- N19-8** F. Page ES-24, ES.7.3. Regarding FORT RICHARDSON, ALASKA, a viable alternative to Hawaii. I have lived near Fort Richardson, and every day I went to work in Anchorage. Saying that "only 224 days per year" could training be conducted at Fort Richardson because of "climate limitations" is unrealistic. Training there during bad weather would be more valuable than in Hawaii's climate when potential enemy countries' weather is considered.
- N19-9** In addition, the need for 270-days-per-year training for the Strykers is at great odds with the requested "required" number of days for CALFEX (Company live-fire training exercises) in Makua Valley after 9/11/01, which was fewer than thirty.
- N19-10** Finally, Page ES-24, ES.7.4, paragraph three (and repeated for USAR in paragraph four) reads, "...if wartime situations required deploying Hawaii's SBCT while training on the continental US, the SBCT forces would need to return to Hawaii for full deployment, making it impossible to meet the 96-hour deployment goal."
- Why? I would think the SBCT should be ready to deploy from any training location, having arrived at the training site with everything necessary to fight. As a part of their training, full preparation for deployment worldwide should be planned and carried out. It would be more work but more realistic, too. And more valuable.
- N19-11** G. Figure 3-15. PALILA critical habitat on the Big Island. What is/are palila?
Lack of Acronyms: 1. QA/QC. (Quality assurance/quality control? Not everyone has that information.)
2. GIS? (Maybe this is another well known abbreviation—but not to me.)
Page 12-1. Yoshika Evans is a GIS Technician. GIS initials also appear elsewhere, but not in the list of acronyms.
Page 12-3/12-5. Millet Talada's role is listed as GIS Graphics; Chris Roos as Cultural Resources GIS.
- N19-12** H. Page 12.4. Land Use/Recreation report was prepared by Belt Collins Associates that include two U.H. degree holders. Why "recreation"? We common civilians make or find our own recreation!
- N19-13** Page ES-27, Table ES-5. Land use is determined less than significant on Oahu for the "Reduced Land Acquisition". How do you know that acquisition and use of that land will not affect the water table, which is already insufficient for the needs of this Island.
- N19-14** Table 6-18., Page 6-77 lists Monk Seals (which are also at Makua) and Page 6-79 Green Sea Turtles. Surely runoff, noise and other impacts will be significant to them and other sea creatures and the people who enjoy them.

N19-4

Chapters 4.14, 5.14, 6.14, 7.14, 8.14, and 9 discuss the impacts of this project on Public Services and Utilities including impacts on water, fossil fuels, and electricity.

N19-5

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. Section 5.8 addresses impacts to water resources.

N19-6

Mr. Whitehead is a registered geologist and has 14 years experience in preparing impact analysis around the world.

N19-7

The recommended dust control compounds are hygroscopic salts (calcium chloride and/or magnesium chloride) with a long history of safe and effective use for dust control. They have been subjected to comparative testing against other dust control products at Fort Hood, Texas and Fort Sill Oklahoma. Calcium chloride salts were found to be the most effective and longest lasting of all of the dust control products tested at these installations. Calcium chloride and magnesium chloride are considered virtually nontoxic in normal use. Dust control compounds would be applied directly to unpaved roadways and parking areas, and thus would have no effect on areas used by cattle or wildlife.

N19-8

In fact the limitation to maneuver training is during the summer month due to potential damage to the permafrost. Maneuver training is restricted to when the permafrost is covered with a protective layer of snow.

N19-9

The CALFEX requirement for SBCT is 24 days per year depending upon mission requirements. While Makua is not required to meet this training need, if it becomes available some SBCT CALFEX training would likely be conducted there as it would be much more efficient.

Comments

- N19-15** | Page 13-11 "William and" Aila, Hui Malama o Makua; Page 13-17
cont'd | William Aila, Jr.
- N19-16** | 2. In view of the many inadequacies—together with corrections and additions—it is clear that the FEIS must contain other than the material in the DEIS. However, in order to save many trees from being sacrificed for the manufacture of paper, DO NOT REPRINT the sections of the DEIS that require no alterations. Paying anywhere near the \$25.00 to send out the FEIS with re-duplicated material is an exorbitant waste of our world's resources and our tax dollars. (For an example, I point you to the three Draft Environmental Assessments for Makua Valley in which the second and third were mostly a repeat of the first.)
- N19-17** | **J.** Appendix O, Page 1-4. If the Wildfire Management Plan has not been updated and revised since the last "controlled" burn at Makua Military Range and environs, it MUST BE. This is another significant reason Makua Valley EIS should be incorporated in this EIS.
During the ten years prior to Earthjustice and Malama Makua's lawsuit to force an EIS for Makua, over 270 fires occurred. The Army claimed most of them were naturally occurring. During the 39 months immediately preceding 9/11/01 (while the Army was court-prevented from training) not a single fire occurred.
In the three drafts of the MMR EIS, a voluminous Fire Safe Management Plan was published. However, on two subsequent occasions fires got out of control. In the most recent, in the summer of 2003, over 2,000 acres burned. The Fire Management Plan was not adequate—or was not followed. Both Makua and Kahanahaiki Valleys burned, and the fire went all the way to the Satellite Tracking Station at Kaena Point.
To me, the lack of concern of the Army for the citizens camping along the beaches from Kaneana Cave to Kaena Point was most significant. When the fire became too hot and extensive to handle, all the people connect to the Army left MMR. They did nothing to warn our citizens of the fire danger, neither posting nor advertising the advent of a "controlled burn" nor making any effort to get picnickers, surfers, fishermen, divers or campers off the Coast and past the burn area.
Smoke and fire diminished the sight-distance for drivers to less than 2 feet as the long line of "endangered species"—civilians—tried to make their way to safety on the one ingress/egress road along the Waianae Coast.
The damage to the coral reef and everything, both flora and fauna, in MMR and contiguous thereto is undeniably drastic. The soot clings, the runoff from the denuded soil continues.
- N19-18** | Page 1-2, 1.2.2. If the goal of the WFMP is no human loss or injuries due to wildfire, remember there are humans other than the military who must be protected as well, even if they are off a military reservation but affected by your wildfires. You say, "Wildfire is the single largest impact made by military activities in the Hawaiian ecosystem." I agree, and I want also to point out that this includes the cultural and environmental damage caused by those fires.

Responses

N19-10

Not all training would be conducted in the mainland nor would all of the SBCT forces be training at the same time on the mainland. Much of the support equipment needed for combat would remain on Hawai'i. In order to deploy all troops and equipment would need to deploy together which would require the troops and equipment sent to the mainland for training would have to return to Hawai'i to prepare for full deployment.

N19-11

The palila is a bird found on the Island of Hawai'i that is federally listed as Endangered. A discussion of this species can be found in Section 8.10 of the EIS. These acronyms were added to the list.

N19-12

EISs are prepared by interdisciplinary teams. The reason that recreation was included in the analysis is that this proposal could have impacts on that aspect of the human environment.

N19-13

Selection of the RLA alternative would mean the purchase of 100 acres adjacent to SBMR. Impacts to ground water supply would be the same as those anticipated for the Proposed Action. Please see discussion on Section 5.8.

N19-14

These issues have been considered in the impact analyses for both monk seals and sea turtles. Chapter 6.10 discusses potential impacts from noise and runoff.

N19-15

Some individuals are on the list to receive a personal copy and also representing an agency or organization. We cannot remove names unless the individuals in question ask that their name be removed. Your name has been removed per your request.

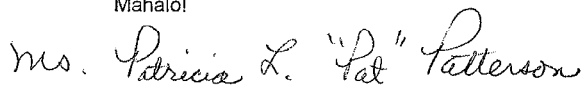

N19-16

The Army is required by law to distribute copies of the FEIS to all that requested them. We cannot distribute just portions of the document.

Comments

- N19-19** **K:** Clean-Up After Usage. Page 6-74, paragraph 5, indicates that coral reefs are within a half mile of Dillingham. How will you clean them up if erosion or wildfire should damage them?
- N19-20** Do you intend the Strykers to be here forever, or are you planning to evacuate Schofield Barracks, Dillingham Airfield and Pohakuloa sometime and leave them destroyed and unusable like Waiahole, Waikane, Halawa and Makua Valleys?
- N19-21** **L.** CONCLUSION: The Islands are too fragile for 300 19-ton Strykers and their accompanying service, maintenance, personnel and dependents. This is not just an NIMBY PLEA; THERE ARE OTHER AREAS IN THE WORLD THAT COULD HANDLE THIS INVASION; neither Oahu nor the Big Island of Hawaii can do so. Go back to the drawing board!

Responses

N19-17

The Wildland Fire Management Plan is now finalized for the Islands of O'ahu and Hawai'i and was revised based on lessons learned from the most recent fire at Makua.

N19-18

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. The WFMP goal of protecting human life includes non-military people as well.

N19-19

These are not expected to be project impacts.

N19-20

If the Army were to vacate any lands in Hawai'i it would be addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. The Army is committed to cleanup existing sites as required and to prevent new sites in accordance with applicable laws and regulations.

N19-21

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. In accordance with NEPA regulations, the Army is conducting this EIS in order to identify the direct, indirect and cumulative environmental effects of the proposed action on the ROI. If the Army decides to implement the proposed action, the Army will mitigate all significant impacts in order to minimize the overall environmental impacts of the proposed action. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

 Subject: QUESTIONS REGARDING SENSITIVE AREA AT POHAKULOA TRAINING AREA

ALOHA - WE ARE THE KANU O KA AINA CHARTER SCHOOL STUDENTS IN GRADES 8-12 FROM THE COMMUNITY OF WAIMEA IN THE DISTRICT OF KOHALA. WE ARE CONDUCTING A SCIENCE FAIR PROJECT THAT POSES THE QUESTION:

N20-1 Has the military thoroughly educated Hawaii's communities about the proposed Stryker Brigade combat unit at Pohakuloa Training Area?

WE HAVE A FEW QUESTIONS THAT HAVE COME ABOUT SINCE REVIEWING YOUR ARCHAEOLOGICAL SENSITIVE AREA MAP. WE WOULD APPRECIATE YOU ANSWERING OUR QUESTIONS TO THE BEST OF YOUR KNOWLEDGE. ANY INFO THAT YOU CAN HELP US WITH WILL BE A BENEFIT TO THE EDUCATION OF OUR HAWAII COMMUNITIES AT LARGE.

N20-2 1. How far back are the bombing zones or set back areas from the sensitive areas as marked on the map?

N20-3 2. What is the reason for having the Stryker Brigade Combat Unit expansion in Hawai'i?

N20-4 3. How much land is currently aquired for maneuvers at Pohakuloa Training Area?

N20-5 4. How much more land does the military plan to aquire for the new the proposed stryker brigade?

5. Can you please send us pictures, colored maps, overview or background information as to how this proposal came about.

N20-6 6. Can you please put us in touch with your cultural liasons

Mahalo,
 Kanu O Ka yAina Students

Responses

N20-1

The community outreach plan included members of Cultural groups, Focus groups, Community Support Groups and Public Sessions. This outreach plan ensured a balanced coverage of all concerned community groups both on O'ahu and the Big Island. Moreover, we held two comprehensive scoping meetings and two comprehensive public meetings on the Big Island to ensure the public was aware of our proposals and had various opportunities to be a part of the process and provide input in the form of comments, suggestions and ideas.

N20-2

While it is true that the maximum range of many weapons may exceed the impact area on some ranges, the charges for the munitions used on those ranges are reduced to avoid rounds landing outside the impact areas. Therefore the chances of a round landing outside the impact area are very small. All ranges have a designated safety zone as well. The safety zone are set so that the odds of a round landing outside this zone are, statistically, one in a million. This has been determined to be a less than significant impact so no mitigation is necessary.

N20-3

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

N20-4

The Army provided maps from the DEIS to the commenter as requested.

Hau'ula, Hawaii 96717

Re: Comments on SBCT Draft EIS

Ko'olaupia Hawaiian Civic Club is opposed to the proposed use of lands on Oahu and Hawaii Island for the purpose of Stryker Brigade Combat Training.

The Ko'olaupia Hawaiian Civic Club was organized in June 1924 by Native Hawaiians dedicated to the preservation of our culture. To accomplish this end we are committed to preserve and perpetuate our language and history and to support the education of Native Hawaiians. To accomplish these objectives we are active participants in the pursuit of social, economic and civic development and success of our people.

Historically the United States of America has not been the best partner in our endeavors. We are the First People of Hawaii whose lands were illegally taken by the USA. We have been reduced to the lowest levels in health, education and economics of all of the residents of Hawaii. Even our culture and language are being "managed" to fit the program to lure tourists to Hawaii.

N21-1

KHCC Practices Ho'oponopono (set things right), Kokua (help), Ohana (family), Malama Pono (take good care), Lokahi (harmony), 'Ike (recognition), Aloha (love), Kupono (honesty), and Laulima (cooperation). The Stryker proposal is an offense to malama pono ka 'aina (take good care of the land). The EIS does not put concern for the impact to the land first but addresses it as a necessary evil. It has reduced the value of our land, environment and culture to zero.

N21-2

We say no to further acquisition of our land by the US military and no to the SBCT. Hawaii is a small island state limited in land and resources. There are more threatened animal and plant species in Hawaii than any where else in USA. Some of the worst damage to the environment in Hawaii can be attributed to those lands managed by the military over these many years of occupation.

N21-3

Finally, we are most disturbed that the voluminous EIS presented to the public did not include the Army's planned use of howitzers in SBCT live fire training nor does it

N21-4

include the use of helicopters. Also, during the hearings on Oahu the military limited

N21-3

After the publication of the Draft EIS, the Army announced plans for an enhancement package for SBCTs. The enhancements include an aviation task force, an increase from twelve to eighteen 155mm howitzers in the direct support artillery battalion, and improvements to command, control, communications, computer, and intelligence (C4I) assets. The announcements indicated that the aviation task force would include Comanche helicopters when the aircraft were ready for fielding. In February 2004, the Army determined that no further testing or fielding of Comanches would occur and canceled the Comanche program. The SBCT aviation task force will come from existing 25th ID(L) aviation brigade assets and will result in minor changes to training, primarily some increased aviation training over WPAA in support of units training in that area. The FEIS has analyzed the impacts of the increased aviation training over WPAA and those impacts are minimal. The Draft EIS analyzed the impacts of twelve 155mm howitzers, a change from the eighteen 105mm howitzers currently in the direct support artillery battalion for 2nd brigade. The addition of another six 155mm howitzers was analyzed in the FEIS and resulted in minimal changes to noise impacts and no change in the overall determination of effect. The C4I improvements are not expected to have any impacts on the environment. Overall, the Army has determined that the enhancements are within the original scope of the proposed action as described in the Draft EIS, are minor in nature, and do not require a supplemental Draft EIS.

Comments

N21-4

testimony from the public by holding meetings in private locations and banning persons holding signs from testifying. We cannot accept that the requirements of EIS has been met. We expect further hearings to be scheduled to review the additional information regarding live fire exercises.

These comments are being forwarded to Senators Daniel Akaka and Dan Inouye and Congressmen Ed Case and Neil Abercrombie. Their support of this program is reprehensible. Money appears to be the primary motivation which perpetuates the further colonization and militarization of Hawaii.

We look forward to receiving full response to concerns and the announcement of future hearings.

Cathleen Pi'ilani Mattoon, President
Ko'olauloa Hawaiian Civic Club

Responses

N21-4

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs.

It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

RE: SBCT Draft EIS

Dear Ms. Barger:

N22-1

Attached are the comments approved by the Ko'olaupua Neighborhood Board # 28 at its November meeting. The Board has significant problems with this project and this EIS. Subsequent to the Board passing the attached comments the newspaper has reported that the military is now looking at using the area for helicopter landings and howitzer fire training neither of which were addressed in the EIS. Thus the EIS is incomplete and a supplemental should be prepared. The Neighborhood Board has already on page three of its comment questioned the completeness of the document because of the action of addressing Drum Road impacts in a separate document. The increase and or addition of these two uses further question the adequacy of the Draft EIS document.

The Neighborhood Board respectfully requests an answer by its January 8th meeting on its request for a supplemental EIS document.

Sincerely,

Creighton Mattoon, Chair
Ko'olaupua Neighborhood Board

CC: Senator Daniel Inouye
Senator Daniel Akaka
Representative Neil Abercrombie
Representative Ed Case
Governor Linda Lingle
Mayor Jeremy Harris
Senator Melody Aduja
Representative Colleen Meyer
Councilmember Donovan Delacruz

Responses

N22-1

After the publication of the Draft EIS, the Army announced plans for an enhancement package for SBCTs. The enhancements include an aviation task force, an increase from twelve to eighteen 155mm howitzers in the direct support artillery battalion, and improvements to command, control, communications, computer, and intelligence (C4I) assets. The announcements indicated that the aviation task force would include Comanche helicopters when the aircraft were ready for fielding. In February 2004, the Army determined that no further testing or fielding of Comanches would occur and canceled the Comanche program. The SBCT aviation task force will come from existing 25th ID(L) aviation brigade assets and will result in minor changes to training, primarily some increased aviation training over WPAA in support of units training in that area. The FEIS has analyzed the impacts of the increased aviation training over WPAA and those impacts are minimal. The Draft EIS analyzed the impacts of twelve 155mm howitzers, a change from the eighteen 105mm howitzers currently in the direct support artillery battalion for 2nd brigade. The addition of another six 155mm howitzers was analyzed in the FEIS and resulted in minimal changes to noise impacts and no change in the overall determination of effect. The C4I improvements are not expected to have any impacts on the environment. Overall, the Army has determined that the enhancements are within the original scope of the proposed action as described in the Draft EIS, are minor in nature, and do not require a supplemental Draft EIS. Presently Drum Road is used for access to the Kahuku Training Area (KTA) and the Kawaihoa Training Area (KLOA) during current force training activities. The existing road lacks proper drainage and safety measures such as guard-rails, barriers, and warning signs. To safely continue using Drum Road for current force training activities considered mission-essential, the Army is proposing upgrades to the road, regardless of the final decisions on SBCT in Hawai'i. If the Army decides to transform to SBCT in Hawai'i, the Army would use Drum Road for access to the KTA and KLOA regions, as such the use of Drum Road is discussed in this EIS in Chapter 7. Since the proposed upgrade of Drum Road is a single and complete project separate for the proposed SBCT, the upgrade itself is discussed in Chapter 9 of this document in relation to cumulative impacts.

Comments

TO: Cindy Barger, SBCT EIS Project Manager
U.S. Army Corps of Engineers, Honolulu District

FR: Ko'olauloa Neighborhood Board #28

RE: Comments on SBCT Draft EIS

The Ko'olauloa Neighborhood board encompasses the Kahuku Training Area and as such represents people who will be affected by this action. These comments are arranged in two parts the first are general comments about the overall proposals, impacts and the concerns the board has about the document. The second part goes through Chapter 7 section-by-section and raises questions specific to these sections.

The Board wishes to express its support for our military men and women in uniform and acknowledge that this support should not be construed to imply support for this project which the Board has significant concerns about.

PART I

N22-2

The Department of Defense (DOD/military) owns a vast amount of land in the Hawaiian Islands. The board has heard the argument that different branches of the DOD i.e. the Army and Marine Corp need their own training facilities, as it is difficult to coordinate using each other's facilities. The Neighborhood Board does not agree with this assessment and points out that there is sufficient land owned already in the state to meet training needs. The DOD should require all branches of the military to coordinate their training activities instead of purchasing more of a very limited commodity in Hawai'i i.e. 'aina (land) for destructive military purposes. The military should first learn to share its training resources before coming to the community and asking for more.

The document largely asks the community to trust the Army that they will make the best faith effort and do things right. You have picked a poor time to expect this kind of trust. The DOD in general as well as the Army in particular does not have a great track record. Just a few examples the "controlled burns" at Makua, the inability to honor any commitment to clean up and return any site that has been used for live ordinance fire.

N22-3

Although the document has done a good job of disclosing the impacts on site and admitting that the Army intends to do no mitigation to minimal mitigation, which is the purpose of the NEPA process it has failed to adequately address offsite impacts. The document also fails to look at all cumulative impacts by separating out the assessment of Drum Road into a separate document, which amounts to piecemealing of the project. This is not allowed under NEPA. Until you combine these processes under one document and timeline you fail to address all negative impacts of the action at the same time.

N22-4

N22-5

Offsite impacts not adequately addressed include:

- Long term health hazards on residents and school children of particulate dust levels that exceed the federal standard. You note that PM10 emissions (dust

Responses

N22-2

There are no other branches of DOD who own any tract of land large enough to be used for off road maneuver training on the islands. Existing ranges were evaluated for this use and were found lacking. However, the Army does coordinate with and make available it's training areas to other DOD agencies such as the Marines, Navy, and Coast Guard.

N22-3

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

N22-4

Presently Drum Road is used for access to the Kahuku Training Area (KTA) and the Kawaihoa Training Area (KLOA) during current force training activities. The existing road lacks proper drainage and safety measures such as guard-rails, barriers, and warning signs. In order to safely continue using Drum Road for current force training activities, the Army is proposing upgrades to the road, regardless of the final decisions on SBCT in Hawai'i. If the Army decides to transform to SBCT in Hawai'i, the Army would use Drum Road for access to the KTA and KLOA regions, as such the use of Drum Road is discussed in this EIS in Chapter 7. The Transformation EIS recognizes the need to include all projects and actions directly related to or dependent upon SBCT and covers 28 projects and actions in its scope. Since the proposed upgrade of Drum Road is a single and complete project separate for the proposed SBCT, the upgrade itself is discussed in Chapter 9 of this document in relation to cumulative impacts.

N22-5

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of

Comments

- N22-5 cont'd** particulates) would increase by 315 tons per year to 476 tons meaning that currently the community is only exposed to 161 tons per year. This amount would violate both state and federal air quality regulations. You note that the impact "poses the greatest potential for creating either nuisance conditions at nearby off-post locations or localized violations to ... standards". The document does not discuss the potential long-term impacts to the surrounding populations especially children and asthma suffers of prolonged exposure over many years to these levels of wind blown particulates. You also do not link this impact to the very real fact that as activities progress the dust may become contaminated with lead, asbestos and PCBs which makes this dust even more dangerous to the long-term health of inhabitants of the area. You describe possible mitigating measures but then say "These mitigation measures, if implemented," again we question your commitment to mitigate anything if you are allowed to proceed. There is also a proposed increase in these emissions of another 163 tons from wind generated erosion due to the activity this increase is not short term or even remotely localized in nature.
- N22-6**
- Impacts on the aquifer of accidents and spills of oils and other chemicals from the wash down and training activities. You claim that the wash down facility will separate and recycle the water and oil/contaminants. There are no details as to how this will be done and the remoteness and controlled access to the area assure that no state or community organization will know if it is being done or ignored.
 - You talk about fire hazards being increased and that you will do all you can to control it. As previously stated you have shown how well you do that at Makua. When this Neighborhood Board was asked to support your initial purchase at KTA from Campbell Estate the then Army Command here promised us that there would be no live fire training on the site. People in your command may change often but this is a stable community that expects institutions to honor their promises. On top of the increase in hazard from live fire (which was promised never to happen) you mention the increase from discarded cigarettes which is a clear example of the institution's lack of aloha for the 'aina. That you would accept as a matter of course that your soldiers will not properly dispose of their cigarettes but will and are expected to just throw them on the ground is an indication of the level of "sensitivity training" you propose to give your personnel regarding the culture of the 'aina (land) and its significance to the Hawaiian people. What happens if a fire gets to Kahuku town?
- N22-7**
- N22-8**
- The community of Kahuku with the assistance of the Neighborhood Board has worked for many years to get its flooding problems under control. The document does not address the impact of your activity on flooding problems in the area. Facts: water runs down hill and water flows faster off compacted, eroded, non-vegetated land. Why would you think that this is an impact you do not have to address?
- N22-9**
- The military has shown this community over and over that it can not be a responsible steward of the land where live ammunition is concerned. The DOD has not honored any commitment to clean up and return land after live fire. Because of the dismal track record in this area and the fact that a promise was

Responses

washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

N21-6

Inspections of hazardous waste generating facilities are required under federal law (RCRA), and inspection records are available to the public. The State of Hawai'i is authorized to enforce sections of RCRA and will have access to perform inspections. The Army is required to maintain maintenance and inspection records and to account for all waste generation and disposal. Internal audits of waste facilities are conducted by the Army as part of its standard procedures. Wastewater discharges are regulated under the Clean Water Act, and require a permit. These provisions of the CWA are enforced by the state. It would be illegal to discharge process wastewater to the ground without a permit. These protections, and the ability of the public to access records, are built into the law and regulations that apply to the facility operations. One of the principal purposes of building a modern facility is to enable operations to be conducted in an environmentally protective manner, using limited water resources efficiently, and collecting and disposing of waste properly. At this time, the details of the design are not available. However, pollution control technology, waste containment, and wastewater recycling equipment are sufficiently standardized that the Army can estimate the cost of the facilities reasonably accurately.

N21-7

Smoking would not occur during mounted or dismounted training along any of the project trails or roads. Smoking on the installations during training would only be allowed in administrative bivouac sites or designated areas. Both types of locations would have receptacles for the proper disposal of tobacco products and associated lighting devices (e.g. matches or lighters. The munitions used will be Short Range Training Ammunition (SRTA) that, while technically considered live-fire, have plastic bullets with a range of only 500 feet. The potential for fire is also extremely low and the EIS impact analysis identified no significant impact from training activities at KTA. The munitions used will be Short Range Training Ammunition (SRTA) that, while technically

Comments

- N22-9 cont'd** | made that there would be no live fire on the site as part of the prior purchase no live fire should be allowed.
- N22-10** | In general this document has more “wiggly words” to qualify mitigation measures than any this Board has ever reviewed. A mitigation measure that is implemented “if practicable” or “feasible” is not a mitigation measure but a statement of good intentions at best and more likely an empty promise.
- PART II**
- 7.1.1 Construction**
- N22-11** | The washdown facility - what is its impact on ground water should the oil receptor facility breakdown or not be present or used? What is the impact of the spread of alien species into native species areas as seeds from non-natives are carried off in the wash down water? The collective training facility construction section mentions latrines – what method of disposal is proposed? What systems will be put in place to assure that if a major storm hits during construction the coastal plain will not get a mud bath? What are the possible interference impacts of the proposed antenna arrays?
- Training**
- N22-12** | As previously stated no live fire should be allowed in the area per the Army’s prior promise – if you are going to continue to propose it the document is incomplete without a discussion of frequency of accidents at live fire facilities world wide so that the community may better address this inappropriate use. This discussion should include wounding and mortality rates for personnel, frequency of brush fires and success with control of same, damage to property and civilians.
- N22-13** | Again the lack of the addressing of impacts of the use of Drum Road by this brigade in this EIS makes this a flawed document under NEPA.
- N22-14** | Table 7-1 the documents notes that many impacts may be mitigated to less than significant but when you get to the discussion of mitigation it is not described in the usual terms of shall and will but in terms of where practicable and where feasible. The very language implies that the will to mitigate an impact to less than significant is seriously lacking. Therefore the Board questions every instance in which the Army states its intention to mitigate an impact from significant to not significant. All such references in all tables in the document are hereby question and a request is made that in each instance the document define the concrete difference between significant and less then significant impact.

Responses

considered live-fire, have plastic bullets with a range of only 500 feet. The potential for fire is also extremely low and the EIS impact analysis identified no significant impact from training activities at KTA.

N21-8

Management practices would be implemented to reduce impacts on downstream flooding by reducing rates of runoff in areas affected by the project. However, existing flooding risks would not be mitigated.

N21-9

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. As a mitigation measure for safety, prior to initiation of any construction activities, USARHAW will employ qualified professionals to perform UXO clearance of the proposed construction area, remove all UXO encountered to ensure the safety of the site, and document UXO surveys and removal actions in full accordance with applicable laws, regulations, and guidance. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program. The munitions used will be Short Range Training Ammunition (SRTA) that, while technically considered live-fire, have plastic bullets with a range of only 500 feet. The potential for fire is also extremely low and the EIS impact analysis identified no significant impact from training activities at KTA.

N21-10

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

Comments

7.2 Land Use/Recreation

The land use as noted of agriculture, conservation resource and preservation is inappropriate for the proposed use and if the Army were not part of the federal government and had to go through the permitting process this use would be denied – therefore the expansion of the use proposed under this document should be denied.

N22-15

The section about continuing recreational use of the area appears to unrealistic, 1) it is only allowed when the military is not training, 2) safety becomes an immense issue with live fire and ordinance. The Board seriously doubts that continued recreational use will be allowed at all. This discussion seems to be to placate the current users into thinking that continued use will be allowed when in reality with the increase in activity (i.e. Sniper and machine gun training 355 days a year) and type of activity proposed continued use is not feasible. There is discussion of access permits being necessary. How would these be obtained and where – if you have to go to a military base there is no way any access permit will ever be applied for. One way to stop access while maintaining that you allow it, residents have learned, is to just make the permit incredibly difficult to get. As noted on page 7-13 to access the Schofield-Waikane trail written permission is required from the Schofield Barracks Range Control and a permit is needed from Army Support Command. How many permits have been given in the last 12 months? Where is there discussion on access for native practitioners?

7.3 Visual Resources

Sensitive Views

N22-16

The document mentions the scenic views mauka that are noted in several community plans. The document then states that it will be partially visible and will impact views and will do nothing to mitigate this impact. It also does not address the view impact of large dust plumes from equipment. Even if the equipment itself is not visible the dust it creates will be and this is not discussed. Your discussion of view impacts also only discusses the impact from ground level and not the impact from upper elevations such as the hotel.

7.4 Airspace

N22-17

The section again talks about no significant impact but never quantifies the increase in numbers of aircraft. It notes that the aircraft will be the same as those in the area now so noise impacts won't change, it notes the currently there are average movements of 3,500 aircraft per month but does not clearly state whether this number will go up or stay the same. The document states that the proposed action would not result in any major change to Army helicopter flight operations. Please define "major change" i.e. six more flight per month, 20, 400?

Responses

N21-11

Since the water is being recycled, a breakdown in the system would not result in a spill but a shut down of the facility until the problem is resolved. All water would be retained at the facility. Any temporary latrines will be port-a-pottys. They would be periodically pumped and wastes disposed of by a contractor. The EIS has determined that there is no significant change to wastewater and wastewater treatment if the proposed action is implemented. The Army abides by all applicable laws and regulations in the design and management of its wastewater facilities. All required erosion prevention measures will be installed during the construction phase to minimize erosion during storms. An Electromagnetic Compatibility (EMC) study for the SBCT-5 training sites on O'ahu and PTA was conducted. Over 65,500 frequency records were considered in this study from the civil sector and other federal government agencies. Results indicate no significant interference problems should be encountered on O'ahu and PTA during the operation of the Enhanced Position Locating and Ranging System (EPLRS), backbone of the training systems on the FTI Sites.

N21-12

The munitions used will be Short Range Training Ammunition (SRTA) that, while technically considered live-fire, have plastic bullets with a range of only 500 feet. The potential for fire is also extremely low and the EIS impact analysis identified no significant impact from training activities at KTA.

N21-13

Presently Drum Road is used for access to the Kahuku Training Area (KTA) and the Kawaihoa Training Area (KLOA) during current force training activities. The existing road lacks proper drainage and safety measures such as guard-rails, barriers, and warning signs. In order to safely continue using Drum Road for current force training activities, the Army is proposing upgrades to the road, regardless of the final decisions on SBCT in Hawai'i. If the Army decides to transform to SBCT in Hawai'i, the Army would use Drum Road for access to the KTA and KLOA regions, as such the use of Drum Road is discussed in this EIS in Chapter 7. Since the proposed upgrade of Drum Road is a single and complete project separate for the proposed SBCT, the upgrade itself is discussed in Chapter 9 of this document in relation to cumulative impacts. Drum Road upgrades will be updated in a separate NEPA document.

Comments

7.5 Air Quality

N22-18

Dust generation – this was previously covered under Part I due to the serious non discussion of long term cumulative health impacts. However in this section you discuss maintaining vegetation and re-vegetation as mitigating measures yet you admit that it is uncertain if effective vegetation reseeding programs could be implemented. Therefore there is no mitigation of these long-term effects as well as no mitigation for the erosion caused by 20 ton vehicles at KTA. The document further state that even if you are inclined to rotate training areas (which later in the document you note is not possible because of the topography) it is unlikely that the down time would allow for re-vegetation.

7.6 Noise

N22-19

The document notes that the activities will exceed the urban acceptable dBA levels – since the activity is taking place in a rural community and is proposed to reach in excess of 85 dBA this should be described as a significant impact. If one vehicle is 72 to 85 dBA what is the impact of up to 241 vehicles at a time?

7.8 Water Resources

N22-20

This is an area of high rainfall which will exacerbate the erosion, and run off that have already been described as happening as a result of the proposed action. The fact that there is no discussion of this impact on the areas below the training area is a significant flaw in this document. The Board also believes that there is potential for ground water contamination as a result of oil spills during training, the wash down facility activities, as well as the environmentally hazardous substances found on-site as construction takes place none of these potential impacts are discussed. This is an issue for the entire Island as Board of Water supply documents establish that all the aquifers are linked and that contamination travels from one to the other. The Windward side is the greatest source of water recharge for the island and the potential to contaminate our area with this activity is real. The Army has already shown an inability to control its activities.

N22-21

Under surface water quality there is a statement that none of the watershed in the KTA has been identified as Category I watershed in need of restoration. This is probably because the use in the area has been low. If this proposed action goes forward resulting in maneuvers involving up to 241 vehicles some weighing 20 tons and the admitted inability to control erosion or vegetation stripping caused by the activity this will probably change. Damage to this training area would impact the recharge ability of the watershed. The section also notes that soil erosion has been identified as a potential problem in the Ko'olau Mountains and that major causes of erosion are pigs and human activity. It then goes on to inappropriately compare the proposed activity to the impacts of hiking, dirt biking etc.

Responses

N21-14

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

N22-15

The munitions used at KTA will be Short Range Training Ammunition (SRTA) that, while technically considered live-fire, have plastic bullets with a range of only 500 feet. As discussed in Section 7.2.1, authorized recreation uses of KTA would not change. Unauthorized recreation access would be subject to additional limitations as a result of fencing and the introduction of live-fire training. SDZs would be clearly identified and no public access would be permitted during live-fire activities. There will be no change to access. Those wanting access to military lands already require a permit. Access for native practitioners is discussed in section 7.11.

N22-16

Section 7.3. identifies impacts to visual resources as less than significant, which requires no mitigation. As discussed in Sections 4.5, 5.5, 6.5, 7.5, and 8.5, the Army is developing mitigation techniques in consultation with the USEPA to reduce fugitive dust emissions to a less than significant level. This would negate any visual impacts from fugitive dust.

N22-17

Section 7.4.2 states that no new aircraft activity would be associated with Proposed Action at KTA/KLOA. Therefore, the average number of aircraft movements would not change.

N22-18

The fugitive dust estimates presented in the EIS are based on EPA equations that do not account very well for the controlling effect of high soil moisture conditions. The EPA equations effectively assume a dry soil surface condition, even when precipitation frequency adjustments are included in the analysis. The result is a substantial overestimate of actual dust generation

Comments**Responses**

conditions for locations such as KTA where high soil moisture conditions are likely to prevail. The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. If monitoring demonstrated significant dust generation during large vehicle maneuver exercises at KTA, then the scheduling of maneuver exercises would have to avoid periods when surface moisture levels are low in the maneuver areas. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

N22-19

The maximum noise levels from individual vehicle passby events cannot be compared to land use compatibility standards, which are based on long duration, time-weighted average noise levels. Figure 5- presents the hourly average noise levels associated with various traffic volumes on military vehicle trails. Traffic volumes on the Helemano Trail and Drum Road would be controlled to not exceed 96 vehicles per hour.

N22-20

Impacts on surface water quality from training activities, spills on Drum Road, and during construction are discussed on page 7-60 and 7-61 for the three alternatives. They are considered less than significant because they will be addressed through compliance with storm water pollution prevention plans and best management practices, as required under the Clean Water Act, and through standard spill response procedures. Storm water plans are public documents, and implementation of the components of a storm water pollution prevention program, including best management practices to prevent non-point source discharges, is a regulatory requirement with which the Army is required to comply. Similarly, the Army is required to comply with its spill prevention control and countermeasures plan.

Responses

N22-21

As described in the EIS, the initial ATTACC modeling done by the Army indicates that impacts to the land, which would result in soil erosion, would likely be severe. This is an initial estimate, but combined with the observed sensitivity of the environment to impacts from other activities, it suggests that there is reason to be concerned about the impacts. The impacts can be reduced through good management practices, but the EIS does not claim that the impacts would not be significant. We agree that significant impacts from soil erosion and significant indirect impacts from erosion on water quality could occur. These impacts would be monitored and reduced to the extent possible through implementation of the ITAM program.

Attn. CEPOH-PP-E
Ft. Shafter, Hawai'i 96858-5440

Re: Comments on Army Stryker Brigade Combat Team (SBCT) Draft Environmental Impact Statement

Dear Ms. Barger:

Life of the Land is Hawai'i's own environmental and community action group advocating for the people and the 'aina since 1970. Our mission is to preserve and protect the life of the land through sustainable land use and energy policies and to promote open government through research, education, advocacy, and litigation.

We would like to preface our comments with some observations of this process, which we see as seriously flawed.

Stryker Combat Team Proposal Coincides with DOD's Fight for Exemption from Environmental Laws:

Life of the Land would be remiss not to note the irony of the timing of this proposal with the Department of Defense's battle with Congress for exemption from the National Environmental Policy Act. Life of the Land sued the Navy in 1971 regarding the bombing of Kaho'olawe, which resulted in the decision that the military must obey all environmental laws. Now, more than thirty years later, the DoD is *increasing* activity while working on *decreasing* their responsibility. Auwe!

Changes to Stryker Proposal:

One December 20, 2003, the Honolulu Star Bulletin reported that the Stryker Brigade approved for Hawai'i may be equipped with helicopters and cannons NOT included in this Draft Environmental Impact Statement. Life of the Land is concerned that the public is, therefore, reviewing and commenting on an incomplete document. We suggest that you do a round of PUBLIC MEETINGS IN PUBLIC PLACES and a Supplemental EIS to explain the impacts of this new information. What are your plans in this regard? How will the public be notified?

The Environmental Impact Statement (EIS) Process:

An EIS is done to analyze and document the impacts of a "major federal action significantly affecting the quality of the human environment" (NEPA Sec. 102(C)). The National Environmental Policy Act (NEPA)

Responses

N23-1

After the publication of the Draft EIS, the Army announced plans for an enhancement package for SBCTs. The enhancements include an aviation task force, an increase from twelve to eighteen 155mm howitzers in the direct support artillery battalion, and improvements to command, control, communications, computer, and intelligence (C4I) assets. The announcements indicated that the aviation task force would include Comanche helicopters when the aircraft were ready for fielding. In February 2004, the Army determined that no further testing or fielding of Comanches would occur and canceled the Comanche program. The SBCT aviation task force will come from existing 25th ID(L) aviation brigade assets and will result in minor changes to training, primarily some increased aviation training over WPAA in support of units training in that area. The FEIS has analyzed the impacts of the increased aviation training over WPAA and those impacts are minimal. The Draft EIS analyzed the impacts of twelve 155mm howitzers, a change from the eighteen 105mm howitzers currently in the direct support artillery battalion for 2nd brigade. The addition of another six 155mm howitzers was analyzed in the FEIS and resulted in minimal changes to noise impacts and no change in the overall determination of effect. The C4I improvements are not expected to have any impacts on the environment. Overall, the Army has determined that the enhancements are within the original scope of the proposed action as described in the Draft EIS, are minor in nature, and do not require a supplemental Draft EIS.

Comments

Life of the Land Comments on SBCT
January 2, 2004
Page Two...

regulations of the Council on Environmental Quality (CEQ) go into considerable detail about the content and format of an EIS, and into how an EIS is reviewed, finalized, used in decisionmaking, and if necessary amended and supplemented. Source: <http://www.npi.org/nepa/impact.html>

The EIS process generally has four steps:

1. Notice of Intent published in Federal Register
2. **PUBLIC** scoping meeting is held - **THIS HAS NOT BEEN DONE**
3. *DRAFT* Environmental Impact Statement (DEIS) is published and the public has a minimum of 45-days to offer questions and comments on proposal.
4. Army **MUST** answer all questions and concerns, which are then published in the Final EIS.
5. Record of Decision is published **AFTER** FEIS is accepted.

EIS Definitions:

The regulatory definition of the term "**human environment**" -- impacts on the quality of the human environment being the subjects of any EIS -- includes "the natural and physical environment and the relationship of people with that environment."

The definition of "**effects**" -- as in "effects on the quality of the human environment" -- includes changes in the human environment that are "aesthetic, historic, cultural, economic, (or) social."

The regulatory definition of the word "**significantly**" -- as in "**major federal action significantly affecting the quality of the human environment**" -- includes as measures of impact intensity:

- Impacts on an area's unique characteristics, such as "*historic or cultural resources*, park lands, prime farmlands, wetlands, wild and scenic rivers, and ecologically critical areas".
- Impacts on "districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places" and on "significant scientific, cultural, or historical resources".

Scoping Meetings:

N23-2

Holding **PUBLIC** meetings in **PRIVATE** places is **UNACCEPTABLE** and, in our view, **DOES NOT COMPLY** with the spirit and intent of the National Environmental Policy Act (NEPA). A new round of **PUBLIC** meetings, held in **PUBLIC** places need to be held on **ALL** islands since this project entails money from **all** taxpayers. We look forward to a new round of **PUBLIC** meetings to discuss this proposal and request that we be 'Consulted Partics' to any actions regarding the Stryker Brigade Combat Team anywhere in Hawai'i nei.

Arresting 7 people Exercising their First Amendment Rights:

N23-3

This shameful action initiated by the Army defies **EVERYTHING** that the US Constitution stands for. If troops need to train to preserve freedom, how does the arrest of 7 people exercising their constitutionally protected rights uphold that very freedom? The Army's strong-arm tactics are reprehensible and Life of the Land believes that the Army needs to take the following actions to resolve the issue:

Responses

N23-2

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs.

It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

- issue a formal apology to all seven people arrested
- reimburse them for the time lost and expenses incurred dealing with the arrest and subsequent court hearings and
- publish a formal apology to the community stating that the Army was WRONG to arrest people peacefully protesting with a promise that the Army will uphold the Constitution, not shred it, and that no more actions of this sort will take place again

Stryker Brigade Approved for Hawai'i:

N23-4

On December 15, 2003, the Honolulu Star Bulletin published a story entitled "Stryker brigade approved for Schofield - The Army base will get 300 of the new combat vehicles and 810 more soldiers by 2005." Please explain how a decision can be made BEFORE the public comments are received and evaluated. Is this *entire* process a sham? That is certainly NOT the intent of NEPA!

Are the Strykers Safe?:

N23-5

In researching the Stryker, we have heard from some soldiers who have trained on vehicle and the stories are not good. Although we have been told they are comfortable, quite fast on the road, and very quiet we have heard that this comes at the expense of safety. Several accidents have already occurred during training due to their excessive speed. We have also learned that the Stryker has huge maintenance issues and suffers lots of problems such as not being able to fire on the move or go everywhere the tracked vehicles can go.

In early December 2003, three soldiers from St. Lewis were killed in Iraq when the Stryker rolled over in a canal and a few weeks later, another Stryker rolled over in an irrigation ditch in Iraq. The papers reported following the first accident, "Col. Michael Rounds, the brigade commander, ordered that no more vehicles be driven along roads next to irrigation canals." This seems rather impractical to us.

Soldiers have said that "at the Aberdeen Proving Grounds they didn't test with PG-7 rockets, just small arms projectiles and got penetration from 7.72 AK47 rounds when fired from the 24-inch barrel of the RPK SAW. We won't mention what the 12.7x108mm *Russian Fifty* and 14.5mm slugs did, but that was when they announced the *flawed armor supplied by subcontractors.* Standoff distance for a Monroe Effect shaped charge is 2 times the cone diameter. The PG7's outside diameter is 93mm, the charge itself is 85mm. So 85mm+85mm+ half of 85mm= 212.5mm or about 8.36 inches- call it 8 and a half inches total. The nose of a PG-7 rocket isn't 8.5 inches ahead of the front face of the 2-kilo, 4.4 pound shaped charge, so the extra standoff distance from the Stryker slats will focus the explosive effect better than a hit against bare armor, not worse. Penetration of a PG7's charge is up to 14 inches of steel armor, and Stryker's - inch armor is NOT going to pose any protection from the ones that do go off. So what we've done is make it likely that around half the rockets that hit Strykers won't go off. But the ones that do, will actually work better."

Responses

tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

N23-4

Although the Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2nd Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2nd Brigade, 25th ID(L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law.

N23-5

The Army continues to make changes to the Stryker vehicle to make it more reliable, effective, and safe. The Stryker will continue to evolve to make it as safe and reliable as possible as part of the Army Transformation process.

This is a photo of the Stryker in Kuwait with the 5,000+ pound birdcage the soldiers needed to install for protection. We have been told that the Stryker bird cage

**N23-5
cont'd**

- will hinder and slow vehicle commander and driver from routine egress/ingress
- widen vehicle to absurd width and will snag on objects
- does nothing for vehicle top, and vulnerable side wheel well areas

If Stryker is hit and on fire how do troops trying to escape from top avoid getting stuck/trapped in the cage?

If Stryker is hit and on fire how can troops trying to escape completely depend on only the rear door/ramp?

Why do we want to send troops into harm's way with unsafe equipment?

Life of the Land Testimony at Turtle Bay Hilton Meeting:

A'ole Stryker Brigade

Tuesday, November 4, 2003

Turtle Bay Public Meeting in PRIVATE VENUE

N23-6

- My name is Kat Brady and I am with Life of the Land and a number of other community organizations.
- We sincerely hope that the Army will ask the prosecutor to drop all charges against the people exercising their first amendment rights. It's been said that "There is only one power available to citizens which does not require great wealth or the use of violence. It is the power of collective persuasion. It works on the subtle levels of thought and conversation and it works directly through democracy." The Army's actions regarding democracy has been shameful and you owe an apology to the people who were denied entrance to testify in their own way. Please make a formal apology to those denied democracy and to all of Hawai'i for your strong-arm tactics to reject people who exercised their right to dissent.
- Your choice of venues for these meetings are unacceptable to us. It appears to have been orchestrated to deny people their right to express their opinions. Holding PUBLIC meetings in PRIVATE places is reprehensible and I hope that you are planning to hold REAL PUBLIC HEARINGS IN PUBLIC PLACES on ALL ISLANDS,

Responses

N23-6

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs.

