (Total U) were detected at levels above average background at several locations throughout the site (Figure 14).
- No radionuclides exceed the USEPA drinking water standards of 30 µg/L for uranium, 15 picoCuries per liter (pCi/L) for total alpha emitters, and 4 millirem per year (mrem/yr) dose limit for beta emitters (e.g., Pu-241 limit of 300 pCi/L). The radionuclide-specific standards for the beta-emitter dose threshold are listed in Table 7 and explained in the USEPA (2001) reference.
- The radiologic detections above average background concentrations are summarized below:
  - *Pu-241: Estimated (or "J" qualified) detections up to 14.7 pCi/L were seen in MW-03, MW-07, MW-40, MW-51, and SP-DR-01; the maximum detection was observed at SP-DR-01 and is approximately 5% of the drinking water standard of 300 pCi/L for Pu-241 (Table 7). Several of these results show inconsistencies between filtered and unfiltered samples, such as a mix of estimated detections and non-detections irrespective of filtering. This disparity was evident during the RI, 2011, and 2013 sampling by both the USACE and USEPA. The Pu-241 detections averaged 8.06 pCi/L in 2014 and appear suspect since the radionuclide has a relatively short half life (14.4 years) and its daughter product, Am-241, is not detected at similar values (i.e., Am-241 has a maximum detection of 0.2 pCi/L). Annual sampling will include Pu-241 for verification purposes.*
  - *Th-228: Well MW-20 produced an estimated detection of 4.23 pCi/L in an unfiltered sample that was highly turbid due to manual bailing of the poorly producing well. This causes natural Th-228 on soil particles to transfer to water in the sample container due acidic preservation. All Th-228 detections averaged 0.8 pCi/L.*
  - *Total U: Concentrations up to 7.24 µg/L were detected in MW-53 and at surface-water point SP-DR-01 near Trenches 4 and 5; all total U detections averaged 0.9 µg/L.*
  - *U-234: Concentrations up to 7.25 pCi/L were detected at surface-water point SP-DR-01 near Trenches 4 and 5; U-234 detections averaged 0.95 pCi/L.*
  - *U-238: A maximum concentration of 2.0 pCi/L was detected in MW-53 and SP-DR-01; U-238 detections averaged 0.44 pCi/L.*

## Conclusions

The 2014 USACE and USEPA sampling show that radionuclides are present in site groundwater at concentrations well below USEPA MCLs or dose-based drinking water standards. Data exceptions (above-background values) vary throughout the five hydrogeologic zones at the site and do not indicate a contiguously contaminated zone. These results are consistent with past USACE findings that also showed no FUSRAP-related radionuclides exceed the USEPA MCLs or dose-based drinking water standards. The USACE plans to perform annual groundwater sampling during the summer of 2015.

**NOTES:**

Temperature (F) - Degrees Fahrenheit

Specific Conductance (mS/cm) - millisiemens per centimeter

ORP (mV) - Oxidation Reduction Potential in millivolts

Turbidity (NTU) - Nephelometric Turbidity Units

Purge Rate (mL/min) - milliliters per minute

**Table 5. 2014 Groundwater Monitoring Results for Metals**

Metals Table Definitions:

J - Estimated value below minimum Level of Detectability (LOD)

U - Undetectable below Achieved Detection Limit

µg/L - micrograms per liter

**Table 6. 2014 Groundwater Monitoring Results for Radionuclides**

Radiologic Table Definitions:

J - Estimated value below minimum Level of Detectability (LOD)

U - Undetectable below Achieved Detection Limit

pCi/L - picoCuries per liter

**Radiologic Data**

Thorium-232	0.17	0.03	0.66	6	15	0.39
Uranium-234	0.95	0.06	7.25	24	16.4 (3)	0.6
Uranium-235	0.10	0.05	0.16	9	0.2 (3)	ND
Uranium-238	0.44	0.02	2.00	22	10 (3)	0.3

NOTES:

(1) - USEPA Maximum Contaminant Levels (MCLs), Secondary MCLs, or Pennsylvania DEP MCLs

(2) - USEPA, Directive #9283.1-14, Use of Uranium Drinking Water Standards under 40 CFR 141 and 40 CFR 192.

(3) - Based on 40 CFR 9, 141, 142, Federal Register, 7 Dec. 2000, Assumes a U234:U238 ratio of 1.6:1.

NA - No Standard Available

Average exceeds water quality standard.

NC - Not Calculated for non-FUSRAP constituents of concern

ND - Not Detected