It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

including O'ahu, to receive public comments

- Woodrow Wilson once said, "The history of liberty is a history of resistance" and we hope that you understand that now
- Mahalo for agreeing to extend the comment period to January 3, 2004 on this complex document so that the community can offer a more thoughtful analysis of the serious issues involving the health and welfare of the people of Hawai'i, including your soldiers
- As Henry said, we serve as community members on the Central O'ahu and Hickam Air Force RABs and were the only community members of the Schofield Technical Review Committee, so we know something about the impact the military has had on Hawai'i.
- To quote the poet Arundhati Roy: "I think my eyes were knocked open and they don't close. I sometimes wish I could close them and look away... But once you've seen certain things, you can't un-see them, and seeing nothing is as political an act as seeing something."
- What I have seen of military contamination breaks my heart. Land that was farmed for generations by families has now been rendered unusable because of the massive contamination.
- According to the Hawai'i Military Land Use Master Plan of 1995 210,000 acres are already controlled by the Department of Defense, including 112,000 acres of 'ceded'/ STOLEN land, 71,000 acres of leased lands for 'secondary use', and 27,000 acres owned in fee simple. O'ahu hosts over 91,000 acres, with nearly 5,000 acres on Kaua'i, and 114,000 acres on Hawai'i Island
- Now the Army wants another 1400 acres on O'ahu and 23,000 more acres on Hawai'i Island, while the Navy is staging a grab for 6,000 additional acres as a buffer for Pacific Range Missile Facility. 'NUFF ALREADY! You are squeezing out the peaceful people of Hawai'i with your warring ways!
- The impact of the military on Hawai'i has been and continues to be HUGE.
 - * The Air Force has more than 142 sites and over 60 Areas of Concern;
 - * the Navy's contamination of Pearl Harbor -- once a breadbasket for Hawai'i -- has resulted in it being designated as a Superfund, with 749 sites of significant contamination;
 - * NC TAMS in Whitmore Village is another site with contamination
 - * Kalaeloa - formerly Barber's Point NAS - has enormous hazardous contamination amongst its many cultural and archaeological treasures
 - * Schofield was declared a Superfund because of colossal TCE (trichloroethylene) contamination in their groundwater. After \$8 million the source was never found. This is a great concern for communities on O'ahu because water is our most precious resource
 - * Lualualei on the Leeward side of O'ahu has massive contamination
 - * Makua Valley -- once a thriving agricultural community with springs and streams -- has suffered

Responses

N23-7

We thank you for your comment and your comment has been included into the administrative record for this process. For the purposes of this document, "ceded lands" refers to lands that were "ceded" to the federal government by the State of Hawai'i. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process. We understand that there are several other proposed projects by the federal government and others throughout the state of Hawai'i. We have identified these projects in Chapter 9 of this document. Chapter 9 discusses the cumulative effects of the proposed action and actions proposed by the Army and other entities.

hundreds of burns which destroyed endangered species and critical habitat, as well as continually being littered with toxic contamination and unexploded ordinance

AND THIS IS ONLY ON O'AHU!

N23-8

And now you want to bring a Stryker Brigade that includes almost 300 Stryker vehicles -- eight-wheeled, 19-ton, armored infantry carriers, designed to move troops quickly to any place in the world. But the GAO said, "...meeting the 4-day worldwide deployment goal of a brigade-size force would require more airlift than may be possible to allocate to these brigades; at present, it would take from 5 to 14 days, depending on destination."

N23-9

Locating a Stryker Brigade in Hawai'i will only add to the EXISTING MASSIVE MILITARY CONTAMINATION that needs to be cleaned up. I am concerned because it takes 40 years for water to percolate through the Halawa lens, where most of O'ahu gets its water and any additional contamination, on top of what is already challenging the resource, assures that we will saddle our future generations with polluted groundwater.

And while this is all happening, the military is in Congress demanding sweeping exemptions from public health and environmental law requirements. THIS IS WRONG!

N23-10

Your EIS talks about ranges, saying that when a range becomes too contaminated, you will move to another piece of land. Ranges are full of contaminants, even depleted uranium, which has a half-life of 4.7 billion years. So you'll move your soldiers off contaminated land, but what about us? We live here. You'll leave, but we will have to live with your mess.

A Stryker Brigade will deepen Hawai'i's involvement in waging wars of aggression and occupation of other nations around the world. This is as egregious as naming the stealth bomber the "Spirit of Aloha."

THERE ARE BIG PROBLEMS WITH THE STRYKER

Every person with a loved one in the military should be very concerned about this proposal. I have a nephew in the military. Many, many military people have come out strenuously against it.

Lonnie Shultz, a former Special Agent with the U.S. Treasury Department who served in combat in Vietnam with the 101st Airborne Division and 5th Special Forces Group and a recipient of the Purple Heart medal on several occasions wrote a piece entitled "Into Harm's Way with the Stryker" in which he posits:

N23-11

- If a target is directly in front of the MGS (Mobile Gun System) it can fire a round. If the barrel of the gun must be rotated to either side if the centerline of the weapons carrier, firing the gun can flip the carrier over and render it unusable.
- The Stryker is an overweight, vehicle with insufficient internal space for the infantrymen packed into the rear troop compartment. Unofficial reports indicate it is so tight that those inside cannot even take out their canteens for a drink of water.
- And its armor is dangerously ineffective: The armor plating on the top of the vehicle might stop a 7.62-mm round, but the thin armor behind the eight big wheels will not stop anything.
- Since the front four of the Stryker's eight wheels are used for steering, there cannot be any RPG (Rocket Propelled Grenades)," skirts attached to that area or they will impede the movement of the steering wheels,

Responses

N23-8

As a result of the GAO report and ongoing Army operations, the Stryker vehicles are being modified to fit in C-130 aircraft. Additionally, deployment practices continue to evolve. The Transformation process allows for adaptations to equipment and operations to ultimately meet the goals of current, SBCT, and future forces.

N23-9

The project will include the construction of modern facilities which will reduce the potential for releases, will minimize waste, and will use water more efficiently than in older facilities. Practices that have lead in the past to environmental contamination included land disposal of hazardous waste in unlined pits, and discharge of wastewater to the land. Such practices no longer occur, and the Army is addressing the contamination from past practices through its IRP program. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. The Army is committed to cleanup existing sites in accordance with applicable laws and regulations.

N23-10

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

nor can the builder add appliqué armor to its upper sections if an airlift is anticipated. ,

Retired Army Maj. Gen. Paul Vallety said he has been following development of the Stryker for several years. "It's been a very controversial issue," said the Fox News military analyst in an interview. "This report **'Stryker Brigades Versus the Reality of War,'**" really calls in to question whether this is the combat vehicle for the Army in the future." Gen. Vallety said:

- the Stryker seems designed more for peacekeeping operations than for combat
- the Army still has not decided what size gun to deploy on the Mobile Gun System variant
- it does not appear to be as efficient and effective as a tracked vehicle in combat operations
- it is also very vulnerable to Rocket-Propelled Grenades] and sniper fire at its wheels
- it's a heavier vehicle and harder to move than what is required for very speedy mobility and transportability to areas of combat operations*

* The Washington Times www.washingtontimes.com - "Study finds new Army vehicle too vulnerable" Published August 26, 2003 **HOW WILL STRYKERS BE DEPLOYED?**

**N23-11
cont'd**

Soldiers who have trained on these vehicles said that they are indeed fast, but their excessive speed has led to many accidents. The Strykers have huge maintenance issues, and suffer lots of problems such as not being able to fire on the move or go everywhere the tracked vehicles can go.

STRYKERS BEING SENT TO IRAQ

And now you've endangered your own soldiers with the Stryker. Soldiers inside the Stryker are so cramped that they cannot even reach for their canteens in the 120-degree weather in Iraq!

"Poorly armored and entirely vulnerable to RPGs states the glossy, 108-page report prepared July 18 by consultant Victor O'Reilly. Mr. O'Reilly is an author and counter terrorism authority who has written about military affairs. He said much of his information on Stryker comes from within the Army itself.

An Army spokesman, however, said the Strykers are being fitted with added armor. This will "drastically increase their protection against kinetic energy weapons and increase RPG protection," said Lt. Col. Stephen Barger, spokesman for 1st Corps at Fort Lewis, Wash., where the brigade is being developed. As part of an accelerated development, the Army did not require Strykers to immediately feature anti-RPG armor. The brigade going to Iraq is now being fitted with slat armor.

Mr. O'Reilly, who said he did the report at his own expense, says even with the added armor the Stryker's top and wheel wells are susceptible to RPGs that could kill all 13 soldiers inside the Stryker's infantry carrier version.

Mr. O'Reilly's report, **"Stryker Brigades Versus the Reality of War,"** is being circulated on Capitol Hill and among the active force and retirement community. Among his conclusions on the eight-wheel, 20-ton infantry carrier version: "Poorly armored and entirely vulnerable to RPGs." "Wheels & wells extremely vulnerable to small arms." "Bought to be C-130 deployable but too heavy."

We implore you to rethink this bad idea.

CLEAN UP, DON'T BUILD UP

Land Grab:

The Stryker Brigade Combat Team (SBCT) proposes to acquire even more land -- 1400 more acres on O'ahu and almost 23,000 additional acres on Hawai'i Island. This is problematic for the people of Hawai'i because we are an archipelago...our landmass is small, yet we are one of the most militarized places on the planet. The Hawaiian Islands are unlike any other place on Earth -- we are the most remote archipelago in the world and we have the dubious distinction of having the most endangered and threatened species on the planet. This makes everything we have in these Islands more precious and more in need of protection for future generations.

Life of the Land is deeply concerned because we are members of the following military committees regarding contamination:

- * Schofield Barracks Technical Review Committee
- * Air Force Hickam Restoration Advisory Board
- * Air Force Central O'ahu Restoration Advisory Board
- * Navy Pearl Harbor Restoration Advisory Board

On Schofield alone, the Army spent \$8 million and many years trying to find the source of TCE contamination only to cap the landfill on base without identifying the exact source. The community is concerned that taking even more of our precious 'aina will only create more problems for future generations.

The Army's track record is questionable as stewards of our 'aina and kai. Makua is, sadly, a glaring example of this. The fire that was out of control last July proved that the community's concerns were well founded and even a sincere apology cannot ameliorate the damage done to that valley, one so important to Hawaiian culture.

Kahuku Training Area/Kawailoa Training Area:

Life of the Land is concerned not only with the impacts of this project, but with all the other projects currently being developed on O'ahu's North Shore. The cumulative impacts of all this development on our precious marine resources and fragile 'aina is of great concern to us. Developer Andy Anderson is building a massive gated community at Velzeyland and his project has been a source of contamination along our coastline. O'ahu has been experiencing some major rainstorms this winter, how can you assure the community and the state departments responsible for protecting the public trust that you will actually use 'best practices' to avoid erosion? How will your project, along with other nearby developments, increase ocean, surface and groundwater pollution?

Chapter 7 of the DEIS admits that "as many as 241 vehicles could participate in a single exercise with up to 173 of those vehicles traveling to KTA along Helemano Trail and Drum Road." We note that the overall change in vehicle use would represent a 77% increase in miles traveled and an 80% increase in vehicle operating hours.

How many vehicles currently are used in a single exercise?

Responses

N23-12

The presence of TCE and other volatile organic contamination at Schofield Barracks was likely the results of spilling of the TCE from the 1940's through early 1970's before it was known that such spilling would be potentially harmful to the environment. Use of lands for the SBCT would be subject to all the regulations in place by the Environmental Protection Agency (EPA) and the State of Hawai'i Department of Health to help prevent spillage of TCE and other compounds that might be harmful to the environment. Army practices for handling of the chemicals are much more rigorous than in the past, and these practices are carefully monitored by both State and Federal agencies.

N23-13

Chapter 2 of the EIS states that the proposed action will increase erosion in the training ranges and the impact is not fully mitigable. Chapter 9.5.2 has been revised to indicate the level of impact on surface waters from soil erosion is significant but mitigable to less than significant. Chapter 9.5.2 also discusses the impacts to marine resources which are considered less than significant.

N23-14

As detailed in Table 2-7, up to 312 vehicles will be traveling to KTA under the proposed project for the single largest exercise. Currently up to 264 vehicles travel to KTA on the roadway. Under the proposed action only 97 vehicles will use the roadway and 215 will use the trails.

Page Nine...

- N23-15** | What types of vehicles are currently used in training?
Are they comparable with the Stryker Brigade vehicles?
If so, how? If not, why?
- N23-16** | Does the Army have a fugitive dust problem currently relating to training at KTA?
If so, what mitigation measures are taking place?
Are these mitigation measures effective or ineffective? Please explain
- N23-17** | What other types of vehicular activities, other than transport along Drum Road, are planning for these areas?
What is the heaviest vehicle currently used in these areas?
- N23-18** | Have there been any problems with fugitive dust, emissions, or maneuvering in the area encountered?
If so, what are they? Please describe the problem and your resolution/mitigation measures.
- N23-19** | How will you mitigate the runoff from the construction of the mock village at KTA?
- N23-20** | Have you consulted with US Fish and Wildlife regarding the James Campbell Wetland?
- N23-21** | How will you ensure that run off, fugitive dust, and emission pollution will not reach the endangered species at the Wetland?
- N23-22** | We are amused that under "Less than Significant Impacts" you list "Noise from aircraft operations." The military aircraft activity on the North Shore is an increasing concern for Life of the Land. We receive many calls for residents complaining about the low-flying aircraft at all hours of the day and night. We have been told that it appears to be getting worse. We suggest that you take this issue more seriously and work on mitigating the noise and dust generated from your flights.
- N23-23** | Some residents even fear that the increased flights have caused some of the rockslides experiences on O'ahu in the last several years. Does the Army take responsibility and accept liability, if that is the case?
- N23-24** | Biological Resources:

We have included a copy of the US Fish & Wildlife's Recovery Plan for Ko'olau Mountain Plant Cluster, dated August 1996 for your information.

Life of the Land would again emphasize that the Hawaiian Islands are the most isolated archipelago on earth, making every resource we have priceless. Nainoa Thompson, Master Navigator of the Hokule'a said it best when he described Hawai'i as a canoe. This is all we have, so we must be mindful of how we use our precious and oh so fragile resources. True sustainability means that we will leave enough for future generations to meet their needs.
- N23-25** | Watershed Protection:

The University of Hawai'i's School of Ocean Engineering, Science and Technology has embarked on a huge Watershed Restoration Project on the North Shore, so drainage from the Kawaihoa Training Area and Drum Road route is a great concern to residents. Life of the Land is participating in this effort.
- N23-26** | Species Protection:

In Hawai'i's fragile environment, the introduction of alien species is devastating. Army vehicles traveling from one area to another must be mindful of the spore on the wheels of the vehicles and the boots and clothing of soldiers. What is your protocol for avoiding the introduction of alien species into pristine biological areas?

Responses

N23-15

As noted in Section 2.3, Table 2-3, and Table 2-5, the Army is using 5-ton, 6 by 6 wheeled cargo trucks, which are non-armored, and thus lighter than Stryker vehicles. Stryker vehicles are 20 tons but armored, and 8 wheeled.

N23-16

KTA is in an area of high rainfall, high soil moisture, and relatively dense vegetation cover, as discussed in Section 7.8. No prolonged fugitive dust problem is expected under such conditions. Dust may be generated during construction activities or during maneuver training in dry periods.

N23-17

As discussed in Section 2.3.4, no other transport vehicles, but mounted maneuvers will take place along Drum Road. The heaviest vehicles currently used are 5-ton cargo trucks.

N23-18

KTA is in an area of high rainfall, high soil moisture, and relatively dense vegetation cover, as discussed in Section 7.8. No prolonged fugitive dust problem is expected under such conditions. Dust may be generated during construction activities or during maneuver training in dry periods.

N23-19

Construction related erosion and water quality impacts will be mitigated through standard construction best management practices. The text of the water resources section has been revised to include a list of specific minimum BMPs that would be applied at KTA. The same BMPs would be applied elsewhere. As indicated in the EIS, nearly all project construction would be required to comply with Clean Water Act requirements to prepare a Construction Storm Water Pollution Prevention Plan, which defines training requirements, spill prevention and control measures, BMPs, reporting requirements, etc.

N23-20

Consultation with USFWS is complete and included Army training lands.

Comments

Life of the Land Comments on SBCT
January 2, 2004
Page Ten...

Archaeological Resource Protection:

- N23-27** It is anticipated that there is a 'high probability' that archaeological sites will be discovered during road construction of the segment traversing KLOA. How will you handle the discovery of archaeological and cultural sites? How will the numerous archaeological sites at KTA and KLOA be protected? We note that the area for the proposed tactical vehicle wash at KTA has been surveyed and that the project area contains "no identified cultural resources." The paragraph then goes on to mention, "However a stepped stone platform (site 50-80-02-9508) is in the gulch immediately northeast of the project area, and a heiau (site 50-80-02-2501) is only a short distance to the northwest." Vehicle wash areas are a big part of the clean up that the Restoration Advisory Boards tackle. Many contaminants from vehicle wash areas have been found in gulches around the island, so this is not a remote possibility. Your document states that you will recycle the water, but after several uses, how do you propose to drain and dispose of the used, and now contaminated, water?
- N23-28**

Fire Protection:

- N23-29** Obviously this is a big issue for the community. After instituting what the Army swore were strict measures for fire control, we saw Makua Valley burn last summer. Although there is no proposed live-fire training at KTA because you of the use of short range training ammunition (SRTA), the DEIS does note a high risk of wildfires. Please include the standard operating procedures you will have, hopefully, updated since the last Makua disaster.

PCB Contamination:

- N23-30** We note that the Combined Arms Collective Training Facility (CACTF) is on a location that formerly contained PCB-contaminated soils. Your document says that "moving these soils could create a significant impact by releasing PCBs into the air and exposing construction workers, Army personnel, and the environment." We assert that there is also risk to the community as well, if the wind picks it up, which should not be ignored.
- You may also be interested in knowing that the Navy is currently using a Thermal Desorption Unit at Kalaeloa (formerly Barber's Point) to clean PCB contaminated soil from their various RAB clean-up sites.

Electricity:

- N23-31** The DEIS notes that KTA gets power from HECO via overhead primary distribution lines. Has the Army considered on-site generation (fuel cells, cogeneration units, etc.) instead of relying on HECO's grid?
- N23-32** It appears that the Strykers will be traveling on state and country roads at least some of the time. If a Stryker were stuck on a public road, how would it be towed away? What impact would that have on traffic and vehicle safety? Drum Road is proposed to be a gravel road, can it handle a 20-ton vehicle? What if it gets stuck on that road? How will it be removed and what will the impact on your maneuvers be?

Dillingham (Kawaihapai) Military Reservation:

- N23-33** Life of the Land is concerned about ingress and egress on the North Shore. There is only one road going to

Responses

N23-21

Mitigations for runoff are discussed in section 9 in Chapters 5-8. Mitigations for fugitive dust and emission pollution are discussed in section 5 in Chapters 5-8. All mitigation measures are used to lessen the effects of the impacts.

N23-22

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

N23-23

A wide variety and number of factors could be responsible for rockslides. The Army does not accept responsibility.

N23-24

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

N23-25

The comment does not specify the location of the watershed project. If it refers to the Kaneohe Bay Monitoring Project, then we would note that KTA is not within the watershed of Kaneohe Bay.

N23-26

Measures to mitigate for nonnative species introductions are included in each chapter under the biological resources section 5.10, 6.10, 7.10, 8.10.

N23-27

All site discovery methods, protection measures and avoidance strategies and are detailed in the PA. The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS.

N23-28

As discussed in Sections 5.14.2 and 8.14.2, filtered water would be reused for the vehicle wash. Water is continually reused with no wastewater disposal. Solids from the water are separated in the vehicle wash, removed and treated with EPA approved bioremediation methods so that the solids may be used with existing soils on Army lands. A water/oil separator is included in the vehicle washes. The oil from the vehicle washes is disposed by a contractor in accordance with all appropriate laws and regulations

N23-33 cont'd

Dillingham/Kawaihapai. Our concerns about Strykers breaking down and blocking access is highlighted in this area, where residents have no options if the road is blocked.

N23-34

How many Stryker vehicles and troops are anticipated for training in this area?
What is your safety plan for residents should something happen to block their leaving or entering their neighborhood?
What type of training will be conducted at this site? How often and for what duration?

N23-35

Will soldiers be staying overnight at DMR? For how long? How many soldiers?
What is the nature of the Stryker Training? Please explain in detail.

Pohakuloa Training Area (PTA):

On Hawai'i Island there are hundreds of thousands of acres littered with unexploded ordnance from years of conventional, chemical and biological weapons testing and training. 47 of more than 50 former military areas have known hazards. Military hazards are present on our lands and in our waters. Tides expose munitions buried in the sand off Hapuna Beach and in Hilo Bay. Last year several live grenades were found by school children in a Waimea Middle School garden.

- PTA is an 108,793-acre live fire area, a bombing range for all sorts of military weapons, and has been for more than 60 years. The military wants to expand PTA by 23,000 acres and maybe more.
- Besides being a sacred area, a holy place of union in Hawaiian culture, Pohakuloa has "the highest concentration of endangered species of any Army installation in the world" according to former Pohakuloa commander Lt. Col. Dennis Owen.
- PTA exists in a sub-alpine, tropical, dry land ecosystem, between 4000 and 8600 feet elevation, one of the rarest ecosystems in the world.
- There are approximately 30 species of endangered and at-risk plants and animals found at PTA.
- There are also over 250 known ancient Hawaiian archaeological sites within PTA's boundaries.

It is obvious that NO MORE land should be used in this pristine environment.

N23-36

The DEIS states that two new ranges will be built. This is a cause of great concern to us since we know, as RAB members, that ranges generally are not included in clean up, yet are some of the most contaminated places. At one meeting, we were told that when the Army felt that the range was too contaminated and represented a danger to the troops, they would just leave and find new land to contaminate. This blatant disregard for the community did not go unnoticed. We are, therefore, greatly distressed that as the Army professes to be good stewards of the environment, they are actually planning to abandon places they destroyed and leave them for us and our future generations. Auwe!

N23-37

The DEIS mentions that a road between Kawaihae and PTA is needed so that Strykers can be unloaded from boats, but there is no mention in the DEIS that Strykers will leave Schofield by boat. Will they drive down public roads? Will they be transported by vehicle? If so, what kind of vehicle? How will they get to Pearl Harbor? What changes will be needed at the airports and harbors? This is an error in the DEIS, which is intended to include analysis of all impacts.

Responses

N23-29

The Army's Integrated Wildland Fire Management Plan has been completed and outlines specific measures to be implemented on each installation, including KTA, to reduce chance of and impact from wildfires. These measures are detailed in the biological resources chapters under appropriate mitigation and the hazards chapters.

N23-30

Section 7.12 of the FEIS discusses existing PCB contamination as an issue of potential concern if contaminated soils are disturbed without prior remediation. The FEIS notes that additional evaluations would be conducted to verify the extent of contamination and to determine the appropriate remediation program. Implementation of an appropriate remediation program prior to construction of the CACTF would mitigate this potential impact.

N23-31

The EIS has determined that there is no significant impact to public utilities and HECO energy capacity if the proposed action is implemented. For all proposed construction and use on Army lands, the Department of Public Works Master Planning program regularly assesses the energy needs and demands for Army activities and coordinates as appropriate to ensure that Army demands do not significantly impair power supply for the rest of the region.

N23-32

As stated in Section 2.2.3, to ensure maximum safety, all convoys must comply with local policies, as specified in standard operating procedures, which direct such matters as vehicle safety inspections and convoy safety briefings, and vehicle operators must be properly trained and licensed to operate assigned military vehicles. Drum Road and Dillingham trail are both being constructed to handle heavy military vehicles. The Stryker can be towed by other Strykers is necessary or heavy vehicle tow trucks can move a Stryker if needed. If the Stryker is in an area inaccessible to the tow trucks it can be airlifted to a site where it can be picked up by a heavy vehicle transport.

Page Twelve...

Several branches of the United States Military have recently proposed a number of expansions (Stryker; Naval Carrier; Pearl Harbor Expansion; Kaneohe Marine Air Corps Station; Pacific Missile Range Facility). The cumulative effect must be analyzed.

N23-38

32 CFR 651.16 (a) NEPA analyses must assess cumulative effects, which are the impact on the environment resulting from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions. Actions by federal, non-federal agencies, and private parties must be considered. (Code of Federal Regulations (CFR) National Defense Chapter 5 – Department of the Army Part 651 – Environmental Analysis of Army Actions (AR 200-2) –Table of Contents Subpart B--National Environmental Policy Act and the Decision Process Sec. 651.16 Cumulative impacts)

N23-39 | What is likely cumulative effect of reasonably foreseeable future actions on wastewater facilities?

N23-40 | What is likely cumulative effect of reasonably foreseeable future actions on fresh water aquifers facilities?

N23-41 | What is likely cumulative effect of reasonably foreseeable future actions on electric generation facilities?

N23-42 | What is likely cumulative effect of reasonably foreseeable future actions on storm drains facilities?

N23-43 | What is likely cumulative effect of reasonably foreseeable future actions on endangered species?

N23-44 | What is likely cumulative effect of reasonably foreseeable future actions on alien species?

N23-45 | What is likely cumulative effect of reasonably foreseeable future actions on public access (fences, gates, restrictions, methods of notification)?

N23-46 | What is likely cumulative effect of reasonably foreseeable future actions on military police patrols on easements?

N23-47 | What is likely cumulative effect of reasonably foreseeable future actions on wildfire management, fire break roads?

N23-48 | What is likely cumulative effect of reasonably foreseeable future actions on air traffic?
What is likely cumulative effect of reasonably foreseeable future actions on vibrations caused by low flying helicopters, planes, and ground vehicles? In particular, can the increase in vibrations cause landslides, rock falls, and flora/fauna?

N23-49 | What is likely cumulative effect of reasonably foreseeable future actions on hazardous waste facilities?

N23-50 | What is likely cumulative effect of reasonably foreseeable future actions on contingency plans for evacuations?

N23-51 | What is likely cumulative effect of reasonably foreseeable future actions on the Pearl Harbor sole source aquifer?

What procedures will be used in the handling and the disposal of each of the following chemicals:

(a) Trichloroethylene (TCE; C₂H₃Cl₃);

(b) Carbon Tetrachloride (C-Cl₄);

(c) RDX;

(d) Lead;

(e) Thallium;

(f) Arsenic;

(g) Iron;

(h) Aluminum;

(i) Manganese, and

(j) Nitroglycerin

N23-52

N23-53

The Southern Oahu Basal Aquifer, which underlies [Schofield Barracks Military Reservation] SBMR and part of the East Range was designated by the US EPA as a Sole Source Aquifer in 1987 under Section 1424(e) of the Safe Drinking Water Act (USEPA 2003). A sole source aquifer supplies at least 50 percent of the drinking water consumed in the area overlying the aquifer, and represents a water supply source for which there is no alternative that could 'physically, legally, and economically supply all those who depend on it for drinking water.'" (DEIS page 5-106)

Responses

N23-33

As stated in Section 2.2.3, to ensure maximum safety, all convoys must comply with local policies, as specified in standard operating procedures, which direct such matters as vehicle safety inspections and convoy safety briefings, and vehicle operators must be properly trained and licensed to operate assigned military vehicles. The Stryker vehicle will be as reliable as other military vehicles traveling the highway today. The potential for disruption should be less under the Proposed Action once Dillingham Trail is constructed and the Drum Road project is completed

N23-34

Section 2.3 of Chapter 2 provides information on proposed Stryker training in Hawai'i. Table 2-5 states how many Strykers would train at each installation. The number of soldiers staying in each training area varies based on the level of training that occurs. Table 2-2 states how many soldiers are in a squad, platoon, company, battalion and brigade. In addition, safety measures associated with Stryker training to minimize impacts to the general public are discussed in Section 4.12 Human Health and Safety Hazards.

N23-35

Table 2-lists the training activities at each installation while Section 2.3 describes these training activities in detail and Appendix C provides more in depth descriptions of training.

N23-36

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of

N23-53
cont'd

Residues of explosives and other constituents of munitions would continue to be deposited on soils and on training ranges at [Schofield Barracks Military Reservation] SBMR and PTA. Small quantities of these residues could be transported downwards through soils and rock with infiltrating water. (DEIS page 4-49)

Schofield Barracks Groundwater was and is contaminated by Trichloroethylene (TCE; C₂HCl₃) and Carbon Tetrachloride (C-Cl₄). The source of the carbon tetrachloride contamination was the SB landfill (DEIS 1967-81). TCE contamination source unknown. (DEIS page 5-107; page 5-206; DEIS Appendix K)

Although a relatively small number of samples were collected to represent the ranges, the samples were generally collected from locations that were considered to have a high probability of representing the most contaminated sites. CONCLUSION: Therefore, the sample results represent above average concentrations on the ranges overall. RDX was found in the highest relative levels among the chemicals detected on the ranges, exceeding the PRG for RDX in two composite samples of 39 composite samples taken. (DEIS page 5-134)

The Proposed Action is not expected to cause increased exposures to these chemicals because it would not place personnel in additional contact with contaminated soils. Instead, by moving mounted maneuver training to the [South Range Acquisition Area] SRAA, it would reduce some of the opportunities for exposure. (DEIS page 5-134)

Greater than Preliminary Remediation Goal (PRG) for Residential: Thallium, Arsenic
Greater than Preliminary Remediation Goal (PRG) for: Iron, Aluminum, Manganese, [Cyclo tri methylene tri nitramine] RDX, Nitroglycerin (pages M1-1 through M1-13)

The Statement "a relatively small number of samples ... the sample results represent above average concentrations" can not be justified. Small sample sizes are inherently unreliable, and great care should be used. By analogy, tossing a coin three times and coming up with three heads, does not justify a conclusion that the coin is two-headed.

N23-54

The Statement "the samples were generally collected from locations that were considered to have a high probability of representing the most contaminated sites." needs a lot of explanation. Who decided, how was it decided, what is the probability (the confidence interval estimate) that the guesswork is okay, etc.

How does "generally collected" differ from "collected"? Were some of the samples from elsewhere?

N23-55

How were "composite samples" created?

N23-56

In general, combining different samples together into one composite sample, levels out contamination. Samples with higher or lower concentrations are evened out. So how could the samples "represent above average concentrations"?

N23-57

Were the samples collected at the surface, just below the surface, or a ways underground?

N23-58

In analyzing the samples, did the Army use Quality Assurance/Quality Control (QC/QA) methods; that is, were blank samples and spiked samples used to determine the accuracy of the results?

What lab analyzed the samples?

N23-59

The EPA's Analytical Test 8330 is used to establish and confirm RDX concentrations. Isn't the statement: "RDX was found in the highest relative levels among the chemicals detected on the ranges, exceeding the PRG for

Responses

the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

N23-37

The soldiers will travel to Pearl Harbor in Stryker vehicles and trucks. They will travel the same route that they use today adhering to the strict highway rules pertaining to convoys on public roads. The total number of trips will not change. The Stryker vehicles can travel at highway speeds. No changes to the harbors at Pearl Harbor or Kawaihae are needed. This was analyzed in the EIS and there are no additional impacts over existing conditions. The airfields at Wheeler and Bradshaw Army Airfields are being upgraded and the impacts of the upgrade activities and use are included in the EIS in Chapters 5 and 8.

N22-38

Chapter 9 discusses the cumulative impacts of the Stryker project (SBCT) and Pearl Harbor development activities (Ship Operation and Dry-dock Waterfront Support Facilities) and other past, present, and reasonably foreseeable actions in the ROI. The Pacific Missile Range Facility and KMAC Station are on Kaua'i and outside the ROI which includes the islands of O'ahu and Hawai'i.

N23-39

Section 9 (O'ahu project #2) discusses the cumulative impacts on wastewater facilities. The Army is also putting in a new wastewater treatment facility separate from this proposed action.

N23-40

Assuming that the comment intends "freshwater aquifers," rather than "freshwater aquifers facilities" the cumulative effects in general would include effects on quantity and quality of groundwater, and on direction of flow, and are not expected to be significant. The project would slightly increase demand for potable water at SBMR, but the demand would be offset by lower demand elsewhere. The increased demand for water in the SBMR area will increase the rate of groundwater extraction, and will therefore increase the rate of remediation of the groundwater contaminant plume beneath SBMR. This will result in a beneficial impact on water quality beneath SBMR. Increased water use in the SBMR area will increase the amount of wastewater generated and

Page Fourteen...

N23-59 cont'd RDX in two composite samples of 39 composite samples taken" misleading? Although 39 samples at 8 sites were tested for some contamination, only 9 samples at 3 sites were tested for RDX. If two of these samples were significant (22% of samples tested for RDX), isn't additional testing needed?

N23-60 The EPA's Analytical Test 8332 is used to establish and confirm Nitroglycerine concentrations. Why was it used in only 6 samples at 3 sites? What confidence can the Army have in base-wide Nitroglycerine contamination based on 6 samples?

Why were there 4 samples from site ENG, 2 samples from site FP, 5 samples from site INF, 9 samples from site KR8, 4 samples from site MAC, 8 samples from site NFB, 2 samples from site SR1 and 5 samples from site SR2? What determined the number of samples per site?

N23-61 Why are the samples from site NFB labeled 1, 2, 4, 6, 8, 9, 10, 11? What happened to samples 3, 5, and 7?

N23-62 EPA's Analytic Test 8270 tests for Semivolatile Organic Compounds. EPA's Analytic Test 8270 tests for nitrosodimethylamine (dimethylnitrosamine; C2H6N2). Why were only 9 of 39 samples tested for this contaminant? Why was only 1 of 8 samples at NFB tested for this contaminant? What can be said about the NFB site by testing one sample?

N23-63 Are any of the contaminants mobile (air, water, dust)?

N23-64 What are the strengths and weaknesses of the Attac Model used in analyzing the data?

This project is of great concern to the community because the military has been the largest polluter in Hawai'i with over 1,000 contaminated sites identified and who knows how many yet undiscovered. What is the cumulative impact of all this military contamination on the health, cultural survival and the quality of life of our communities? How much total contamination and unexploded ordinances have been released into our 'aina and wai/kai over the decades? This proposal will:

- increase military landholdings by 12.8%
- increase military-controlled land in Hawai'i from 10.8% - 11.4%
- increase live ammunition by 25%
- increase military vehicle miles by 300% overall (and 700% on Hawai'i Island)
- increase dust emissions by 7 million pounds per year

N23-65

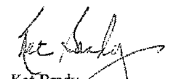

Will the Army assume liability for health problems, such as respiratory ailments, for residents experiencing problems by the 50% increase in fugitive dust?

The Army's trustworthiness is at issue, from the many, many fires in Makua Valley to Hawai'i recently finding out that we were exposed to the military's chemical warfare testing of Sarin in 1967. People are legitimately concerned about their health and welfare and that of their future generations. Please take these issues seriously and answer the communities' concerns thoughtfully and honestly.

Mahalo for this opportunity to comment.

Sincerely,

Henry Curtis
Executive Director

Kat Brady
Assistant Executive Director

Responses

treated, resulting in more treated wastewater being discharged to Kaukonahua Stream. This may result in a small increase in total dissolved solids in the stream. However, the increase is not expected to be significant compared to background levels of TDS, and would be within the range specified by the NPDES permit for the discharge.

N23-41

Section 9.5.2- Public Services and Utilities, discusses the cumulative impacts on electricity demand. The Army would be responsible for using energy-efficient materials, in compliance with EO 13123.

N23-42

As discussed in the EIS, the project would involve construction of new facilities, which would result in an increase in the impervious surface area at SBMR and other installations. An increase in impervious surface area would increase the volume and rate of storm runoff to streams somewhat, and could increase the potential for flooding if existing storm drainage systems are not large enough to accommodate the increased flows. However, the drainage systems of new facilities will be designed to accommodate the anticipated flows and prevent too rapid flushing of water at discharge points.

N23-43

These impacts are discussed in Chapter 9.5.2-biological resources. The EIS states that the net effects of SBCT activities on listed species, critical habitat and sensitive species are significant and unmitigable (pp. 9-39, 9-40). These impacts are discussed in Chapter 9.10.

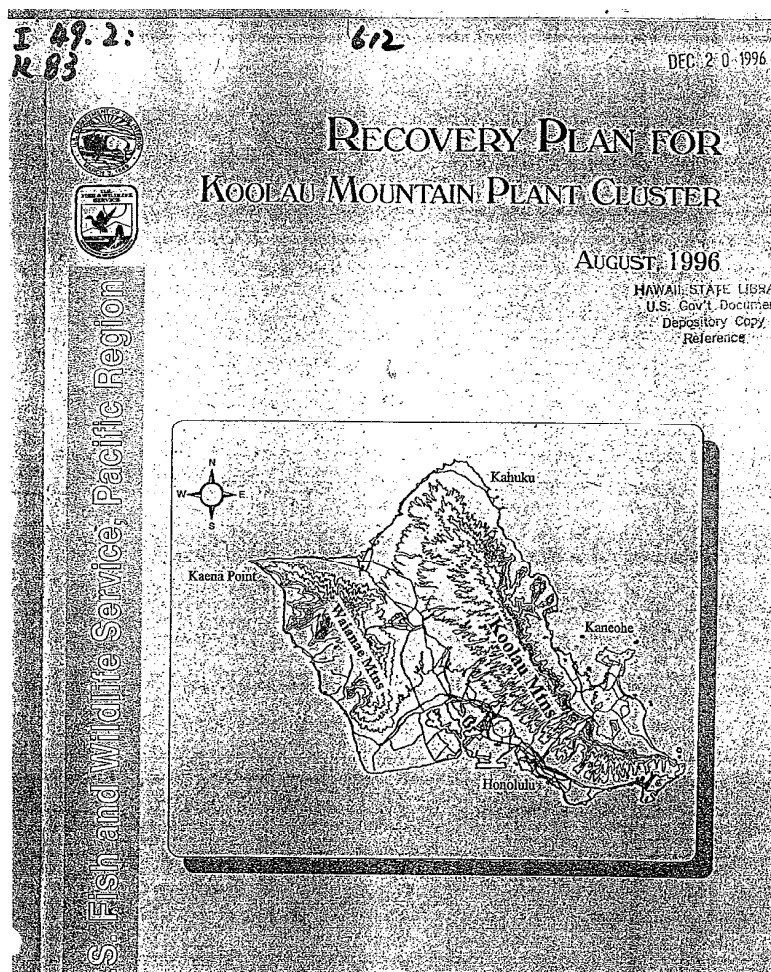

N23-44

Cumulative impacts on recreational access are discussed in Section 9.5.2 - land use Recreational trends are reflected in the sustainable community plans prepared by the City and Count of Honolulu. Trends associates with recreation resources include providing continued, and where possible, increased access to recreational resources.

N23-45

Military police activities are discussed in sections 5.14, 6.14, 7.14, and 8.14. If the Army decides to implement the proposed action, the Army will ensure that the military police are adequately staffed. As part of existing standing operating procedures, the easements will be regularly patrolled by the Army

Comments

Responses

Range Control soldiers on a daily basis during shift changes and to ensure that the gates are secured and trails are in safe conditions.

N23-46

These impacts are discussed in Chapter 9.5.2-Biological resources and is also referenced in the Integrates Wildfire Management Plan.

N23-47

Cumulative impacts on air traffic are discussed in section 9.5.2. No other projects in various other airspace ROIs have been identified. There would be a shift in the instrument approach path to BAAF on PTA, but no impact on airspace used in the ROI.

N23-48

As noted in the Draft EIS, the proposed action would not result in any meaningful change in operations by the Aviation Brigade. The added UAV flight operations would occur primarily within restricted airspace areas, and thus would have no significant impact on commercial or private aviation. Rockslides and landslides are almost always triggered by either seismic events or by saturated soil conditions that destabilize the support of overlying material. Noise and vibrations generated by aircraft and helicopter flight activity or by vehicle traffic are incapable of generating landslides or rockslides unless conditions are so unstable that natural conditions would also be expected to trigger the slide event. Cumulative impacts on air traffic are discussed in Chapter 9.5.2. Vibrations from helicopters (or any aircraft overflight) won't trigger rock slides or landslides. Such overflight would produce the pressure fluctuation equivalent of light to moderate winds. Overflight effects on flora and fauna are discussed in the biological resources sections, Sections 4.10, 5.10, 6.10, 7.10, and 8.10, as well as Section 9.

N23-49

Chapter 9.5.2 discusses the cumulative impacts on hazardous waste management, under the section heading "Human Health and Safety Hazards".

N23-50

Chapter 9.5.2 discusses the cumulative impacts on emergency evacuations under the section heading "Human Health and Safety Hazards".

Comments**Responses****N23-51**

The cumulative effects in general would include effects on quantity and quality of groundwater, and on direction of flow, and are not expected to be significant. The project would slightly increase demand for potable water at SBMR, but the demand would be offset by lower demand elsewhere. The increased demand for water in the SBMR area will increase the rate of groundwater extraction, and will therefore increase the rate of remediation of the groundwater contaminant plume beneath SBMR. This will result in a beneficial impact on water quality beneath SBMR. Increased water use in the SBMR area will increase the amount of wastewater generated and treated, resulting in more treated wastewater being discharged to Kaukonahua Stream. This may result in a small increase in total dissolved solids in the stream.

However, the increase is not expected to be significant compared to background levels of TDS, and would be within the range specified by the NPDES permit for the discharge. Note for all Curtis and Brady comments asking for cumulative effect of future actions: The CI analyses are not intended to assess likely cumulative impacts of reasonably foreseeable future actions on resources but how a particular proposed action (s) will contribute to past, present, and likely future actions with a view forward when these impacts have reached a significance threshold.

The sole source aquifer is an administrative concept that provides additional protection of water quality in areas designated as dependent on groundwater for most of the potable water demand. As described above, the project will result in increased extraction from the Schofield groundwater area in the upper portion of the sole source aquifer. This is also the area of the TCE plumes from past industrial waste practices at SBMR. The remedy for the groundwater contamination is long-term groundwater extraction and above ground treatment to drinking water quality. Increasing the rate of pumping will likely increase the rate of remediation of the groundwater contamination plume, resulting in a beneficial impact on groundwater quality in the sole source aquifer over the long term.

N23-52

The following information and its implications is discussed in the EIS, in the Geological Resources, Water Resources, and Human Health and Safety sections. The Army is an EPA permitted large-quantity generator of hazardous waste. Installations routinely receive, store, and handle hazardous materials, and generate waste in the normal course of operations. The chemicals listed in the comment are just a few of many that have been

Comments**Responses**

identified through sampling, but they are of different origins. For example, iron, aluminum, manganese, thallium, and other metals are naturally occurring as well as man-introduced. Most of the detections of these compounds in soils from the PTA and SBMR ranges likely are due to background concentrations. Arsenic and lead are also naturally occurring, but in some cases the man-introduced concentrations exceed the background concentrations. Arsenic is a human carcinogen, and was found to be present at an average concentration (with 95 percent confidence) in the samples from the ranges that was about twice the industrial PRG. The carcinogenic risk associated with this concentration is within the EPA's acceptable range of 10⁻⁴ to 10⁻⁶ excess cancers. The observed concentrations of arsenic do not represent an environmental concern. Small residual concentrations of lead result from use of explosives and munitions. Lead bullets from live fire exercises and target training may be deposited on the ground. Over time, some of the lead dissolves and contributes to soil contamination. A few soil samples have been found to contain elevated concentrations of lead, but the average concentration in the samples (with 95 percent confidence) was well below the EPA industrial soil PRG. The Army is studying the conversion from lead projectiles to steel alloy projectiles (so-called "green" ammunition) in order to reduce the potential environmental hazards associated with lead. RDX and nitroglycerine are present as a result of explosives use. The concentrations in soils are low and do not present a significant hazard to humans or the environment. The Army explodes many tons of munitions, which deposit minute quantities of these explosives, and others. The dispersal of very small quantities of these compounds is the inevitable result of implementing the Army's training program. Explosives and munitions handling and use is performed by trained personnel according to standard operating procedures, and is not unique to Hawai'i. TCE is no longer in general use as a solvent, and its production and use have been greatly curtailed in the US since the 1980's. Existing TCE contamination of groundwater at SBMR resulted from past disposal practices and is currently being remediated as part of the EPA remedy for groundwater there. This is a long-term remedy, and the Army is committed to continuing it as long as necessary. Carbon tetrachloride is another chlorinated solvent, like TCE, that is no longer in general use. As for TCE and other contaminants in soils and groundwater that resulted from past practices, contamination is being addressed through the Army's Installation Restoration Program (IRP), which is the military equivalent of the EPA's CERCLA (Superfund) program. A large quantity of documentation is available to the public regarding the investigations and

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-240

Comments

Responses

response actions performed in the IRP program. The program is ongoing. Other hazardous materials and hazardous waste are handled and disposed according to standard procedures developed by the Army for compliance with federal, state, and local requirements. Army policy states that the Army will comply with these regulations whenever possible. Requirements for hazardous materials and waste handling are generally covered under federal Resource Conservation and Recovery Act (RCRA) guidelines and regulations, which addresses a wide range of issues including design of storage and accumulation facilities, scheduling, reporting, inspections, training, etc. Inspections are regularly performed by the Army, and by the State of Hawai'i, which has been delegated authority by EPA to implement relevant RCRA programs.

N23-53

The soil investigation of the ranges did not rely on a small sample. In addition to sampling a large number of locations that were in areas of suspected contamination, and with visible evidence of disturbance by explosives or past disposal, the sampling methodology used composite sampling to ensure that any environmentally significant concentrations would be detected. Composite sampling has the disadvantage of not detecting low concentrations, but it is quite good at detecting high concentrations. Therefore, the methodology was well matched to the objectives of the investigation, which was to survey the ranges to determine if environmentally significant concentrations of contaminants were present. The concentrations were compared to the PRGs developed by the US EPA Region 9. These are conservative measures of the acceptable long term exposures to workers under an occupational exposure scenario. The exposure assumptions of the PRGs overestimate the exposures of soldiers who use the ranges.

N23-54

The locations were selected by the US Army Corps of Engineers investigation team, based on information provided by installation personnel. The sampling locations included impact areas, firing points, and disposal areas. The sampling locations were adjusted in the field to sample areas with visible evidence of potential contamination, such as munitions fragments, discoloration of soils, low topography in which runoff would collect. Some pre-selected areas were found not to be accessible. The word generally was meant to convey that specific sites thought high in contaminants were selected rather than using more random methods. The word "generally" has been replaced with "specifically".

Comments

Responses

N23-55

Composite samples were collected within a 5-to-10 meter diameter circle or along a 15 to 25 meter linear transect by obtaining 10-30 increments of equal quantity.

N23-56

The samples were collected from areas believed to be representative of the highest risk of contamination on the ranges, based on knowledge of the ranges and visual evidence of soil disturbance, discoloration, etc. The intention was not to identify the highest individual concentrations of contaminants, but to identify the concentrations that would lead to exposures or to environmental risk. For example, in a composite sample comprising 10 subsamples, the maximum possible dilution of a high concentrations is by a factor of ten. However, if only one sample from among 10 subsamples taken from the same 10-meter diameter circle on a range contains a concentration exceeding the PRG, then the environmental significance of that one sample is not very high.

N23-57

They were collected from the surface. The objective was to identify contaminants that would either be transported by runoff, or to which military personnel would be exposed, or that might be transported in blowing dust.

N23-58

The analytical program was conducted according to the QA/QC plan developed for the investigation, and the results underwent a QA/QC audit. The samples were analyzed by EMAX Laboratory of Torrence California, a state-certified laboratory. All samples were analyzed within method holding times.

N23-59

All samples were tested for the same suite of analytes, which included RDX. The comparison tables in Appendix M include only the detected concentrations.

N23-60

All samples were tested for nitroglycerine and only those with detected concentrations were reported in Appendix M.

Comments

Responses

N23-61

Some sampling locations that were identified in the work plan were found to be inaccessible in the field.

N23-62

All samples were tested by EPAs Analytic Test 8270. Only those samples with detected concentrations were reported in Appendix M.

N23-63

All of the contaminants may be mobilized in air, water, or through other pathways (physical tracking on vehicles, boots or clothing). Different chemicals have different characteristics affecting their mobility, however. Some chemicals sorb relatively strongly to soil particles and others are more soluble in water and tend to dissolve and be transported in the dissolved state more readily.

N23-64

Appendix M-2 and M-3 describes the ATTAC model and the results. The ATTAC methodology quantifies the impacts of vehicles and training events in relation to a standard vehicle and event. This methodology is a generally accepted model for evaluating a vehicles impact on training areas.

N23-65

Chapter 9 addresses cumulative impacts of both contaminated sites and air emissions and there is more detailed information in the chapters 4 through 8 on specific contaminated sites and dust emissions. Chapter 9 for instance points out that there should be a decrease in petroleum, oils and lubricants releases and an increase in cleanup.

Ms. Cindy S. Barger
SBCT EIS Project Manager
U.S. Army Corps of Engineers
Honolulu District
Bldg. 230, Rm 306, ATTN: CEPOH-PP-E
Ft. Shafter, HI 96858-5440

Dear Ms. Barger:

Comments on Stryker Brigade Draft E.I.S.

Thank you for the opportunity to comment on the Stryker Brigade Draft E. I. S. We would also like to thank the Army for its stated commitment to protect biological, cultural, and scenic resources on military lands, and to involve the public in the planning process. Malama O Puna is a Hawaii nonprofit corporation and 501c3 volunteer service organization which focuses on the environment. Our mission is to assure critical habitat for native species and open space for future generations through environmental education, hands-on projects, advocacy, watchdogging, and land trusting.

Our comments are divided into two parts: (1) General comments on the Draft E.I.S. and (2) specific comments and information regarding the proposed PTA land acquisition area here on the Big Island.

General Comments on the Draft E.I.S.:

N24-1

It is generally understood that the E.I.S. process normally proceeds in a programmatic way, with alternative project configurations proposed, followed by analysis of impacts for each alternative. Finally, an alternative is chosen that is most acceptable. If recent news reports are to be believed, none of the

N24-1

No presumption has been made as to the alternative to be selected. All alternatives are being considered equally. Once the Final EIS is published the selected alternative will be identified in the Record of Decision to be published in the Federal Register.

Comments

Page 2 of 5
December 29, 2003

- N24-1 cont'd** | proposed alternatives is being seriously considered. In view of that, alternative courses of action within the preferred alternative need to be much more fully detailed, and impacts analyzed in detail for these variations.
- N24-2** | We are disappointed by the superficiality of the analysis of impacts on biological and cultural resources, including endangered species. Apparently very few new field studies were done for this E.I.S. and recent literature on biological and cultural resources is not cited for some of the areas to be affected. This is surprising, because the Army has ongoing programs for managing these resources.
- N24-3** | According to the D.E.I.S. there will be significant impacts to biological, cultural, and scenic resources from implementation of the SBCT, but in almost every case the D.E.I.S. states that these impacts are mitigable to "less than significant". How the Army intends to mitigate these impacts is nowhere made entirely clear. The potential impacts, and the proposed mitigations for those impacts need to be fully described in detail in the E.I.S. In the Draft E.I.S., impacts to biological and cultural resources are analyzed only in general terms. The document refers to the Army's ongoing programs for resource management (e.g. ITAM) and essentially says that those programs will result in impacts to biological and cultural resources being mitigated. Given the military's recent requests to congress to be exempted from federal environmental rules, we view these assurances with some suspicion.
- N24-4** | We believe that the final E.I.S. must address potential impacts to important resources in greater detail. In some cases, new field studies should be carried out. In all areas much greater detail concerning proposed actions, resources, impacts, and mitigations need to be given. Impacts on endangered species need to be detailed in terms of where, when, and how they will occur, how populations of individual species will be affected, what those effects mean in terms of the endangerment of each species so affected, and finally, details of how these effects will be mitigated. Actions and impacts that may adversely affect cultural resources also need to be described in more detail together with details of how these effects will be mitigated. Many details are also missing from the analysis of impacts on visual or viewshed resources.
- N24-5**
- N24-6**
- N24-7**

Responses

N24-2

Data from past field studies and current field studies were used in the preparation of the EIS. These studies are referenced in chapters 5.10 and 11, 6.10 and 11, 7.10 and 11 and 8.10 and 11 – Biological Resources and Cultural Resources respectively.

N24-3

The FEIS has been revised to recognize that there are potential significant impacts to biological and cultural resources that may not be mitigated to less than significant levels. Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

N24-4

Data from past field studies and current field studies were used in the preparation of the EIS. These studies are referenced in chapters 5.10 and 11, 6.10 and 11, 7.10 and 11 and 8.10 and 11 – Biological Resources and Cultural Resources respectively.

N24-5

Impacts to individuals and populations of sensitive species and habitats are discussed in chapters 5.10, 6.10, 7.10, and 8.10.

N24-6

Specific actions are described in Ch. 2, and specific cultural mitigations are described in the PA.

N24-7

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

Specific Comments on the PTA Land Acquisition Area.

1. The only new survey (for this EIS) of biological resources in the West PTA Acquisition Area we could find in the draft document was the mention on page 8-117 (Volume 2) of "Biological surveys in spring 2002". These surveys found five (5) federally designated plant species. In fact, studies carried out by the Corps of Engineers have documented seven (7) federally designated plants (and another probably extinct plant) in the West PTA Acquisition Area. No other details about these "Biological surveys" are given and no reference to any literature is cited.

N24-8

Other recent surveys of biological and cultural resources in the West PTA Acquisition Area are not referenced. The Corps of Engineers has been conducting surveys for endangered plants and animals as well as compliance monitoring in the Waikoloa Maneuver Area (which includes the acquisition lands) for over five years. Almost none of this information is referenced, even though it contains detailed descriptions of natural resources, particularly wildlife and plants in the acquisition area.

We are also very concerned about the statement on p.8-141 that up to 88% of the *Haplostachys haplostachya* in the West PTA Acquisition Area could be destroyed by off-road vehicle maneuvers, and that populations of *Stenogyne angustifolia* and *Vigna o-wahuensis* could also be adversely affected. A section 7 consultation with USFWS is being carried out, but no details of impacts or any real mitigation plans for these impacts are presented in the Draft.

N24-9

2. Recent work by the Hawaii Department of Land and Natural Resources on endangered plants in the acquisition area is not referenced.

N24-10

3. Recent work by the U.S. Fish and Wildlife Service on endangered plants in proposed critical habitat areas in the West PTA Acquisition Area is referenced in the bibliography, but no discussion is included in the text of the Draft. The map of proposed USFWS critical habitat areas in the acquisition lands (Figure 8-30 p.8-134) is very unclear. Apparently Pu'u Nohona o Hae is shown, but it is unclear whether Pu'u Papapa is. USFWS proposed both Pu'u Nohona o Hae and Pu'u Papapa in the acquisition area as critical habitat for endangered plants, but removed both areas in their final rule because the Army is acquiring the area and does not want critical habitat designations on military lands. Prior to this

Page 4 of 5
December 29, 2003

- N24-10 cont'd** time, botanists regarded both pu'u as extremely valuable areas for endangered plants. No mention is made anywhere in the Draft E.I.S. of the botanical significance of these areas, even though they meet the criteria stated in the Draft E. I. S. for "biologically significant area" (BSA).
- N24-11** Not only are botanically significant areas in the PTA acquisition lands no mentioned in the Draft E.I.S., but also details regarding specific impacts to these areas are sketchy at best. We are told on p. 8-4 that about 28 miles of roads will be constructed in the West PTA Land Acquisition Area and that the Army will comply with all environmental regulations, but we can find no description of proposed surveys for endangered plants or proposed management actions, other than the overall fire management plan, for protecting endangered plant resources in these areas.
- N24-12** Communications facilities are proposed for several of the pu'u in the West PTA Acquisition Area. Construction details are insufficient to fully evaluate effects on native plants or communities. Again, no biological or botanical surveys are described or proposed in connection with the construction of these facilities. Because the pu'u in the West PTA Land Acquisition Area are important areas for endangered plants, the final E.I.S. should describe surveys for endangered plants and other biological resources that should be conducted prior to construction. We would also like to see a recognition in the E. I. S. that some of the pu'u in the area are not suitable for communications facilities, nor training exercises, because of the severity of impacts on biological, cultural, and visual resources.
- Descriptions of botanically significant areas in the PTA Land Acquisition Area and lists of the endangered plants that occur in these areas can be found in Palmer & Paul (2003) "Botanical Survey of the Waikoloa Maneuver Area" U. S. Army Corps of Engineers, Pacific Ocean Division, Honolulu, Hawaii. Additional information on these sites can be found in USFWS 50 CFR Part 17 "Endangered and Threatened Wildlife and Plants; Designations of Critical Habitat for Plant Species from the Island of Hawaii, HI; Proposed Rule" Federal Register, Tuesday May 28, 2002 36967-37106.
- N24-13** 4. Without more detailed descriptions of actions and impacts, there is no way to evaluate the adequacy of proposed mitigations, which are also given in very general terms. To adequately mitigate (little mention is made of "prevent") impacts to endangered plants in the PTA Land Acquisition area up to date field surveys must be done in those areas known to be botanically significant. Details

Responses

N24-11

Information regarding the acquisition lands was incorporated in the report. The measures outlined in the 2003 BO for Hawai'i describes the additional mitigation measures and surveys planned for Hawai'i. Environmental regulations are included in Appendix N.8.

N24-12

Information regarding the acquisition lands was incorporated in the report. The measures outlined in the 2003 BO for Hawai'i describes the additional mitigation measures and surveys planned for Hawai'i. The pu'us in the Palmer report are included in buffer zones of activity as determined through Section 7 consultation.

N24-13

The results of Section 7 consultation include development of an Pōhakuloa Implementation Plan funded by the Army which addresses some of your concerns about the endangered species at PTA. The individual measures determined in Section 7 to mitigate from Army actions are outlined in the biological resource section of chapter 8.10

Comments

Page 5 of 5

N24-13 | of proposed training activities that might impact these areas must then be set
cont'd | forth, an analysis of significance made, and mitigations developed.

N24-14 | 5. On pages 8-104 and 8-105 in the discussion on soil erosion resulting
| from the preferred alternative it is pointed out that the Army's ATTACC model-
| ing of training intensity of the SBCT indicates that the land condition will deteri-
| orate to a "severe" condition in terms of denudation of vegetation and severe soil
| compaction and erosion. We are very concerned about this, because, as pointed
| out in the Draft, revegetation efforts at PTA have so far not been very success-
| ful. This also means that botanically important areas would need to be protected
| from off-road vehicle maneuvers. Although these impacts are considered signifi-
| cant, mitigations are discussed in only general terms.

N24-15 | 6. The vegetation map in Figure 8-27 (p. 8-116) is overly generalized for
| PTA and is inaccurate for the West PTA Acquisition Area. The Draft refers to
| Shaw and Castillo (1997), and states that 24 vegetation types occur on PTA. This
| is not reflected in Figure 8-27. We assume that the West PTA Acquisition Area is
| shown as "nonnative" in the figure because of the extensive fountain grass inva-
| sion. This obscures the presence of botanically significant areas in the WPAA.

N24-16 | 7. We are also concerned that the numerous archeological features identi-
| fied in the West PTA Acquisition Area will be obliterated by Stryker maneuvers.
| The proposed mitigations (p. 8-180) do not seem sufficient to prevent the event-
| al loss of most of these features given the proposed intensity of Stryker training.

In summary, we think that the Draft E.I. S. could be significantly im-
proved by giving more specific information concerning impacts and mitiga-
tions, particularly for biological and cultural resources. We also feel that the
information presented in the Draft E.I.S. for biological and cultural resources
in the WPAA is incomplete and, in the case of biological resources, inaccurate
and misleading because it fails to clearly identify biologically significant areas
and endangered species in the WPAA. We are also concerned with the internal
inconsistency of one analysis showing a predicted deterioration of land condi-
tion to "severe" while another indicates that impacts to endangered plants and
cultural resources can be mitigated to less than significant.

Thank you,

Malama O Puna

Responses

N24-14

Mitigation measures will be finalized in the ROD. However, measures
identified by USFWS and the Army in the Biological opinion for Hawai'i have
already been finalized and included in section 8.10.

N24-15

Botanically significant areas are discussed in the text of chapter 8.10. The map
is only intended to give the reader a general idea of the vegetation in the ROI.
Individual sensitive vegetation species locations are provided for more
specific information on Figure 8-28.

N24-16

We thank you for your comment and participation in this public process.
Your comment has been considered and has been included as part of the
administrative record for this process. Avoidance and mitigation measures
have been developed as described in the PA. The Final PA as signed by the
Army, SHPO, ACHP and concurring parties is included in Appendix J of the
Final EIS.

Letter Cindy Barger, SBCT EIS Project Manager
 N25 US Army Corps of Engineers
 Honolulu District Bldg. 230 Rm 306
 ATTN: CEPOH-PP-E
 Fort Shafter, Hawaii 96858-5440

January 2, 2004

Dear Ms. Barger:

Enclosed are the following to be made part of the record for the Stryker EIS

1. Copy of my written testimony given at the Waikoloa Beach Hotel, Nov. 5, 2003 hearing.
2. Copy of my written testimony given at the Hilo Hawaiian Hotel Nov. 6, 2003 hearing.
3. Copy of a Big Island map entitled "Sites NOT for Tourists or Locals concerning 57 known Military Hazard areas on Hawaii Island in need of military clean up before any military expansion plans should even be considered. Some documents are still classified after 40 years concerning secret testing of chemical and biological agents in Waiakea Forest. Declassify those documents. It's time for the military to come clean on its past dirty deeds.

In addition to the above I want to pose the following questions or areas for further investigation that should be addressed in the final EIS.

- N25-1 1. **The Stryker EIS needs to seriously consider many possible alternative locations for a Stryker Brigade besides Hawaii**, notwithstanding the Pentagon's decision to base a Stryker Brigade in Hawaii before the draft EIS process is even completed. The lack of seriously investigated alternative sites is a serious deficiency of the draft EIS. Please investigate site locations along the West coast of the U.S., sites in New Mexico, Arizona, Texas, etc. where wide open land space is more available than on small Hawaiian islands. Should not a project of this magnitude have at least 10 seriously studied alternative sites?
- N25-2 2. **The area of cumulative impact of past military activity on Hawaii Island needs to be addressed as evidenced by the attached map listing 57 known military hazard areas totaling hundreds of thousands of acres in need of military clean up from live arms and other military toxins.** In

Responses

N25-1

As discussed in section 1.6 of the FEIS the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue to carry out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

N25-2

Quantitative information on unexploded ordnance left during the past century is not available. It is not known what the commenter means by "military toxins." The EIS has been revised to contain analyses of cumulative impacts considering other military projects and astronomy activities at Mauna Kea (Hawai'i projects #1-4, 8-11 and 12). Although specific clean-up costs are unknown at this time, the Army is committed to cleaning up existing sites in accordance with applicable laws and regulations.

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

N25-2 cont'd addition the cumulative impact of C-17 military aircraft associated with the Stryker Brigade, impacts at Kawaihae harbor, the impact of increased astronomy and military training on the sacred mountains of Mauna Kea and Mauna Loa need to be addressed. Live arms fire at PTA is expected to increase from 7.1 to 14.8 million live rounds annually. How does this affect expected clean up cost when PTA is eventually returned to the State or nation of Hawaii? In light of the military's past failure to clean up sites, should not bonding be required to ensure present clean up?

N25-3 3. Appendix M-1 of the Stryker EIS acknowledges Beryllium and lead in soil samples taken at Pohakuloa Training Area. No soil samples were taken in the impact area. Why? I believe soil samples should be taken in the impact area to know the impacts. Please have samples taken. In addition, personal sampling needs to be done of military people who have been involved in training at PTA to check for lead or Beryllium exposure. Personal sampling should also be done in civilian areas (i.e. girl scout camp nearby, Waikii ranch, Waikoloa town, Waikoloa resorts and Hilo residential areas. Sampling should also be done along Saddle road to check for civilian exposure while traveling Saddle road. After all signs are posted along Saddle Road which read "Live fire overhead!" I have received a copy of written EIS testimony provided by Mr. Rollin Frost, a professional in metal toxics with a background working for OSHA and occupational health. I support his call for further testing/sampling,

N25-4 4. Investigate reports of live ordnance buried at various spots including just below the Girl Scout Camp west of Pohakuloa Training Area. Investigate
N25-5 burial sites in the path of the 40 foot wide tank trail from Kawaihae Harbor to
N25-6 PTA. Investigate impact of heavy Stryker vehicles to the structural integrity
N25-7 of the Pu'ukohola Heiau. What is the impact of Pohakuloa Stryker dust on Mauna Kea astronomy?

Sincerely,

James V. Albertini, President
Malu Aina Center For Non-violent Education & Action
P.O. Box AB Kurtistown, Hawaii 96760
Phone 808-966-7622 ja@interpac.net www.malu-aina.org

N25-3

All samples were analyzed by the same analytical methods. Beryllium was analyzed in all samples, including samples from impact areas. The table in Appendix M includes only detected concentrations. Inhalation of beryllium metal can present an occupational health hazard due to sensitivity of some individuals to very low levels. These effects would not be unique to the Army in Hawai'i, but could affect military personnel anywhere involved in the same activities. It has not been established that the beryllium detected in the soil samples results from beryllium present in munitions or in the metal tubing used in munitions or rockets, although there is a high likelihood that beryllium is present in these materials. Beryllium is also naturally present in the environment, as a constituent of some minerals, and it is present in many consumer products. The beryllium concentrations detected on the ranges were compared to US EPA Region 9 PRGs, which are conservative health-based concentrations established for screening level analysis to determine if the potential for a significant human health exposure exists. The beryllium concentrations observed in soils at the ranges at SBMR and PTA were well under the industrial soil PRGs. The only exposure that might impact offsite civilian receptors would be exposure to windblown dust. Such exposures would be negligible at the boundary of the installations.

N25-4

There are no records of buried live ordnance on PTA lands west of the Girl Scout Camp.

N25-5

The Army is conducting this investigation.

N25-6

The trail has been in use for a number of years and no impacts from this use have been recorded.

N25-7

Given the elevation differences between PTA and the Mauna Kea observatories and the feasibility of controlling fugitive dust from vehicle travel on unpaved roads, no significant impact on observatory operations is expected. Predominant wind directions are down slope, away from the observatories. Strong winds from the southwest can occur, but these situations may create other atmospheric conditions that are not ideal for observatory operations. A discussion has been added to Section 8.3 - Visual.

Stop the Stryker Invasion! No More Country Club/Hotel Public Hearings!

Tonight I would like to focus on the shamefully flawed military Stryker Environmental Impact Statement (EIS) process. Tomorrow night in Hilo I will speak more to the substantive destructive nature of the Stryker invasion. Let me preface my remarks and questions by saying that I want written answers to my questions provided directly to me by the Army and to be included in the final draft of the EIS.

Right from the beginning of the EIS, the process was flawed. Private, by invitation only, winning and dining of politicians and business people at the exclusion of the public; conducting tours of Pohakuloa for political and business people while canceling at the last minute a tour by Hawaiians, environmental, and grass root community leaders, saying CERTAIN UNNAMED MEMBERS of the delegation were unacceptable because of their outspoken criticism of the military. Having exclusive private country clubs and luxury hotels as settings to intimidate and distance ordinary people from participating in the process. Using police and hotel security as a military fence to block and arrest citizens from attending public hearings because they peacefully carried protest signs. The banning of signs as a peaceful expression of free speech testimony at the first of six EIS public hearings tainted the entire public hearing process with a chilling effect on expression.

N25-8

Just yesterday I spoke at a University of Hawaii class and scared students asked --will we be arrested if we go to the hearings? Just yesterday, a Hilo police captain called my home and asked a member of my household if "Mr. Albertini was planning on being arrested at the Stryker hearings?" What kind of a message is that? I have been informed by a federal worker that many federal workers are afraid to get involved and speak out on the Stryker issue, or even be seen at public hearings like this. They fear they could lose their jobs just by being here. What kind of working environmental impact is that? Hotel security left a message on my answering machine that anyone carrying a protest sign should not enter this hotel through the main lobby but go through the loading dock. What kind of an insult is that? Reminds me of blacks not being allowed to enter restaurants to eat but having to go around to the back kitchen door to eat. I left a message on the hotel security message phone that such a request was insulting and demeaning and I would not be a party to it.

So what has been accomplished by the Army's attempt to privatize public hearings and ban signs at public hearings? I have a few observations.

1. The Army exposed and demonstrated its contempt for dissent and trampled on the very constitution it has sworn to protect, did it not?
2. The Army exposed and demonstrated its complete lack of understanding and respect for citizen constitutional right of peaceful expression and right to assemble, did it not? Even the Governor told you that the hearings should have been held in schools.
3. The Army provided unintended publicity on free speech issues and the Stryker EIS hearings, did it not?
4. The Army caused a chilling environment of fear in the community for people to even attend these hearings, did it not?
5. The Army, by banning silent peaceful expression of protest by signs, provoked a climate for verbal protest and confrontation, did it not?

Through all of the above, the Army so tainted the environment for open public participation that the entire process of public hearings should be redone during the now extended comment period. And the

Responses

N25-8

We thank you for your comment and understand your concern. It was not the intent of the Army to restrict the public through the format and location of the public meetings. Once the issue arose, we worked to correct the situation by working with the other facility locations to allow signs in the actual meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu prosecutor to have all charges dropped against the individuals involved in the situation. Through these measures and the extension of the public comment period, we believe we allowed sufficient venues for public input including ample opportunity for written comment.

Comments

N25-8 cont'd public hearings should be held in public community centers or school facilities. There were four hearings held on Oahu. Oahu is smaller than the Puna district of this island. There should be at least five hearings on this island. One in Hilo, one in Kailua-Kona, one in Waimea, one in Puna and one in Ka'u. And if the people of Hamakua and North Kohala also want hearings, so be it. Have more hearings. After all, it's your job to listen to the people that pay your salaries. That includes all the people not just your invited dinner guests who support your pork barrel project because they get to feed at the trough.

The Hawaii Stryker Brigade proposed budget is \$1.5 billion. That's what it costs to run the entire Hawaii public education system for two years. Ask the people of Hawaii what they'd rather -- a Stryker Brigade or a doubling of the State's school budget for the next two years? Let me know what answer you get please.

N25-9 I have another question but I want to preface it. Many people believe the Hawaii Stryker Brigade is a done deal. That these hearings are a fraud, a façade to give the appearance of listening to the people when the decision has already been made. Dan Inouye has said he's been assured of the Stryker Brigade. He's already pushed through Congress over \$80 million in support of the Hawaii Stryker. Here's my question: Why is it that the military gets all the money and land it wants and Hawaiians die on a waiting list to get what is rightfully their own home land, much of which is being occupied and bombed by you?

Now I have a few "foot in mouth" presentations to make:
To Major Stacy Bathrick for her Oct. 29th comments in the Honolulu Star-Bulletin:
"The Army won't allow any demonstration or protest involving banners or signs carried into the meeting room."
Col. David Anderson who said banning signs was done out of concern for potential damage to facilities. Sign carrying protesters could be disorderly.
Troy Griffen who said the protesters "agenda is to break up the meeting."

N25-10 Let me say this: To Major Bathrick --It's the Army's job to uphold not suppress the constitutional rights of citizens. To Col. Anderson --Be more concerned about the damage and disorder your Strykers will do to Hawaii and other places around the world.
To Troy Griffen --my agenda is to break up nothing. Breaking up is what Strykers do. My agenda is to get you and the U.S. military to clean up your opala on the more than 400 square miles of Hawaii Island, the equivalent of 9 Kaho'olawe, littered with a toxic stew of unexploded ordnance, chemicals, and biological agents from current and past military training. Enough is enough. It's time for clean-up NOT Build-up.

The first step in clean up is to properly identify and caution people about the dangers of your opala. Our Malu Aina organization is hereby donating to you the first, of what I hope will be hundreds of signs made by you and placed around present and former bombing ranges and other hazardous military sites on our island. By the Army making these signs it will be a positive step forward after trying to ban signs from these hearings.

It's time to stop the Stryker invasion now. Clean-up NOT Build-up. This is my agenda!

Aloha,
James V. Albertini, President, Malu 'Aina Center For Non-violent Education & Action
P.O. Box AB Kurtistown, Hawaii 96760(Ph 808) 966-7622 Email ja@interpac.net www.malu-aina.org

Responses

N25-9

Although Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2d Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2d Brigade, 25th ID (L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law. The Department of the Army issued a Programmatic EIS for Army Transformation in 2001, and issued its Record of Decision to implement Army Transformation on April 11, 2002. In that ROD, Lieutenant General David McKiernan confirmed a series of previously announced conversions of 6 brigades to interim brigade combat teams, "subject to appropriate evaluation of potential environmental effects in accordance with the National Environmental Policy Act" (ROD, page 11). The Department of the Army will make a decision whether or not to transform the 2d Brigade, 25th ID(L) in Hawai'i only after a full consideration of all the environmental impacts identified and analyzed under NEPA, weighed equally with considerations of strategic importance, military training and readiness, technical considerations, economic and fiscal considerations, and other considerations mandated by law or policy.

N25-10

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs.

It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with

Stop the Stryker Invasion! Cancel the Hawaii Stryker Brigade here and now! Thursday, Nov. 6, 2003 by Jim Albertini at the Hilo Hawaiian Hotel

Before I begin, let me preface my remarks and questions by saying that I want written answers to my questions provided directly to me and to be included in the final or future drafts of the EIS. The present EIS draft has failed to address many of the questions I asked at the scoping hearings.

In Kanaka Maoli tradition we are entering the Makahiki season -- a time for thanksgiving and peace. I am very thankful for all the people, especially Kanaka Maoli who spoke at the Stryker hearing last night at the Waikoloa Beach Marriott Hotel. Last night's hearing was an extremely moving experience. The large and powerful turnout and testimony lead by Kanaka Maoli kuptuna, makua, and opio speaking on behalf on their ancestors, their ohana and the aina to stop military expansion, cleanup the existing military opala and return the land to the sovereign Nation of Hawaii was as we say "chicken-skin." The testimony of non Kanaka Maoli was also very moving. In all, a total of about 40-50 people testified and only about 4 spoke in support of the expansion. From what I have read and heard, this is how the other hearings have been going as well --people overwhelmingly opposed to military expansion despite the climate of fear created

Last night I spoke about the shamefully flawed military EIS process --the private, by invitation only, wining and dining of politicians and select business people, at the exclusion of the public; conducting select tours of Pohakuloa for political and certain business people, while canceling at the last minute a tour by Kanaka Maoli sovereignty leaders, environmental and grass root community representatives, saying certain unnamed members of the delegation were unacceptable because of their outspoken criticism of military expansion; having exclusive private country clubs and luxury hotels as settings to intimidate and distance ordinary people from participating in the process; using police, private security firms and hotel security as a fence to block and arrest citizens from attending public hearings because they peacefully carried protest signs. The banning of signs as a peaceful expression of free speech testimony and arrests at the first two of six public hearings tainted the entire public hearing process with a chilling effect on participation and expression.

On Tuesday, I spoke to a class at the University of Hawaii at Hilo and scared students asked --"will we be arrested if we go to the hearings?" What kind of a climate is that for a university and a community? On Tuesday, a Hilo police captain called my home and asked a member of my household if "Mr. Albertini was planning on being arrested at the Stryker hearing?" What kind of a message is that? Several federal workers told me that they are afraid to get involved and speak out on the Stryker issue, or even be seen at public hearings like this. They fear they could lose their jobs just by being here. What kind of a working environmental impact is that? Earlier in the week, a Waikoloa Beach Marriott Hotel security officer left a message on my home answering machine that anyone carrying a protest sign should not enter their hotel through the main lobby but go thru the loading dock. What kind of an insult is that? Reminds me of blacks not being allowed into restaurants and told to go around to the kitchen door to eat. I left a message on the Marriott security message phone that such a request was insulting and demeaning and I would not be a party to it. Fortunately the Marriott backed off of its back-door position but even their handout in the parking lot to everyone attending the hearing said: "picketing, sign waving, chanting, or any other public displays of protest is NOT allowed on any part of the premises of the hotel --including, but not limited to the lobby, in front of the property, or the beach front."

So what has been accomplished by the Army's attempt to privatize, ban signs and chants, and arrest people holding signs at public hearings?

1. The Army exposed and demonstrated its contempt for dissent and trampled on the very constitutional it has

Responses

the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

Comments

sworn to uphold and protect.

2. The Army showed its complete lack of understanding and respect for citizens constitutional right of peaceful expression, right to assemble, and right to petition government for a redress of grievances.
3. The Army provided unintended publicity on free speech issues and the Stryker EIS hearings.
4. The Army caused a chilling environment of fear in our community for people to even attend these hearings.
5. The Army, by banning silent peaceful expression of protest by signs, provoked a climate for verbal protest and confrontation.

Through all of the Above, the Army, Honolulu Police Dept., Royal Guard Security Company, Honolulu Country Club, Helemano Plantation, Hawaii County Police Dept., Waikoloa Beach Marriott hosting these public hearings so significantly tainted the environment for open public participation that the entire process of public hearings should be redone. The climate of duress created for these public hearings is evidenced by university students asking --"will I be arrested if I go to the public hearings?" Public hearings should be held in public facilities --community centers and schools. Even Governor Lingle told you this. The biggest land impact in your Stryker proposal is here on Hawaii Island -- a 23,000 acre expansion at Pohakuloa, yet you only scheduled two hearings on the entire island. Oahu had four hearings and all of Oahu can fit inside the Puna district. There should be a minimum of five hearings on Hawaii Island: one in Hilo, one in Kailua-Kona, one in Waimea, one in Puna and one in Ka'u. And if the people of Hamakua, North Kohala and other areas want public hearings too, so be it. After all, you said you want to hear the concerns of ordinary people, isn't that right? Not just the concerns of your "by invitation only" politician and select business dinner guests who support your pork barrel project because they get to feed at the trough.

The Hawaii Stryker Brigade proposed budget is \$1.5 billion. That's what it costs to run the entire Hawaii public education system for two years. Ask the people of Hawaii what they'd rather -- a Stryker Brigade or a doubling of the State's school budget to educate our children for the next two years? Let me know what answer you get please.

I have more question but I want to preface them. Many people believe the Hawaii Stryker Brigade is a done deal. That these hearings are a fraud, a façade to give the appearance of listening to the people when the decision has already been made. Dan Inouye has said he's been assured of the Stryker Brigade. He's already pushed through Congress over \$80 million in support of the Hawaii Stryker., when the draft EIS hasn't even been completed. Isn't that putting the cart before the horse? I want to know who assured Dan Inouye of a Hawaii Stryker Brigade? More questions: Why is it that the military gets all the money and land it wants and Kanaka maoli die on a waiting list to get what is rightfully their own home land, much of which is being occupied and bombed by the U.S. military?

I have been made aware of a shocking and damning new Army recruiting ad that shows an Army engineer blowing up Pohakuloa. What's the message you are trying to convey to young recruits by that ad?

N25-11

Lets follow the money trail of this corrupt Stryker boondoggle. Dan Inouye and Ted Stevens of Alaska, sit on the powerful senate military appropriations committee. Any wonder Hawaii and Alaska are sites for Stryker Brigades. The Stryker is the baby of Hawaii recently retired Army General Eric Shinseki. Shinseki, rumored to want Dan Inouye's senate seat, was the Army's top General for 4 years. The auditor of the Stryker program just happened to be a 4 year classmate of Shinseki's at West Point. One of Shinseki's right hand men was General Dave Heebner who retired (early) from the Army but immediately got a job as Vice President of General Dynamics to seal the Stryker deal for General Dynamics with the Army. Heebner had his Army pension sweetened by over 13,000 shares of General Dynamic stock and I'm sure other perks that have not been made

Responses

N25-11

The tentative decision to field one of the six Stryker Brigades in Hawai'i was analyzed in the Programmatic Environmental Impact Statement for Army Transformation and announced in the Record of Decision of April 2002. A full set of alternative sites at various Army installations were examined. The Hawai'i EIS is tiered to the PEIS and examines the details of fielding at locations in Hawai'i. The alternative of not fielding a Stryker Brigade in Hawai'i (the no action alternative) was also examined in detail. Both documents have been made available to the public for comment as required by CEQ Regulations in order to insure that an informed decision could be made.

public. This is probably only the tip of the iceberg.

When dealing with the military, money and power, much is often hidden. Take for instance the secret chemical, biological and nerve gas testing in Hawaii's past. The military lied to us about it. They said they were doing weather testing. When the secret testing was finally confirmed, the military acted like they were doing us a favor by telling us that they poisoned us and the aina. Can the military be trusted today? It's track record is not good. The military has more than 50 current and former sites on this island alone of military opala in need of clean up.

N25-12

It totals more than 400 square miles, the equivalent of nine Kaho'olawe, littered with a toxic stew of unexploded ordnance, chemicals, and biological agents from current and past military training. Enough is enough. All of our mothers have taught us to clean up after ourselves. Don't even think about making a new mess until you have cleaned up your old mess. The Army Corps of Engineers says at present funding levels it will take centuries to clean up the opala on military sites in Hawaii. Yet somehow, amid budget constraints for clean up, the Army has found the funds to clean unexploded ordnance from its new 30 mile tank trail from Kawaihae to Pohakuloa. This is not acceptable. You can clean up tank trails of unexploded ordnance, but places where people live, work and go to school. A'ole! Your mother, all of our mothers, and the mother of us all, are telling you to clean up not build up. No military expansion in Hawaii. No Stryker Brigade.

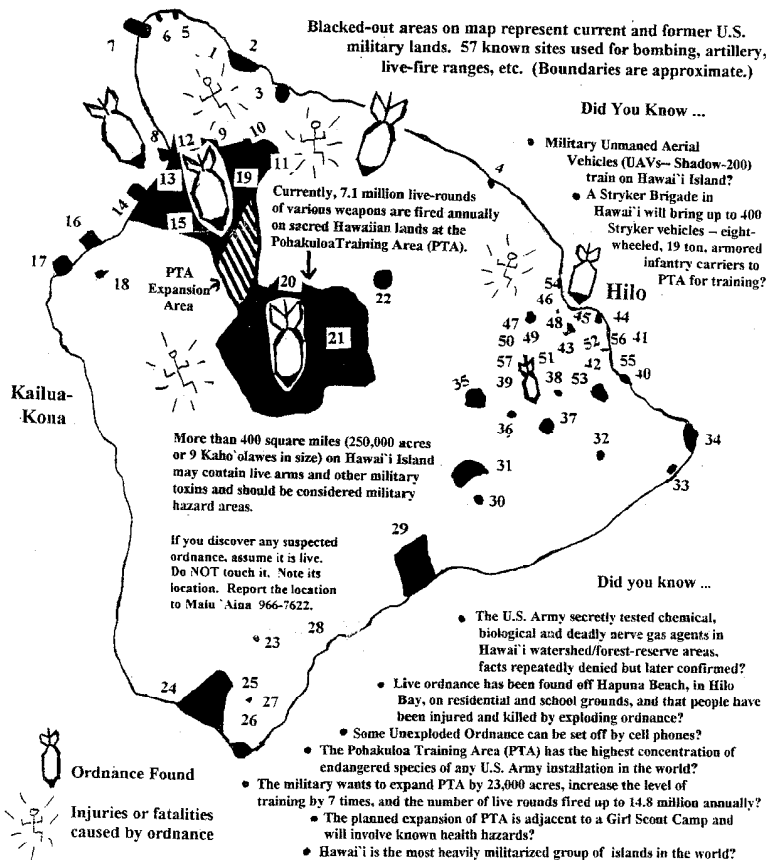

Col. Anderson, you appear to be a man of integrity. I ask you to act on that integrity. Stand up here and now and say at this hearing, based on the overwhelming testimony you have heard throughout Hawaii, that you will recommend that the entire Hawaii Stryker Brigade project be cancelled and put in the scrap heap of history. And that furthermore, as a first step toward cleaning up and returning current and former military lands to the nation of Hawaii you will immediately begin to place thousands of signs such as these around present and former bombing ranges and other hazardous military sites on our island to simply alert people. The sign reads: Caution - Former Military Site -- Live Arms Hazard! By the Army making and posting signs such as these it will be a small, but positive, step forward after trying to ban signs from these hearings. Mahalo and aloha. Malama pono! Malama i ka aina!

N25-12

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. Chapter 4.12 of this document discusses the methods assessed in evaluating potential impacts to human health and safety hazards from the proposed action. As discussed in this section, the Army has determine that the general public or soldiers would not experience any significant health impacts as a result of this proposed action. The Army abides by and will continue to abide by all appropriate laws and regulations in conducting appropriate toxicology studies and implementing appropriate measures to protect the health of the community. The U.S. Army Center for Health Promotion and Preventive Medicine assists in this compliance with a mission to provide worldwide technical support for implementing preventive medicine, public health, and health promotion/wellness services into all aspects of America's Army and the Army Community anticipating and rapidly responding to operational needs and adaptable to a changing world environment.

Letter
N26**NO POHAKULOA
EXPANSION!**

**Mr. Military: Clean-up
your mess now before
more people get killed
and injured**

The biggest military land-grab in Hawai'i since WWII is about to take place under the name of "Army Transformation." We need your help to stop it. The military wants 23,000 more acres on Hawai'i Island to add to its 108,793-acre Pohakuloa Training Area (PTA), located in the saddle between Mauna Kea and Mauna Loa. Help us say to the military: "Clean-Up NOT Build-Up." There are more than 50 former and ongoing military sites on the island. Hundreds of thousands of acres are littered with unexploded bombs and toxins from conventional weapons training and secret chemical and biological weapons testing. Military hazards are present on our lands and in our waters. Tides expose munitions buried in the sand off Hapuna Beach, Hilo Bay and other areas. Last year several live grenades were found by school children in a Waimea Middle School garden. Get involved to clean-up and make our island a safe place. Make copies of this flyer, circulate and post them. Arrange for community/house meetings to discuss the issues. Speak out. Write letters to the editor. Call public officials. Mahalo.

N26-1

The Stryker Brigades represent a new concept and a new organization that dictate how we will fight in the future. The officially approved Army doctrine lays out the training requirements and the amount of training lands needed to adequately prepare our soldiers to fight and win in the 21st century. We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

Comments

CLEAN UP NOT BUILD

To U.S. Military and public officials:

We, the undersigned, oppose the further build up and desecration of Hawaiian military forces in Hawaii, including plans for "Army Transformation." This means additional troops, equipment, aircraft, training, and military land on Hawaii Island. We believe it is time for the military to clean up, not build. This includes the 123,000-acre former Waikoloa Maneuver Area, the 108,000-acre Training Area, and Kawaihae Harbor area on Hawaii Island, the entire Makua Valley on Oahu, and other areas where the military has left uncleaned toxins. The U.S. military presently controls over 22% of Oahu and 5% of the Hawaiian Islands.

Stop the Stryker Invasion!

- 1 SAY "NO" TO THE MILITARY'S 24,000-ACRE LAND GRAB!
- 2 SAY "NO" TO INOUE'S FEDERAL RECOGNITION BILL BECAUSE FEDERALIZING HAWAIIANS MEANS MILITARIZING THEIR LAND!
- 3 SUPPORT THE "STRYKER SEVEN DEFENSE—DEFEND YOUR RIGHTS!"

WHAT IS THE STRYKER? It's a *Civilian Assault Vehicle*: This "20-ton axles of evil" is being built for the quick transportation of infantry battalions on highways. It was not built for use in the deserts of Iraq where mortar shells and bombs have recently destroyed the strongest American tank. The Stryker is lightweight. It's built to be transported in airplanes three at a time, so that Bush and Company can quickly position American infantrymen throughout the world to put down civilians, fighting for their sovereignty and demonstrating against the U.S. EMPIRE BUILDERS.

HOW WILL THE MILITARY GRAB THE 24,000 ACRES OF HAWAIIAN LAND? Akaka Bill has morphed into Inouye's Federal Recognition Bill—Inouye's attempt to Federalize the Hawaiian people: After 6 revisions of the Akaka Bill, the initial thrust of the bill which would have given some "autonomy" to Hawaiians, has been stripped down, and if passed will give the US Department of Interior, control over the Hawaiians as "wards of the state"—where the Hawaiians must surrender all claims to the ceded lands (which already make up 56% of the military lands in Hawaii). Governor Lingie supports the Inouye Federal Recognition Bill, and the state would no longer have to pay any Hawaiian reparations. They hope to get the morphed bill passed, by threatening to extinguish about \$59 million worth of current Hawaiian health, educational, homesteader programs that would lead to evictions of homesteaders. However, there's no assurance that the \$59 million federally funded programs for Hawaiians would be maintained after the bill's passage.

WHAT HAVE THEY DONE TO THE LAND! Look at Kahoolawe and Makua: Kahoolawe has been a symbol of the Hawaiians' quest for sovereignty, as George Helm and Kimo Mitchell lost their lives during the struggle for its return. Come November 11-12th, 2003, the military will be handing the desecrated island over to the State of Hawaii, having cleaned 1/10th of the ordinances, and leaving the island contaminated and uninhabitable. They call this "GOOD FAITH?" And, they have enlisted supposed leaders of the Hawaiian struggle to validate this farce—"Leaders" who have a vested interest in the \$59 million federal programs. Makua residents were evicted and given only a pittance during WWII—their homes, school, and church bombed, to make way for military training. In the Executive Order, the army had agreed to return the land to the territory six months after the war, but reneged. After Statehood, due to pressure from the community, 1/3 of Makua was returned to the state, but the state simultaneously, leased the land back to the military at \$1.00 for 65 years. The bombing continues leaving highly toxic materials and no plans by the US Military to clean up the mess. Bombed and burnt, exploded and unexploded ordinance litter the valleys. This is the future desecration of our Hawaiian people, land and sacred sites once Inouye **FEDERALIZES THE HAWAIIAN PEOPLE AND THEIR LAND.**

SUPPORT THE "STRYKER SEVEN!" *Defend your rights!* The military tried to exclude opponents of their plans and silence dissent by arresting seven opponents of the strikers who attempted to testify at the public hearings. By arresting people with phony charges of trespass for bringing signs to the "public" hearings, they hope to intimidate and silence the voice of the people. This is an example of the future loss of rights of not only Hawaiians, but the people of Hawaii, as the military's expansion here turns our lovely islands into a military base of the Pacific. Ask the people of South Korea, Okinawa and the Philippines about the rapes, "accidental killings", and colonizer mentality that will come along with lands used as a military base. N26-2

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs.

It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

MOKULEIA COMMUNITY ASSOCIATION
68-411 Farrington Highway
Waialua, HI 96791

Letter N28

December 23, 2003

US Army Corps of Engineers, Honolulu District
(Attn: Ms. Cindy Barger)
Bldg 230, CEPOH-PP-E
Fort Shafter, HI 96858-5440

RE: COMMENTS ON THE DRAFT EIS FOR THE STRYKER BRIGADE

Dear Ms. Barger,

After reviewing the Draft EIS for the Stryker Brigade that will be stationed at Schofield Barracks, the Mokuleia Community Association has the following concerns regarding a couple of points.

N28-1

- (1) Antennae are to be built to support the Brigade's training needs. There is not enough information on where these antennae would be located, the operational characteristics of these antenna, their overall visibility to the community, and how the Army will mitigate any impact on the view plane and potential operational impacts on humans, animals, and wildlife.

In the North Shore Sustainable Communities Plan (approved by the City and County of Honolulu in July 2000 and the primary land use planning document for the North Shore district), the view plane of the Mokuleia area looking toward the Waianae mountain range is considered to be a valuable asset and is to be protected from unnecessary intrusions. These unspoiled views are part of what make the North Shore an attraction for visitors to Oahu and for other Oahu residents. We do not want to see this natural beauty marred by large, unattractive antennae. Tourism is now the primary economic driver on the North Shore.

N28-2

In addition to three private outdoor camps plus a City park for overnight camping, residential areas are also located within the Mokuleia community. Agricultural activities of the community also include animals such as cattle and horses. Operation of the antenna and their impact on humans, animals, and wildlife in our community is of concern.

Responses

N28-1

Details regarding antenna location, height, and other characteristics are found in Appendix D. As discussed in Sections 4.3, 5.3, 6.3, 7.3, and 8.3, the Army has committed to implementing mitigation for visual impacts by screening construction, mimicking surrounding areas, and other means. Biological impacts of the FTI towers are discussed in sections 4.10, 5.10, 6.10, 7.10, and 8.10.

N28-2

Biological impacts of the FTI towers are discussed in sections 4.10, 5.10, 6.10, 7.10, and 8.10.

Comments

RE: COMMENTS ON THE DRAFT EIS FOR THE STRYKER BRIGADE (continued)

N28-3

- (2) The Army has also expressed their intention to use an old sugar cane road that formerly cut across the historic Dillingham Ranch property for transporting their troops and vehicles. This former sugar cane road easement no longer exists.

The future viability of Dillingham Ranch is important to the Mokuleia and North Shore community. If the Army does intend to cut across the Dillingham Ranch as a means of transportation, it could seriously impact the viability of the Ranch to operate. This could cause serious socio-economic consequences for the North Shore area as the Ranch provides jobs for the community.

N28-4

How does the Army plan to mitigate their adverse impact on the Dillingham Ranch and its operation? How does the Army plan on using a road that no longer exists? What other alternatives are being considered to the condemnation of a right of way across Dillingham Ranch?

The potential socio-economic impact on our Mokuleia community of these antennae and of Army plans for Dillingham Ranch is not adequately addressed. Thank you for the consideration of our concerns. We look forward to your response.

Sincerely,

LLOYD O'SULLIVAN
Acting President
Mokuleia Community Association

Responses

N28-3

"The Dillingham military vehicle trail alignment shown in the EIS is the Army's preferred alignment. If the Army decides to implement the proposed action, the Army will coordinate with the property owners over the location of the proposed alignment. If the coordination results in a change in alignment which results in environmental impacts not analyzed in the EIS, the Army will conduct all appropriate NEPA, ESA and NHPA consultations prior to a final decision on a new alignment."

N28-4

Section 6.13 discusses socioeconomic impacts as a result of project activities at Dillingham Military Reservation. No socioeconomic impacts have been identified resulting from the construction of FTI antennas.

*Mililani B. Trask, Convener
Na Koa Ikaika o Ka Lahui Hawaii
400 Hualani Street, Suite 194
Hilo, HI 96720*

Testimony Re: Stryker Brigade in Hawaii

Aloha:

I am Mililani Trask, a resident of Hilo and the Convener of an indigenous NGO named Na Koa Ikaika o Ka Lahui Hawaii that is located in Hilo, Hawaii.

Access to Report

N29-1

I am requesting that a copy of the report on the Stryker Brigade be sent to my office at the above address. I have had a limited opportunity to read the report. It has only been available at the Hilo Library – and has been in use 4 of 5 days I attempted to access it. DLNR Hilo has informed me that they have only 1 copy – on Oahu Island. I would like a copy to completely review the document and to provide a fuller response. I am also requesting that the comment period be extended to 90 days.

Concern Regarding Stryker

N29-2

As a resident of Hawaii Island and of the State of Hawaii, I am opposed to locating the Stryker Brigade in our state. The U.S. military has extensive holdings in Hawaii. In fact, data indicates that Hawaii is the most militarized State of the Union. Current military uses in Hawaii have created significant problems, which the U.S. military has been unable to address. These problems include toxicity, environmental degradation, threats to security of our community due to unexploded ordinance and the ongoing issue of compensation for land use.

N29-3

Hawaii island has 57 known sites that have or are being used for bombing, artillery and live fire exercises. Live ordinance has been found at Hilo, Hapuna and elsewhere. Last year, school children at Waimea found live grenades. At present, the U.S. has no strategic plan to address the threat posed by unexploded ordinance and it has no fiscal allocation to appropriate for this purpose. These questions should be addressed before further military expansion occurs.

N29-4

1. What is the current plan of the U.S. to address clean up of live ordinance on Hawaii island? How much money has been appropriated for this purpose?

N29-5

2. What is the current plan to identify and clean up live ordinance used by the Stryker Brigade on Hawaii island? How much funding has been appropriated for this purpose and where is the funding now?

Responses

N29-1

The public comment period was extended to 90-days and ended on January 3, 2004.

N29-2

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

N29-3

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws and regulations.

Cindy S. Barger
SBCT EIS Project Manager
U.S. Army Corps of Engineers, Honolulu District
Bldg 230, Rm. 306 ATTN: CEPOH-PP-E
Ft. Shafter, HI 96858-5440

Dear Ms. Barger:

The Nature Conservancy (TNC) is an international non-profit organization dedicated to conserving the earth's biodiversity by protecting habitat for native plants and animals. We have more than 20 years of on-the-ground experience in Hawai'i. We appreciate the opportunity to provide formal comments on the Army's Draft Environmental Impact Statement (DEIS) for the Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawai'i.

Our comments follow several face-to-face discussions we have had with Army personnel for more than a year. We are pleased that the Army has listened to our concerns related to the proposed acquisition of the northern portion of our Honouliuli Preserve for use as a small arms qualification range (QTR2). In this letter, we present formal comments on the DEIS, beginning with those related to the South Range Land Acquisition of Schofield Barracks, continuing to Pōhakuloa Training Area, and to general concerns related to proposed actions in other areas. Due to limited time, we are not able to provide page-by-page and word-for-word edits wherever needed, and trust that our comments will aid the Army in editing the DEIS where applicable.

SRAA - South Range Acquisition Area

The Nature Conservancy is the sole manager for Honouliuli Preserve on the island of O'ahu, which encompasses 3,700 acres along the eastern slopes of the southern Wai'anae Mountains (i.e. above Makakilo and Kunia). Our neighbor to the north is Schofield Barracks. In 1990, the landowner of the Honouliuli parcel (the Estate of James Campbell) granted TNC a long-term conservation lease to manage more than 90 rare species and some of Oahu's last remnants of diverse native forest. Since then, the Conservancy has spent more than \$3 million to conduct resource management and community outreach activities at Honouliuli.

Threats to Honouliuli Preserve include wildfire, animals such as feral pigs and rats, invasive weeds, and especially human disturbance. Consistent and intensive management in the form of fencing, weed control, planting native species, and seed collection is required to protect the area's many rare plants and animals and to restore native Hawaiian forests.

For the past four years, we have concentrated our work in the northern part of the preserve (Kalua 'ā/Waieli Priority Management Area) due to the higher chance of species' survival and ease of access. This Priority Management Area contains some of the most intact, diverse, and accessible native habitat in the Wai'anae Mountains. Kalua 'ā/Waieli also contains the largest reintroduced populations of several endangered plant species, now totaling more than 700 individuals. The entire preserve is also critical habitat for the O'ahu 'elepaio bird and numerous plant species.

This area is integral to the Army's Mākua Implementation Plan. Upon agreement with the U.S. Fish and Wildlife Service, the Army is required to stabilize existing populations and reintroduce new populations of 29 endangered species in order to continue training at Mākua. Five of these species occur in the

Kalua'ā/Waieli area. The Mākua Implementation Plan designates four management units within Honouliuli Preserve, in which many activities are intended to take place for decades in order to stabilize populations of target species. The ability to work in these areas is directly connected to the successful implementation of the Plan, and the Army's ability to train in Mākua.

Land Use/Access (Section 5.2)

Impacts on natural resources management and recreational land use

Our activities in any given week could consist of rare plant restoration, high school classes participating in Project Stewardship (a conservation education program), fenceline inspection, control of rats eating endangered snails as well as young 'elepaio, and interpretive hikes for the public. Our management and education work requires us to have access everyday of the week.

Contrary to the impression given throughout the DEIS (especially on p. 9-22), our main concerns are not focused on the 100 acres of current preserve land that would be acquired nor the impact on monthly interpretive hikes. Though they are important, we are primarily concerned about impact on access to the entire 400 acre Kalua'ā/Waieli Priority Management Area due to our need to manage the area as described above.

We are also concerned about possible crossing of boundary around the 100 acre area by TNC and Army personnel alike. On several occasions, we have witnessed Army personnel wandering through the preserve on their training maneuvers, apparently because they were unclear on the boundaries. Not only could these incidents disrupt planned activities, they could also result in harm to the plants and animals we are working to protect.

We are disappointed that the Draft EIS, on page 5-31, under "Regulatory and Administrative Mitigation" states that our access would only be allowed when the range is not in use. With the estimated 180 to 242 days per year and 8 to 12 hours of use per day, that could mean that we would be allowed only on weekends, holidays, and a few days in between. That clearly does not coincide with our work schedule, and as a result, these priority areas would be unmanaged and the impacts would be significant. An additional Mitigation that the Army "considers" in the Draft EIS is obtaining a permit to allow us access.

We propose that the following statements be rewritten to give us continual access that is necessary to carry out our work. Conservation is a long-term and continuous process, which requires a long-term commitment.

Mitigation:

The following language should be replaced in the DEIS, section 5.2.2; p. 5-31.

Significant Impacts Mitigable to Less than Significant

- Impact 1: Impacts on natural resources management and recreational land use. Training on and operation of the proposed QTR2 on the SRAA could affect land use within a portion of the Honouliuli Preserve. Approximately 100 acres (41 hectares) within the SRAA are part of the TNC-managed lands, which are available for intensive natural resource management and hiking. Immediately above the SRAA are lands intensively managed and used by TNC personnel, including volunteers. Access to this area would be blocked by the acquisition. Also, during training and operation of QTR2, as QTR2 was initially designed, natural resources management and recreational activities would be restricted within certain portions of the SRAA. This would have resulted in a significant impact on natural resources management and recreation within SRAA.
- Regulatory and Administrative Mitigation 1. In response to comments received early in the EIS process, USARHAW reoriented QTR2 such that the SDZ would no longer impact any lands within the Honouliuli Preserve. Additionally, if the Army implements the proposed action, it would grant TNC personnel and TNC-sponsored personnel (including volunteer hunters) daily, controlled access to the TNC-managed lands along a route to be determined by mutual agreement between TNC and the

Responses

N30-1

In response to comments received early in the EIS process, USARHAW reoriented QTR2 such that the SDZ would no longer impact any lands with the Honouliuli Preserve. Army will grant TNC personnel and TNC-sponsored personnel daily, controlled access to the TNC-managed lands along a route to be determined by the Army in consultation with TNC for as long as they have legal right to use of the affected property for conservation/stewardship purposes. Access controls will be developed and implemented to ensure the safety of all personnel and will consist of notification by TNC to the Army prior to entering Army lands and notification by the Army to TNC of any unusual activities that may present, or appear to present a danger to TNC personnel in the area. The boundary will be signed to prevent unauthorized use/trespass. Sections 5.11.2 and 8.11.2 discuss access for cultural practitioners.

Responses

N30-1
cont'd

Army later. Access will be granted via an easement to TNC and the landowner, for as long as they have legal right to use of the affected property for conservation/ stewardship purposes. Access controls will be developed and implemented to ensure the safety of all personnel and will consist of notification by TNC to the Army before entering Army lands and notification by the Army to TNC of any unusual activities that may present, or appear to present, a danger to TNC personnel in the area. This would include demarcation of boundary with signs, for example, around the 100 acre area, to alert soldiers and TNC personnel of official boundaries and prevent trespass. As reoriented, the QTR2 SDZ encompasses land that was previously used for agricultural purposes. Thus, the impact is considered significant but mitigable.

Biological Resources (Section 5.10)*Impacts from fire on sensitive species and habitat*

Wildfire is one of the greatest threats to native Hawaiian forests. Largely due to live-fire training, the Army was had a history of fires that were ignited by training activities. The DEIS states that approximately 90, 110, 130 fires were identified in Schofield Barracks Military Reservation (SBMR) in 1998, 1999, and 2000, respectively (p. 9-50). We are very concerned about the spread of fires from Schofield, and especially from the proposed SRAA, into Honouliuli Preserve and the forests above SBMR. Given the number of TNC staff, students, and volunteers in the TNC managed area adjacent to the SRAA, the threat to human personnel is significant.

The recently completed "Integrated Wildland Fire Management Plan (IWFMP) - O'ahu and Pōhakuōa Training Areas" (October 2003), is an integral component of the DEIS and should be included as an appendix. The DEIS alone does not adequately detail the measures outlined in the IWFMP that potentially mitigate the training impacts of a Stryker Brigade Combat Team with regard to wildfire management. Please see the attached document for specific comments on the IWFMP that we would like to see added to the IWFMP as soon as possible. In addition, we would like to make particular note of some specific items regarding the SRAA and the IWFMP.

Tracers and pyrotechnics

It is our understanding, both from reading the DEIS (p. 5-2) and speaking with Army officials in person, that the use of tracers and pyrotechnics would not be allowed in QTR2. The IWFMP, section 3.1 Pre-suppression Actions, Fire Danger Rating System, makes reference to the allowable use of pyrotechnics when the fire danger rating is green. Pyrotechnics would only be restricted when the fire danger rating is red. Enclosure 1 (page SRAA-13 of the IWFMP) also states that smoke grenades or simulators are authorized except in flammable areas. We view these statements as conflicting with the stated restriction of tracers and pyrotechnics in QTR2. The DEIS and IWFMP are vague and inconsistent as to exactly what types of live fire and pyrotechnics would be allowed in SRAA. We feel strongly that there should be no tracers or pyrotechnics allowed.

N30-2

Fuels Management

We are highly concerned about the spread of flammable grasses, such as guinea grass (*Panicum maximum*) and molasses grass (*Melinis minutifolia*) in the SRAA and neighboring areas. These grasses are ubiquitous in lower areas of the forest and along gulches in the pineapple fields, and could easily spread into the abandoned pineapple fields that would be encompassed in the SRAA. The IWFMP states that the areas immediately surrounding the QTR2 would be mowed regularly. The majority of the land area, however, would not. Fuel modification, or weed control, would consist of "crushing, chemical herbicide, and prescribed burning techniques (where applicable)." (IWFMP p. 7-96) We feel that weed control is of utmost importance, and that given the poor success rate of prescribed burns conducted by the Army in Hawai'i, prescribed burning should not be used at all in this area. The possibility of the fire escaping the firebreak road and running up into Kaiua ā guich is very real, and would be extremely difficult to stop.

Smoking and open fires

Other sources of fire could be catalytic converters, campfires, and smoking. According to the IWFMP, smoking would be allowed in the QTR2 parking lot and on roads or other barren surfaces, and cooking

N30-2

The discussions in Sections 4.8, 4.9, 4.10, 8.8, 8.9, and 8.10 have been expanded in the Final EIS to better discuss the potential impacts of wildland fires. The impact to biological resources from wildland fires has been changed to significant. The mitigation measures proposed, including the updated IWFMP, will substantially reduce the severity of the impact on biological resources but not to less than significant levels.

N30-2
cont'd

fires would also be allowed when the fire danger rating is green. Due to the high fire danger, especially from the likely spread of flammable grasses, smoking and any type of open fire should not be allowed anywhere in QTR2.

Annual Work Plan

The IVFMP (p. SRAA 4) lists development of an annual work plan to identify fire management projects by priority. We urge the Army to include TNC and fire-prevention stakeholders such as the State Division of Forestry and Wildlife, and the Honolulu Fire Department, in this annual work plan development. An annual meeting would also greatly assist in review of fire prevention and suppression protocols of all parties and aid in collaboration.

N30-3

Education

Fire-prevention briefing of Army personnel is included in the IVFMP. We urge the Army to include more information on the native forest resources and endangered species that would be threatened by fire, and include visual aids to supplement the verbiage stated on the briefing sheet (Enclosure 1, p. SRAA 13). TNC could assist the Army in providing more information for the briefing as well as brochures and signs. The Army's very capable Environmental Program could also assist.

N30-4

Funding and Human Resource Support

As a preventive measure, the Army should provide funding and human resource support to help minimize potential impacts of fire in neighboring areas, including Honouliuli Preserve. Should a fire escape, the Army should provide adequate funding and human resources to replant any damaged area with native species appropriate for the area.

Mitigation:

- The IVFMP should be updated to reflect our concerns regarding tracers and pyrotechnics, smoking, use of open fire, use of prescribed burning technique, fire prevention-briefing, annual work plan development, and other concerns listed in this letter and the supplemental comment sheet.

- Potential mitigation measures listed under "Additional Mitigation 1" should be moved to "Regulatory and Administrative Mitigation 1." (DEIS p. 5-162)

N30-5

Providing resources to help adjacent private landowners and organizations to manage their properties to minimize potential impacts of fire or other threats that may result from USARHAW activities or that may originate on private property and affect USARHAW activities.

Replanting any area that is damaged by fires with plants, *preferably native species*, suitable for the habitat. Plants known to be invasive or noxious would not be used.

- Adequate funding should be allocated for proper wildfire prevention education of all soldiers. This includes development of educational materials (e.g. Power Point presentations, brochures, signs). The Army should consult with conservation organizations and/or the Army's Environmental Program for their assistance in producing these materials.

Impacts on federally listed species

N30-6

Pu'u Hāpapa, located at the northern-most peak of the preserve along the current Honouliuli-Schofield boundary, is another important area of concern. It is considered a Biologically Significant Area 1 (BSA1) by the Army (DEIS p. 5-157). It is habitat for many native and protected plant species, and contains one of the largest and most diverse native land snail populations on O'ahu, including the endangered *Achatinella mustelina*, which is one of the target species in the Mākua Implementation Plan. Because rats prey on the snails and feral pigs devastate their habitat, the Army's Environmental Program and TNC have been working together to reduce rats through baiting and trapping. Additionally, TNC has focused its volunteer hunting program in the area to reduce the pig population.

N30-3

All soldiers are briefed and given pocket information cards regarding safety issues and important resource areas at each training area prior to training. Please contact the Army at 655-3083 if you'd like to offer assistance.

N30-4

The Army will follow all measures outlined in the Integrated Wildland Fire Management Plan.

N30-5

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

N30-6

In response to comments received early in the EIS process, USARHAW reoriented QTR2 such that the SDZ would no longer impact any lands with the Honouliuli Preserve. Army will grant TNC personnel and TNC-sponsored personnel daily, controlled access to the TNC-managed lands along a route to be determined by the Army in consultation with TNC for as long as they have legal right to use of the affected property for conservation/stewardship purposes. Access controls will be developed and implemented to ensure the safety of all personnel and will consist of notification by TNC to the Army prior to entering Army lands and notification by the Army to TNC of any unusual activities that may present, or appear to present a danger to TNC personnel in the area. The boundary will be signed to prevent unauthorized use/trespass. Sections 5.11.2 and 8.11.2 discuss access for cultural practitioners.

Comments

**N30-6
cont'd**

This area is in the safety danger zone of the proposed firing range, QTR2, which would preclude effective hunting in the area, likely resulting in an increase in feral pigs, the rapid loss of the snail habitat, and the eventual loss of the snail population itself.

Mitigation:

- Working closely with TNC, the Army should assist in funding, constructing, and maintaining a fence at P'u Hāpapa that would eliminate pig ingress to the native snail population. They should also assist in reducing rat populations.

Impacts on sensitive species resulting from the spread of nonnative species

We agree with the DEIS' assessment regarding the movement of troops and equipment into Hawai'i, introduction of alien species through the use of sand and gravel for construction and the resulting effect of the spread of invasive species. For example, ants and their associated insect pests can be devastating to rare native plant and animal populations. No ants are currently known from the middle to upper portions of the TNC managed areas. We agree that the impact of these actions would be lessened by instituting the Army's ongoing environmental programs and expanding them to newly acquired areas.

N30-7

Mitigation:

The following "additional mitigation" (DEIS p. 5-166) that the Army is "considering" should be made mandatory:

- educating soldiers and other potential users of the facilities and roads in the importance of cleaning vehicles and field gear.
- using native plants in any new landscaping or planting efforts where practicable.
- requiring all construction vehicles and equipment to undergo a mandatory wash prior to entering construction sites.
- inspecting and washing all military vehicles at wash rack facilities before they leave SBMR, KTA, or PTA to minimize spread of weeds and insects.

PTA – Pōhakuloa Training Area

The Nature Conservancy does not manage any preserves in the immediate vicinity of PTA. However, we do work cooperatively with State officials, other agencies and private landowners to identify and protect important native habitats in several watersheds on the Big Island. Of particular significance in relation to PTA are remnant dry-forest ecosystems that have been severely impacted historically by incompatible grazing, commercial logging, invasive grassland plants and fire.

N30-8

In recent years, the Army has made considerable progress in the identification, assessment and protection of rare plant habitat at PTA. However, we are concerned that the impacts associated with the proposed expansion of PTA by addition of the 23,000 acre Ke'āmuku parcel have not been fully evaluated nor have the most appropriate mitigation strategies been identified.

The Army acknowledges that there will be significant impacts to neighboring communities due to airborne dust, wind erosion and noise. We doubt, however, that these impacts can be adequately mitigated through operational protocol, troop training, strategic routing of access roads and/or reseeding of eroded lands.

N30-9

Our primary concern with expanded troop activity within PTA and, particularly, within the Ke'āmuku parcel, relates to wildfire. The recently prepared IWFMP helps to address our concern, but falls short in significant ways. Although live-fire training is not contemplated within the Ke'āmuku addition, proposed training exercises will include pyrotechnics. In addition, there appears to be no consideration of the risks associated with catalytic converter or other vehicle-related fires in grassland areas. The IWFMP does acknowledge increased fire risk due to diminished grazing in this parcel. That change in habitat condition,

N30-7

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

N30-8

The discussions and analysis in Sections 8.3, 8.5, 8.6, 8.9, 8.10 and 8.12 have been expanded to better evaluate the potential impacts from fugitive dust by the Proposed Action. With the expanded discussion and analysis, the Army has identified additional mitigation measures and in some cases the determinations of effect have changed

N30-9

The discussions in Sections 4.8, 4.9, 4.10, 8.8, 8.9, and 8.10 have been expanded in the Final EIS to better discuss the potential impacts of wildland fires. The impact to biological resources from wildland fires has been changed to significant. The mitigation measures proposed, including the updated IWFMP, will substantially reduce the severity of the impact on biological resources but not to less than significant levels.

Comments

N30-9
cont'd

taken together with substantial increase in proposed troop and vehicle activity within this area, will exacerbate the wildfire risk.

We support the proposal for expanded development of firebreaks and fuel breaks around the perimeter of the Ke'āmuku parcel and elsewhere at PTA. Special attention should be given to the adequacy of fire/fuel breaks around the areas that support significant populations of rare plants. In addition, we believe there are additional pre-suppression actions that should be implemented. The IWFMF indicates that a helicopter with trained personnel will be on station during live fire operations. We believe this SOP should extend, at least, to include all activities involving pyrotechnics and, potentially, for all off-road maneuvers in the Ke'āmuku parcel. We also believe that more permanent water sources and/or dip tanks be in place and operational during maneuver activity within this parcel.

General Comments

N30-10

TNC has general concerns about the consequences of expanding other training areas that echo those expressed for the SRAA and PTA. Key areas of concern are:

- Preventing wildfire, particularly in areas that will receive live-fire training including the use of tracers and pyrotechnics,
- Preventing the spread of non-native invasive species by troops and vehicles,
- Replanting damaged areas with native plants and using native plants in any new landscaping or planting efforts where practicable, and
- Providing resources to help adjacent private landowners and organizations to manage their properties and minimize impacts by the Army's training activities.

The DEIS should require rather than "consider" proposed mitigation measures to prevent and minimize the impacts of wildfire and alien species on native forests and endangered species. We recommend strongly that the Army plan and implement a very aggressive fire and weed prevention, response and rehabilitation program for all Transformation activities.

N30-11

Lastly, recent newspaper reports have announced that there has been a change to the Stryker Brigade in Hawai'i, approved by the Secretary of Defense. As we understand it, some of the changes relate to use of larger weaponry and different helicopters. Should the changes create impacts that are not reflected in the current DEIS, we ask that a supplemental DEIS be developed with an extended comment period.

In conclusion, we appreciate the Army's on-going consideration of our concerns, stated in this letter as well as in meetings. We recognize that the Army has tried very hard to work with concerned landowners, managers, and community members. We urge the Army to continue to communicate and work with us, as the Army is an important and valued conservation partner in Hawai'i. We will continue to seek ways to work together to accommodate the Army's training needs without damaging irreplaceable resources found only in these islands.

Sincerely,

Suzanne Case
Executive Director

N30-11

After the publication of the Draft EIS, the Army announced plans for an enhancement package for SBCTs. The enhancements include an aviation task force, an increase from twelve to eighteen 155mm howitzers in the direct support artillery battalion, and improvements to command, control, communications, computer, and intelligence (C4I) assets. The announcements indicated that the aviation task force would include Comanche helicopters when the aircraft were ready for fielding. In February 2004, the Army determined that no further testing or fielding of Comanches would occur and canceled the Comanche program. The SBCT aviation task force will come from existing 25th ID(L) aviation brigade assets and will result in minor changes to training, primarily some increased aviation training over WPAA in support of units training in that area. The FEIS has analyzed the impacts of the increased aviation training over WPAA and those impacts are minimal. The Draft EIS analyzed the impacts of twelve 155mm howitzers, a change from the eighteen 105mm howitzers currently in the direct support artillery battalion for 2nd brigade. The addition of another six 155mm howitzers was analyzed in the FEIS and resulted in minimal changes to noise impacts and no change in the overall determination of effect. The C4I improvements are not expected to have any impacts on the environment. Overall, the Army has determined that the enhancements are within the original scope of the proposed action as described in the Draft EIS, are minor in nature, and do not require a supplemental Draft EIS.

Re: DRAFT ENVIRONMENTAL IMPACT STATEMENT
Transformation of the 2nd Brigade, 25th Infantry Division (L)
to a Stryker Brigade Combat Team in Hawaii-- Ke'āmuku
Acquisition

Dear Ms. Barger:

These comments relative to the Draft Environmental Impact Statement (DEIS) for the Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Combat Team in Hawaii are offered in behalf of the Paniolo Preservation Society (PPS), a not for profit 501c3 corporation established five years ago with the primary mission of preserving Hawaii's unique and historic ranching heritage.

In an April 16, 2002 memorandum delivered to the public scoping meeting held at the Outrigger Waikoloa Beach Hotel on April 17, 2002, the Paniolo Preservation Society availed to the IBCT transformation process its expertise in identifying, interpreting and preserving those features of the lands of Ke'āmuku that reflect significant historic, cultural and pastoral values relative to Hawai'i's ranching and paniolo heritage. The society has to date never been consulted, but did acquire a copy of the draft EIS and taken several meaningful exceptions to its findings. To place these objections in the appropriate context, kindly review our purposes and goals in attached document.

N31-1

Specific areas of concern of the PPS for the conversion of the lands of Ke'āmuku into a West Pōhakuloa Training Area include the risk of degradation of historic sites, cultural features, educational value, community vision, grassland resources, and environmental integrity, as well as aesthetic, spiritual and inspirational values. Despite the offer by the PPS to provide such background and counsel, the draft EIS clearly overlooked the opportunity leaving the society with little alternative but to oppose the transformation process.

Responses

N31-1

Based on public comment, the Army has conducted more detailed analysis and expanded the discussion in many of the resources sections in the Final EIS. In some cases, the Army has changed the determination of effect to reflect this analysis and discussion. The impacts to the resources and the Army's determination of effect are summarized in Chapter 4 - Environmental Consequences.

Historic Sites

In chronological order, concerns are registered with regard to the risk of further destruction to the original campsites of early native Hawaiian shepherds, Nahuku to the northwest and Akuna to the southeast.

The camp, stonewall enclosures, corrals, loading chutes, house foundations, dipping vats and water cisterns date back to the eras of MacFarlane, Johnson, Spencer and Parker operators of the mid-1800s.

Fixtures representative of the early to mid-1900s have clearly defined remnant features including bar and post corrals, loading chutes, alleyways and parting gates. Many of these features are evident throughout the entire length and depth of the Ke'āmuku Lands from Kalawa Mauna in the northwest to Pu'u Ke'eke'e in the southeast.

While Parker Ranch in recent years added portable panels to erect temporary corral facilities, all other fixtures throughout the body of the lands of Ke'āmuku clearly fall within the spirit of preservation and stewardship standards mandated by the Paniolo Preservation Society and quite likely by the rules of the State Historic Preservation Division and the purview of the National Historic Preservation Act.

Cultural Features

The lands of Ke'āmuku are deeply embedded with culture of the early Hawaiian people who conducted livestock farming (pigs, dogs and chickens) in the Waimea area as early as 750 A.D. Evidence of crop farming (yams) precedes that date. In the ensuing eleven centuries before the arrival of cattle, sheep, goats and horses, the hog rapidly propagated in the hills and plains of Ke'āmuku. The hog is the animal icon of native Hawaiian beliefs that in the life of a single person, the sacrificial and celebratory consumption of pork marks the six stages of life starting with birth and ending with death.

As the wild cattle spread across the plains of Waimea from Kalawa Mauna to the west, Kawaihae-uka to the north and Mānā to the east, with them came English, Mexican, Scottish and Irish cattlemen who early on recognized the Native Hawaiian skills in working of cattle and horses, hence was borne the image of the Hawaiian cowboy, the paniolo who has amassed a cultural image of his very own.

Ke'āmuku is featured repeatedly in the writings of pioneer sheep and cattle ranchers as the birthplace of the industry largely due to its bountiful forage resources, the foundation of ranching throughout the world, bringing into history the American hero, the cowboy. Hawai'i's paniolo are likewise cultural heroes as evidenced by the heroic bronze monument of Ikua Purdy in Waimea—celebrating all of the cowboys of the Kingdom, Territory and State of Hawai'i.

Educational Values

As one of its primary purposes, public awareness of the community of Hawaii and greater America, regarding our ranching heritage is a "front burner" issue of the PPS. In addition to contributing to various media avenues regarding the documentary portrayal of

N31-2
cont'd

Hawaii's ranching heritage, PPS members and agents have conducted innumerable classroom, panel, seminar and conference presentations regarding the historic background of the cattle industry, its leaders and its field personnel. Ke'āmuku is a vital component of this history given its multi-specie, multi-ethnic, and multi-purpose features spanning more than a dozen centuries from the early Hawaiian farmer to the present day Parker paniolo.

Community Vision

The general community of Waimea does in fact reflect the values of the people of North Hawai'i. Without a doubt, the villages of North and South Kohala, the Pu'uānāhulu village of North Kona and the multiple hamlets of Hāmākua including Ahualoa, Hōnoka'a, Waipi'o, Kukuihaele, Pā'auhau, Pa'auilo and 'O'ōkala are alive with people that are part of the paniolo history of the Island of Hawai'i.

N31-3

The 23,000-acre lands of Ke'āmuku represent a more than significant component of ranching and paniolo heritage. Conversion of these lands to military use would impose a serious impact on the desire of the community to retain its ranching image and paniolo lifestyle.

After World War II community leadership resisted military attempts to convert the Lālanilo training area to a permanent facility. Without such resistance, Waimea would become what Wahiawa became, relative to Schofield Barracks, simply an "Army town" with little indication of Hawaiianess. Fifty years later, the communities of North Hawai'i rise to the challenge with profound support of the PPS in opposing military imposition on the rural and paniolo character of 'āina Waimea. The community vision calls for greater emphasis on its ranching heritage, not dilution.

Grassland Resources

From the days of MacFarlane's Pu'u'loa Sheep and Cattle Company through the eras of Parker, Carter and modern management, the Ke'āmuku grasslands properly managed carried about 3,500 mother cows on an annual basis. Furthermore the historic success of the 4-H youth programs routinely called for Ke'āmuku steer calves for show purposes, often resulting in blue ribbon state champions.

N31-4

The most profound testimony to the strength of the Ke'āmuku grasslands came in a 1986-87 study conducted by Drs. W.C. Bergin (myself) and Ben Norman of the Veterinary Extension Department of the University of California-Davis. It involved measuring performance of calf crops from nine different Parker Ranch sections over a two-year period. Over 20,000 calves were ear-tagged and tracked from birth through weaning, feedlot entry and slaughter at finishing. Of the nine sections, the Ke'āmuku steer and heifer calves were heaviest at weaning, heaviest at feedlot entry and heaviest carcass at slaughter. Such objective data clearly demonstrate that under proper management, the grasslands of Ke'āmuku represent a highly productive agricultural resource that should remain unencumbered for ranching use.

Cindy S. Barger
December 31, 2003
Page 4

Environmental Integrity

N31-5 Brittle is the term used to describe the Ke'āmuku environment. Until recently, prudent pastoral management called for periodic rest and recovery periods. At times, the whole division was depopulated of livestock for significant time periods representing appropriate stewardship of ground cover (forage) and deterring soil erosion. Military use, as described in the draft EIS fails to adequately address the impact of the transformation process. A striking example of poor military stewardship is the deeply rutted and heavily eroded "tank trails,"—one traversing Waiki'i Ranch (original) and the second one paralleling in a western course a mile away in Parker Ranch proper.

N31-6 It is the position of the PPS relative to the draft EIS that the state Office of Environmental Quality Control which is charged with administering portions of HRS 343 will require that assessments of proposed action on cultural practices to include all ethnicities. If the Ke'āmuku lands are to be re-classified away from its present pastoral (agricultural) use, the PPS would expect an inquiry into the affect of such transformation on the ranching or paniolo lifestyle and local cowboy culture. The draft EIS has provided no significant indication that such an inquiry ever took place.

N31-7 The draft EIS proposes that an Integrated Training Area Management program (ITAM) would be used to mitigate potential impacts on the land via a cooperative relationship with Parker Ranch to continue grazing the lands of Ke'āmuku. The PPS takes the position that the proposed rate of exercises (40-60/year) would unduly tax the brittle environment to a point of severely stripping forage and topsoil, leaving significantly damaged surface area for grazing. To graze cattle over and above such soil forage degradation raises an issue of prudent stewardship of land and livestock, in fact, raises concerns for animal welfare. Animal and plant life are doubly taxed under such a proposal with gross disregard for the integrity of the soil and grasslands of Ke'āmuku.

Aesthetic, Spiritual and Inspirational Values

The sweeping plains, rolling hills, scented eucalyptus and scattered multi-colored livestock represent the serenity that marks the district of Waimea as unique and special.

Of significant spiritual impact however, is the fact that among the green grass and low-lying olive trees are the scattered remains of two great men of Parker Ranch, Andrew Fong and Walter Stevens who in their twilight years chose to have their ashes interred in their beloved 'āina Ke'āmuku.

Andrew Fong, a noted paniolo worked for Parker Ranch under Walter Stevens for over 35 years. Walter was his dearest friend, boss and confidant. Walter, in turn, was the consummate Hawaiian cowboy—stoic, handsome and capable. In the 155 years of Parker Ranch's existence, the name Wala (Walter) continues to be remembered with reverence, as he was undoubtedly the finest horseman the Ranch ever produced.

N31-8 The Paniolo Preservation Society recommends that the EIS process reflect on the aesthetic, inspirational and spiritual aura that is sensed in the sheer beauty of pastoral Ke'āmuku. For these values and the above registered concerns, the PPS takes significant

Responses

N31-5

The EIS identifies erosion as a potential significant impact of the project in this area. The discussion can be found in Section 8.9.

N31-6

Army Transformation is a federal project, not a state project, and is therefore not required to comply with state law regarding cultural impact studies. Conversion of the WPAA to military use is described as a less than significant impact in Section 8.2.2. However, it is possible that cattle grazing would continue on the WPAA. If the Army decided to implement the proposed action, the Army would weigh the potential of continued cattle grazing on the proposed West PTA acquisition area based on the potential benefits to fire reduction, potential interference with ongoing Army training, and requests of local cattle ranchers. If the Army decided that cattle grazing were appropriate, cattle would be managed so as to avoid any overgrazing and any resulting significant soil erosion. In accordance with Army Regulations 350-4, the mandate of the ITAM program is to manage land for Army training and repair damage incurred by Army training. As part of this mandate, this would also include any related actions such as managing land for grazing or repairing damage caused by the cattle. Continued use of the WPAA for agricultural purposes, consistent with Army use, would result in a less than significant impact on the community.

N31-7

The purpose of the ITAM program is to assess impacts of training activities and restore areas damaged or make changes to training and operations to minimize future damage. By making changes to training schedules, activities, and restoration activities on an ongoing basis the impacts can be minimized.

N31-8

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

N31-8 cont'd issue with the proposed transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team using the lands of Ke'āmuku as a West Pohakuloa Training Area.

N31-9 In closing, the PPS has two requests. First, that the society be formally acknowledged as a consulting party and, secondly, that the ensuing structure of the EIS be fashioned in a manner that would allow interested parties to review, digest, identify and respond to potential impacts of transformation proposals. A more concise, less bulky and ambiguous document may produce more meaningful responses from concerned citizenry as well as interested bodies such as the PPS.

N31-10 With a deep sense of appreciation for this opportunity to address the concerns found in the draft EIS, I remain:

Sincerely,

W.C. Bergin, D.V.M.
President
Paniolo Preservation Society

Attachment

c: Pat FitzGerald
Sonny Ke'akealani
Co-chairpersons, Trails and Artifacts Committee

Responses

N31-9

In response to the comment, the Army has initiated consultations with the Paniolo Preservation Society as an interested party in the NHPA Section 106 process. If the Army decides to implement the Proposed Action, the Army will continue to work with the Society as the project progresses.

N31-10

The FEIS is divided into 5 geographical areas making it easier for the general public to focus on impacts the project might have on their community. In addition there is a guide inside the front cover describing the organization of the document, an abstract of the FEIS, and a very detailed Table of Contents. In addition the Executive Summary highlights the important aspects of the proposed project including a project description, a summary of impacts, and proposed mitigation.

Re: DRAFT ENVIRONMENTAL IMPACT STATEMENT
Transformation of the 2nd Brigade, 25th Infantry Division (L)
to a Stryker Brigade Combat Team in Hawaii

Dear Ms. Barger:

Attached is comment letter submitted on behalf of Hawaii Preparatory Academy, Parker School Trust, and North Hawaii Community Hospital. These entities are beneficiaries of the Parker Ranch Foundation Trust and are referred to collectively in the Trust document as the "Kamuela Charities."

While these comments are being submitted jointly, they constitute separate comments relative to the DEIS on behalf of separate nonprofit entities. In other words, there is no formal association or committee of the beneficiaries at this time. The Kamuela Charities do have common interests relative to the quality of the physical and cultural environments in the Kamuela area as supported organizations under the Parker Ranch Foundation Trust.

The Kamuela Charities thank you for the opportunity to submit these comments and look forward to working cooperatively with the Army Corps of Engineers and other interested parties to ensure that an appropriate environmental review is completed before any irretrievable commitment of resources occurs. Please include Hawaii Preparatory Academy, Parker School Trust, and North Hawaii Community Hospital as consulted parties in the EIS process and

Re: DRAFT ENVIRONMENTAL IMPACT STATEMENT
Transformation of the 2nd Brigade, 25th Infantry Division (L)
to a Stryker Brigade Combat Team in Hawaii

Dear Ms. Barger:

These comments relative to the Draft Environmental Impact Statement ("DEIS") for the Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawaii are offered on behalf of Hawaii Preparatory Academy, North Hawaii Community Hospital, and Parker School Trust as individual nonprofit entities and as beneficiaries of the Parker Ranch Foundation Trust ("PRFT"). PRFT is the current fee owner of the parcel identified in the DEIS as THE West Pohakuloa Acquisition Area ("WPAA").

Hawaii Preparatory Academy ("HPA") is a nonprofit organization which operates a kindergarten through grade 12 boarding and day school in Kamuela, Hawaii, which has provided quality education to a wide range of Hawaii, United States, and international students for more than 50 years. HPA's uniqueness as an educational institution and its curriculum are dependent upon the quality of the Kamuela community and the surrounding environment. HPA's setting in a healthy, diverse cultural and physical environment enhances the school's ability to attract quality students, faculty, and employees as well as educational opportunities for students. HPA is one of the largest employers in the Kamuela area and offers a range of financial aid and scholarship options to local students.

The Parker School Trust ("Parker School") is a nonprofit entity which operates a 6th through 12th grade day school in the heart of Kamuela town. Like HPA, Parker School is dependent on the quality of the Kamuela and North Hawaii communities to attract students,

Cindy S. Barger
December 31, 2003
Page 2

faculty, employees, and to offer a wide range of course offerings. One of Parker School's founders was Richard Smart, former owner of the Parker Ranch and settlor of PRFT. Parker School, together with other beneficiaries, has been deeply involved in working with PRFT to effectuate Mr. Smart's vision for PRFT, its beneficiaries, and the Kamuela community.

The North Hawaii Community Hospital ("NHCH") is a nonprofit organization which operates a full-service community hospital in Kamuela, Hawaii. NHCH is dedicated to the mission of improving the health status of the people of North Hawaii, not only by providing quality medical and hospital care, but also in enhancing other aspects of the community which contribute to the overall health and wellbeing of the people of North Hawaii. NHCH, like the other beneficiaries, depends on the quality of the cultural and physical environment of North Hawaii to attract employees, physicians, patients, and donors to the hospital.

HPA, Parker School, and NHCH are identified in the PRFT as the "Kamuela Charities." The Hawaii Community Foundation, a Honolulu-based nonprofit organization, is the other PRFT beneficiary. The Kamuela Charities believe that they were selected as beneficiaries of the PRFT because they have an interest in the long-term quality of the physical and cultural environment in the Kamuela area. The Kamuela Charities have worked cooperatively and in concert to exercise their rights and responsibilities as the organizations supported by PRFT pursuant to Internal Revenue Code § 509A(3). This effort has included a thorough review of PRFT's financial and organizational status including review of the current state of strategic planning and land use planning conducted by the trustees of PRFT.

As nonprofit entities in the Kamuela area and as beneficiaries of the PRFT, the Kamuela Charities are interested parties in proposed sales and use of large tracts of land in the North Hawaii area, particularly where those tracts are owned in fee simple by PRFT. The Kamuela Charities have interest in the proposed federal acquisition and use of the subject property which are special and personal to the Kamuela Charities, and not in common with interest with the general public.

N32-1 Specifically, with respect to the DEIS, the Kamuela Charities are concerned that the DEIS fails to adequately identify and assess the full range of potential adverse environmental and cultural impacts that may be caused by the proposed project:

N32-2 1. Biological Resources. The DEIS fails to adequately assess the potential effects of the proposed project on the physical environment. The DEIS does not attempt to assess the proposed environmental effects of the project from the perspective of restoration potential of the subject property. In other words, while the 23,000-acre parcel has been significantly impacted by grazing activity, a strong potential for environmental restoration exists--particularly in the up-slope areas adjacent to Saddle Road and Waiki'i Ranch. Specifically, while the property has lost forest coverage due to grazing, many areas have not yet been impacted by fire and there exists a real potential for reforestation and restoration of critical habitat for a number of native species including endangered bird species.

Responses

N32-1

Based on public comment, the Army has conducted more detailed analysis and expanded the discussion in many of the resource sections in the Final EIS. In some cases, the Army has changed the determination of effect to reflect this analysis and discussion. The impacts to the resources and the Army's determination of effect are summarized in Chapter 4 - Environmental Consequences.

N32-2

Revisions have been made to section 8.10 regarding impacts to biological resources. After a careful reevaluation the Army has determined that the impacts from fire would cause a significant impact to sensitive species. The mitigation measures described will reduce the impact considerably it will not reduce it to less than significant. While the property may have the potential to allow native forests and grasslands, there are no current or future plans for that to occur. The Final EIS has looked at all reasonably foreseeable projects in evaluating the impacts.

Comments

Cindy S. Barger
December 31, 2003
Page 3

**N32-2
cont'd**

The biological work performed as part of the DEIS fails to adequately address the potential contribution of this area to restoration of endangered species habitats if grazing activities were modified to accommodate reforestation.

The Kamuela Charities believe there is a potential to continue viable economically rewarding agricultural use of the property under conditions that allow for reestablishment of native forests and grassland environments. Instead, the DEIS assesses the potential adverse environmental effects of the project as if only alternative potential use is extensive grazing. This does not present an adequate or appropriate picture of the potential adverse effects of the project.

N32-3

2. Fire. Clearly and unquestionably, a military maneuvering area causes an increased risk of wild fire. In areas previously forested with native plants, risk of fire can be catastrophic as fire destroys seed banks in the soil and prevents wide-scale reforestation. These risks are in addition to the risks of fire escaping into existing forest areas, pockets of native vegetation currently located within the subject area, and residential structures, and the like. The DEIS does not adequately assess the risk of fire to seed banks in the soil and the adverse effects that fire may have on potential reforestation.

N32-4

3. Cultural Impacts. The DEIS fails to conduct an adequate assessment of the cultural impacts of the proposed project. The area of the proposed project has a rich cultural history of both pre-contact native Hawaiian use and historic use of the property which have been conducted for more than 50 years. The DEIS does not contain a thorough, systematic cultural impact assessment. The attempt to assess cultural impacts of the project by simply looking at specific features on the property does not adequately identify potential adverse effects. Instead, an appropriate cultural impact assessment should include assessment of the traditions, families, and activities involved in and connected to the property and should look at how denial of access to the property or conversion of the use of the property from traditional activities to military maneuvering will result in adverse cultural impacts throughout the community. The Kamuela Charities understand that Kapa Maly of Kumu Pono Associates has studied the cultural history of the area on behalf of the Waiki'i Homeowners Association and has done cultural impact assessments relative to Mauna Kea as part of the Mauna Kea Master Plan. Consequently, a great deal of cultural information potentially relevant to the subject area is available and should have been considered in conjunction with the DEIS.

N32-5

4. Community Impacts. The subject property is currently part of a working cattle ranch which is part and parcel of the rural, agricultural "Paniolo" lifestyle of the Kamuela community. Diverting lands used from an active cattle ranch to military maneuvering will have adverse cultural impacts on the rural traditions important to ranching communities such as Kamuela and Puuanahulu. The Kamuela Charities are concerned that the potentially adverse cultural and environmental impacts cannot be mitigated and have a widespread negative effect on the quality of life in the North Hawaii area.

N32-6

5. Effects on Other Surrounding Properties. The Kamuela Charities are concerned that there has been an inadequate assessment of other potential environmental consequences of

Responses

N32-3

The text has been changed in Sections 4.10 and 8.10 to incorporate this request. Large scale reforestation is an unlikely management option in the immediate future. Presently research in Hawai'i Volcanoes National Park is being done on revegetating recently burned pockets of nonnative forest with fire tolerant native plants to increase the ability of these communities to combat encroachment by alien plants. The initial research shows that some native plants are indeed fire tolerant and can successfully resprout or germinate in a post-fire environment

N32-4

Sections 4.11, 8.11, Chapter 9, and Chapter 10 have been expanded to incorporate information from the Maly studies. The Army has determined that project impacts and cumulative impacts to areas of traditional importance are significant.

N32-5

Conversion of the WPAA to military use is described as a less than significant impact in Section 8.2.2. However, it is possible that cattle grazing would continue on the WPAA. If the Army decided to implement the proposed action, the Army would weigh the potential of continued cattle grazing on the proposed West PTA acquisition area based on the potential benefits to fire reduction, potential interference with ongoing Army training, and requests of local cattle ranchers. If the Army decided that cattle grazing were appropriate, cattle would be managed so as to avoid any overgrazing and any resulting significant soil erosion. In accordance with Army Regulations 350-4, the mandate of the ITAM program is to manage land for Army training and repair damage incurred by Army training. As part of this mandate, this would also include any related actions such as managing land for grazing or repairing damage caused by the cattle. Continued use of the WPAA for agricultural purposes, consistent with Army use, would result in a less than significant impact on the community. However, as discussed in Chapter 9, the Army acknowledges that the cumulative impact on the conversion of agricultural lands from past, present and reasonable foreseeable future actions would be significant.

the proposed acquisition and use of the West Pohakuloa Training Area. Specifically, there are substantial concerns relative to soil loss, erosion, contamination, and slope failure associated with the increased additional use of the area by heavy vehicles. This area is already prone to wind and water erosion and the increased number of roads, increased use of vehicles off road, and other factors with the training will significantly increase the risks of soil loss and erosion. In addition, the results of the assessment of soil contaminates in the Pohakuloa Training Area suggests that the same concerns will exist in the West Pohakuloa Training Area if the acquisition is complete. While these issues have been mentioned in the DEIS, the DEIS does not include assessment of the long-term impacts of soil contamination, loss, and erosion—not only on the subject property itself, but on adjoining properties that may be impacted by these conditions.

N32-7

6. Impacts on the Kamuela Charities, Limitation of Planning Options. The Kamuela Charities submit that the DEIS did not consider potential cultural and community-wide impacts of acquisition of the Pohakuloa Training Area viewed from the perspective of the Kamuela community and particularly the Kamuela Charities. The 23,000 acres currently owned by Parker Ranch are part of the corpus of the Trust that is supposed to provide long-term benefit to the Beneficiaries and, through preserving the lifestyle and quality of the Kamuela community, to the general North Hawaii community. The Kamuela Charities are concerned that a one-time sale of 23,000 acres of land with potential future economic value has a significant adverse environmental and cultural effects on the community which has simply not been evaluated in the DEIS.

N32-8

7. Loss of Agricultural Lands. The current use of the property is primarily for grazing. There have been other historical and agricultural efforts undertaken on the property or on nearby property. The land is currently suited for agricultural use and the Kamuela Charities are concerned that moving up to 23,000 acres from productive agricultural use may have an adverse impact on the availability of appropriately zoned agricultural property and may have an adverse general impact on agriculture in the North Hawaii area. As parcels of land are taken out of agricultural uses and put to other uses, there are significant and immediate changes in the character and quality of the Kamuela community; there is an irretrievable commitment of resources to nonagricultural uses which will have significant effects throughout the community. To the extent that loss of prime agriculture lands reduces the commitment to agriculture in a region, the future use of the balance of PRFT lands or other lands currently in grazing activity becomes questionable. It is important that a thorough and thoughtful analysis of the region-wide impacts of removing prime agriculture lands from agriculture use be conducted as part of the DEIS.

N32-9

8. Archaeological and Cultural Resources. The Kamuela Charities are concerned that the DEIS does not adequately address protection of existing cultural and archaeological resources on the property. The Kamuela Charities question the significance assessments and mitigation plans. Increased access to the area by vehicles and ground troops will clearly impact archaeological and cultural site and this is not adequately addressed in the DEIS.

N32-10

9. Cumulative Impacts. The Kamuela Charities are concerned that the DEIS does not contain an adequate assessment of potential cumulative impacts of the proposed project.

N32-6

Among the potential impacts on adjacent lands would be deposition of soil and sediment that is eroded from the WPAA parcel. The effects would be monitored within the framework of the ITAM program, and erosion impacts would be addressed on an ongoing basis. While the erosion impacts discussed in the EIS are considered likely to occur, they will not occur instantaneously, but will develop over time. Mitigation measures will be implemented to reduce the impacts, and the effectiveness of the mitigation measures will be evaluated. The location and nature of the long term impacts is unpredictable, and may be mitigable in specific areas. The Army will perform additional detailed baseline studies of the existing vegetation and soil conditions, and will refine the model of the potential impacts of the project on these conditions. While the available data and modeling suggest that significant impacts will occur within the WPAA, no modeling has been performed to forecast the extent of the effects, if any, on adjacent lands. Mitigation measures are discussed in Section 8.9.

N32-7

Conversion of the WPAA to military use is described as a less than significant impact in Section 8.2.2. However, it is possible that cattle grazing would continue on the WPAA. If the Army decided to implement the proposed action, the Army would weigh the potential of continued cattle grazing on the proposed West PTA acquisition area based on the potential benefits to fire reduction, potential interference with ongoing Army training, and requests of local cattle ranchers. If the Army decided that cattle grazing were appropriate, cattle would be managed so as to avoid any overgrazing and any resulting significant soil erosion. In accordance with Army Regulations 350-4, the mandate of the ITAM program is to manage land for Army training and repair damage incurred by Army training. As part of this mandate, this would also include any related actions such as managing land for grazing or repairing damage caused by the cattle. Continued use of the WPAA for agricultural purposes, consistent with Army use, would result in a less than significant impact on the community.

N32-8

During the EIS review process, the Army has coordinated with Natural Resource Conservation Service and is compiling with all requirements of the Farmland Policy and Protection Act (FPPA). (See Sections 4.2, 8.2, and Appendix E.) If the Army decided to implement the proposed action, the

Comments

Cindy S. Barger

N32-10 cont'd | These impacts include transportation, population increases, impacts on schools, health care, traffic, etc.

N32-11 | 10. Structure of DEIS. The Kamuela Charities are concerned about the structure and presentation of the DEIS. It is extremely difficult for potentially impacted parties to review the entire DEIS and excerpt out portions of the DEIS that may apply to their areas of specific concerns. The potential impacts of different aspects of the project are buried in a mass of information which essentially prevents the average citizen from being able to review the DEIS and identify potential impacts relative to their area of involvement. This structure deters community members, native Hawaiians, and others who may have limited resources from being able to adequately address the potential impacts of the project. The DEIS should be divided into separate areas which are treated separately or a key should be provided that allows one seeking to review the DEIS to identify pages and exhibits which are relevant to the different components of the project.

N32-12 | 11. Request to be Consulting Parties. The Kamuela Charities—i.e., Hawaii Preparatory Academy, Parker School Trust, and North Hawaii Community Hospital—ask to be consulted parties as this project goes forward. Please communicate with the separate entities as follows:

Hawaii Preparatory Academy
c/o Mc Blasdel, Chairperson
65-1692 Kohala Mountain Road
Kamuela, Hawaii 96743

and

Hawaii Preparatory Academy
c/o Roy A. Vitousek, Director

Responses

management and use of the West PTA acquisition area would be conducted per federal regulations and guidelines. State regulations and guidelines do not apply to federal actions. However, the Army has considered State policies in its overall assessment of impacts in the EIS. In following FPPA requirements, CEQ guidance and Army policy, the Army has determined that the proposed conversion of West PTA acquisition area is consistent with these regulations and guidance and the impact would be less than significant.

N32-9

Based on public comment, the Army has expanded the cultural resource discussions throughout the document and including Section 8.11 and Chapter 9 - cumulative impacts. Based on the expanded discussion, the Army has changed the determination of effect to cultural resources in some cases to significant. The Army, SHPO, and ACHP have completed the PA that addresses these issues. The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS.

N32-10

Chapter 9 - cumulative impacts, has been expanded in the Final EIS and some of the determinations of effect have been changed to significant.

N32-11

The comment period has been extended to a total of 90-days and ended on January 3, 2004 to allow additional time for review. The FEIS is divided into 5 geographical areas making it easier for the general public to focus on impacts the project might have on their community. In addition there is a guide inside the front cover describing the organization of the document, an abstract of the FEIS, and a very detailed Table of Contents. In addition the Executive Summary highlights the important aspects of the proposed project including a project description, a summary of impacts, and proposed mitigation.

N32-12

Thank you for your comment. There is not a "consulting party" status for the NEPA process. However, the Army has added the names and addresses to the distribution list. All will be notified of the availability of the Final EIS and the availability of the final Record of Decision.

When the Army has studied, incorporated and addressed the crucial information contained in the following documents, and also made these two publications published by federal government departments available to all of Hawaii's citizens, then the Army might be able to come up with a meaningful, legitimate Final EIS that does not insult our intelligence, our health, our islands, our water, our air, our children, and future generations of Hawaii's citizens:

N33-1

1. FEDERAL HAZARDOUS WASTE SITES IN THE STATE OF HAWAII: COMPLIANCE, CLEANUP AND WASTE MANAGEMENT, HEARING BEFORE THE COMMITTEE ON GOVERNMENTAL AFFAIRS UNITED STATES SENATE ONE HUNDRED FIRST CONGRESS SECOND SESSION AUGUST 29, 1990 (U.S. GOVERNMENT PRINTING OFFICE, WASHINGTON, 1992, ISBN 0-16-039033-8);
2. RECOVERY PLAN FOR KOOLAU MOUNTAIN PLANT CLUSTER, AUGUST, 1996 (PUBLISHED BY U.S. FISH AND WILDLIFE SERVICE, PORTLAND, OREGON);
3. RECOVERY PLAN FOR WAIANAE MOUNTAIN PLANT CLUSTER, AUGUST, 1996 (PUBLISHED BY U.S. FISH AND WILDLIFE SERVICE, PORTLAND, OREGON);
4. RECOVERY PLAN FOR THE BIG ISLAND PLANT CLUSTER, SEPTEMBER, 1996 (PUBLISHED BY U.S. FISH AND WILDLIFE SERVICE, PORTLAND, OREGON).

Responses

N33-1

Thank you for your comments. For Document No 1: This project only covers those installations that will have Transformation activity or projects on them. For those hazardous waste sites identified in the project area they are addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning existing sites in accordance with applicable laws and regulations. For Documents 2,3, and 4: Information in these reports were included in the Biological Assessment. The data from the BA was incorporated into the EIS.

RE: Draft Environmental Impact Statement: Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawai'i

The Sierra Club, Hawai'i Chapter submits the following comments regarding the Draft Environmental Impact Statement for the Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team (SBCT) in Hawai'i. Unfortunately, due to process concerns, errors, omissions, and inconsistencies, the Sierra Club believes that the DEIS should be redrafted and put out for public comment once again.

In some ways, the military has made positive contributions to Hawaii's environment through their Ecosystem Management Programs. They have been proactive in protecting endangered species and maintaining watersheds on many military-controlled lands on O'ahu and the Big Island. Their fencing programs, invasive species eradication, and endangered species propagation programs have made notable, albeit small, improvements in biological resources on lands that may otherwise go unmanaged due to lack of resources. The Sierra Club compliments the military on these programs and encourages their maintenance and expansion.

Unfortunately, such improvements have been eclipsed by incredible damage and resource degradation due to uncontrolled fires from training, pollution from hazardous materials, unexploded ordnance in the environment, and other environmental and health impacts from the military's presence in Hawai'i. Last year, over 2000 acres burned in Makua Valley on O'ahu by a "controlled" fire that became uncontrolled. Approximately 150 acres of Oahu Elepaio Critical Habitat and approximately six acres of O'ahu Plant Critical Habitat were burned. The O'ahu Plant Critical Habitat that burned was designated for *Schiedea hookeri*, *Bonania mensezji*, *Nerardua angulata* var. *dentata*, *Nototrichium humile*, *Euphorbia haeleleana*, and *Gouania vitifolia*. Individuals of three endangered taxa were burned including *Chamaesyce celastroides* var. *kaenana*, *Nototrichium humile* and *Lipochaeta tenuifolia*. Thirty-seven individuals of *C. celastroides* var. *kaenana* from two locations, 29 individuals of *L. tenuifolia*, and 5 individuals of *N. humile* were burned in this fire. Other species were also damaged or destroyed.

The fire confirms two problems. First, military training in Hawai'i brings significant environmental impacts. When the unavoidable results of live-fire training occur in areas with some of the highest concentrations of endangered species in the world, irreparable damage will occur. Second, no

Jeff Mikulina, Director

Comments

Sierra Club Comments on Stryker Brigade expansion DEIS Page 2

matter how much mitigation is proposed and carried out, accidents happen. The fire at Makua was a "controlled" burn that turned into a wildfire. Although promises to protect species and resources are made, the military simply cannot guarantee that accidents with significant, long-term damage will not occur.

In Hawai'i, the military has contaminated groundwater sources, left land riddled with unexploded ordnance, blocked access to cultural sites, and failed to adequately clean up areas that were previously used for training. Promises made to return land in a cleaned-up condition have been broken. After nearly \$400 million was spent in cleaning up the island of Kahoolawe, only about 10% of the island will be completely clear of unexploded ordnance. Some of this reflects the military's commitment to protecting the environment; some is simply the physical reality of military training in Hawai'i.

It is from this background that we review the SBCT DEIS.

The Sierra Club, Hawai'i Chapter's main concerns can be summarized as follows:

- N34-1

• **New information.** In December 2003 it was announced that the Stryker Brigade would include training with Comanche helicopters and 155 mm howitzers. Impact information from this equipment was not contained in the DEIS.
- N34-2

• **Stryker expansion as a foregone conclusion.** The Pentagon announced on December 17th, 2003, that Hawai'i would have a Stryker Brigade. This decision calls into question the legitimacy of the environmental review process, where such a decision is made based on full disclosure of impacts and alternatives.
- N34-3

• **Military's failure to clean up old sites.** From Kahoolawe to areas on the Big Island, the military has a history of inadequately cleaning up former training sites. The Sierra Club believes that former military sites should be cleaned completely before new areas are adopted for training.
- N34-4

• **Habitat protection.** In Makua Valley and elsewhere, fire and invasive species have degraded habitat and destroyed endangered species. Training is currently occurring in areas without adequate wildfire management plans and the DEIS does not include wildfire management plans for each area where training is proposed.
- N34-5

• **Cultural site protection.** Desecration of cultural and sacred sites has been an ongoing concern for the native Hawaiian community and others. The DEIS does not contain an adequate Cultural Impact Statement, complete with interviews of cultural practitioners. Surveys to identify and evaluate archaeological sites at proposed training areas have not been fully completed, and Cultural Resource Management Plans and programmatic agreements for historical sites have yet to be completed.
- N34-6

• **Public access.** Public access on military-controlled lands for recreation, resource protection, hunting, and cultural practices is limited. The DEIS does not adequately disclose how much access will be curtailed for resource protection (ie. for the Nature

Responses

N34-1

After the publication of the Draft EIS, the Army announced plans for an enhancement package for SBCT's. The enhancements include an aviation task force, an increase from twelve to eighteen 155mm howitzers in the direct support artillery battalion, and improvements to command, control, communications, computer, and intelligence (C4I) assets. The announcements indicated that the aviation task force would include Comanche helicopters when the aircraft were ready for fielding. In February 2004, the Army determined that no further testing or fielding of Comanches would occur and canceled the Comanche program. The SBCT aviation task force will come from existing 25th ID(L) aviation brigade assets and will result in minor changes to training, primarily some increased aviation training over WPAA in support of units training in that area. The FEIS has analyzed the impacts of the increased aviation training over WPAA and those impacts are minimal. The Draft EIS analyzed the impacts of twelve 155mm howitzers, a change from the eighteen 105mm howitzers currently in the direct support artillery battalion for 2nd brigade. The addition of another six 155mm howitzers was analyzed in the FEIS and resulted in minimal changes to noise impacts and no change in the overall determination of effect. The C4I improvements are not expected to have any impacts on the environment.

Overall, the Army has determined that the enhancements are within the original scope of the proposed action as described in the Draft EIS, are minor in nature, and do not require a supplemental Draft EIS.

N34-2

Although the Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2nd Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2nd Brigade, 25th ID(L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law.

Conservancy at their Honouliuli Preserve on O'ahu) and cultural practice, especially at PTA on the Big Island.

On the following pages, our comments and questions (in italics) follow the bulleted section of the DEIS or the issue that we are commenting on. We look forward to your responses to our concerns and request that we receive physical copies of all future correspondence and EIS process documents.

Thank you for the opportunity to submit our concerns.

Sincerely,

Jeff Mikulina
Director, Sierra Club, Hawai'i Chapter

Responses

N34-3

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

N34-4

The Integrated Wildland Fire Management Plan for O'ahu and Pōhakuloa Training Areas was updated on October 2003 and incorporated lessons learned from the Makua fire. As discussed in the Final EIS Executive Summary proposed mitigation, the Army will fully implement this plan for all existing and new training areas to reduce the impacts associated with wildland fires. The plan is available upon request.

N34-5

Cultural resource sections have been updated in the Final EIS. The overall impact to cultural resources on a project wide basis is significant. The Programmatic Agreement and other measures will reduce the severity of the impact but not always to a less than significant level.

N34-6

In response to comments received early in the EIS process, USARHAW reoriented QTR2 such that the SDZ would no longer impact any lands with the Honouliuli Preserve. Army will grant TNC personnel and TNC-sponsored personnel daily, controlled access to the TNC-managed lands along a route to be determined by the Army in consultation with TNC for as long as they have legal right to use of the affected property for conservation/stewardship purposes. Access controls will be developed and implemented to ensure the safety of all personnel and will consist of notification by TNC to the Army prior to entering Army lands and notification by the Army to TNC of any unusual activities that may present, or appear to present a danger to TNC personnel in the area. The boundary will be signed to prevent unauthorized use/trespass. Sections 5.11.2 and 8.11.2 discuss access for cultural practitioners.

Page 5

ENVIRONMENTAL IMPACT STATEMENT PROCESS CONCERNS

New Information

- In December, 2003, it was announced that the Stryker Brigade expansion would use Army Comanche helicopters, which will replace the OH-58 Kiowa Warriors. The brigade would also add 155 mm howitzers, which are normally assigned to larger units, in addition to the smaller 105 mm howitzers.

This information was not included in the Draft EIS. Different helicopter use and larger howitzers will cause new impacts that need to be fully disclosed in the EIS and be made available for public comment. The Sierra Club believes the changes are significant enough to warrant a new EIS with new public comment period.

"Done deal"

- CFR Appendix E, (a) "EISs will: ... (4) Serve as a means to assess environmental impacts of proposed military actions, rather than justifying decisions."
- According to the *Honolulu Star-Bulletin*, on December 17th, 2003, the Pentagon officially announced that Stryker combat teams will be stationed in Hawaii and Pennsylvania. The paper wrote: "The Schofield brigade is expected to be operational by 2006, according to the Pentagon."

Was a decision on the Stryker Brigade Transformation location in Hawai'i made before the draft EIS came out in October 2003?

If the decision was not made a priori, were the following statements by elected leaders and others false?

Senator Daniel Inouye said "he has been assured that Hawaii will get a Stryker brigade" ("Sen. Inouye Says He Was Assured a Stryker Brigade," Associated Press, Hawaii Tribune-Herald, June 20, 2003)

The Army is planning to relocate its Big Island Fire and Emergency Service from Kilauea Military Camp to Pohakuloa Training Area by August 2004... "This decision... is directly related to the increased workload associated with PTA's Transformation Plan and the significant number of additional facilities planned" and the many wildland acres which require more firefighting capability (June 24, 2003 letter from Colonel Anderson to Rep. Ed Case)

"Despite an adverse government report, the U.S. Senate, urged by Hawaii's Daniel Inouye, has set aside \$17.5 million for the new Stryker brigade slated for Schofield Barracks over the next decade. The money... is contained in the \$369.2 billion Defense Appropriations bill for next year, approved by the Senate Appropriations Committee yesterday. Inouye said the money is an addition to the \$71.8 million moved by the same... Committee last month to fund four projects at Schofield Barracks to support the Stryker brigade." (Isle Strykers Gain More Funds, Honolulu Star-Bulletin, July 10, 2003)

Construction and research money for transformation have already been put into the military budget. About \$89 million has already been set aside for Schofield alone. ("Stryker Meeting to Draw Picketers" Gregg Kakesako, Honolulu Star-Bulletin, July 14, 2003)

"Although there's been no official word from the Pentagon on where the new quick-strike [Stryker] units would be based, 'We're moving as if this is already an accomplished fact,' said

N34-7

After the publication of the Draft EIS, the Army announced plans for an enhancement package for SBCTs. The enhancements include an aviation task force, an increase from twelve to eighteen 155mm howitzers in the direct support artillery battalion, and improvements to command, control, communications, computer, and intelligence (C4I) assets. The announcements indicated that the aviation task force would include Comanche helicopters when the aircraft were ready for fielding. In February 2004, the Army determined that no further testing or fielding of Comanches would occur and canceled the Comanche program. The SBCT aviation task force will come from existing 25th ID(L) aviation brigade assets and will result in minor changes to training, primarily some increased aviation training over WPAA in support of units training in that area. The FEIS has analyzed the impacts of the increased aviation training over WPAA and those impacts are minimal. The Draft EIS analyzed the impacts of twelve 155mm howitzers, a change from the eighteen 105mm howitzers currently in the direct support artillery battalion for 2nd brigade. The addition of another six 155mm howitzers was analyzed in the FEIS and resulted in minimal changes to noise impacts and no change in the overall determination of effect. The C4I improvements are not expected to have any impacts on the environment. Overall, the Army has determined that the enhancements are within the original scope of the proposed action as described in the Draft EIS, are minor in nature, and do not require a supplemental Draft EIS.

N34-8

Although Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2d Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2d Brigade, 25th ID (L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law.

Abercrombie, D-Hawaii. 'I don't think the secretary of defense if going to turn us down at this stage...I am assured personally that Hawaii will get a Stryker brigade,' Inouye said in June. (Hawaii Prepares for Brigade, Hawaii Tribune-Herald, August 13, 2003)

"Both houses of Congress also have passed a...\$9.7 billion military construction bill...\$75 million of which is for Hickam Air Force Base's new C-17 jet transport squadron being established to set up the...Stryker combat brigade...More than \$80 million...would go to acquire more land in Wahiawa to begin...work for the...Stryker..." (Akaka Plans \$400 billion defense bill...Honolulu Star-Bulletin, November 13, 2003)

"Earlier this year, a defense spending bill approved by the House and Senate included \$433 million for Hawaii projects, including funds earmarked for a new Stryker brigade." (Hawaii Nets Stryker, Hawaii Tribune-Herald, December 16, 2003)

Participation

- Executive Summary p 3 "Those having a potential interest in the Proposed Action...were notified and invited to participate in the scoping and environmental impact analysis process."

This is not accurate:

Arrests *The Army had people arrested at two hearings in Honolulu for bringing signs. Signs were allowed at hearings before the arrests, and later after the arrests. The arrests deprived people of their right to speak, and probably had a chilling effect on participation in the remaining hearings.*

Intimidation and harassment *The Hilo police left a phone message asking a Hilo activist if he planned to be arrested at the hearings. Waikoloa Beach Marriott left him a message that people carrying protest signs must enter through the loading dock. The Marriott passed out a flyer saying "public displays of protest" were not allowed in the hotel.*

N34-9

Private facility venues *for EIS hearings, where citizens can be ejected at the word of the property owner, were used instead of public venues.*

Closed-door meetings *The Army kept the public out of meetings about the expansion.*

"On May 16, 2002 the Army invited selected business and government people to a meeting and dinner in Hilo. Concerned citizens picketed outside, then entered the meeting and said such meetings must be open to the public.

**The Army again invited a selected group to a another closed meeting where the Army expansion and other land use issues were discussed, on July 16, 2003, in Hilo. This time police barred protesters from entering, and the Army ejected a Sierra Club representative who entered the meeting.*

Cancelled tour *In September 2002 the Army abruptly cancelled a tour of Pohakuloa requested by about 15 community people concerned about the Army transformation plans. The Army said some of the people were unacceptable, but refused to say who.*

Disability accommodation *The Army failed to provide adequate accommodation at the November 6 hearing for a Hilo person with a disability.*

Comment time *The comment time was extended, but is still inadequate for groups to explore the ramifications of the proposed action and prepare a meaningful response. There are only 90 days to comment on an EIS that fills three 2-inch books, and proposes the largest Army construction project in Hawaii since World War II.*

N34-10

Decision-maker *A neutral third-party, or an agency other than the Army, should make the decision on the EIS. The Army should not make the decision on its own EIS.*

N34-9

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs.

It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

N34-10

Under NEPA, the agency proposing the action makes the decision on the action after the EIS has been completed. The Army will make the final decision on the action with the issuance of the Record of Decision.

Comments on Stryker Brigade expansion DEIS

Page 7

"NEED" FOR STRYKER BRIGADE IN HAWAII

N34-11

- Executive Summary p 3 The Army wants Transformation to meet its goal "to be able to deploy anywhere in the world and be prepared to carry out the Army's military mission within 96 hours of deployment from Hawaii."

Please explain how the goal of "able to deploy...within 96 hours" can be met in light of the US GAO comments: "...the U.S. General Accounting Office reiterated last month an Air Force-sponsored report that the Army cannot achieve its goal of deploying a Stryker brigade anywhere in the world within four days." ("Isle Strykers gain more funds," Honolulu Star-Bulletin, July 10, 2003)

N34-12

- Executive Summary p 23 "If the 2nd Brigade is to train at either of these installations [Alaska, Fort Lewis, Fort Polk]...all the people, equipment, and vehicles...would have to be transported...[so] soldiers could train with their own equipment..."

If identical or similar equipment is available at the other four locations, why can't the soldiers train there without transporting their own equipment? Wouldn't this save a substantial amount of money?

N34-13

- Chapter 2 p 35-38 "Doctrine provides that the area of operations for which the SBCT could be responsible in combat is normally 31 miles by 31 miles...training lands must be sufficient and widely spread to approximate operating in an area that size by simulating the density of units and activities that might occur during combat...advanced communication makes it possible for the SBCT to train on noncontiguous parcels of land, even separate islands, and still simulate operating in a 31-mile by 31-mile area...[Land Use Requirements Study U.S. Army 1997c is cited]...the RTLP Range Development Plan (RDP) describes the land required for individual maneuvers necessary to meet the training requirements for combat within a 31-mile by 31-mile area...The largest of these maneuvers...requires 122,564 acres...land acquisitions would add up to...approximately 78% of the goal, which, when combined with training available along the proposed military use trails, will meet mounted maneuver training needs."

The EIS needs to give more details from the 1997c Army Land Use Requirements study and the Range Development Plan by Nagata Group LLC 2002, plus details on how trails will be used for maneuvers, to support the conclusion that the Army needs 23,000 more acres. The EIS should specify if the 23,000 acres is needed for maneuver training needs or mounted maneuver training needs.

N34-14

Fewer than 4500 out of 12,500 soldiers will be left at Schofield Barracks by early summer 2004--4500 soldiers in the Second Brigade go to Iraq in February 2004, and 3500 soldiers with the Third Brigade go to Afghanistan in April 2004. Both will stay for a year. But note that in 1965, some soldiers who went to Vietnam stayed five years. The draft EIS must evaluate the need for 23,000 more training acres with this decrease in numbers. ("Deployment for 25th likened to Vietnam," Honolulu Star-Bulletin, November 9, 2003)

N34-15

While the Army is proposing the largest Army construction project in Hawaii since WW II, the military is planning to close out about one-fourth of its base capacity on the continental US, including one-third of Army posts and one-quarter of Air Force bases. Closures also occurred

Responses

N34-11

As a result of the GAO report and ongoing Army operations, the Stryker vehicles are being modified to fit in C-130 aircraft. Additionally, deployment practices continue to evolve. The Transformation process allows for adaptations to equipment and operations to ultimately meet the goals of current, SBCT, and future forces.

N34-12

The equipment located at the installations noted will be used to capacity by the units stationed there. There would be not enough downtime for that equipment to allow for training an additional brigade.

N34-13

For more information on the Range Development Plan please contact US Army Hawai'i, Range Control Office. Section 2.3, under the paragraph heading Mounted Maneuver Training, discusses the need for the additional 23,000 acre WPAA parcel as necessary for mounted maneuver training.

N34-14

These deployments, while lengthy in some cases, are temporary and are part of Army activities at all bases. The Army is engaged in a wide range of missions around the world requiring all types of forces. There is no information to suggest that Stryker forces would be deployed more often or for longer durations than current forces.

N34-15

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not

cont'd

in 1988, 1991, 1993, and 1995. ("Quarter of US Military Bases May Be On the Chopping Block," Stars and Stripes European edition, October 15, 2003)

Why can't the Stryker Brigade be located at one of the existing bases that is slated for closure instead of expanding onto new land in Hawai'i?

MILITARY FAILURE TO CLEAN FORMER SITES

N34-16

- **Executive Summary p 60** "Impacts of introduction of contaminants to ranges from increased ammunition use" would be mitigated by "taking appropriate remediation prior to transferring property out of DoD control."

Increased ammunition should not be allowed because adequate remediation has not occurred with past sites. Kaho'olawe was returned to the State without adequate clean up. Over 50 former military sites on Hawaii Island still await cleanup 60 years after WW II. The Army Corps of Engineers says it will take "centuries" at present funding levels to clean them up.

We understand that nearly \$400 million was expended by the end of 2003 in cleaning up the island of Kahoolawe of unexploded ordnance. Reports are that only about 10% of the island will be clear of UXO. The existing Pohakuloa Training Area of 108,000 acres is approximately 3 times the size of Kahoolawe. The 123,000-acre Waikoloa Maneuver Area is about 4 times Kahoolawe. Add to that the former Pakini Iki bombing range near south point, the Mt. View range, the Makuu bombing range, the several south Kohala off shore bombing ranges to clean up. What is the estimated cost of cleaning up PTA of UXO? What is the estimated quantity and kinds of UXO at PTA?

N34-17

- **Chapter 4 p 77-78** "Recent range studies at...PTA have revealed elevated levels of munitions byproducts, such as lead and RDX, [cyclotrimethylenetrinitramine] above USEPA Region IX residential and industrial PRGs [preliminary remediation goal]...This material...is an environmental hazard...the quantity of ammunition rounds fired during Army training on all Army training ranges in Hawai'i would increase from 16 million to 20 million rounds per year, primarily consisting of small arms munitions. The proposed increased level of training could elevate contamination levels in range soils by 25 percent...Existing and potential impacts from ammunition are considered significant and not mitigable until live-fire range training ceases and a remediation plan is considered...in the event any active range is closed and transferred out of DoD control...remediation necessary to mitigate an imminent threat to human health and the environment would be undertaken at such time."

The draft EIS needs to include a closure cleanup plan so Pohakuloa is returned to the state in usable condition. This did not occur with Kaho'olawe.

N34-18

- **Chapter 8 p 28** People may be evacuated and roads may be closed to clean up unexploded ordnance so the tank trail can be built.
- Evacuation and road closures will impact residents severely. Cleaning up unexploded ordnance on the 50-plus former military sites hazardous to the people who live here must be done before cleaning up for new military land. Unexploded ordnance has been turning up all over the island for 60 years...Hilo Bay, Hapuna Beach, a Waimea school, South Point, Maku'u Farm Lots area, and other sites.*

Responses

analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

N34-16

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

Comments on Stryker Brigade expansion DEIS

Page 9

N34-19

- Chapter 8 p192 "...ammunition presents a significant risk of soil contamination in the range areas. Remedial cleanup would take place when the training areas are permanently closed."

This risk is unacceptable. Ammunition use must be changed to eliminate the risk. The EIS must specify how soon after closure cleanup will be completed, since the Army is saying it will take "centuries" to clean up the more than 50 former military sites on Hawaii Island.

The EIS must define "cleanup," since Kaho'olawe is being returned to the state "cleaned up" but with hazards still present.

N34-20

- Chapter 8 p194 tank trail "construction would be preceded by Army-sponsored surface and subsurface clearance and if necessary followed by ordnance health and safety monitoring during construction in order to reduce potential exposure and impacts from this project...Prior to initiation of any construction activities...USARHAW (US Army Hawaii) would employ qualified professionals to perform a UXO [unexploded ordnance] sweep of the proposed construction area, remove all UXO encountered to ensure the safety of the site, and document UXO surveys and removal actions..."

The Army should be clearing ordnance on the more than fifty former military sites that threaten residents on Hawaii Island, before clearing ordnance for a new military site.

HAZARDOUS MATERIALS

N34-21

- Chapter 2, p 16-17: "Per state regulation, military convoys are not authorized to operate on state highways during 'rush hour'...Movements on Saturday, Sunday, and holidays are by special request only. Convoys travelling from Kawaihae Harbor to PTA must get clearance, and vehicles operating on Saddle Road within the boundaries of PTA must not exceed 25 mph. Units must seek permission from the 25th Infantry Division for convoys of 25 vehicles or more. Permission must also be granted from the State of Hawai'i DOT for convoys of six or more vehicles or to move oversized or outsized cargo over state highways. As long as all federal, state, and Department of Defense...regulations are followed **no additional permits are required to move munitions.**" [bold added]

The EIS should include comments from Hawaii State Department of Transportation and Hawaii County Civil Defense, Police, and Public Works on this policy re munitions.

N34-22

- Chapter 2 p 3-4 "nonlive fire (blank ammunition)...Blank ammunition contains powder..."

The EIS must specify what is in the powder and evaluate hazards to soil, water, wildlife, cattle, and people using meat or milk from the cattle.

N34-23

- Chapter 3 p 8 "UXO hazards along the Saddle Road corridor...need to be cleared..."

UXO should be cleaned, or a commitment to full removal made, before new UXO is produced.

Responses

the land as a result of a BRAC, the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the FUDS program.

N34-18

Thank you for your comment and your participation in the public process. The Army acknowledges that there may be some impact from these activities but believe it would be less than significant because the likelihood of evacuations or road closures is low and their duration, if required, would be short. Section 8.2 has been changed to reflect this. As a mitigation measure for safety, prior to initiation of any construction activities, USARHAW will employ qualified professionals to perform UXO clearance of the proposed construction area, remove all UXO encountered to ensure the safety of the site, and document UXO surveys and removal actions in full accordance with applicable laws, regulations, and guidance. In addition, if the Army chooses to relinquish ownership of the land as a result of a BRAC, the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the FUDS program.

N34-19

Risk of soil contamination and risk to human health and the environment are two separate and very different types of risk. The EIS describes how we arrive at the conclusion that the soil contamination present on the ranges does not currently present a significant risk to human health or the environment. The Army is responsible for uncontrolled release of contaminants to the environment, and will be required to remediate the contaminants appropriately before turning over the land to civilian uses. However, in its current use, there is no significant risk from the contaminants present. The Transformation EIS does not address closure of installations. That would be addressed in a separate EIS prior to closure.

N34-20

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department

- Section 3.12: Human Health and Safety Hazards

N34-24

The military uses many substances that are confidential or proprietary. Some of these substances have not been adequately studied to determine their impacts on human health or the environment. Are any classified substances going to be used in the project areas that may have a significant impact on human health or the environment but are not yet classified as hazardous or toxic because of their secret nature? What substances have been detected at the project locations on O'ahu and the Big Island that have yet to be tested for their toxicity or long-term health impact?

N34-25

Information on perchlorate must be included: current and proposed level of use; indications of past contamination of water and/or food; present and future measures to prevent contamination. Perchlorate was found in supermarket milk in Texas at levels exceeding the federal safe dose for drinking water. Perchlorate is the explosive main ingredient of solid rocket and missile fuel. It disrupts thyroid hormone levels and can cause lowered IQ, loss of hearing and speech, and motor skill deficits.

- Chapter 3 p 80 and Appendix K

N34-26

There is no hazardous waste report for Pohakuloa—this should be included

N34-27

- Chapter 3 p 82 "...on a squad battle course, where there are no established firing points, units will have to return to where they fought the biggest battles and retrieve what they can. All ASPs [ammunition storage point] require that a certain percentage of weight...be returned. If the unit is short, they either go back...and find more residue...or the commander signs a statement...that it is not practical to try to retrieve any more residue."

The EIS must estimate how much residue is expected with the 25% increase in ammunition use, and evaluate the hazards to soil, water, and wildlife.

N34-28

- Chapter 3 p 85 "Lead is...used in manufacturing ordnance/ ammunition, such as that used for small arms training. Lead accumulates in backstops, range floors, and berms and can leach into groundwater, be carried off-site by stormwater, be ingested by wildlife, or become airborne. Erosion can overload streams and rivers with sediments...when looking at the risk of lead migration, both the total number and type of rounds fired must be taken into consideration."

The EIS must estimate how much lead is expected with the 25% increase in ammunition use, and evaluate the hazards, short and long-term, to soil, water, and wildlife.

N34-29

- Chapter 4 p 22 "...synthetic dust control chemicals might prove to be a more appropriate mitigation strategy...Initial dust control effectiveness is typically over 90 percent, but it declines over time. Control effectiveness values of over 50 percent generally can be expected for periods of 30 to 60 days under heavy use conditions...Army tests...indicated that calcium chloride solutions were more effective and longer lasting than various synthetic polymers or calcium lignosulfonate. Use of chemical dust suppressants would be a feasible method to control fugitive dust..."

Responses

of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of BRAC, the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the FUDS program.

N34-21

The Hawai'i State Department of Transportation, Hawai'i County Civil Defense, Policy and Public Works were all provided a copy of the Draft EIS and an opportunity to respond. For those state agencies that commented, their comment letters and the Army response are included in Appendix P of the Final EIS.

N34-22

These results and their potential affect on surface soil and water pollution are further discussed in Sections 4.8 (Water Resources) and 4.9 (Geology, Soils, and Seismology). The investigation report is included in Appendix M1. Gunpowder consists of about 75 percent potassium nitrate, and the rest is inert (for example, charcoal and sulfur). The gunpowder used in small arms ammunition is almost entirely burned upon firing, resulting in discharge of gases (nitrogen, carbon dioxide, sulfuric acid vapor). Potassium nitrate is also used in fertilizer. No impacts to soil, water, groundwater, or human or environmental receptors are expected to result from the minute quantities resulting from firing small arms ammunition.

N34-23

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the

The EIS must evaluate hazards from dust control chemicals to soil, water, wildlife, cattle, and people using meat or milk from the cattle.

N34-30

- Chapter 4 p 46-47 "The Proposed Action could result in significant chemical residue spills on the surface soils that could affect the surface water quality at...PTA. Accumulation of chemical residues in surface soils or occasional spills that may occur during routine training activities can also contribute to degradation of surface water quality...Recent soil sampling at...PTA provided information about concentrations of explosives, semi-volatile organic compounds, and metals in surface and near-surface soils...The results indicated sporadic occurrence of contaminant concentrations greater than EPA [Environmental Protection Agency] preliminary remediation goals (PRGs)...Concentrations of lead that exceeded residential or industrial soil PRGs in some samples may be due to disintegration of bullets...Concentrations of RDX, [from explosives] and other soluble contaminants, in the samples collected from PTA could affect surface and groundwater but are unlikely to result in significant impacts on these media due to the lack of permanent surface water and the great depth to groundwater."

What are the cumulative impacts of adding more ammunition if contaminant concentrations are already exceeding PRGs?

N34-31

- Chapter 4 p 49 "Surface water quality may be affected indirectly by increased erosion cause by wildland fires. This could create a significant impact on surface water quality at...PTA...Live-fire training activities on the ranges at...PTA increase the potential for fires...Fires can also generate toxic chemicals that have the potential to enter streams via runoff. Most of these chemicals are naturally occurring, although some may be generated by burning of plastics or other man-made materials."

The full impacts to surface water quality must be disclosed.

- Chapter 4 p 49 "Residues of explosives and other constituents of munitions would continue to be deposited on soils on training ranges at...PTA."

The EIS must estimate how much residue is expected with the 25% increase in ammunition use, and evaluate the hazards to soil, water, and wildlife.

N34-32

- Chapter 8 p 193: "the quantity of ammunition rounds...on all Army training ranges in Hawai'i would increase from 16 million to 20 million rounds per year, a 25 per cent increase..."

All ammunition must be clearly labeled, including depleted uranium. An exemption allows the military to ship DU with "explosive" but not "radioactive" labels. This exemption creates danger for residents, police, fire, and civil defense, and should not apply.

N34-33

A "nuclear, biological, and chemical vehicle" will be delivered in 2004 (US General Accounting Office Report to Congressional Committees on Military Transformation: Army Actions Needed to Enhance Formation of Future Interim Brigade Combat Teams, May 2002)

The impact of these vehicles must be addressed in the EIS.

Responses

identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a BRAC, the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the FUDS program.

N34-24

Chapter 4.12 of this document discusses the methods assessed in evaluating potential human health and safety hazards from the proposed action. As discussed in this section, the Army has determined that the general public or soldiers would not experience a significant level of exposure to hazardous or toxic substances as a result of this proposed action. The Army abides by and will continue to abide by all appropriate laws and regulations in the handling and use of hazardous or toxic substances regardless of the security classification of that substance.

N34-25

Perchlorate was included in the analytical suite for the soil sampling on the ranges at PTA and SBMR. It was not detected. There is no reason to think that perchlorate is present at environmentally significant concentrations from munitions use. The combustion of perchlorate results in formation of small quantities of hydrogen chloride in the atmosphere. Chloride is a major constituent of sea water (table salt is sodium chloride). The non-detection of perchlorate was expected. Sites at which perchlorate has been identified as an environmental concern are typically associated with larger scale use or production of rocket fuel or explosives, and was typically disposed with process wastewater. No analogous conditions occur now or are expected to occur under the project.

N34-26

Since all hazardous materials go through SBMR or Wheeler, there are no hazardous waste reports for PTA.

Comments

Comments on Stryker Brigade expansion DEIS

Page 12

N34-34

- Chapter 8 p184 "PTA operates its own TAP [transfer accumulation point] site, where it stores hazardous waste for a maximum of 90 days before a contractor picks it up and transports it to the DRMO, [Defense Reutilization and Marketing Office] where it is shipped off-island for permanent disposal at a certified hazardous-waste disposal site..."

Materials from the test pit at Waiakea Forest Reserve, where germ and nerve agents were tested, were taken to the PTA trash dump about October 1970, according to an Army memo. Were the materials transported out following this protocol?

N34-35

- Chapter 8 p184 "There have been no accidents involving the transport of ammunition in the last two years."
- Chapter 8 p185 "During the last 24 months, there were no accidents pertaining to the transporting, storage, or firing of ammunitions at PTA that risked public safety"

Have accidental involving transporting, storage, or firing of ammunitions at PTA occurred in the last 5 years?

N34-36

- Chapter 8 p186 "Results from recent range soil sampling revealed metals, explosives, and SVOC [semi volatile organic compound] levels above EPA [Environmental Protection Agency] Region IX residential and Industrial PRGs [preliminary remediation goal] on PTA ranges."

The EIS must discuss risks to soil, water, wildlife, and humans, and spell out measures that will be taken for cleanup and prevention of further contamination.

N34-37

- Chapter 8-193 to 8-194 "...under the Proposed Action, the quantity of ammunition rounds fired during Army training on all Army training ranges in Hawai'i would increase from 16 million to 20 million rounds per year, a 25 per cent increase primarily consisting of small arms munitions (97 percent of the total increase)..The proposed increased level of training could elevate contamination levels in range soils by 25 percent...in the event any active range is closed and transferred out of DoD [Department of Defense] control. All remediation necessary to mitigate an imminent threat to human health and the environment would be undertaken at such time."

Small arms ammunition contains lead. The EIS must spell out threats to soil, water, wildlife, and humans, and remedies. Remedies should be implemented while training is active, not when the base is closed.

N34-38

- Chapter 8 p 199 "The 105mm cannon on the Stryker mobile gun systems and the 120mm mortar are the only new weapons to be introduced at PTA under the Proposed Action. The amounts of other weapon systems would also be increased with the elevated level of training proposed in the transformation. Although the Proposed Action would generate a significant increase of ammunition use (an additional four million rounds) due to the elevated level of training and expansion in military force, the impact of this increase would not be significant as management of artillery and ammunition would not change...Excess ammunition not used during training [may be transported by]...commercial carrier to...WAAF [Wheeler Army Air Field]"

Responses

N34-27

These results and their potential affect on surface soil and water pollution are further discussed in Sections 4.8 (Water Resources) and 4.9 (Geology, Soils, and Seismology). The investigation report is included in Appendix M1. While the rate at which metallic lead from bullets would be deposited on the ranges would likely increase by 25 percent overall, the concentrations of lead that would be detected in soil samples taken at some future date would not increase by this amount. There are several reasons for this. The current concentrations of lead in soils are the result of years of past use of the ranges. The lead comes from the gradual weathering and disintegration of bullets in addition to other possible sources of lead in munitions, all of which is in addition to the natural background concentration of lead in the soils. Each year, more bullets accumulate on the ranges, adding slightly to the average concentration of lead present in the soils. Some of the lead is removed with soils through erosion. Some migrates deeper in the soil column. Also, much of the increased use of bullets will occur on small arms firing ranges where the bullets are deposited in small target areas. Therefore, the additional lead projectiles will not be widely dispersed on the ranges. Therefore, it is likely that the rate at which lead is deposited on ranges will decrease, while the concentration of lead in soils will continue to increase for a time, and then decrease when lead bullets are phased out. Since the lead is widely distributed, except in the small arms target ranges, the rate at which concentrations in soils increase in any particular location should be very low. It should also be noted, as mentioned in the EIS, that the Army is evaluating a gradual shift from use of lead-containing ammunition to use of "green ammunition" that does not contain lead.

N34-28

Under the No Action Alternative, lead projectile ammunition would continue to be used in training and lead metal would continue to accumulate on the ranges at about the rate it has in the past. No data are available to quantify the amount of lead metal per acre that is present on the ranges, or to accurately estimate the rate of accumulation of lead metal from firing of small arms. The rate of accumulation would differ widely from location to location, depending on intensity of use. Assuming 16 million rounds per year under the No Action Alternative, and that each round contains an average of approximately , Metallic lead represents a low environmental hazard. Military small arms projectiles have been made with a hardened alloy of lead and antimony, which is less soluble than pure lead. Lead metal weathers slowly in the environment

There will be much more excess ammunition, so there will be significant impact, especially if commercial carriers are transporting some of it. Impacts and mitigation need to be spelled out. All ammunition must be clearly labeled, including depleted uranium. An exemption allows the military to ship DU with "explosive" but not "radioactive" labels. This exemption creates danger for residents, police, fire, and civil defense, and should not apply.

WATER USE

N34-39

- The October 14th, 2003 *Hawaii Tribune Herald* states that 500,000 gallons of water a year will be needed for the vehicle wash.

The EIS must state where the water will come from in this dry area. If it will be trucked in, the EIS must address supply, noise, and traffic problems.

N34-40

- Chapter 8 p 210 "the water supply is now hauled by tanker trucks from the town of Waimea...Excess demand can be supplied by the City of Hilo..."

With additional troops more truckloads will be needed. The EIS should spell out where the additional water trucks will come from, and the impact on noise, air quality, traffic, and County and State expenses for road maintenance.

LAND USE

N34-41

- "The following are steps required for significant major acquisitions of training land at Army installations:
(1) Land Use Requirements Study
(2) Analysis of Alternatives Study
(3) Environmental Impact Study
(4) Real Estate Planning Report
(5) Decision on Land Acquisition
(6) Decision on Programming [sic] Priority
(7) Congressional Approval
(8) Acquisition by the Corps of Engineers"

Per an April 27, 1990 memo on Land Acquisition and Disposal in the United States to the Assistant Secretary of Defense from Susan Livingstone, Assistant Secretary of the Army. The Analysis of Alternatives should have been done before the EIS. All steps must be followed.

N34-42

- Executive Summary p 48 Construction of the new range control building at PTA could have significant impacts on cultural resources, depending on its location."

The EIS must specify the location of the range control building so the impacts can be evaluated.

N34-43

- Chapter 2 p 21 "Land ...is a priceless nonrenewable asset that must be responsibly managed to support the national defense mission....USARHAW adheres to five basic concepts...[one is] meeting...environmental concerns..."
- Chapter 3 p 10 (quoting form from County of Hawaii General Plan 1989): "long-range

Responses

forming soluble or relatively insoluble compounds depending on the chemical conditions in the soil. Not all of the lead in soils is from weathering of lead bullets. Some explosive munitions may contain small quantities of lead compounds used in propellants or initiators. Soils also contain natural background concentrations of lead from minerals in the parent rock. The rate of weathering of metallic lead is a function of surface area of the metal exposed to atmospheric conditions or soil moisture. Lead concentrations are expected to be highest in the soils in contact with, or in the immediate vicinity of a projectile undergoing weathering. Over time, the lead becomes more dispersed. Continued use of lead projectiles in small arms rounds under the No Action Alternative will lead to continued accumulation of lead metal on ranges, which in turn will result in more surface area of lead metal exposed to weathering. On average, the observed concentrations of lead in soils are quite low, and the weathering process is very slow. The Army is examining the use of "green ammunition" that does not contain lead, to replace ammunition that contains lead projectiles.

N34-29

The Air Quality and Water Resources sections (Sections 4.5, 4.8, 5.5, 5.8, 6.5, 6.8, 7.5, 7.8, 8.5, 8.8) have been expanded to discuss proposed dust palliative treatments and potential impacts or considerations for their use. If the Army decides to implement the Proposed Action, the Army proposes to use "environmentally friendly" dust control measures that would have less than significant impacts on water resources.

N34-30

Sections 4.9, 4.12, 8.9 and 8.12 discuss the impacts from potential contaminants in soils. The soil sampling showed that contaminants occurred over a range of concentrations, as would be expected. Some of the concentrations exceeded EPA PRGs. However, when taken together, the exposure risks were generally well below the EPA threshold criteria. The soil investigation of the ranges was designed to determine if there is an overall risk of exposure to the public or military personnel by changes in range designs in the Proposed Action. US EPA PRG levels were used as a reference criteria for this analysis. Based on comparison of the investigation results to US EPA PRGs, the human health and environmental risks from the cumulative results of past activities at the ranges appear not to be significant. Some contaminants degrade more slowly than others. Those that degrade more slowly will tend to accumulate more quickly in soils, while those that degrade quickly may

goals...Protect, preserve and enhance the quality of areas endowed with natural beauty, including the quality of coastal scenic resources; Protect scenic vistas and view planes from becoming obstructed; and Maximize opportunities for present and future generations to appreciate and enjoy natural and scenic beauty."

The EIS should explain how leaving the over 50 former military sites on Hawaii Island in hazardous condition and how dust, severe erosion, runoff into the ocean, and threats to native species and cultural sites on the 23,000 acres follows these principles.

- Preservation of Agricultural Lands

N34-44

The transformation of lands from agricultural to military training ranges is an alteration that, historically, is permanent in Hawai'i. The military has shown its unwillingness or inability to clean up after itself time and again in Hawai'i (Makua, Kaho'olawe, etc.), and thus the conversion of any agricultural land should be heavily weighed against the consequences. In this island ecosystem, lands suitable for agriculture are not many. Areas suitable for agriculture are limited by the steep terrain of the Ko'olau and Wai'anae Mountains, as well as the dry conditions on the leeward side of the island. In addition, urban and residential growth, along with the importance of preserving forested watersheds, further limits agricultural areas. Thus it is very important to preserve the few areas that are currently designated for agriculture.

N34-45

- Chapter 4 p 4 "Examples of projects conflicting with land uses include converting agricultural land to training land...and constructing FTI [fixed tactical internet] in a Conservation District."

The EIS should detail the full impacts from these incompatible uses.

N34-46

- Chapter 4 p 4 "...the Farmland Protection Policy Act of 1981...is intended to minimize the impact of Federal programs have [sic] on the unnecessary and irreversible conversion of farmland to nonagricultural uses..."

The EIS must spell out how the FPPA is being followed.

N34-47

- Chapter 4 p 5 "The Army...will submit a CZM [Coastal Zone Management] consistency determination to the State Office of Planning."

This should be completed and included in the draft EIS, then comments from the public should be taken again on the complete draft EIS.

N34-48

- Chapter 4 p 7 "The Army is considering establishing cooperative relationships...to allow...continued grazing activities at the WPAA, [West PTA Acquisition Area] in conjunction with training..."

The EIS must address the health risks of beef or milk cattle grazing on land contaminated by chemicals used for dust control and powder from blank ammunition. The EIS must spell out how continued grazing will add to the severe erosion which it states the Strykers will cause.

N34-49

- Chapter 4 p 18 because the "clear zone and accident potential zones that extend beyond each end of the runway...must be cleared, graded, and free of objects, there is

Responses

decrease, depending on use. The initial sampling of the ranges suggests that explosives degrade quickly relative to the rate of deposition. Lead and some other metals may accumulate over time. However, the rate of accumulation will be slow, and in the case of lead, for example, may be reversed in the future by the substitution of "green" ammunition for lead-alloy projectiles.

N34-31

The discussions in Sections 4.8, 4.9, 8.8 and 8.9 have been expanded in the Final EIS to better discuss the relationship of the impacts to surface water quality and soils erosion from the Proposed Action. The Army determined that the impacts to soil loss from training activities would be significant and the impacts to surface water quality and soil erosion from wildland fires would be significant but mitigable to less than significant. Mitigation measures discussed in these sections would reduce the severity of the impact.

N34-32

No depleted uranium has been used or is currently being used on the island. No depleted uranium is planned to be used in the future.

N34-33

These vehicles are hazardous response vehicles and do not carry nuclear, biological, or chemical materials in them. There impacts are the same as any other Stryker vehicle.

N34-34

EPA began regulating the treatment, storage and disposal of hazardous materials under RCRA in 1976. All hazardous materials today are transported and disposed of in accordance with applicable federal, state, and Army laws and regulations. We could not find any information regarding the disposal of materials from the test pit at Waiakea Forest Reserve in the early 1970s referred to in this comment.

N34-35

To the Army's knowledge, there have been no accidents to the public due to storage, transportation or use of ammunitions in recent history. The Army continues to manage the storage, transport and firing of ammunitions at all ranges, including PTA, in a manner that creates no safety hazards for the public.

Responses

N34-36

These results and their potential affect on surface soil and water pollution are further discussed in Sections 4.8 (Water Resources) and 4.9 (Geology, Soils, and Seismology). The investigation report is included in Appendix M1. The results of the investigation indicate that there are no significant impacts to human health or the environment from residual chemical contaminants on the ranges.

N34-37

The potential impacts from ammunitions are discussed in Section 8.12 and mitigation measures are proposed to address potential lead contamination. While the rate at which metallic lead from bullets would be deposited on the ranges would likely increase by 25 percent overall, the concentrations of lead that would be detected in soil samples taken at some future date would not increase by this amount. There are several reasons for this. The current concentrations of lead in soils are the result of years of past use of the ranges. The lead comes from the gradual weathering and disintegration of bullets in addition to other possible sources of lead in munitions, all of which is in addition to the natural background concentration of lead in the soils. Each year, more bullets accumulate on the ranges, adding slightly to the average concentration of lead present in the soils. Some of the lead is removed with soils through erosion. Some migrates deeper in the soil column. Also, much of the increased use of bullets will occur on small arms firing ranges where the bullets are deposited in small target areas. Therefore, the additional lead projectiles will not be widely dispersed on the ranges. Therefore, it is likely that the rate at which lead is deposited on ranges will decrease, while the concentration of lead in soils will continue to increase for a time, and then decrease when lead bullets are phased out. Since the lead is widely distributed, except in the small arms target ranges, the rate at which concentrations in soils increase in any particular location should be very low. It should also be noted, as mentioned in the EIS, that the Army is evaluating a gradual shift from use of lead-containing ammunition to use of "green ammunition" that does not contain lead.

N34-38

The Army has expanded the discussion of cumulative impact of ammunitions and UXO to human health and safety in Chapter 9. The Army has determined that in light of past, present and reasonably foreseeable future actions, the proposed action would have a significant cumulative impact on human health and safety hazards from an increase in ammunitions and UXO. All

 - **Appendix N pp 1-2** "The Farmland Protection Policy Act...is intended to minimize the extent to which Federal activities contribute to the conversion of farmland to nonagricultural uses. It also stipulates that federal programs be compatible with state, local, and private efforts to protect farmland—for example, Hawai'i's land use law (Act 187) which designates agricultural district lands. Federal agencies are required to examine the impact of any activity that would convert farmland...Because...portions of the West PTA Acquisition Area and PTA Trail easement...may be subject to the requirements of the FPPA, the Army has requested a farmland determination from the NRCS, which evaluates the impacts of converting farmland areas to nonagricultural use."

Responses

commercial carriers are required to follow strict protocol in the transportation of ammunition to ensure safety. The Army assumes that these carriers are following all requirements for their permits. No depleted uranium has been used or is currently being used on the island. No depleted uranium is planned to be used in the future.

N34-39

As discussed in Section 8.14, current water demands at PTA (ranging between 3.6 million and 50 million gallons of water per year) are met by trucking in water in 5,000-gallon tankers from Waimea. The increased demand would fall within the range of water demand experienced currently and is not expected to adversely affect supply. Traffic increases would total fewer than two extra truckloads per week.

N34-40

As discussed in Section 8.14, current water demands at PTA (ranging between 3.6 million and 50 million gallons of water per year) are met by trucking in water in 5,000-gallon tankers from Waimea. The increased demand would fall within the range of water demand experienced currently and is not expected to adversely affect supply. Traffic increases would total fewer than two extra truckloads per week.

N34-41

Thank you for your comment and your participation in the public process. Your comment has been considered and has been included in the administrative record for this process. The Army is following all appropriate laws and regulations in the consideration of the Proposed Action. An analysis of alternatives study has been completed for each of the proposed land acquisition actions and is available upon request. If the Army decides to implement the proposed action, Steps 4 through 8 would begin after a Record of Decision has been issued.

N34-42

Figure ES-4 is provided as an overview of project locations in the Executive Summary. Table 2-4 lists all of the projects and directs the reader to Appendix D for details as does Section 2.3.2. Appendix D provides detailed maps and descriptions of all projects including the proposed range maintenance facility and range control building.

Comments

Sierra Club Comments on Stryker Brigade expansion DEIS Page 17

N34-62
cont'd

Since this determination was not included in the draft EIS, the public was deprived of its right to comment. This determination must be included.

Beneficial mitigation

N34-63

The Sierra Club requests that the Army mitigates any expanded training by assisting non-profit conservation organizations in the purchase of buffer areas near training areas. ACUB's (Army Compatible Use Buffers) provide an actual net benefit to the local effected communities. O'ahu training areas have already been listed by the Army's Deputy Director of Training as a top national priority for buffering. Before any Stryker activity begins, the Army should request funding for and partner with local conservation non-profits to buffer impacted training areas.

PUBLIC ACCESS

- Public Hunting Access

N34-64

Oahu's forests have been degraded and stressed by feral goats and pigs. It is important to maintain native forest ecosystems to preserve biodiversity and watershed integrity. We believe it is not an option to allow pig and goat populations to grow, especially in native or sensitive ecosystems. Pigs and goats eat native vegetation, dig up areas enough to cause erosion problems and landslides, degrade stream water quality, and facilitate the ingress and spread of non-native weedy species such as grasses, blackberry, and strawberry guava. These weed threats, in addition to direct predation, threaten and harm native and endangered plant and animal species. How will the Army address feral pig and goat control in areas that are not currently open to hunting?

N34-65

- Chapter 4 p 70-71 "Potential impacts related to construction...could include destroying or damaging ATIs, [Areas of Traditional Importance] including shrines, archaeological sites, burials, or elements of Native Hawaiian cultural landscapes. Purchasing...the WPAA...and then using [it]...for military training, could limit Native Hawaiian access to and use of sites...for traditional or religious purposes. Mitigation **may** reduce the impact to less than significant. Construction of FTI [Fixed Tactical Internet] antennas...at PTA may result in visual impacts on cultural landscapes...Facility construction or training area uses would be designed to avoid ATIs and limit visual impacts on traditional cultural landscapes...**where feasible**. Mitigation for impacts on the cultural landscape **could** include consulting with the Native Hawaiian community to determine the extent of such impacts and **possible** means of avoiding or limiting them." [bold added]

The terms "where feasible," "could," and "possible" are insufficient. The EIS is not complete without impacts spelled out.

N34-66

- Section 5.2: Honouliuli Management Access
- While the SRAA and QTR2 military range use cannot exceed 242 days per year, it is possible that all of those days will be utilized, leaving only 123 days per year for TNC management access. This averages out to be approximately 2 days per week. This will cause tremendous scheduling restrictions for management activities, which often involve volunteer groups and includes time-sensitive predator control around endangered plant and animal populations.*

Responses

N34-43

The purpose of these concepts are to minimize impacts to the valuable resources of lands the Army is responsible for. They do not guarantee there will be no impacts. The impacts associated with the proposed Transformation are described in the EIS.

N34-44

During the EIS review process, the Army has coordinated with Natural Resource Conservation Service and is compiling with all requirements of the Farmland Policy and Protection Act (FPPA). If the Army decided to implement the proposed action, the management and use of the West PTA acquisition area would be conducted per federal regulations and guidelines. State regulations and guidelines do not apply to federal actions. However, the Army has considered State policies in its overall assessment of impacts in the EIS. In following FPPA requirements, CEQ guidance and Army policy, the Army has determined that the proposed conversion of West PTA acquisition area is consistent with these regulations and guidance and the impact would be less than significant. The farmland conversion rating forms are included in Appendix E of the Final EIS. In addition, the cumulative impacts of Proposed Action in light of past, present and reasonably foreseeable actions by the Army or other parties are discussed in Chapter 9. Based on cumulative impacts, there is a significant impact on human health and safety from an increase in ammunitions and UXO, and increased impacts on biological resources.

N34-45

Discussions of these impacts can be found in more detail in sections 5.2, 6.2, 7.2, and 8.2.

N34-46

The farmland conversion rating forms are included in Appendix E of the Final EIS.

N34-47

The CZM Consistency Determination and State of Hawai'i letter of concurrence is included in the Final EIS in Appendix E.

N34-48

Conversion of the WPAA to military use is described as a less than significant

Comments

Page 18

N34-66 cont'd How will the Army ensure that TNC will have adequate management access? Please provide maps that delineate the TNC management area of Honouliuli Preserve within section 5.2.

N34-67

- Chapter 8 p176-177 "Conducting military training at the WPAA [West PTA Acquisition Area] would limit access to the property. There are cultural resources of Native Hawaiian origin on the property, and it is possible that some of these resources constitute ATIs [areas of traditional importance.] Converting the use of the parcel to military training may also damage or destroy any unrecorded sites...Facility construction or training area uses would be designed to avoid identified ATIs and to limit visual impacts on traditional cultural landscapes...where feasible. Mitigation could include consulting with the Native Hawaiian community...mitigation would be developed...in accordance with the provisions of the PA." [bold added]

"Where feasible" should be deleted. "could" should be "would". It is not clear what the provisions of the PA are, since the PA "may have been revised." The EIS is incomplete without a final PA. The final, not draft, version of the PA must be clearly indicated and included in the EIS.

FIRE

N34-68

- Chapter 3 p90 "The WFMP [Wildland Fire Management Plan] for Pohakuloa...acknowledges that most fire history files are incomplete...after five years, following the disposition of records, they were destroyed, in accordance with the Modern Army Recordkeeping system..."

The EIS must include a plan for more complete fire records in the future.

N34-69

- Chapter 3 p91 "According to the WFMP, in the recent past, the entire Hawaiian ecosystem has experienced an increase in wildfire frequency...Causes for the increase in fire frequency include the spread and intensification of alien grasses. On Army land, technological advances in ammunition and supporting pyrotechnic devices used for training have contributed to the fire frequency increase...In 1992, the Army began to reduce the frequency of fires on Army land with the application of a fire prevention and prescribed burn program...[on Oahu] Military live-fire activities start many of the fires within ordnance impact areas..."

The EIS should detail the amount of increase in wildfires from alien grasses, pyrotechnics, and live fire, as well as the impacts of additional fires on ecosystems, air quality, nearby communities, and endangered species recovery programs.

N34-70

- Chapter 2 p 39 "Nonlive-fire exercises use blank ammunition, laser weapons, and simulated artillery and mortar fire with pyrotechnics."
- Chapter 4 p 25 "Tracers, flares, and pyrotechnics have the potential for starting wildfires on training range areas. The use of such munitions would increase somewhat under the Proposed Action, with a corresponding increase in the potential for wildfires."
- Chapter 8 p190 "Tracer ammunition, which easily starts fires and is one of the most commonly used ammunitions, has started the largest number of fires at PTA."
- Chapter 8 p193-194 "...under the Proposed Action, the quantity of ammunition rounds fired during Army training on all Army training ranges in Hawai'i would increase from

Responses

impact in Section 8.2.2. However, it is possible that cattle grazing would continue on the WPAA. If the Army decided to implement the proposed action, the Army would weigh the potential of continued cattle grazing on the proposed West PTA acquisition area based on the potential benefits to fire reduction, potential interference with ongoing Army training, and requests of local cattle ranchers. If the Army decided that cattle grazing were appropriate, cattle would be managed so as to avoid any overgrazing and any resulting significant soil erosion. In accordance with Army Regulations 350-4, the mandate of the ITAM program is to manage land for Army training and repair damage incurred by Army training. As part of this mandate, this would also include any related actions such as managing land for grazing or repairing damage caused by the cattle. Continued use of the WPAA for agricultural purposes, consistent with Army use, would result in a less than significant impact on the community. However, as discussed in Chapter 9, the Army acknowledges that the cumulative impact on the conversion of agricultural lands from past, present and reasonable foreseeable future actions would be significant. Any dust palliative used would be "environmentally friendly".

N34-49

Thank you for your comment and your participation in the public process. Your comment has been considered and has been included in the administrative record for this process. These impacts are addressed in Sections 8.2 – Land Use, 8.6 – Noise, 8.10 – Biological Resources, and 8.11 – Cultural Resources.

N34-50

As summarized in Section 4.8, the Army has determined that the impacts to water resources on a project wide basis is significant but mitigable to less than significant. This project wide analysis includes potential impacts to watersheds. The Army minimizes impacts to watersheds through institutional programs such as ITAM as well as abiding by all applicable laws and regulations. As summarized in Section 4.10, the Army has determined that some impacts to sensitive species will be significant. The Army proposed mitigation measures to substantially reduce the severity of the impacts. These mitigation measures are listed in detail in the Biological Opinions issued by USFWS for the current force and Proposed Action on the islands of O'ahu and Hawai'i. These BOs are available upon request.

Comments on Stryker Brigade expansion DEIS

Page 19

N34-70
cont'd

- 16 million to 20 million rounds per year, a 25 per cent increase
- Chapter 8 p199 there will be "...a significant increase of ammunition use (an additional four million rounds)... [at PTA but] ...the impact of this increase would not be significant, as management of artillery and ammunition would not change..."
 - Appendix O p1-1 "In the past, military activities on Army lands have burned areas of native vegetation and threatened the habitat of endangered species of plants and animals."

Despite the increase in fire risk detailed in the sections above, it seems little will be done to address fire. What, specifically, will be done to reduce or eliminate the risk of devastating fires? How will the Army ensure that endangered species or their habitats are not destroyed by fire? Is some endangered species loss unavoidable?

N34-71

- Chapter 4 p 83 "...no FMAs [fire management areas] and wildland fire SOPs [standard operating procedures] have been completed for installations where Transformation would occur."

The EIS must spell out the increase in fire risk and proposed mitigation, including FMAs, SOPs, and fire avoidance efforts. The EIS is incomplete without the FMAs and SOPs.

N34-72

- Section 5.5.2, page 5-54: it is stated that the use of tracers and pyrotechnics would result in the "small increase in the potential for wildfires."

Within the last year, O'ahu alone has seen over 10 wildfires caused by training. Most were limited to training ranges, but a few did burn outside of the established firebreak in the endangered forest bird (the O'ahu Elepaio) habitat (SB West Range). We disagree that the potential for wildfires will increase only a small amount, and would like to see the wording changed to reflect the large increase in potential for wildfires.

N34-73

- Section 5.12.2, Hazards: it is stated that weather conditions will be monitored to determine the probability of wildfire caused by training maneuvers.

Will there be set conditions that are known to be high wildfire probability? Will training be put on hold until weather conditions are more favorable for safe training? How will the weather conditions influence the decision of administering a prescribed burn in the future? What changes to the Wildfire Management Plan will be made to insure that another incident, such as the July Makua tragedy, does not occur?

Since the threat of wildfire is one of the most probable threats to endangered species and the native ecosystems upon which they depend, how can this EIS adequately address wildfire mitigation if the WFMP is not included within this document? Please include all appropriate wildfire management plans for each area within the EIS.

N34-74

- Appendix O p1-2 "Prescribed fire will be considered as a viable tool to manage fuels and will be utilized under environmentally appropriate conditions."

Recently a prescribed fire burned out of control in Makua Valley. The EIS must spell out what will be done to prevent a repeat of such a fire at PTA.

N34-75

- Appendix O p1-4 "The Hawaiian ecosystem is not resistant to, nor dependent on

Responses

N34-51

As summarized in Section 4.8, the proposed action would not result in significant impacts from stream crossings. The Army has also received a FWA (2) (b) Planning Letter for those activities that would result in the crossing of a stream (See Appendix E). The Army will implement mitigation measures summarized in Section 4.8 and will abide by applicable laws and regulations to minimize impacts from stream crossings.

N34-52

These are internal training roads and their optimal placement and location will not be known until training activities commence. Once the location of the roads are determined, additional NEPA documentation will be completed as needed.

N34-53

As discussed in Section 8.2 and shown on the Farmland Conversion Rating Form from NRCS in Appendix E, there are no designated prime or unique agricultural lands at WPAA. Of the 23,000 acres, approximately 16,266 acres are zoned as important by State or local plans. This represents a total conversion of 0.029 percent of agricultural lands in the county of Hawai'i. The Army has determined that this conversion of agricultural land on a project wide basis is a less than significant impact. As discussed in Chapter 9 - Cumulative Impacts, in light of past, present and reasonably foreseeable future actions, there is a significant impact to land use from the conversion of agricultural lands.

N34-54

Factors considered in determining impact significance are discussed in Section 4.2.

N34-55

Details regarding antenna location, height, and other characteristics are found in Appendix D. As discussed in Sections 4.3, 5.3, 6.3, 7.3, and 8.3, the Army has committed to implementing mitigation for visual impacts by screening construction, mimicking surrounding areas, and other means.

N34-56

Section 8.2 has been updated to address the comment.

Comments

Sierra Club Comments on Stryker Brigade expansion DEIS Page 20

N34-75
cont'd

fire...Wildfire is the single largest impact made by military activities in the Hawaiian ecosystem. The use of Army lands must include fire avoidance efforts."

The EIS must spell out the increase in fire risk and proposed mitigation, including FMAs, SOPs, and fire avoidance efforts.

WATER QUALITY

N34-76

- Section 5.8.2, page 5-110: "No systematic sampling investigations of the major streams or tributaries that drain the watersheds of SBMR have been performed to determine whether or not explosives residues or other chemical pollutants from military training have affected surface water quality."

How can the impact of explosive residues or other chemical pollutants on surface water quality be determined if monitoring is currently not in place? Is it known if the current levels of contaminants are acceptable?

N34-77

- Page 5-111: states it is unlikely that soil contaminants concentrations observed at SBMR ranges would affect water quality due to the nature of contaminants to bind to soil particles.

Don't certain organisms feed directly upon soil sediments in streambeds, particularly plant species and algae, of which are fed upon by other organisms up the food chain? Wouldn't water quality thus be indirectly negatively affected for those organisms living in it?

N34-78

- Section 8.1 (pg.8.2): Construction of Tactical Wash Facility to support a 60' long x 12' wide vehicle, Waste water "would be treated".

How would this waste water be treated?

N34-79

- Chapter 8 p211 "Due to a revision in USEPA regulations, cesspools serving more than 20 people per day must be closed by April 5, 2005"

The EIS should spell out a plan for replacing the cesspools.

N34-80

- Oil and fuel runoff

Oil and fuel from vehicles can pollute stream water if heavy rains wash road residue directly into streams, so what will be done to minimize the impacts to water quality? Will some sort of filtration system be used to treat runoff that is drained into streams? In Hawai'i, best management practices (BMPs) to reduce or mitigate runoff from soil disturbing activities have historically failed at protecting water resources. How will the Army ensure that muddy runoff and pollutants do not degrade surface and ocean water quality?

BIOLOGICAL RESOURCES

N34-81

- Executive Summary p41 "Project-wide impacts from impacts from fire on sensitive species and habitat, and federally listed species and designated or proposed

Responses

N34-57

Factors considered in determining significant impacts on land use are set forth in Section 4.2.

N34-58

Visual impacts from construction of FTI antennas are discussed in sections 4.3, 5.3, 6.3, 7.3, and 8.3. The Army has committed to implementing mitigation for visual impacts by screening construction, mimicking surrounding areas, and other means.

N34-59

As summarized in Section 4.2, the Army has determined that this conversion of agricultural land on a project wide basis is a less than significant impact. As discussed in Chapter 9 - Cumulative Impacts, in light of past, present and reasonably foreseeable future actions, there is a significant impact to land use from the conversion of agricultural lands.

N34-60

Visual impacts from construction of FTI antennas are discussed in sections 4.3, 5.3, 6.3, 7.3, and 8.3. The Army has committed to implementing mitigation for visual impacts by screening construction, mimicking surrounding areas, and other means.

N34-61

No proposed activities will occur until the Army has abided by all appropriate laws and regulations and received all applicable permit approvals. If a permitting authority proposes to deny a permit, the Army will work with the permitting authority to redesign the project and/or implement permit conditions as appropriate in order to obtain permit approval.

N34-62

The farmland conversion rating forms are included in Appendix E of the Final EIS.

N34-63

The Army is considering ACUBs as mitigation for other proposed actions and has met with the commenter. For this action ACUBs were also considered but more feasible mitigation measures were proposed. The mitigation measures proposed are listed in the Executive Summary.

Comments

Sierra Club Comments on Stryker Brigade expansion DEIS Page 21

- N34-81 cont'd** **critical habitat** would result in overall significant impacts not mitigable to the less than significant level...**Impacts on sensitive species from the spread of nonnative species, and impacts from loss and degradation of sensitive species and habitat** would be significant and mitigable to the less than significant level on both the installation specific and project-wide level."
- What will the significant impacts to listed and sensitive species be, exactly? Would the likelihood of survival for some species be diminished?*
- N34-82**
 - Executive Summary p 58 To mitigate impact on natural resources from introduction of alien species, a vehicle wash is proposed at Kawaihae Harbor, if utility requirements and space permit.*Keeping alien species out is extremely important to Hawaii's ecosystems. If a vehicle wash is not constructed, the probability and the impacts of new species introductions must be fully disclosed.*
- N34-83**
 - Executive Summary p 51 The State or County is responsible for building a visitor center at PTA to mitigate impact on cultural and natural resources.*A visitor center is not acceptable mitigation for destruction of cultural and natural resources. The EIS must spell out a plan to avoid destruction of cultural and natural resources.*
- N34-84**
 - Page 5-163: no off-road maneuver training or dismounted training will occur on or near federally designated or proposed critical habitat.*The USFWS recently excluded the USAGHAW from designation of plant critical habitat, thereby raising the concern that those federally listed species would not be adequately protected. How will the Army protect endangered plant habitat even though it may not be federally designated critical habitat? Will the Army be conducting off-road or dismounted training maneuvers within or around endangered species?*
- N34-85**
 - Page 5-164: the ecosystem management plan would help to lessen the impact to listed species and their federally designated habitat.*Previously it was stated that the USAGHAW was "considering" implementing such a plan. Will the Army certainly construct and administer such an ecosystem management plan? Where will the funding come from? Will the funds be available before the implementation of the transformation? What protection will be awarded for federally listed species with no critical habitat designation on Army lands? Please include the results of the Section 7 consultation with the USFWS in reference to impacts of transformation actions and training maneuvers on federally listed species and their habitat.*
- N34-86**
 - Page 5-164: the current lack of public hunting access, pig and goat populations are not expected to increase.*Please provide evidence of this reasoning. Without population control measures, it is highly probable that feral ungulate numbers will continue to increase. Please provide data on current and past feral ungulate population trends. What will the Army do to mitigate feral ungulate impacts to endangered species and their habitat?*

Responses

N34-64

As discussed in Section 5.10, 6.10 and 7.10, there is no anticipated impact to biological resources from increased ungulate activity associated with the Proposed Action. However, as discussed in Section 8.10, the Biological Opinion issued by USFWS for ESA Section 7 consultation on the Proposed Action at PTA requires that a large portion of existing Army land that supports prime habitat for endangered species be protected from impacts associated from feral ungulates. The BO is available upon request. The Army will continue to work with the community through current programs to allow hunting access where there is no threat to human health and safety or interference with Army training activities.

N34-65

Mitigation measures are now more specific. The ROD will specify which mitigation measures will ultimately be implemented. Text in the FEIS cultural resource sections has been revised to address public comments.

N34-66

In response to comments received early in the EIS process, USARHAW reoriented QTR2 such that the SDZ would no longer impact any lands with the Honouliuli Preserve. Army will grant TNC personnel and TNC-sponsored personnel daily, controlled access to the TNC-managed lands along a route to be determined by the Army in consultation with TNC for as long as they have legal right to use of the affected property for conservation/stewardship purposes. Access controls will be developed and implemented to ensure the safety of all personnel and will consist of notification by TNC to the Army prior to entering Army lands and notification by the Army to TNC of any unusual activities that may present, or appear to present a danger to TNC personnel in the area. The boundary will be signed to prevent unauthorized use/trespass. Sections 5.11.2 and 8.11.2 discuss access for cultural practitioners.

N34-67

Mitigation measures are now more specific. The ROD will specify which mitigation measures will ultimately be implemented. Text in the FEIS cultural resource sections has been revised to address public comments.

Page 22

- Chapter 8 p 149 "No significant impacts from potential runoff are expected for marine wildlife resources or coral ecosystems."

N34-87

Currently, from Spencer beach to Kawaihae Harbor extending to one-half mile offshore, coral is known to be covered with silt and dying due to road, residential, and business construction-related storm runoff along Kawaihae Rd and the Waimea area. Any new soil-disturbing activities should take this into account and disclose the cumulative impacts of aggravating the erosion situation.

CULTURAL AND HISTORICAL RESOURCES

N34-88

- Executive Summary p 59 mitigation for construction impact on "Native Hawaiian traditional cultural properties and traditionally important places...is not likely to reduce the impact on the Native Hawaiian community to less than significant, if such resources are severely damaged or destroyed..."

Has a cultural impact statement been completed for the Stryker Brigade expansion? Have any interviews of native Hawaiians or native Hawaiian practitioners been completed for this DEIS?

N34-89

- Chapter 3 p 76 "USARHAW has developed Cultural Resource Management Plans (CRMP) for the cantonment areas of SBMR, Fort Shafter, Kilauea Military Camp, and WAAF...USARHAW is preparing an ICRMP [Integrated CRMP] for management of the Army's one installation with 28 subinstallations in Hawai'i."

The EIS should state whether a CRMP or ICRMP is required for PTA and WPAA. If so, the EIS is not complete without them. They should be included in a new draft EIS which is then put out again for public comment.

N34-90

- Chapter 3 p 77 "consultation on the PA [Programmatic Agreement re historic properties] is ongoing...If the PA is not executed, the Army will follow the procedures at 36CFR 800..."

The EIS is not complete without the final PA or the 36 CFR 800 procedures. They should be included in a new draft EIS which is then put out again for public comment.

N34-91

- Chapter 4 p 72 "The Army would conduct surveys to identify and evaluate archaeological sites...Construction of...PTA Trail would result in a potentially significant impact on archaeological resources...Some trail or road construction is projected to go through areas with a high potential for archaeological resources and areas that have not been surveyed for cultural resources."

The EIS is not complete without these surveys. The archaeological and cultural resources should be surveyed, identified, and included in a new draft EIS so the public can comment.

N34-92

- Chapter 4 p 73 "Construction of the Range Maintenance Facility at PTA would require demolishing Cold War-era buildings, and the BAAF runway scheduled for upgrade may be a Cold War-era historic property as well. The Ke'amuku Village Complex within the WPAA may be eligible for listing on the NRHP. [National Register of Historic

Responses

N34-68

The Integrated Wildland Fire Management Plan for O'ahu and Pōhakuoloa Training Areas was updated on October 2003 and incorporated lessons learned from the Makua fire and other historical wildland fires. As discussed in the Final EIS Executive Summary proposed mitigation, the Army will fully implement this plan for all existing and new training areas to reduce the impacts associated with wildland fires. The plan is available upon request.

N34-69

The discussions in Sections 4.10, 4.12, 8.10 and 8.12 have been expanded in the Final EIS to better discuss the potential impacts of wildland fires. The impact to biological resources from wildland fires has been changed to significant. The mitigation measures proposed, including the updated IWFMP, will substantially reduce the severity of the impact on biological resources but not to less than significant levels. The updated IWFMP is available upon request.

N34-70

The discussions in Sections 4.10, 4.12, 8.10 and 8.12 have been expanded in the Final EIS to better discuss the potential impacts of wildland fires. The impact to biological resources from wildland fires has been changed to significant. The mitigation measures proposed, including the updated IWFMP, will substantially reduce the severity of the impact on biological resources but not to less than significant levels.

N34-71

Since the publication of the Draft EIS, the Army has updated the Integrated Wildland Fire Management Plan (October 2003). As discussed in Executive Summary proposed mitigation, the Army proposes to implement the IWFMP to reduce the risk of wildland fires. The IWFMP is available upon request.

N34-72

In the Final EIS, the Army has expanded the discussions on the potential risks of wildland fires from the Proposed Action. As discussed in Section 4.10, the Army has determined that the risk to impacts to biological resources from wildland fires is significant. For other resources such as Air Quality (Section 5.5), the impacts from wildland fires is proposed as significant but mitigable to less than significant with the implementation of the updated IWFMP and other measures. The discussions in Sections 4.10, 4.12, 8.10 and 8.12 have

Places] This site may be put at risk from military use, particularly as a result of training exercises...If Ke'amuku Village could not be avoided or protected from damage, the Army would document the buildings in accordance with HABS/HAER [Historic American Building Survey/ Historic American Engineering Record] and the NHPA. [National Historic Preservation Act]

Ke'amuku Village must be avoided or protected. The EIS is incomplete without the NRHP determination.

N34-93

- Chapter 8 p177 "One FTI antenna will be placed on Mauna Loa...Mauna Loa has been identified as a particularly sacred element of the Native Hawaiian cultural landscape."

The impact of this antenna on the native Hawaiian practices should be discussed. This is equivalent to putting an antenna on a church.

N34-94

- Chapter 8 p178-179 "Facility and range construction...activities...would result in direct damage to or destruction of unidentified archaeological resources..." Proposed mitigation is a "visitor center" with "interpretive displays" and "a small theater for interpretive video or live presentations."
- Chapter 8 p179 "...seven cultural resources identified in the trail corridor, sites near the corridor, and in or near construction staging areas...Many archaeological sites have been identified near the northern end of the trail alignment." Proposed mitigation, again, is a "visitor center" with "interpretive displays" and "a small theater for interpretive video or live presentations."

The EIS is incomplete without identification of archaeological resources. If significant, the resources should be left in place. How do displays and videos compensate for lost resources?

N34-95

- Chapter 8 p 182 "Cables and conduits "could have an adverse affect on the historic integrity of Cold War era buildings or archaeological sites at PTA. The Army is conducting an evaluation of historic structures..."

The EIS is incomplete without this evaluation.

N34-96

- Chapter 8 p 182 "adverse effects would be mitigated by compliance with the...Standards for Treatment of Historic Properties.

Compliance actions specific to PTA must be spelled out.

N34-97

- Chapter 8 p 182 "Impacts on buildings and archaeological sites can be mitigated by compliance with the provisions of the PA."

It is not clear what the provisions of the PA are, since the PA "may have been revised." The EIS is incomplete without a final PA. The final PA should be included in a new draft EIS.

N34-98

- Chapter 8 p182 For the eleven FTI antennas, "construction...would be ground disturbing and could result in adverse impacts on archaeological resources. The Army has conducted a survey of the sites to ensure no impacts on cultural resources."

Detailed survey results should be included the EIS.

Responses

been expanded in the Final EIS to better discuss the potential impacts of wildland fires. The impact to biological resources from wildland fires has been changed to significant. The mitigation measures proposed, including the updated IWFMP, will substantially reduce the severity of the impact on biological resources but not to less than significant levels. The updated IWFMP is available upon request.

N34-73

The discussions in Sections 4.8, 4.9, 4.10, 8.8, 8.9, and 8.10 have been expanded in the Final EIS to better discuss the potential impacts of wildland fires. The impact to biological resources from wildland fires has been changed to significant. The mitigation measures proposed, including the updated IWFMP, will substantially reduce the severity of the impact on biological resources but not to less than significant levels.

N34-74

The Integrated Wildland Fire Management Plan for O'ahu and Pōhakuloa Training Areas was updated on October 2003 and incorporated lessons learned from the Makua fire. As discussed in the Final EIS Executive Summary proposed mitigation, the Army will fully implement this plan for all existing and new training areas to reduce the impacts associated with wildland fires. The plan is available upon request.

N34-75

Appendix O has been updated with the overview of the October 2003 Integrated Wildland Fire Management Plan (IWFMP). The risks were considered in the development of the IWFMP when developing the specifics of the plan. The IWFMP for O'ahu and Pōhakuloa Training Areas was updated on October 2003 incorporating lessons learned as a result of the Makua fire. As discussed in the Executive Summary as proposed mitigation, the Army will fully implement this plan for all existing and new training areas to reduce the impacts associated with wildland fires. The plan is available upon request.

N34-76

The conclusion is based on the data available from soil sampling. The analysis shows that although it is unlikely that the contaminants are migrating off site there is a potential for migration in eroded soils. However, implementation of the mitigation measures identified in Section 5.8.2 will reduce this potential to less than significant. Therefore, the EIS does not conclude that there would

- Chapter 2 p 14 "Combat effects, such as smoke and obscurants, noise, and simulated artillery, nuclear, biological, and chemical conditions, are integrated into training..."
- The EIS should spell out how this will effect (and mitigation for) Waik'i Ranch, Kilohana Girl Scout Camp, Waikoloa, and Waimea.*
- N34-103**
- Chapter 2 p 17 "During some training exercises, aircraft may fly at treetop level or lower...This type of training requires up to 20 helicopters flying in tactical formations...Aircraft pick up soldiers in pickup zones and carry them to landing zones."
- If this will occur at PTA the EIS should spell out the noise levels.*
- N34-104**
- Chapter 4 p 31-32 "Noise levels from weapons firing and ordnance detonations...would cause noise levels to exceed the Army's acceptable noise level criteria...in...PTA... At PTA, the use of blanks and other training munitions on the WPAA would produce unweighted peak dB levels in the Zone II range at the Waik'i Ranch and Kilohana Girl Scout Camp near the installation boundary. Ordnance firing and detonations at PTA might also lead to Zone II noise conditions at the Mauna Kea State Park rental cabins. These noise exposure conditions would be a significant noise impact...An updated ENMP [Environmental Noise Management Program] is in preparation and should be used for exploring feasible ways to reduce the size of existing and proposed Zone III and Zone II noise exposure areas. The ENMP also

Responses

be no migration of contaminants from the ranges to streams, but only that the concentrations are not expected to significantly impact human or environmental receptors with proper mitigation.

N34-77

The pathway to the food web alluded to in the comment does not result in an impact on surface water. Particulates with sorbed chemicals may be suspended in the water column. The chemicals might be detected in water samples that contain the suspended sediment. Some chemicals, such as the chlorinated pesticide DDT, or dioxins, bioaccumulate and become concentrated in higher organisms. This is not the case for explosives and most metals, which are either metabolized or excreted

N34-78

There is no wastewater associated with the Tactical Vehicle Washes. The water is recycled and separated within the vehicle wash. The separated particulates (such as dirt and oils) are removed on a regular basis and disposed of in accordance with appropriate material disposal laws and regulations. The treatment system is described generally in Section 8.14

N34-79

Replacement of the cesspools is not within the scope of the Transformation of the 25th ID(L). As discussed in Chapter 9 - cumulative impacts, the Army is proposing an advanced wastewater treatment upgrade as a separate single and complete action. The Army will abide by all appropriate laws and regulations in the proposed development and design of this upgrade.

N34-80

As discussed in Section 4.8, the Army proposes to expand the existing Spill Prevention and Control plan to all activities under the Proposed Action. The Army maintains vehicles and equipment to reduce the potential for releases. Spills would be cleaned up quickly. If soil erosion threatens water quality or could result in sediment movement and deposition in channels, measures to slow and redirect the runoff could be implemented. The choice of mitigation measures would depend on the specific conditions at the site. The ability to apply appropriate measures to specific land areas rather than to depend on a single approach for every area is one of the strengths of the ITAM program. The Army has determined that there would be an significant impact to water quality from the Proposed Action. The mitigation measures proposed would reduce it to less than significant levels.

N34-104
cont'd

should explore the feasibility of providing increased acoustical insulation..."

The ENMP must be completed and added to the EIS. Noise is a very important concern for Big Island residents. The EIS is inadequate without complete disclosure of the noise impacts—with or without the ENMP.

N34-105

- Chapter 4 p 33 "...at PTA...up to 400 vehicles could be used during a single exercise. If 400 vehicles traveled along PTA trail in a single hour, resulting noise levels would be about...75 dBA at a distance of 50 feet...PTA is well over 1 mile...from the Waiki'i Ranch development and the Kilohana Girl Scout Camp."
- Appendix H p 5... 75 dBA is "Street sweeper at 30 feet; Idling locomotive, 50 ft"

Noise levels for the distance of 1 mile away should be specified—now it's just a guess what the levels will be at Waiki'i Ranch and Kilohana Girl Scout Camp. It is clear that the noise will increase from current conditions.

N34-106

- Chapter 4 p 34 "...maneuver activities would be expected to produce hourly average noise levels of less than 55dBA at a distance of about 500 feet..., with brief peaks at 65 to 70 dBA...As part of the ENMP, the Army **should consider** establishing a 500-foot...noise buffer at PTA around the Waiki'i Ranch property and the Kilohana Girl Scout Camp property and **should attempt** to minimize nighttime vehicle maneuver activities within 1,000 feet...of those properties." [bold added]
- Appendix H p 5 70 DBA is "300 feet from a busy 6-lane freeway"
- 65 dBA is "Typical daytime busy downtown background conditions"
- 55 dBA is "Typical urban residential area away from major streets"

People go camping or live in the country to escape this kind of noise level. "Consider" and "attempt" are insufficient mitigation for such noise.

- Section 5.6.2

N34-107

Section 5.6.2 does not address the impacts increased noise levels will have on endangered and native animal species. Of particular concern are the endangered O'ahu Elepaio and the endangered tree snails. What impacts will increased noise levels have on endangered plant pollinators? Please provide a map of all endangered plant and animal populations that may be affected by increased noise levels along roadways, vehicle trails, and off-road vehicle maneuvers.

N34-108

- Page 5-70: "Despite increased numbers of vehicles, traffic volumes and vehicle speeds typically would be too low to cause noise problems for areas surrounding roadways and vehicle trails."

Because the Stryker is an off-road military vehicle, which areas will be designated for off-road maneuvers? Because those off-road areas may not surround typical roadways and vehicle trails, what other impacts might Stryker vehicle noise have on surrounding endangered species?

- Figure 5-15

Responses

N34-81

The discussions in Sections 4.10, 4.12, 8.10 and 8.12 have been expanded in the Final EIS to better discuss the potential impacts of wildland fires. The impact to biological resources from wildland fires has been changed to significant. The mitigation measures proposed, including the updated IWFMP, will substantially reduce the severity of the impact on biological resources but not to less than significant levels.

N34-82

As shown in Table ES-23, the proposed mitigation of placing a vehicle wash at Kawaihae Harbor is unlikely to occur because of logistical constraints including the lack of space and lack of utilities. The Army has identified other mitigation measures to reduce the impact of the spread of non-native species. These are identified in Table ES-22 and Section 4.10. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

N34-83

As shown in Table ES-23, the cultural resource visitors center is not proposed as likely mitigation. There is a cultural resource education center proposed under the PTA Master Plan NHPA Section 106 consultation. The Army has identified more feasible mitigation measures to reduce the impact to biological and cultural resources as discussed in Table ES-22, Section 8.10 and Section 8.11.

N34-84

The outcome of ESA section 7 consultation between the Army and USFWS has resulted in numerous management activities to mitigate any impact to sensitive biological species and habitat. These measures are identified in the individual chapters 5.10,6.10,7.10 and 8.10.

N34-85

The results of ESA Section 7 consultation include the Army development of an O'ahu Implementation Plan. The individual measures determined in ESA Section 7 to mitigate from Army actions are outlined in the biological resource sections of each chapter; 5.10, 6.10, 7.10, 8.10.

- N34-116** *The buffer zone is inadequate for luxury homes and camping experiences. Will the Army be committed to establishing this zone? Or are they simply just considering it?*

Responses

N34-86

The text has been revised to say "The prolonged prohibition of hunting in certain areas because of unexploded ordnance has allowed populations of nonnative mammals, such as pigs, to expand. However, no new impact areas would be created in conjunction with the Proposed Action therefore the Proposed Action will not cause any change in the growing ungulate populations." As discussed in Section 8.10, the Biological Opinion issued by USFWS for ESA Section 7 consultation on the Proposed Action at PTA requires that a large portion of existing Army land that supports prime habitat for endangered species be protected from impacts associated from feral ungulates. The BO is available upon request.

N34-87

As discussed in Section 8.9, standard best management practices for erosion control will be implemented to limit erosion during construction of the PTA Trail. This subject is also addressed in the EIS Chapter 9, paragraph titled - "Runoff impacts on marine wildlife and coral ecosystems."

N34-88

Sections 4.12, 8.12, Chapter 9, and Chapter 10 have been expanded to incorporate information from the Maly studies. The Army has determined that project impacts and cumulative impacts to areas of traditional importance is significant.

N34-89

In 1998 an overall CRMP was developed for all ranges. An HPP was done for PTA, but since WPAA has not been purchased one has not been done. Management actions are incorporated in the EIS in Section 4.11.

N34-90

The text has been revised. The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS.

N34-91

As discussed in Section 8.12, all areas that could be impacted by the Proposed Action have been surveyed for presence/absence of cultural resources. The survey results have been included in the Final EIS. In addition, the cultural resource analysis has been expanded and in some cases the determination has been changed to significant.

Comments

Sierra Club Comments on Stryker Brigade expansion DEIS Page 27

- Chapter 8 p 70 "Noise from Aircraft Operations"

N34-117 *The EIS must include routes to the airfield and noise levels under these routes. Even at current levels, noise from aircraft going to and from PTA is substantial.*

- Chapter 8 p208 "...no impact on the health and safety of children..."

N34-118 *Dust and noise will impact children at Waiki'i Ranch and Kilohana Girl Scout camp.*

- Appendix N p 21 "The federal Noise Control Act...directed all federal agencies to comply with federal, state, interstate, and local noise control and abatement requirements to the same extent that any person is subject to such requirements."

N34-1119 *The EIS must spell out whether plans for PTA are in compliance. If compliance is impossible, the EIS should detail the impacts of ongoing non-compliance.*

EROSION

- Erosion Control

N34-120 *How will the Army specifically minimize erosion and runoff during the construction of roads? How will erosion control be maintained for roads when they are subject to use? In Hawai'i, best management practices (BMPs) to reduce or mitigate runoff from soil disturbing activities have historically failed at protecting water resources.*

- Exec Sum p 40 "Significant impacts would occur at...PTA (See Section...8.9) relating to **soil loss** from training activities. Significant but mitigable impacts would occur at...PTA (See Section...8.9) relating to **soil erosion and loss from wildland fires**. Significant but mitigable impacts would occur at...PTA (See Sections...8.9) from **soil compaction**, and **slope failure**. Project-wide impacts would be significant from **soil loss**, and significant but mitigable from **wildland fire-related soil loss**, **soil compaction**, **soil contamination**, and **slope failure**...Less than significant impacts from exposure to soil contaminants are expected at ...PTA." [bold added]

N34-121 *The long and short-term impacts of soil loss, erosion, contamination, and runoff must be detailed. How much soil will be lost, contaminated, or compacted? How will the military be able to return the land in the same condition they received it if the soil has been eroded away or contaminated?*

- Chapter 4 p 48 "The Proposed Action could result in a **significant long-term impact on surface water quality from suspended sediment at SBMR and PTA**. Surface water quality may be affected by soil erosion, which can result in transport of sediment to streams and an increase in the turbidity of the water or in increased rates of sediment deposition in stream channels. These effects are probably occurring under existing conditions, and ATTACC [Army Training and Testing Area Carrying Capacity] results suggest that soil erosion would increase at SBMR and PTA. ..It is **unlikely to affect surface water quality at PTA** due to lack of perennial streams there." [bold added]

N34-122

Responses

N34-92

As discussed in Section 8.11, the Army proposes to restrict and protect training activities at the Ke'amuku Village.

N34-93

The sacredness of both Mauna Kea and Mauna Loa have been addressed in revisions to the EIS. Cultural resource sections have been updated in the Final EIS. The overall impact to cultural resources on a project wide basis is significant. The Programmatic Agreement and other measures will reduce the severity of the impact but not always to a less than significant level.

N34-94

Based on public comment, the cultural resource sections have been expanded and updated. Where cultural site cannot be avoided, the determination has been changed to significant. The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS. As shown in Table ES-23, the cultural resource visitors center is not proposed as likely mitigation. There is a cultural resource education center proposed under the PTA Master Plan NHPA Section 106 consultation. The Army has identified more feasible mitigation measures to reduce the impact to cultural resources as discussed in Table ES-22 and Section 8.11.

N34-95

The discussions in Section 8.11 have been expanded to better discuss the effects on cultural resources at PTA. The Army has determined that the impact to cultural resources including historic buildings is significant. The Army will implement mitigation measures such as the Final PA as signed by the Army, SHPO, ACHP and concurring parties (Appendix J of the Final EIS). The PA described the process for site specific compliance actions with avoidance to the full extent practicable as the first measure. A separate NHPA Section 106 consultation is being developed for the PTA cantonment area in association with the PTA Master Plan.

N34-96

The discussions in Section 8.11 have been expanded to better discuss the effects on cultural resources at PTA. The two sections in bold appear to contradict each other. Will surface water be affected? What surface water, exactly, and what will be the significant impacts?

N34-123

- **Chapter 4 p 53** "ATTACC modeling results suggest that...soil erosion may be significantly increased by training activities under the Proposed Action at SBMR and PTA, due to increased intensity of use within limited maneuver areas. Also, the amount of land subject to increased soil erosion would increase at SBMR and PTA...The ATTACC modeling results indicate that increased training intensity would severely degrade the condition of the land...due to the degree of severity of the impact indicated by the ATTACC modeling, and because the ability to fallow damaged land may be limited by lack of sufficient mounted maneuverable land area, soil loss at...PTA may be only partially mitigable. Also, soil loss would increase significantly in spite of land management measures under the ITAM program."
- **Chapter 4 p 54-55** "Soils in training areas, and especially in areas that have not previously been used for maneuver training, such as...portions of the WPAA, [West PTA Acquisition Area] are likely to become compacted by use of tracked or wheeled vehicles, potentially affecting their ability to support vegetation and altering their permeability and moisture retention capacity. Widespread compaction could generally reduce recovery of vegetation cover. Preferred drainage pathways could develop along the compacted linear track left by off-road vehicles, creating increased erosion along the tracks. The impacts of these changes are considered to be significant depending on the amount of land area affected. ATTACC modeling results suggest that a large proportion of the land area in the maneuver areas could be affected...The ITAM [Integrated Training Area Management] Program would be used... to identify land management measures that **might** reduce the impact. The impacts **could** be partially or fully mitigable by requiring motorists to avoid affected off-road areas **if impacts are observed** and be revegetating and **recontouring** affected areas." [bold added]

"Might" and "could" are not mitigation. Waiting till impacts are observed is too late. Wouldn't recontouring add to soil compaction problem?

N34-124

- **Chapter 8 p 106** [re tank trail] "During construction, erosion by both wind and water could occur...this impact is considered potentially significant. After construction, the road could affect surface drainage...Large runoff events could result in soil accumulation in culverts at gulch crossings, resulting in flooding and possible washouts of the roadway...Soil erosion may be reduced or prevented by implementation of standard construction practices."

Will soil erosion be prevented by implementation of best management practices?

N34-125

- **Chapter 10 p 1** "NEPA [National Environmental Protection Act] requires additional evaluation of the project's impact with regard to...Any irreversible or irretrievable commitment of resources."

Eroded, washed-away land is an irreversible, irretrievable commitment of resources. The EIS fails to address this impact.

DUST AND AIR QUALITY

Responses

EIS). The PA described the process for site specific compliance actions with avoidance to the full extent practicable as the first measure. A separate NHPA Section 106 consultation is being developed for the PTA cantonment area in association with the PTA Master Plan.

N34-97

The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS. The Final PA has had minor changes from the version made available to the public in October 2003 with the Draft EIS. The Final PA in the version that has been signed has been available to the public via the SBCT website since January 2004.

N34-98

Each specific site was surveyed and no artifacts or surface features were found indicating the presence of cultural resources. However, once construction begins these sites will be bound by the conditions described in the PA to protect any resources discovered at that time.

N34-99

The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS.

N34-100

Chapter 10 has been expanded to better discuss the potential impacts to environmental justice issues included Areas of Traditional Importance. Mitigation measures including the implementation of the Final PA are discussed. As part of the mitigation, the Army will consult with Native Hawaiian organizations on potential impacts to ATIs.

N34-101

Noise impact discussions regarding training activities at WPAA have been expanded in the Final EIS. Smoke devices used as obscurants or to simulate biological, chemical, or nuclear exposure conditions have minimal noise impacts. Grenade and artillery simulators would have localized noise impacts, but the frequency of their use has not been determined. Noise impacts from these devices could be minimized by maintaining adequate separation from noise-sensitive land uses or by limiting their use during nighttime hours. As noted in the DEIS and the revised discussion in the Final EIS, potentially significant noise impacts from such training activities can be mitigated to a less

- Munitions

N34-126

As there is no air quality monitoring station in SBMR, we wonder how air pollution in the area can be monitored and a baseline established? While increasing ordnance use quantities by 25 percent seems significant, in section 5.5.2 it is stated, "Because emission quantities from ordnance use are very small and include only trace quantities of hazardous components they pose very little risk of creating adverse air quality impacts." As there are significant amounts of ordnance explosions during training, it would seem possible that trace quantities of hazardous components can add up to pose a risk of hazardous air quality. Have there been studies done to determine localized air quality impacts of ordnance explosions? Based on evidence in research that air quality has a direct impact to soil and water quality, have there been studies done to determine soil and water quality before and after ordnance use? How can you determine that no significant air quality impacts would occur, based upon the lack of an air quality monitoring station in the area?

N34-127

Has the Army tested the transport of vaporized lead and beryllium through the air from munitions explosions?

- Stryker vehicle emissions

N34-128

What is the rate of emissions for criteria pollutants from a Stryker vehicle? How does that compare to the average emissions of cars and trucks? Please include a figure to show the average rate of emissions from military vehicles, including Stryker vehicles. How will these Stryker vehicle emissions affect the sensitivity of the small-lunged avian fauna? What air quality impacts will these emissions have on the endangered O'ahu Elepaio forest bird and the insects upon which it depends for food? What impacts upon Elepaio territory selection and nesting success might Stryker air emissions have?

- Dust control

N34-129

What impacts do synthetic dust control chemicals have on soil and water quality? If these chemicals wash into streams or ocean, how will they affect aquatic organisms?

N34-130

Which species will be used in vegetation reseeding programs to reduce the fugitive dust generation? We would like to see native species used to the greatest extent possible in order to reduce the facilitation of weed dispersal.

N34-131

Please calculate the estimated water quantities necessary to reduce fugitive dust generation by 70 – 90 percent throughout SBMR per month. Please specify where you would obtain this water, and what effects this would have on your water source. Please determine which method, water application or synthetic dust control chemicals, would have less detrimental effects on the adjacent environment, specifically air, soil and water quality.

N34-132

- Chapter 4 p 21 "Net increases in fugitive dust from vehicle use would be...420 tons...per year at PTA."

What are the short and long-term impacts to the ecosystem and human health from increasing the amount of fugitive dust at PTA?

Responses

than significant level. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels.

N34-102

Noise impact discussions regarding training activities at WPAA have been expanded in the Final EIS. Smoke devices used as obscurants or to simulate biological, chemical, or nuclear exposure conditions have minimal noise impacts. Grenade and artillery simulators would have localized noise impacts, but the frequency of their use has not been determined. Noise impacts from these devices could be minimized by maintaining adequate separation from noise-sensitive land uses or by limiting their use during nighttime hours. As noted in the DEIS and the revised discussion in the Final EIS, potentially significant noise impacts from such training activities can be mitigated to a less than significant level. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels.

N34-103

Low altitude helicopter flights are a routine component of training exercises at PTA. The Proposed Action would extend low altitude helicopter flight activity into WPAA. Section 8.6 in the Final EIS has reanalyzed noise contours based on this change, finding only minimal changes to the noise contours at both PTA and SBMR. For the aviation training, there are no changes proposed in the number of aircraft from what already exists at the US Army Hawai'i's Aviation Brigade. The only change that would occur is a slight increase in aviation training over the proposed West PTA Acquisition Area, as the Aviation Brigade would train along with the SBCT brigade during different training maneuvers. The analysis in the FEIS reflects this change in aviation training over West PTA. As noted in the DEIS and the revised discussion in the Final EIS, potentially significant noise impacts from such training activities can be mitigated to a less than significant level. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels.

N34-104

As discussed in Section 3.6, the ENMP program is an on-going Army planning program that is not directly related to the proposed action. As such, the ENMP is not a required element of the EIS process. The EIS incorporates available information from the ENMP, and supplements that information with additional noise analyses related to vehicle noise, helicopter and aircraft noise,

N34-133

- Chapter 4 p 22 "Providing a gravel cover...will reduce fugitive dust...Gravel produced by crushing local lava-derived rocks would have moderate dust content unless thoroughly washed. In addition, lava-derived gravel...is likely to fragment and crumble...the resulting gravel surface would be expected to generate noticeable quantities of fugitive dust. Gravel treatments by themselves are unlikely to reduce dust generation to less than significant levels."

What will the source of the water be to "thoroughly wash" the gravel cover?

N34-134

- Chapter 8 p 29 "Projects...would not affect natural resources management areas."

How will running tanks and paving parts of the 23,000 acres, with the associated noise, dust, and pollution not affect the natural resources management areas?

N34-135

- Chapter 8 p 51 "PM10 [inhalable particulate matter] emissions...are easily airborne and are small enough to be inhaled deep into the lungs creating potential adverse health effects. The 429 tons per year...increase in fugitive PM10 emissions generated by military vehicle [sic] at PTA, the likelihood of exceeding the federal 24-hour standard, and the potential impacts to quality of life to Waiki'i Ranch residents and users of Kilohana Girl Scout Camp combined may result in a significant air quality impact...it is unlikely that...dust control programs would be effective enough to reduce the net increase to a less than significant level."

What will be the long and short-term impacts of increased inhalable particulate matter be on the health of the children at the Kilohana Girl Scout camp?

MISCELLANEOUS

N34-136

- Executive Summary, p. 34: "Beneficial impacts would be realized at the WPAA from the expansion of public access for hunting during periods when no military training is taking place."

The EIS should state whether Waiki'i Ranch homeowners and users of Kilohana Girl Scout Camp consider more shooting nearby to be beneficial.

N34-137

- Chapter 2 p 41 "UAVs...individual use and frequency has yet to be determined..."
- Chapter 8 p 46 Unmanned aerial vehicles are planned.

The EIS must state the number of UAVs, where they will fly, how often they will be used, and address noise and safety issues.

N34-138

- Chapter 3 p 19 Table 3-4 currently military use of Hilo airport is 10% and Kona airport 13%.

The EIS should specify how this would change.

- Chapter 4.13: Socioeconomics and Environmental Justice

Responses

and small arms firing noise. Mitigation measures to reduce the impact from noise are identified in Sections 4.6, 5.6 and 8.6.

N34-105

The discussion of noise from vehicle traffic on the PTA Trail has been expanded in the Final EIS. The closest point on the PTA Trail to is 1.25 miles from Waiki'i Ranch, and 1.8 miles from Kilohana Girl Scout Camp. Hourly average noise levels from normal convoy traffic on PTA Trail would be about 37 dBA at Waiki'i Ranch and about 31 dBA at Kilohana Girl Scout Camp. These noise levels are comparable to or less than normal daytime background noise levels. Consequently, vehicle traffic on the PTA Trail would not cause significant noise impacts to either Waiki'i Ranch or Kilohana Girl Scout Camp. Diversion of a significant portion of military vehicle traffic onto the PTA Trail would clearly reduce vehicle noise impacts at the Kilohana Girl Scout Camp because the PTA Trail is much further from the camp than is Saddle Road. The diversion of military vehicle traffic to PTA Trail also would reduce vehicle noise impacts for most of Waiki'i Ranch. Although the southwest corner of Waiki'i Ranch would be slightly close to PTA Trail than it is to Saddle Road, noise levels from PTA Trail would be equivalent to or less than normal daytime background noise conditions throughout the Waiki'i Ranch property. Individual vehicles on PTA Trail may produce peak pass by noise levels that would be audible at Waiki'i Ranch, but those noise levels would not differ much from current conditions with military vehicle traffic on Saddle Road.

N34-106

As discussed in Section 4.6, the Army proposes to evaluate training activities and timing of training actions to reduce noise levels as mitigation for noise impacts. In addition, the Army proposes a 1,000 foot daytime noise buffer and a 2,000 foot nighttime noise buffer at WPAA for training activities.

N34-107

These impacts are discussed in the Biological Resources section, 5.10.

N34-108

Impacts from noise and locations of sensitive species are discussed in the Biological Resources section, 5.10.

Comments

Sierra Club Comments on Stryker Brigade expansion DEIS Page 31

N34-139 *This section should consider the impact of decreased property values in the Waiki'i/ Waikoloa/ Waimea area and the cost to taxpayers for cleanup when PTA closes.*

- Chapter 4 p 7 A proposed mitigation is "Establishing a citizens' advisory board for O'ahu and Hawai'i USARHAW training lands..."

N34-140 *This is not a viable mitigation, given the Army's track record on boards. The Sierra Club, Moku Loa Group requested a citizen advisory board for Pohakuloa Training Area in December 2002. The Army proposed utilizing the Hawaii Land Use Council for this purpose in March 2003 and said the Army would contact Sierra Club about the agenda and schedule. As of December 2003, no contact had been made. Gerald DeMello, Big Island representative to the Land Board; Chris Yuen, director of the Hawaii County Planning Department; and Sierra Club Moku Loa group have never heard of the Council. Major General Olson has not replied to a June 2003 inquiry.*

- Chapter 10 p1 "NEPA requires additional evaluation of the project's impact with regard to...Any irreversible or irretrievable commitment of resources."

N34-141 *The Army Corps of Engineers says it will take "centuries" to clean ordnance from the over fifty former military sites on Hawaii Island. When and if the military stops using PTA and the 23,000 acres, cleanup may take "centuries" also. So military use of this land is effectively "irreversible" and "irretrievable." The impact of committing the 50-plus old sites, PTA, and the 23,000 acres to military use... followed by probable centuries of ordnance hazard to the public and possible contamination from deteriorating old ordnance... must be evaluated.*

CUMULATIVE IMPACTS AND SEGMENTATION CONCERNS

Consider the following piecemeal planning approach at PTA:

- N34-142**
- (1) *From January 1990 to March 1998 a Social, Economic, and Environmental Team held meetings to discuss the Saddle Road.*
 - (2) *From June 1993 to July 1999 the Saddle Road Community Task Force met.*
 - (3) *In March 1994 a Notice of Intent for the Saddle Road realignment was published.*
 - (4) *In January 1997 the Army identified "a requirement for 98,840 acres of contiguous maneuverable land...The largest single usable parcel is the 19,148 acres at Pohakuloa Training Area. This equates to a deficiency of 79,692 acres..." [January 1997 Army Land Use Requirements Study (LURS) quoted in the March 2002 Environmental Assessment for Land Acquisition at Pohakuloa Training Area for purchase of 1010 acres]*
 - (5) *In February 1997 the Army showed "a shortfall of 70,723 total acres and 46,745 contiguous acres for a single Army Training and Evaluation Program task" and recommends "Support the acquisition of 69,933 additional training acres for the 25th ID(L) & USARHAW to fulfill the ARTEP requirements." [February 7, 1997 Army memo in a Land Use Requirement Study]*
 - (6) *Hawaii Island is probably the only island where the Army could find 46,745 to*

Responses

N34-109

As discussed in Section 5.6, no school or child care facilities are located within the Zone III contour. As discussed in the EIS, two on-post schools (Solomon Elementary School and Hale Kula Elementary School) are within the Zone II noise contour, although Hale Kula Elementary School would be outside the Zone II contour if the nighttime noise penalty factor in the Ldn calculation is ignored. The Army proposes as mitigation for noise impacts at SBMR to evaluate training activities and timing to reduce the nighttime noise levels

N34-110

The text on page 5-82 of the DEIS has been revised; the 52% increase in vehicles applies only to the 2nd Brigade, not SBMR as a whole. Because the EIS is only addressing actions related to the transformation of the 2nd Brigade, the total vehicle fleet for SBMR has not been inventoried. The SBCT process would result in the 2nd Brigade having 1,005 vehicles, while the 3rd Brigade would retain the current inventory of 659 vehicles. There are 10 other commands located at SBMR, plus the Public Works Department. Most commands have their own vehicle fleets. With transformation of the 2nd Brigade, the total military vehicle fleet at SBMR would undoubtedly exceed 2,000 vehicles. Stryker vehicles would account for no more than 12% – 15% of the military vehicles based at SBMR.

N34-111

Locations of sensitive species and potential impacts are discussed in section 5.10.

N34-112

As noted in the Airspace discussion (Section 8.4), there are no defined enroute flight corridors to BAAF.

Flights by C-17 or C-130 aircraft would be too infrequent to yield noise contours from standard airfield noise models. Section 8.6 of the Final EIS and the figures therein illustrate.

N34-113

Neither the Army nor the Marine Corps use tanks at any USARHAW installations. The noise analysis in Section 8.6 evaluates the potential noise impacts from Strykers and other military vehicles under "noise from military vehicle use". The Army has determined that the noise impact from military vehicle use would be less than significant.

Responses

N34-114

As discussed in Section 3.6, the ENMP program is an on-going Army planning program that is not directly related to the proposed action. As such, the ENMP is not a required element of the EIS process. The EIS incorporates available information from the ENMP, and supplements that information with additional noise analyses related to vehicle noise, helicopter and aircraft noise, and small arms firing noise. Mitigation measures to reduce the impact from noise are identified in Sections 4.6, 5.6 and 8.6.

N34-115

Noise impact discussions regarding training activities at WPAA have been expanded in the Final EIS. Smoke devices used as obscurants or to simulate biological, chemical, or nuclear exposure conditions have minimal noise impacts. Grenade and artillery simulators would have localized noise impacts, but the frequency of their use has not been determined. Noise impacts from these devices could be minimized by maintaining adequate separation from noise-sensitive land uses or by limiting their use during nighttime hours. As noted in the DEIS and the revised discussion in the Final EIS, potentially significant noise impacts from such training activities can be mitigated to a less than significant level. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels.

N34-116

Noise impact discussions regarding training activities at WPAA have been expanded in the Final EIS. N34-118

Please see Section 8.6 for a discussion of noise levels and mitigation measures that have been developed in consideration of Waiki'i Ranch and Kilohana Girl Scout camp. Please refer to Figure 8-14 for a depiction of noise level contours of the proposed action in the PTA. Presently, both Waiki'i Ranch and Kilohana Girl Scout camp lie outside of the proposed action noise level contours. Due to potential aircraft activities that may take place in the West PTA Acquisition Area, aircraft noise contours are currently being mapped, and Waiki'i Ranch and Kilohana Girl Scout camp may potentially fall within these contours. However, no live-fire activity will take place in this region. Further modeling of dust in the PTA and WPAA areas indicate the PM10 guidelines set forth by EPA will not be exceeded. The FEIS will include this information. No impacts on health and safety of children are anticipated.

N34-119

As discussed in Section 8.6, impacts to noise from the Proposed Action at PTA are significant but mitigable to less than significant. Current noise levels are in compliance with the Army standards. If the Army decides to implement the Proposed Action, the Army proposes to mitigate noise levels at WPAA with a 1,000 foot daytime noise buffer and a 2,000 foot nighttime noise buffer on training activities.

N34-120

Among the BMPs that may be implemented for road construction would be scheduling construction to avoid wet periods; constructing drainage controls to divert runoff and runoff away from disturbed areas; designing drainage ditches to slow the rate of runoff, properly size culverts and ditches, and avoid concentrating runoff. Roads tend to act either as barriers or as conduits for runoff. Drainage for roads will be designed to maintain flows across or under the roads so that the roads do not act as barriers or conduits. The integrity of the roads and drainage across the roads would be maintained by the Army. A list of specific minimum BMPs that would be implemented have been added to the discussion of mitigation measures in Section 7.8 (Water Resources at KTA). The same, or similar measures would be applied elsewhere.

N34-121

The Army has determined that there would be a significant impact to soil loss from training activities. As summarized in Section 4.9, the Army proposes mitigation that will substantially reduce the severity of the impact but not to

Comments**Responses**

less than significant levels. In addition, the Army discusses in Section 10.5 that if the Proposed Action were implemented there would be an irreversible loss of soils at WPAA from training activities.

N34-122

The impacts to surface water quality and soil erosion have been expanded to clarify the relationship of the two and associated impacts. There is a potential for erosion to impact surface water without effective mitigation measures. The Army will implement several mitigation measures to control erosion so that soil erosion will not have a significant effect on water quality. See sections 4.8, and 4.9 for a summary of the impacts and mitigation measures for water and soil and sections 5.8,6.8, 7.8, 8,8, 5.9, 6.9, 7.9, and 8.9 for impacts at specific installations.

N34-123

The ITAM program is an interactive, dynamic, adaptive approach to management of land resources. The Army has determined that with mitigation such as ITAM, impacts will still occur but the impacts from soil loss from training activities would be significant and impacts from soil compaction would be less than significant. Soil compaction, such as in vehicle tire tracks, can create preferential pathways for runoff and can affect regrowth of vegetation. The use of heavy equipment to alter slopes would also compact soils, but the slopes may be revegetated manually. The surface would be protected from erosion while the vegetation was becoming established. Recontouring might be used locally as a means of redirecting or slowing runoff, and to re-establish a desired slope. The Army will also develop and implement a Dust and Soils Management and Monitoring Plan (DuSMMoP) for the training area. The plan will address measures such as, but not limited to, restrictions on the timing or type of training during high risk conditions, vegetation monitoring, soil monitoring, and buffer zones to minimize dust emissions in populated areas. The plan will determine how training will occur in order to keep fugitive dust emissions below CAA standards for PM10 and soil erosion and compaction to a minimum. The Army will monitor the impacts of training activities to ensure that emissions stay within the acceptable ranges as predicted and environmental problems do not result from excessive soil erosion or compaction. The plan will also define contingency measures to mitigate the impacts of training activities which exceed the acceptable ranges for dust emissions or soil compaction.

Comments**Responses****N34-124**

The standard construction practices referred to in the text are best management practices that are in common use in the construction industry to address erosion problems. While these practices will not prevent soil erosion, their implementation may substantially reduce such effects as related to construction. The incorporation of engineering controls related to storm water drainage will help to direct runoff away from disturbed soil areas, and to contain, disperse, or re-direct runoff. Mitigation measures are discussed in section 8.9.

N34-125

NEPA requires that a Federal EIS include a discussion of irreversible and irretrievable commitments of resources that would be involved in the proposed action if it is implemented (40 CFR 1502.16). This refers primarily to energy requirements and conservation potential of the proposed action and alternatives. An EIS should present the energy and material uses that would result from construction and operation of a proposed action and alternatives. Chapter 10 discusses impacts on renewable and nonrenewable energy and material resources and is considered adequate. Impacts on land resources are extensively discussed in Chapters 4-9 of the main text. The vehicles referenced have the capability to identify various reagents, but do not contain these agents. Their environmental impacts are virtually identical to similar vehicle that have been on island for several years.

N34-126

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant. The Army Environmental Center and CHPPM have on-going

Comments

Responses

programs to determine emission rates from munitions use during military training and to use dispersion modeling studies to evaluate the potential for air quality impacts at locations near military training facilities. Health risk assessments completed to date show no significant health risks for either short term or long term exposure to emissions from weapons firing points for hypothetical residential locations within a few hundred meters (600 to 1,200 feet) of the firing point. Firing points at USARHAW installations are much further from off-post residential locations than the distances assumed in the health risk assessment studies.

N34-127

The Army has not done any air sampling at SBMR or PTA. Ordnance firing and detonation are not expected to be a significant source of metal fumes. Projectiles can be fragmented when they impact the ground, and metal coverings of high explosive warheads are fragmented by detonation processes. Metals are not vaporized by these processes. Friction between projectiles and the gun tube or barrel generate small particles of metals, but would not generate metal fumes. The only metal fumes that would form in the detonation processes would be from metals contained in the chemical composition of the energetic material itself (propellants, explosives, and pyrotechnics). Shell propellants and explosive materials have very low metal contents. Flares and smoke devices are the items most likely to produce metal fumes. Smoke devices can include various metal salts that color the smoke generated by the device, and the pyrotechnic material in flares various metal compounds. Flares can vaporize a small portion of the aluminum in the flare casing, in addition to the metals that are incorporated into the pyrotechnic material itself. Flares and smoke devices are only a small component of the ordnance items used at USARHAW ranges. Lead is not a significant component of pyrotechnic materials. Available information indicates that the beryllium concentrations found in soil samples at SBMR and PTA are almost certainly dominated by beryllium of natural origin, not the result of munitions use. Beryllium is a trace component of only a small number of munitions items, being present either as part of the alloys used in metal parts or as a trace component of various rocket propellants and a few other energetic materials. Rocket propellants would be expected to be the primary source of beryllium releases at USARHAW installations, but beryllium has not been found in all types of rocket propellants. The quantities of beryllium found in munitions items is much too small to account for the beryllium content of soils sampled

Comments**Responses**

at SBMR or PTA. The beryllium levels found in SBMR and PTA soil samples are all within the range of published data on the natural beryllium content of soils from around the world (Helmke 2000).

N34-128

No data are available specifically for the Stryker vehicle. But since the diesel engine in the Stryker vehicle is not of an unusual design, emissions can be expected to be similar to those from any conventional 350 horsepower diesel engine used in off-road heavy equipment. Consequently, EPA's diesel engine emission rates for non-highway engines were used for the EIS analyses. Emission estimates for all military vehicle traffic by the 2nd Brigade are presented in Appendix G-3 of the Final EIS, and are discussed briefly in the air quality sections of the Final EIS chapters for each installation.

N34-129

The recommended dust control chemicals (calcium chloride and/or magnesium chloride) are considered virtually nontoxic. These compounds are applied directly to the surface being treated, so there should be no direct exposure of adjacent areas. Given normal use procedures and quantities, hygroscopic salt solutions pose no significant risk to soils or aquatic ecosystems. The Air Quality and Water Resources sections (Sections 4.5, 4.8, 5.5, 5.8, 6.5, 6.8, 7.5, 7.8, 8.5, 8.8) have been expanded to discuss proposed dust palliative treatments and potential impacts or considerations for their use. If the Army decides to implement the Proposed Action, the Army proposes to use "environmentally friendly" dust control measures that would have less than significant impacts on water resources.

N34-130

The feasibility of any revegetation program would be determined in the context of the Army's established INRMP and ITAM programs. It is unlikely that any revegetation programs could be implemented for dust control purposes at SBER or KTA. Until actual use patterns at WPAA are assessed, it is premature to speculate on the feasibility or effectiveness of revegetation programs for that area.

N34-131

As indicated in the DEIS, use of water for dust control on unpaved roads is not recommended due to the very large quantities required. Synthetic dust control chemicals are considered the only feasible treatment for unpaved roads

Comments**Responses**

at USARHAW installations. The discussion of dust control chemicals has been expanded in the Final EIS. The frequency of dust control chemical applications would be determined by actual experience and monitoring changes in dust generation in response to changing weather conditions. Until the required frequency of application has been determined, it is not practical to estimate annual water use quantities required for mixing the dust suppressant solutions. The Air Quality and Water Resources sections (Sections 4.5, 4.8, 5.5, 5.8, 6.5, 6.8, 7.5, 7.8, 8.5, 8.8) have been expanded to discuss proposed dust palliative treatments and potential impacts or considerations for their use. If the Army decides to implement the Proposed Action, the Army proposes to use "environmentally friendly" dust control measures that would have less than significant impacts on water resources.

N34-132

The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/or the use of washed gravel for surfacing military vehicle trails. In addition, the Army will develop and implement a Dust and Soils Management and Monitoring Plan (DuSMMoP) for the training area. The plan will address measures such as, but not limited to, restrictions on the timing or type of training during high risk conditions, vegetation monitoring, soil monitoring, and buffer zones to minimize dust emissions in populated areas. The plan will determine how training will occur in order to keep fugitive dust emissions below CAA standards for PM10 and soil erosion and compaction to a minimum. The Army will monitor the impacts of training activities to ensure that emissions stay within the acceptable ranges as predicted and environmental problems do not result from excessive soil erosion or compaction. The plan will also define contingency measures to mitigate the impacts of training activities which exceed the acceptable ranges for dust emissions or soil compaction. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

N34-133

Any available water supply (including sea water) could be used for gravel washing purposes, and the wash water could be recycled for washing multiple batches of gravel.

Comments**Responses****N34-134**

As discussed in Section 8.2, impacts to land use will not be significant. The discussions in Section 8.10 have been expanded to better address potential impacts from the Proposed Action on biological resources. In some cases, the determination has been changed.

N34-135

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

N34-136

Noise impact discussions regarding training activities at WPAA have been expanded in the Final EIS. Smoke devices used as obscurants or to simulate biological, chemical, or nuclear exposure conditions have minimal noise impacts. Grenade and artillery simulators would have localized noise impacts, but the frequency of their use has not been determined. Noise impacts from these devices could be minimized by maintaining adequate separation from noise-sensitive land uses or by limiting their use during nighttime hours. As noted in the DEIS and the revised discussion in the Final EIS, potentially significant noise impacts from such training activities can be mitigated to a less than significant level. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels.

N34-137

Impacts on safety, noise, and emissions are addressed in the EIS in all Chapters 4 - 8 in sub sections 4 for airspace, 6 for noise, 5 for air quality, and 12 for human health and safety. As noted on page 2-39 of the DEIS, the

Comments**Responses**

Proposed Action would equip the 2nd Brigade with 4 UAVs, each of which would be flown for about 600 hours per year. There would be an average of 600 total sorties per year. Thus, typical sorties would last about 4 hours each. As noted in the Airspace sections of the various installation chapters for the DEIS, most UAV flights would be conducted within existing restricted airspace areas. Any flight activity outside of restricted airspace areas would require compliance with FAA regulations and procedures. Consequently, UAV flight activity would not create any significant safety issues. And as noted in the noise impact sections of the DEIS, UAV flight activity would not create any significant noise impacts.

N34-138

Chapter 2 identifies no proposed use of either Hilo or Kona airports.

N34-139

Future property values are based on several factors that fall outside of the purview of the Army action. It would be speculative in nature for the Army to assume either positive or negative impacts to adjacent property values. If the Army decides to implement the proposed action, the Army will implement mitigation measures to help keep the proposed action to less than significant impact levels where practicable.

N34-140

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

N34-141

NEPA requires that a Federal EIS include a discussion of irreversible and irretrievable commitments of resources that would be involved in the proposed action if it is implemented (40 CFR 1502.16). This refers primarily to energy requirements and conservation potential of the proposed action and alternatives. An EIS should present the energy and material uses that would result from construction and operation of a proposed action and alternatives. Chapter 10 discusses impacts on renewable and nonrenewable energy and

Comments**Responses**

material resources and is considered adequate. Impacts on land resources are extensively discussed in Chapters 4-9 of the main text.

N34-142

Table 9-2 and the cumulative impact analysis in Chapter 9 addresses the two land acquisitions, Saddle Road and the trends mentioned in the comments. The EIS considers the Saddle Road realignment project and takes into account the Saddle Road EIS. The EIS also takes into account the Pu'u KeeKee acquisition, as well future acquisition projects in the PTA area. The EIS, while not critiquing the adequacy of the planning efforts, assesses the impacts of the projects and trends mentioned in the comment. Chapter 9 has been updated, based on comments and any project changes since the DEIS.

N34-143

Based on public comment, Chapter 9 - Cumulative impacts has been expanded. The cumulative impact analysis in Chapter 9 assesses in detail the impacts on cultural resources, unexploded ordinance and other hazardous materials. Sections 4.12, 5.12, 6.12, 7.12, 8.12 include in depth discussions regarding unexploded ordinance. Chapter 9 also includes a discussion of the historical trends for each resource area, including information on trends for both military and non-military land use in Hawai'i.

N34-144

The reference has been changed to Section 9.5.2 – Cumulative Impacts by Resource under the paragraphs for Airspace.

N34-145

Last line in next to last paragraph on page 8-46 (Airspace) has been revised to say Section 8.6 rather than Section 9.6.

Comments

- Letter N35** Cindy S. Barger
SBCT EIS Project Manager
U.S. Army Corps of Engineers
Honolulu District
Bldg 230, Rm. 306 ATTN: CEPOH-PP-E
Ft. Shafter, HI 96858-5440
- Dear Ms. Barger,
- We request that you extend the hearing dates and comment deadline to at least 90 days after release of the draft Environmental Impact Statement on Army transformation.
- Army NEPA regulations stress the importance of public involvement (e.g., 32 C.F.R. 651.47) and there are problems in this area.
- N35-1** 1-The proposed transformation is the largest Army construction project in Hawaii since World War II. We have heard that the EIS may run to 1500 pages. The legally required 15 days (between EIS release and hearings) is completely inadequate for groups to explore the ramifications of the proposed action and prepare a response.
- N35-2** 2-Construction and research money for the plan is already in the military budget, although the draft EIS will not come out till about October 1.
- N35-3** 3-Before the scoping meetings, the Army failed to provide the public with necessary information, to the point that Earthjustice asked that the scoping comment period be extended.
- N35-4** 4-In September 2002 the Army abruptly cancelled a tour of Pohakuloa requested by about 15 community people concerned about the Army transformation plans. The Army said some of the people were unacceptable, but refused to say who.
- N35-5** 5-The Army is excluding the public from meetings about the expansion.
Major General Olson has not replied to a June 2003 inquiry.
On May 16, 2002 the Army invited selected business and government people to a meeting and dinner in Hilo. Concerned citizens picketed outside, then entered the meeting and said such meetings must be open to the public. But the Army again invited a selected group to a another closed meeting where the Army expansion and other land use issues were discussed, on July 16, 2003, in Hilo.
- N35-6** 6-Nine months have gone by with no concrete response from the Army re. a citizen advisory board for Pohakuloa Training Area.
Sierra Club Moku Loa group requested the board in December 2002.
The Army proposed utilizing the Hawaii Land Use Council for this purpose in March 2003 and said the Army would contact Sierra Club about the agenda and schedule. No contact has been made.
- Moku Loa Group, P.O. Box 1137, Hilo, Hawai'i 96721

Responses

N35-1

The DEIS was released to the public October 3, 2003 and the first public meeting was held October 28, 2003, 25 days after the release of the DEIS.

N35-2

Although funds have been programmed for certain SBCT activities, no funds have been spent beyond planning and design measures permitted under NEPA.

N35-3

In response to public comments during the scoping period, the Army provided additional information to the public and extended the public scoping period.

N35-4

We thank you for your comments. We acknowledge the postponement of the proposed meeting scheduled for September 12, 2002. The meeting was postponed due to conflicting mission requirements. The Army contacted the Sierra Club and informed them of the postponement and procedures for rescheduling. The Army continues to welcome requests for tours of PTA as part of our overall community relations outreach program.

In order to protect the safety of those on the tours and the security of Army training activities, accessible locations and tour sizes will be determined on a case by case basis. For more information, please contact the U.S. Army Hawai'i, PTA Public Affairs Office.

N35-5

The Transformation program encompasses a number of projects and operations on two islands and requires extensive planning and coordination. Over the past two years, the Army has gone to great lengths to be inclusive of both the public-at-large and the many various groups that may be directly or indirectly affected by the proposed action. Since January 2002, Transformation representatives have participated in approximately one hundred meetings to present information on the program and to discuss concerns and issues that these groups may have. Over a dozen meetings at various locations on O'ahu and Hawai'i were designed specifically for the general public to attend. The purposes of these meetings included general information dissemination, technical discussions on specific topics, discussions of issues and concerns, planning and analysis, etc. In addition, smaller

Comments

7-There was no notice of the comment deadline for a draft agreement.

No notice re. the draft programmatic agreement (PA) among the 25th Infantry Division (Light), Hawaii State Historic Preservation Office, and Advisory Council on Historic Preservation was given to Earthjustice, American Friends Service Committee, or Sierra Club Moku Loa group, although all were involved in the EIS process.

N35-7

No notice was posted on the Army Transformation web page as of May 10 for the May 16, 2003 deadline.

Laurie Lucking e-mailed me that comments can still be made since the PA will be in the draft EIS.

But with a 1500-page EIS, extra comment time would have been helpful.

In light of the above, we request an extension.

Sincerely,

Cory Harden

Pohakuloa Coordinator
Sierra Club, Moku Loa Group

Responses

meetings were held to discuss a diverse range of interests on a more focused level. Invitees and specific agendas varied depending upon the particular issues involved, but these meetings have been attended by representatives from federal, state and county agencies; the media; cultural resources, hunting, engineering, conservation and civic groups; neighboring landowners; neighborhood boards; the Boy Scouts, and other community leaders, to name a few. The 15 May 2002 meeting was held specifically for key leaders from the island of Hawai'i and the invitation list was developed for a discussion aimed at that level. This meeting followed a series of Public Scoping meetings held several weeks earlier to inform the general public and encourage their input. The 16 July 2003 meeting was a specific Land Use meeting for an array of interested parties. Attendees included representatives from the County of Hawai'i, the Economic Development Board, Hawaiian Homelands, Royal Order of Kamehameha, The Nature Conservancy, Chamber of Commerce, University of Hawai'i at Hilo, a State Representative, State Senators, and, among others, Ms Harden herself from the Sierra Club.

N35-6

The Army has made, and will continue to make, itself openly available to communicate, coordinate, and interact with various individuals and groups in various manners and forums, to include through the Hawai'i Land Use Council (renamed Land Use Meeting). Therefore, we have determined that there is no need to establish a citizen's advisory council.

N35-7

The PA was submitted for public comment in April 2003 via a notice of availability published in the newspapers (same ones as the DEIS) and in OEQC. In addition, the PA was made available during the DEIS review and comments solicited through the DEIS comment period. The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS. The public comment period was extended to 90 days and ended on January 3, 2004.

COMMENTS ON ARMY TRANSFORMATION

ENVIRONMENTAL IMPACT STATEMENT

11-6-03

Cory (Martha) Harden

Pohakuloa Issue Coordinator for Sierra Club, Moku Loa Group

I applaud the Army for extending the comment deadline to January 3. This allows more time to address serious concerns about expansion.

N36-1

But on January 3, there will still be unexploded ordnance and other hazards left on the more than 50 old military sites scattered all over our island. The Army says it will take centuries to clean them up.

This is unacceptable.

Sierra Club's position is that the military should not take any new land until all the old sites are cleaned up.

Other people will say more about old sites. I'll be speaking about the EIS process.

The EIS process is flawed...

...to the point that Sierra Club asks the Army to set up a question and answer session to respond to serious concerns we have about the EIS.

N36-2

First flaw: the public has been prevented from participating in the EIS process.

People were arrested at EIS meetings in Honolulu... for carrying signs...which were allowed in previous meetings. These arrests violated their civil rights...and have chilling effect on others seeking to voice well-founded concerns about Army plans.

Responses

N36-1

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a BRAC, the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the FUDS program.

N36-2

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs. It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

Comments

**N36-2
cont'd**

The Army held two private expansion meetings and an unpublicized press conference in Hilo despite citizen protests about the need for open meetings.

15 or so people concerned about Army expansion plans set up a tour of Pohakuloa. The Army abruptly cancelled the tour... said some of the people were unacceptable...but refused to name these people.

I asked for a disability accommodation for this meeting and it was not provided.

N36-3

Second flaw: expansion seems to be a done deal.

Months before the draft EIS came out, the Army announced fire and emergency service would move from Kilauea Military Camp to Pohakuloa and said the decision was "directly related to the increased workload associated with PTA's Transformation Plan..."

Construction and research money for transformation was already in the military budget.

And Senator Daniel Inouye said he was assured that Hawaii would get a Stryker brigade.

Third flaw: pieces of the EIS are missing.

A few examples:

N36-4

There will be a vehicle wash, says the EIS...if utility requirements and space permit...so it's not clear whether we will have this protection against alien species.

The EIS refers to the reader to four sections that discuss airspace and noise impacts. I can't find any of those sections.

The EIS repeatedly refers to a Programmatic Agreement with the State Historical Preservation Office... says it may have been revised...and never resolves what version is being used.

To sum it up, Army actions endanger our island.

There is danger from abuse of the environment.

N36-5

There is danger from unexploded old ordnance.

And there is the danger of forgetting that in a democracy...

the people don't serve the will of the Army...

the Army serves the will of the people.

PO Box 10265 Hilo, Hawaii 96721 968-8965 mh@interpac.net

Responses

In regards to disability accommodations at the Hilo meetings, Ms. Harden had requested a well-ventilated room with no carpeting and no air conditioning due to health related issues. The Army held the meetings in a well-ventilated room and set up a live video feed of the meetings in the lanai area that was free of air conditioning and carpeting.

N36-3

Although the Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2nd Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2nd Brigade, 25th ID(L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law.

N36-4

This is a proposed mitigation measure. There will be a wash rack at PTA that should provide adequate protection; the proposed wash rack at Kawaihae is somewhat redundant and likely not feasible for logistical reasons.. Mitigation measures that will be included in the project will be identified in the FEIS and the ROD. Airspace impacts are discussed in Sections 5.4, 6.4, 7.4, 8.4, and in Chapter 9 – Cumulative Impacts. Noise impacts are discussed in Sections 5.6, 6.6, 7.6, 8.6 and in Chapter 9 – Cumulative Impacts. The final version of the PA was used in the Final EIS. The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS.

N36-5

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. Significant project impacts will be mitigated (see chapters 4-8 of the EIS). Ordnance removal on lands that are no longer under military ownership is not part of this proposed action but is handled through the Formerly Used Defense Program (FUDs). For information on FUDs projects and clean up status on the island of Hawai'i, you may contact Mr. Chuck Streck, the FUDs manager at the U.S. Army Corps of Engineers, (808) 438-6934.

Re: Draft Environmental Impact Statement—Transformation of the 2nd Brigade,
 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawai'i

Mesdames and Messieurs:

We are attorneys for Western United Life Assurance Company ("Western United"), the current owner of the real property in Mokuleia, Oahu, Hawaii, known as the "Dillingham Ranch". On Western United's behalf we present herewith, comments on the subject Draft Environmental Impact Statement (DEIS). While Western United is not opposed to the transformation in concept, the DEIS contains two significant deficiencies in evaluating the impact of the proposed travel corridor linking the Schofield Barracks Military Reservation (SBMR) and the Dillingham Military Reservation (DMR):

1. The singular focus on the "Dillingham Trail" alignment as the only travel corridor between SBMR and DMR fails to consider and fully address other viable alignments through Western United's property, the Dillingham Ranch.
2. The adverse environmental and economic impacts to Western United's property in Mokuleia—which the proposed alignment would bisect—have not been adequately addressed.

In particular, it is noted that salient information provided to your staff by Western United has been inexplicably ignored in the preparation of the DEIS. Western United finds this omission disturbing, given the pertinence of the information to the proposed action.

Consideration of Alternate Travel Corridors

N37-1 Over the past year, meetings were held by Western United representatives with project planners and engineers for the Army on numerous occasions. Based upon what Western United

Responses

N37-1

The Dillingham military vehicle trail alignment shown in the EIS is the Army's preferred alignment based on informal discussion with property owners. If the Army decides to implement the proposed action, the Army will coordinate with the property owners over the location of the proposed alignment. If the coordination results in a change in alignment which results in environmental impacts not analyzed in the EIS, the Army will conduct all appropriate NEPA, ESA and NHPA consultations prior to a final decision on a new alignment. As discussed in Chapter 2, the Army will be transporting munitions and other training supplies on Dillingham Trail. Section 4.12 discusses that the Army will implement its Spill Prevention Plan for all such activities. Anticipated impacts are expected to be less than significant.

Page 2 of 6

believed to be a frank and open dialog, Western United was under the impression that the parties were working in good faith to identify viable alternative alignments for the corridor that the convoys would traverse between SBMR and DMR. It was anticipated that the discussions would result in a comprehensive environmental evaluation of each of alternative routes. Instead, the DEIS is limited to the discussion of a single alignment, which provides no basis for a comparative assessment.

The extent of Western United's interaction with the Corps of Engineers and other parties representing the Army is summarized below:

**N37-1
cont'd**

- 5 March 2003: Western United's project attorney met with Carl Larson, Michael Sakai and Darren Walls of the Army Corps of Engineers. At that meeting, it was disclosed that the Army would be proposing a Stryker access corridor along an old cane haul road that bisects Western United's property. At that time, the Army's representatives were aware of the potential adverse impacts of this alignment to Dillingham Ranch, as well as to a neighboring banana farmer. At that meeting, it was indicated that the proposed alignment was preliminary and other options for the travel corridor would be explored.
- 10 April 2003: A subsequent meeting was held at the Corps of Engineers, during which Western United received a briefing of the proposed project from Michael Sakai, Darren Walls and Richard Rodier. At that meeting, a master plan of the proposed Dillingham Ranch development (a rural agricultural community consisting of 80 lots) was presented to your staff. It was emphasized that the planned community would be permitted under existing land use entitlements and that implementation of the development would not encounter extended processing times. In addition, it was pointed out that the easement for the former cane haul road (identified as the Dillingham Trail in the DEIS) had been cancelled when Dillingham Ranch was purchased in August 2002, reverting the easement to private ownership and use.
- 23 April 2003: A site inspection was hosted at Dillingham Ranch by company representatives, its project attorney, and its project planner for ten representatives of the Army from the Corps of Engineers, Division of Public Works and Environmental Division. The primary purpose of the site inspection was to explore alternative alignments for the proposed corridor. Western United representatives emphasized their ongoing efforts in implementing Western United's agricultural community master plan and the cancellation of cane haul road easement.

The merits and feasibility of two alternate alignments were identified and initially explored during the site inspection. These alternate alignments were:

- Alternative 1 – A mauka route using a portion of the existing DLNR road (called the Mokuleia Access Road in the DEIS) and a mid-level alignment for the corridor across Western United's property to reach the DMR,

Comments

Ms. Cindy Barger
January 2, 2004
Page 3 of 6

- Alternative 2 - A makai route that would use the DLNR road to reach Farrington Highway, an improved two-lane roadway. From this point, the corridor would use a one-mile segment of Farrington Highway running west to Dillingham Air Field to access the DMR.

At that meeting, the potential for a negotiated land purchase or exchange was also discussed in regard to approximately 1,000 acres of Western United's property that abuts the DMR.

- 21 July 2003: A subsequent site inspection was conducted at Dillingham Ranch with representatives of the Army, including Tom Piskel, Horace Puxitoy, Alvin Char and Victor Garo. The purpose of this follow-up inspection was to further explore a land exchange or purchase of portions of Western United's property for Army training and environmental mitigation. A test in regard to the feasibility of creating a mid-level route for the corridor, Alternative 1, was also conducted during this site inspection. The Directorate of Public Works requested a helicopter reconnaissance of the site, but such reconnaissance has not taken place.

At the second site inspection, it was again emphasized that the master plan for Dillingham Ranch had been prepared based on existing entitlements. Once again, the Army representatives present were reminded that the portion of the cane haul road easement through the property had been cancelled.

- 28 October 2003: Western United's project planner attended the public information meeting on the DEIS at the Honolulu Country Club. At that meeting, Western United representatives expressed Western United's concern to facilitators that the DEIS illustrated only the Dillingham Trail venue through Western United's property. Western United pointed out that the document failed to discuss the alternate alignments for the corridor—Alternate 1, which would create a mid-level route or Alternate 2, which would run makai and use a portion of Farrington Highway.

In light of the foregoing chronology, the discussion of only one alternative for establishing a travel corridor between SBMR and DMR—i.e., one that bisects Western United's property (see Land Acquisition/ Easements on pages 2-34, 2-35)—represents a serious deficiency in the DEIS.

Impacts to Dillingham Ranch

In addition to the singular focus on the proposed alignment for the Dillingham Trail, the related concern is the limited depth of the assessment as to how the proposed corridor would impact Western United's property. Specific comments on the DEIS are as follows:

- Section 4.2, Land Use/Recreation, page 4-5, states that impacts on land use were assessed based on whether "project activities" were: 1) consistent with state and local plans and 2) compatible with existing and planned land uses. The DEIS states minimally (in Chapter 6, Dillingham Military Reservation, Land Use/Recreation,

Responses

N37-2

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. The Dillingham Trail is discussed as a separate construction activity in Chapter 6 – Dillingham Military Reservation. Land use impacts are discussed in Section 6.2 – Land Use/Recreation including Dillingham Trail which has been called out in separate paragraphs throughout. The EIS does acknowledge that impacts would occur to current land use, however they are determined to be less than significant. Future property values are based on several factors that fall outside of the purview of the Army action. It would be speculative in nature for the Army to assume either positive or negative impacts to adjacent property values. If the Army decides to implement the proposed action, the Army will implement mitigation measures to help keep the proposed action to less than significant levels of impact where practicable.

N37-1
cont'd

N37-2

Comments

Ms. Cindy Barger
January 2, 2004
Page 4 of 6

**N37-2
cont'd**

Surrounding Land Uses, page 6-14) that Dillingham Ranch, a former cattle ranch, is approximately 1.6 miles west-southwest of DMR and that its uses includes horse stables. Environmental impacts associated with the proposed action relative to the acquisition of an easement and construction of the Dillingham Trail were judged to be less than significant and impacts were not expected to significantly affect land use (page 6-18). Western United strongly disagrees.

a. Since the corridor between SMBR and DMR is an integral part of training logistics, it should be considered a part of the "project area" and discussed as a major component of the proposed action. The DEIS did not discuss the impacts to planned land uses on or around the travel corridor, despite the fact that specific information had been provided as early as April 2003.

N37-3

b. The DEIS fails to address impacts to ranching operations, presently the primary land use activity and an integral element of Western United's master planned agricultural community. Degradation of the pristine environment of Dillingham Ranch, including noise, vibration, dust, visual distractions and other adverse impacts associated with convoy movements have not been addressed. These activities have a direct impact on Western United's livestock breeding operations, equestrian training facility, exercise yards and stables. In addition, the effects on the planned agricultural community are completely ignored.

N37-4

c. The DEIS does not disclose how access to the agricultural lots to be situated on the mauka portions of the property can be accommodated in the event the proposed Dillingham Trail corridor is implemented. Basic questions have not been addressed with respect to whether the proposed corridor would be fenced and gated, which would impede access and freedom of movement within Dillingham Ranch.

N37-5

Additional questions relate to whether the proposed corridor would create negative impacts with respect to safety, noise, air quality and vibration on the adjacent farm dwellings. Further questions relate to whether maintenance of the proposed corridor would create a visual blight that would impact the planned agricultural community.

N37-6

2. Section 6.7, Traffic, page 6-48, states that a perpetual easement of 55 acres would be acquired from private landowners for the Dillingham Trail. Should this occur, what provisions are contemplated to provide alternate access to present owners and lessees who have been using portions of the cane haul road to access their agricultural fields and homes? Does the Army intend to limit the Dillingham Trail to military use? This matter is not addressed by the DEIS.

N37-7

a. The DEIS fails to adequately address the environmental and economic impacts of the proposed corridor on the rural agricultural community proposed by Western United's master plan for Dillingham Ranch. As depicted in the DEIS, the Dillingham Trail follows a former cane haul road easement that has been legally

Responses

N37-3

If the proposed project is selected and the Army decides to acquire this easement, it will be a joint use road, accessible by both the property owner and the Army. The Army will work with the property owners on a notification process to minimize potential interference with regular farming practices.

N37-4

If the proposed project is selected and the Army decides to acquire this easement, it will be a joint use road, accessible by both the property owner and the Army. The Army will work with the property owners on a notification process to minimize potential interference with regular farming practices.

N37-5

The impacts of the proposed corridor and described in Chapter 6 – Dillingham Military Reservation. Significant but mitigable impacts to visual and cultural resources from land easements and trail construction were identified. There were no other significant impacts identified.

N37-6

If the proposed project is selected and the Army decides to acquire this easement, it will be a joint use road, accessible by both the property owner and the Army. The Army will work with the property owners on a notification process to minimize potential interference with regular farming practices.

N37-7

If the proposed project is selected and the Army decides to acquire this easement, it will be a joint use road, accessible by both the property owner and the Army. The Army will work with the property owners on a notification process to minimize potential interference with regular farming practices. Future property values are based on several factors that fall outside of the purview of the Army action. **N37-7
cont'd**

cancelled. The alignment for the proposed corridor would bisect the rural agricultural community and disrupt access to approximately 60 subdivided lots.

In terms of ranching operations, the proposed corridor would also impede the movement of livestock from the makai areas of the ranch to the mauka pastures that are a vital component of the working ranch. The Dillingham Trail would significantly affect the economic value of the working ranch and the master planned agricultural community. The decrease in economic value also creates potential hardships for the lot owners, which could lead to undesirable impacts on the social fabric of the community.

N37-8

- b. The DEIS fails to disclose details in regard to access. Will the entire corridor through Dillingham Ranch be fenced and gated as a security measure? Will there be provisions for access points to permit the required movement of livestock throughout the working ranch? Alternately, will unfettered access be permitted to the owners of the subdivided agricultural lots contemplated by the master plan for Dillingham Ranch?

N37-9

3. Section 6.7. Traffic, page 6-49, estimates the volume of military vehicle traffic between SBMR and DMR. The DEIS indicates that the maximum number of vehicles per convoy would be 24, sequenced at 15- to 30-minute intervals, with a maximum volume of 96 vehicles per hour. The convoys would be scheduled for non-peak hour traffic times. In terms of annual frequency, the convoys between SBMR and DMR would occur 4 times per year. The DEIS further states that the identified impact would be less than significant, and no mitigation would be necessary. Western United seriously questions the basis on which such a determination was made. Questions abound as to the criteria used to arrive at this conclusion. Specific points are as follows:

- a. What would be the total number of vehicles (not vehicle density) involved in a Company Level exercise? At what hours of the day would these convoys pass through Dillingham Ranch during each exercise (i.e., How early? How late?). What would be the duration of operations during the four scheduled exercises (i.e., one day, one week, one month or some other period?). At what speed would the convoy move through Western United's property? What would be the duration required for a typical convoy to pass through Dillingham Ranch?

N37-10

- b. During Company Level exercises, how would access across the proposed road be handled? Who would be liable for accidents at crossings? Would the owners of the agricultural lots have advance notice of scheduled exercises and convoy travel times? What accommodations would be made for the movement of private vehicles between the mauka and makai areas of Western United's property?

N37-11

- c. The DEIS does not disclose what would be transported through Western United's property during Company Level exercises. Although the DEIS states that only blank ammunition will be used at DMR, would any live ordnance be transported

N37-8

If the proposed project is selected and the Army decides to acquire this easement, it will be a joint use road, accessible by both the property owner and the Army. The Army will work with the property owners on a notification process to minimize potential interference with regular farming practices. The EIS has determined that there would be no significant impact from vandalism to other facilities by the implementation of the proposed action. If the Army decides to implement the proposed action, gates on the Dillingham trail will be coordinated with the property owner to prevent unauthorized use, reducing the risk of vandalism to other facilities in the area.

N37-9

If the proposed project is selected and the Army decides to acquire this easement, it will be a joint use road, accessible by both the property owner and the Army. The Army will work with the property owners on a notification process to minimize potential interference with regular farming practices. The proposed activity on this trail is as follows ; (1) Daily activity - range control vehicles patrolling daily with shift changes; (2) Frequent by non-daily activity - small military vehicle traffic (e.g. Jeeps); (3) Infrequent activity - Convoys of 10 or more vehicles. These convoys would be coordinated with the property owner prior to execution; (4) Twice a year activity - Convoys of 200 or more vehicles. When these convoys are proposed, they would also be coordinated with the property owner. Convoys of this size run in maximum of 20 vehicle groupings with space between convoy segments.

N37-10

If the proposed project is selected and the Army decides to acquire this easement, it will be a joint use road, accessible by both the property owner and the Army. The Army will work with the property owners on a notification process to minimize potential interference with regular farming practices.

N37-11

If the proposed project is selected and the Army decides to acquire this easement, it will be a joint use road, accessible by both the property owner and the Army. The Army will work with the property owners on a notification process to minimize potential interference with regular farming practices. This has been not been identified as a significant impact in the DEIS. The Army has a spill prevention plan to minimize the potential for spills and for fast response and cleanup to any spills that may occur.

Comments**Responses**

Ms. Cindy Barger

Page 6 of 6

**N37-11
cont'd**

through Dillingham Ranch as part of an exercise? Would hazardous materials, including but not limited to explosive munitions, petroleum products and chemical agents, be transported through Western United's property? What would be the risks associated with spills of hazardous materials, including the potential contamination of Western United's grazing lands and waterways? Would the Army be responsible for clean-up operations?

The DEIS is extremely deficient in addressing the potential impacts on Dillingham Ranch related to the proposed corridor through prime areas of the working ranch. In addition, the adverse impacts caused by the movement of convoys through Western United's property during the exercises at DMR have been ignored.

Conclusion

The Dillingham Trail, as discussed in the DEIS, would cut a major swath through Western United's property. The travel corridor would create significant consequences with respect to internal circulation, operation of the working ranch and the character of the planned agricultural community. The proposed corridor and the related convoy movements would generate significant adverse impacts on Dillingham Ranch that extend well beyond a 21-foot wide easement.

We urge the Army to fully address the two major deficiencies of the DEIS noted above, so that a comprehensive and accurate assessment of project impacts can be determined, including the consideration of appropriate mitigation measures.

Thank you for this opportunity to provide comments on the DEIS.

Subject: Waikii Ranch Meeting

Sir
 Good meeting with the Waikii Board of Directors this morning. They were very happy that we took the time to come see them and that we felt it important to get their thoughts.

Here were their concerns in order:

- N38-1** | 1 Buffer Zone required (The figure of 1 mile was thrown out but I believe it was not a formal or hardline request but a starting point for negotiations).
- N38-2** | 2 A road within the Buffer to act also as a fire break
- N38-3** | 3 Wildfire Management Plan in place (I brought with me Fire Chief Moller which they very much appreciate as fire is definitely a concern). Chief took some time to meet with their fire department representative and they express gratitude for our good neighbor policies.
- N38-4** | 4 They are concerned about the soil type of the area and what the real recovery period will be even if ITAM mitigation methods are utilized.

Responses

N38-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process

N38-2

The WFMP considers the potential need of firebreak and/or fuel breaks at all Army installations including West PTA if the Army decides to acquire this parcel. Specific locations of firebreak roads will be determined based on the recommendations of the IFSO. The WFMP and Army IFSO will ensure that all adjacent properties are protected from wild land fires including Waiki'i Ranch, if the Army decides to acquire West PTA Acquisition Area.

N38-3

The Army's Integrated Wildland Fire Management Plan has been completed and specific measures are detailed to reduce chance of and impact from wildfires. These measures are detailed in the biological resources chapters under appropriate mitigation and the hazards chapters.

N38-4

A full discussion of soil is located in Chapter 8.9.

Comments

- N38-5

5 They express concern about noise but feel that this can be mitigated by buffer.
- *They offered an alternative piece of land for the Army to consider on the South side of Waikoloa but did not elaborate much.
- N38-6

They did not believe they would gather big objections from their community on were the Military Vehicle Trail would be if there was a buffer.
- They also mentioned that it was much more favorable to have us own the land than another developer.
- They will submit their formal response to the EIS soon.
- Overall a good open discussion and feel for what their concerns are.

Letter
N39**COMMENTS ON THE ARMY TRANSFORMATION DRAFT
ENVIRONMENTAL IMPACT STATEMENT**

This document contains the comments of the Waikīi Ranch Homeowners' Association ("the Association") regarding the Army Transformation Draft EIS. These comments only address the West Pohakuloa Acquisition Area (WPAA) portion of the EIS.

LAND USE

The Draft EIS concludes the impact (Tables 4-1, 8-8) is "less than significant". The Association believes the impact from the proposed action is **Significant** for the following reasons:

The proposed WPAA land is presently owned by Parker Ranch and is zoned "agricultural" in the County of Hawaii General Plan. The draft EIS (8-27) acknowledges that, "The proposed training land use of agricultural grazing land at the WPAA is not consistent with the land use set forth in the County of Hawaii General Plan."

N39-1

However, the draft EIS fails to address or acknowledge that the proposed WPAA land is located in an "agricultural district" regulated under the State Land Use classification system established by HRS Chapter 205 and administered by the State Land Use Commission ("LUC"). Permitted activities and uses in an agricultural district include: "cultivation of crops, orchards, forage, and forestry; farming activities or uses related to animal husbandry, aquaculture, and game and fish propagation; . . . wind generated energy production . . . ; bona fide agricultural services and uses which support the agricultural activities of the fee or leasehold owner of the property. . . ." HRS § 205-2(d). The military uses proposed for the WPAA land are not consistent with the state agricultural land use classification.

The State LUC must approve land use district boundary amendments involving land areas greater than 15 acres. HRS § 205-3.1(a). Under HRS § 205-4(h), the LUC may approve an amendment of a land use district boundary only if the petitioner establishes by a preponderance of the evidence that the proposed amendment does not violate HRS § 205-2 (districting and classification of lands) and is consistent with policies and criteria established pursuant to HRS § 205-16 (compliance with Hawaii state plan) and § 205-17 (decision-making criteria). The LUC must consider the proposed reclassification's impact on the preservation or maintenance of important natural systems or habitats; maintenance of valued cultural, historical, or natural resources; and maintenance of other natural resources relevant to Hawaii's economy, including but not limited to, agricultural resources. HRS § 205-17. The Department of the Army must obtain a state land use boundary amendment before proceeding further.

Responses

N39-1

During the EIS review process, the Army has coordinated with Natural Resource Conservation Service and is compiling with all requirements of the Farmland Policy and Protection Act (FPPA). (See Sections 4.2, 8.2, and Appendix E.) If the Army decided to implement the proposed action, the management and use of the West PTA acquisition area would be conducted per federal regulations and guidelines. State regulations and guidelines do not apply to federal actions. However, the Army has considered State policies in its overall assessment of impacts in the EIS. In following FPPA requirements, CEQ guidance and Army policy, the Army has determined that the proposed conversion of West PTA acquisition area is consistent with these regulations and guidance and the impact would be less than significant.

N39-1
cont'd

Hawaii State Third Circuit Court Judge Ronald Ibarra recently ordered a developer to stop all work on a several hundred acre residential development of agricultural lands in Kona in *Kelly v. 1250 Oceanside Partners*, Civil No. 00-1-0192K (Third Circuit Court, State of Hawaii). Although the developer had previously obtained the County of Hawaii's approval of its residential subdivision, Judge Ibarra required the developer to obtain reclassification of the agricultural lands before the State LUC. Military training on the WPAA land that will cause air quality impacts and soil loss due to wind and water erosion (5.5, 5.9, 7.5, 7.9, 8.5, 8.9) is not an appropriate use of agricultural land. Given Judge Ibarra's ruling in the *Oceanside* case, the Department of the Army must apply for and obtain a district boundary amendment for the WPAA lands before it may proceed with any military uses.

Uses that are not expressly permitted in the agricultural district in HRS Section 205-4.5(a) are prohibited under HRS Section 205-4.5(b) with limited exceptions. The exceptions are: (1) uses allowed under special permits granted under HRS Section 205-6, and (2) nonconforming uses that preexisted the establishment of the agricultural district under HRS Section 205-8. HRS Section 205-4.5(b). The County Planning Commission may grant special permit for areas of land fifteen acres or less. HRS Section 205-6(d). However, special permits for areas of land greater than fifteen acres are subject to the approval of the Land Use Commission. *Id.*

The Hawaii Supreme Court recently held that HRS Chapter 205 "clearly limits the permissible uses allowed within an agricultural district. *Save Sunset Beach Coalition v. The City and Count of Honolulu*, No. 21332, slip op. at 35 (Haw. Oct. 20, 2003). In *Save Sunset Beach Coalition*, the Court held that special permits granted under HRS Section 205-6 to allow "unusual and reasonable uses" within an agricultural district other than those for which the district is classified "cannot be utilized to circumvent the essential purpose of the agricultural district." *Save Sunset Beach Coalition*, slip op. at 36. The use "[can] not change the essential character of the agricultural district nor be inconsistent therewith" and may "not contravene the general purpose of an agricultural district." *Id.*

The land use reclassification/boundary amendment process is complex, and requires the LUC to consider and evaluate a number of criteria set forth in HRS § 205-17. Hawaii courts take these criteria seriously. One of the criteria, for example, requires the LUC to consider impacts on cultural and historic resources. In *Ka Pa'a Kai O Ka'Aina v. Land Use Commission*, 94 Hawai'i 31, 7 P.3d 1068 (2000), the Hawai'i Supreme Court reiterated that state agencies like the Land Use Commission had an obligation to protect, to the extent possible, traditional and customary practices of Native Hawaiians protected by Hawaii's Constitution, Article XII, Section 7. In order to protect these practices, the Court held that the LUC needed sufficient information to understand what practices existed, the extent of the practices, and how the development would affect those practices. In other words, the LUC or the petitioner was required to prepare the equivalent of a cultural impact statement. In 2000, the State Legislature amended Hawaii's environmental impact assessment/statement law and NEPA equivalent, HRS Chapter 343, expressly requiring an evaluation of impacts on cultural practices in

environmental assessments and impact statements necessary for state permits like an LUC boundary reclassification. HRS § 343-2. The State Office of Environmental Quality Control, the agency charged with administering portions of HRS Chapter 343, has required that assessments of a proposed action on cultural practices include all ethnicities. Reclassification of the WPAA lands owned by Parker Ranch that are in the agricultural district may require an inquiry into the effects on the ranching or "paniolo" culture, which are not discussed in the draft EIS.

Chapter 8.9 (8-104) states that "the loss of other important agricultural lands through conversion to military use is considered a significant impact, pending a formal determination by NRCS. The impact is considered potentially mitigatable and is discussed in the section on Land Use." However, Chapter 8.2's (land use) description of possible mitigation is so vague that the Association cannot reasonably determine whether or not the impacts will be reduced to non-significant levels. The draft EIS provides that Integrated Training Area Management (ITAM) program would be used "to identify and mitigate potential impacts on the land." (8-28). The draft EIS claims that the Army is "considering establishing a cooperative relationship with the landowner to allow continued grazing at WPAA in conjunction with training on the land, subject to constraints posed by training." Given that the number of training exercises would increase to 40 to 60 exercises per year in the WPAA, and that these activities may strip areas of vegetation and necessitate revegetation efforts that have been unsuccessful in the PTA in the past (8-105), the idea of continued grazing in the WPAA and other agricultural areas seems implausible or impractical. The "mitigation" proposed in the draft EIS does not appear to reduce the potential impacts to non-significant levels.

AIR QUALITY

The Association agrees with the conclusion that the proposed action under the subjects "Fugitive dust from military vehicle use" and "Wind erosion from areas disturbed by military vehicle use" is **Significant**. In addition we believe another Impact Issue should be added, that being "Wind erosion from areas burned by wildfires". The impact of this subject would also be **Significant**. We also request the portions of Chapter 4.5 and 8.5 relating to the dust storms at Waiki'i Ranch in 1999 be rewritten to reflect the severity of what actually took place.

The use of the WPAA land for off road exercises and the highly increased risk of wildfires (and resulting dust storms) will cause a significant degradation of air quality. The fine dust will be a hazard to the health of Waiki'i Ranch residents. It will also cause property damage.

The references in the draft EIS to a dust storm (4.5 & 8.5) resulting from a wildfire in the WPAA implies that there was a single and discrete dust storm. However, after the fire, dust storms occurred several times a week for a period of over two months. Affected homes at Waiki'i Ranch were evacuated for over two months. Dust accumulated in homes at a rate of up to ¼ inches per week, even though the homes were sealed to the

N39-2

Conversion of the WPAA to military use is described as a less than significant impact in Section 8.2.2. However, it is possible that cattle grazing would continue on the WPAA. If the Army decided to implement the proposed action, the Army would weigh the potential of continued cattle grazing on the proposed West PTA acquisition area based on the potential benefits to fire reduction, potential interference with ongoing Army training, and requests of local cattle ranchers. If the Army decided that cattle grazing were appropriate, cattle would be managed so as to avoid any overgrazing and any resulting significant soil erosion. In accordance with Army Regulations 350-4, the mandate of the ITAM program is to manage land for Army training and repair damage incurred by Army training. As part of this mandate, this would also include any related actions such as managing land for grazing or repairing damage caused by the cattle. Continued use of the WPAA for agricultural purposes, consistent with Army use, would result in a less than significant impact on the community. However, as discussed in Chapter 9, the Army acknowledges that the cumulative impact on the conversion of agricultural lands from past, present and reasonable foreseeable future actions would be significant. The farmland conversion rating forms are included in Appendix E of the Final EIS.

N39-3

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas and training activities. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant. A separate analysis was added to Chapters 4.3, 5.3, 6.3, 7.3, and 8.3 - Visual, concerning the impacts of dust on the visual resources. In the Final EIS, the Army has expanded the discussions on the potential risks of wildland fires from the Proposed Action.

Comments

- N39-3 cont'd** extent possible. Many of the furnishings were ruined, and the rest had to be moved out, cleaned, and placed into temporary storage until the dust storms eased. Each homeowner's insurance claims were quite large.
- N39-4** Dust caused by military vehicle use and erosion (both from military vehicle use and wildfires) will also cause visual impacts. During the dry season, it is common to see dust clouds created by vehicles from miles away. However, a discussion of visual impacts (i.e., dust plumes from military vehicle use) is not included in Chapter 8.3 of the draft EIS. We request that the Department of the Army make further inquiry into and discuss these visual impacts. We believe that these impacts are significant and may not be mitigatable due to the lack of a ready source of water available for dust control during training activities.
- N39-5** Dust will also likely cause human health impacts and hazards, exacerbating medical conditions such as asthma or other lung diseases (e.g., lung cancer). Several homes at Waiki'i Ranch were evacuated for several months following dust storms in large part because of health concerns. Although Chapter 8.5 (8-51) mentions fugitive dust emissions "are important because they are easily airborne and are small enough to be inhaled deep into the lungs creating potential adverse health effects," Chapters 8.5, 8.12, and Appendix G do not address the impact of increased dust emissions on human health, particularly on the residents of Waiki'i Ranch who will be closest to, and surrounded on three sides by, the activities proposed for the WPAA. We believe that these potential health impacts may be significant and non-mitigatable.
- N39-6** We request that further inquiry be made into the human health hazards associated with the increased fugitive dust and wind erosion and that a discussion be included in Chapter 8.12.

Responses

As discussed in Section 8.5 - Air Quality the impacts from wildland fires is proposed as significant but mitigable to less than significant with the implementation of the updated IWFMP and other measures. The updated IWFMP is available upon request.

N39-4

A separate analysis was added to Section 8.3 - Visual, concerning the impacts of dust on the visual resources.

N39-5

The Army's analysis has determined that there would be no significant impacts on human health and safety that cannot be mitigated to less than significant level. The impacts of the project on human health and safety can be found in section 8.12 - Human Health and Safety Hazards in the FEIS. The finding of no significant impact is based in part of the Air Quality analysis. The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations as described in Section 8.5. The implementation of the Integrated Wildland Fire Management Plan would reduce the overall risk of fire to less than significant. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

N39-6

The discussions in Section 8.12 have been expanded in the Final EIS to better discuss the potential impacts of wildland fires and fugitive dust. The Army's analysis has determined that there would be no significant impacts on human health and safety that cannot be mitigated to less than significant level. The impacts of the project on human health and safety can be found in section 8.12 - Human Health and Safety Hazards in the FEIS. The finding of no significant impact is based in part of the Air Quality analysis. The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations as described in Section

Responses

8.5. The implementation of the Integrated Wildland Fire Management Plan would reduce the overall risk of fire to less than significant. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. NOISE

- N39-7** The increase in noise levels due to small arms fire and heavy weapons simulators is discussed in Chapters 4.6 & 8.6. The conclusion in 4.6 under the subject of "Noise from ordinance use" is "Significant". The conclusion in 8.6 is "Significant, but mitigable to less than significant". Table ES-5 adopts the conclusion of 8.6. This is inconsistent. The Association believes the impact from the proposed action is **Significant** for the following reasons:
- N39-8** Waiki'i Ranch was developed and sold as a place where residents could live in a quiet peaceful environment. The location of the Ranch on sloping mountainside land is conducive to very efficient sound transmission. A dog barking a mile away is loud enough to be a nuisance. The center of the Ranch is approximately 9 miles from the headquarters area of Pohakuloa. When military training is taking place at Pohakuloa, the concussion from artillery and mortar fire is enough to rattle windows and shake the ground. Small arms fire can be heard clearly, particularly at night. Although no one on the Ranch likes this, it is accepted because the range was there before our community, and we knew what to expect in advance. Allowing additional sources of this type of noise to within less than ¼ mile from our borders is unacceptable.
- N39-9** The discussions in 4.6 and 8.6 maintain that the noise levels from small arms fire and weapons simulators can be mitigated to a reasonable level by maintaining a distance of 500 feet (1,000 feet at night) from the borders of Waiki'i Ranch. We do not agree with this conclusion. The amount of noise that will be generated from training exercises and the frequency of those exercises on the WPAA will be significant, and will impact life on Waiki'i Ranch in an extremely negative manner. The mitigation proposed – a 500 foot buffer – is insufficient to mitigate noise impacts, given the Association's prior experience with training exercises at PTA. The 1,000 foot buffer for nighttime activities is also insufficient.
- The impact of noise on humans is dependent on the normal background noise level. A 75 dB sound against the normal background noise level of a city is not a significant event. However, the same sound in a place like Waiki'i Ranch (with almost no background noise) is perceived as very loud.
- N39-10** The noise testing done for the EIS is incomplete. There was no testing with weapons induced impulse sound sources from points within the WPAA. The Association requests the Department of Army to conduct on the ground tests at Waiki'i Ranch in consultation with the Association to determine the actual impulse noise impact from the ammunition and weapons simulators proposed to be used in the WPAA. In addition to measurement with electronic equipment, a neutral third party needs be present to provide a human impression of the noise impact from the weapons firing tests. We believe that such tests will reveal the impact of weapons noise to be at an unacceptable level.
- There also appears to be a typographical error or portion missing on page 8-65 of the draft EIS, first sentence, which states: "Use of blank ammunition and simulator devices

Responses

N39-7

These sections have been revised in light of an additional noise analysis. Noise impact discussions regarding training activities at WPAA have been expanded in Section 8.6 in the Final EIS to include current estimates of helicopter flight activity at WPAA as well as additional information on small arms firing noise. The discussions also include information on the typical extent of annoyance related to the corresponding noise levels. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels. As discussed in Section 8.6, impacts to noise from the Proposed Action at PTA are significant but mitigable to less than significant. Current noise levels are in compliance with the Army standards. If the Army decides to implement the Proposed Action, the Army proposes to mitigate noise levels at WPAA with a 1,000 foot daytime noise buffer and a 2,000 foot nighttime noise buffer on training activities.

N39-8

These sections have been revised in light of an additional noise analysis. Noise impact discussions regarding training activities at WPAA have been expanded in Section 8.6 in the Final EIS to include current estimates of helicopter flight activity at WPAA as well as additional information on small arms firing noise. The discussions also include information on the typical extent of annoyance related to the corresponding noise levels. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels. As discussed in Section 8.6, impacts to noise from the Proposed Action at PTA are significant but mitigable to less than significant. Current noise levels are in compliance with the Army standards. If the Army decides to implement the Proposed Action, the Army proposes to mitigate noise levels at WPAA with a 1,000 foot daytime noise buffer and a 2,000 foot nighttime noise buffer on training activities.

N39-9

As described in Section 8.6, if the Army decides to implement the Proposed Action, the Army proposes to establish a minimum 1,000 foot daytime noise buffer around Waiki'i Ranch property and the Kilohana Girl Scout Camp. In addition, the Army will consider training guidelines that minimize nighttime training activities that involve weapons fire or aviation activity within a minimum of 2,000 feet of those properties. The Army will continue to work with affected communities on noise buffers and may adjust the buffer size dependent upon these discussions.

Comments

N39-11

in the WPAA area may create noise problems in the Waiki'i Ranch development and the Kilohana Girl Scout Camp, both of which share fence line boundaries with the Peak unweighted noise levels from blank ammunition typically would be about 94 dB at 2,500 feet from the most common types of arms." Portions of this sentence do not make sense, and we suspect there is something is missing.

GEOLOGY AND SOILS

N39-12

The discussion in Chapter 8.9 is a thorough treatment of the soils and geology of the WPAA. We agree with the conclusion under the subject of "Soil Loss" in Table 8-18 that the impact is "Significant".

The Association believes the impact from "Soil erosion and loss from wildland fires" (Table 8-18) should be changed to **Significant** for the following reasons:

Our first hand experience with the effects of a nearby wildland fire in 1999 has shown us how extreme the effects can be. After the fire, nearly every day, large quantities of exposed topsoil were lifted by the wind and blown away. This went on for several months until the topsoil was essentially gone. The recovery of the affected area has been extremely slow. There are still areas of bare earth where plant life has not been able to reestablish itself.

N39-13

The draft EIS proposes certain mitigative measures, including land management and rehabilitation measures in the ITAM program, to reduce impacts to non-significant levels. However, the draft EIS acknowledges that Army's revegetation efforts in the PTA (presumably pursuant to the ITAM program) have been, to date, unsuccessful (8-105). Accordingly, the assumption that the proposed mitigation will reduce soil erosion and wildland fire impacts to non-significant levels appears to be unfounded.

Rainfall in the Waiki'i Ranch area ranges from an average 23 inches per year (long term Parker Ranch records) at the higher elevations to an average of 15 inches at the lower elevations. The WPAA spans an area that receives less than 10 inches a year at the lowest elevations, to 25 inches a year at the upper elevations. This is an arid (almost desert) climate zone. The ground cover of Kikuyu grass normally protects the topsoil from wind erosion, even though there are months at a time when it is brown from lack of rain.

N39-14

The proposed mitigation measures that involve reseeding and watering eroded areas are unrealistic. For such a plan to be effective, large amounts of water are needed. The Army has no source of water, and must truck water to Pohakuloa at great expense. The nearest source of water to the WPAA is the water system at Waiki'i Ranch. The two wells are over 4,000 feet deep, and are the deepest wells in the state. The direct cost of producing water for Waiki'i Ranch is \$8.50 per 1,000 gallons. The water system is run as a non-profit utility. The initial capital cost of each well was over \$1,000,000. This does not include the storage reservoirs and distribution system. It is unlikely that

Responses

N39-10

Noise impact discussions regarding training activities at WPAA have been expanded in Section 8.6 in the Final EIS to include current estimates of helicopter flight activity at WPAA as well as additional information on small arms firing noise and larger weapons. The discussions also include information on the typical extent of annoyance related to the corresponding noise levels. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels. As discussed in Section 8.6, impacts to noise from the Proposed Action at PTA are significant but mitigable to less than significant. Current noise levels are in compliance with the Army standards. If the Army decides to implement the Proposed Action, the Army proposes to mitigate noise levels at WPAA with a 1,000 foot daytime noise buffer and a 2,000 foot nighttime noise buffer on training activities.

N39-11

The acronym WPAA was inadvertently left out. It has been inserted into the text in the Final EIS.

N39-12

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

N39-13

After further analysis the Army has changed the impact analysis on soil loss from training activities to significant. Although the mitigation measure described in Section 8.9 will reduce the impacts considerably they will not reduce them to less than significant. However, as discussed most of this soil loss will be from dust erosion the measures to be implemented (described below) will reduce soil erosion from other causes to less than significant and would minimize erosion into surface waters. Therefore their impacts to surface water quality due to soil erosion is still considered less than significant. The mitigation measures that will be put in place include: The Army will develop and implement a Dust and Soils Management and Monitoring Plan (DuSMMoP) for the training area. The plan will address measures such as, but not limited to, restrictions on the timing or type of training during high risk conditions, vegetation monitoring, soil monitoring, and buffer zones to minimize dust emissions in populated areas. The plan will determine how

Comments

the Army can produce water for less, assuming they invest millions in capital expense to build a water system.

N39-15

The soil in the Waiki'i area is so fine that large amounts of water are required during home construction for dust control. A home project on a forty acre lot has consumed over 600,000 gallons of water per month from June-October, 2003 just for dust control. The expense of using water for dust control and regrowth of vehicle and wildfire eroded land in the WPAA will be huge.

N39-16

The WPAA area surrounding our borders has almost no human traffic. The risk of fire is currently low. However, the addition of heavy vehicles and warfare simulation with explosive and pyrotechnic devices raises the risk of fire exponentially. The potential for severe damage to our community is very high, if WPAA is used as planned.

Responses

training will occur in order to keep fugitive dust emissions below CAA standards for PM10 and soil erosion and compaction to a minimum. The Army will monitor the impacts of training activities to ensure that emissions stay within the acceptable ranges as predicted and environmental problems do not result from excessive soil erosion or compaction. The plan will also define contingency measures to mitigate the impacts of training activities which exceed the acceptable ranges for dust emissions or soil compaction..

However the Army has determined, that with implementation of the following measures and programs the loss of soil from wildland fires would be significant but mitigable to less than significant. First the potential for a fire would be minimized by the Integrated Wildland Fire Management Plan. Since the publication of the Draft EIS, the Army has updated the Integrated Wildland Fire Management Plan (IWFMP). This update considered the issues surrounding the Makua Valley wildland fire of July 2003 and includes protocols to reduce the risk of a similar fire. As discussed in the Executive Summary, Sections 4.10 and 4.12, the IWFMP is proposed as mitigation to reduce the severity of the risk of wildland fires. The IWFMP is available upon request. The Army will also implement land management practices and procedures described in the ITAM annual work plan to reduce erosion impacts (US Army Hawai'i 2001a). Currently these measures include: implementation of a training requirement integration (TRI) program; implementation of an Integrated Training Area Management (ITAM) program; Sustainable Range Awareness (SRA) program; development and enforcement of range regulations; implementation of an Erosion and Sediment Control Management Plan; coordinating with other participants in the Koolau Mountains Watershed Partnership (KMWP); and continued implementation of land rehabilitation projects, as needed, within the Land Rehabilitation and Maintenance (LRAM) program.

N39-14

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented. The use of the mitigation measures described by the commenter will be evaluated using the cost benefit analysis described above.

Comments

Military Armored Vehicle Traffic in WPAA just west of the western border
of Waiki'i Ranch. 2002

Responses

N39-15

As a mitigation measure, the Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/ or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. There are no indications that wind erosion is a significant problem at locations on USARHAW installations where there is no disturbance by vehicle maneuver traffic. The installation of nets, tarps, or other protective covers in barren areas where there is no vehicle use might help reduce general precipitation-related soil erosion, but such actions would have little effect in addressing fugitive dust issues.

N39-16

As a measure to reduce the risk of wildland fires, the Army has updated and improved the Integrated Wildland Fire Management Plan. This plan was updated in October 2003 and is being fully implemented at all Army installations. The plan will be implemented to any new lands that the Army may acquire. The plan is available upon request.

Comments

HUMAN HEALTH AND SAFETY HAZARDS

There are very real human health and safety hazards to the residents of Waiki'i Ranch if the WPAA plan is implemented. These hazards are not adequately addressed in this section of the EIS, Chapter 8.12.

N39-17

Chapters 4.5 and 8.5 (Air Quality) acknowledge that dust generated by vehicles and the subsequent wind erosion has the potential to create adverse health effects. (See above discussion on air quality.) The same chapters conclude that dust generation has a "**Significant**" impact, and is not mitigable. This should be included in the Human Health and Safety Chapters, and further studies and analyses should be completed to determine the health effects of the increased dust on residents of Waiki'i Ranch

Further, the increased threat of wildfires is a direct threat to human health and safety, especially at Waiki'i Ranch. The draft EIS characterizes the increased chance of fire itself, and the likelihood of dust storms after the fire as significant, but mitigable to less than significant. (See above discussion on air quality.) We believe that an impact issue titled "Dust Particle Inhalation" should be added to the EIS, and that careful study and analysis of this issue will result in a determination that the potential impacts are **Significant**. For the same reasons, we believe that the impact from wildfires is potentially **Significant** and non-mitigable.

SOCIOECONOMICS

These chapters (4.13 and 8.13) completely ignore the socioeconomic impact upon the residents of Waiki'i Ranch that will occur if the WPAA plan is implemented. The Association believes the following impact subjects should be added to the Socioeconomic and Environmental Justice Chapters. These are "Loss of enjoyment of property" and "Loss of property value". Both of these impacts should be labeled as **Significant** for the following reasons:

N39-18

Waiki'i Ranch is surrounded by agriculturally zoned land. It was developed and sold as a place where a peaceful and tranquil rural life style could be enjoyed. The planned non-conforming use of the surrounding agricultural land involves health hazards, noise, and a highly increased threat of wildfires. This is certainly a significant social issue. In addition, the Army's planned acquisition of the surrounding agricultural land has already affected property values, and will have a greater effect if the plan is implemented. Local realtors have already reported lost sales when their clients learned of the Army's plans for the land that surrounds our community.

N39-17

The Army's analysis has determined that there would be no significant impacts on human health and safety that cannot be mitigated to less than significant level. The impacts of the project on human health and safety can be found in section 8.12 - Human Health and Safety Hazards in the FEIS. The finding of no significant impact is based in part of the Air Quality analysis. The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations as described in Section 8.5. The implementation of the Integrated Wildland Fire Management Plan would reduce the overall risk of fire to less than significant. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Army has determined that with the implementation of the IWFMP the impacts to Human Health and Safety would be significant, but mitigable to less than significant. The Army's analysis has determined that there would be no significant impacts on human health and safety that cannot be mitigated to less than significant level. The impacts of the project on human health and safety can be found in section 8.12 - Human Health and Safety Hazards in the FEIS. Comments

ALTERNATIVES

We present three alternatives to the published plan for the WPAA. We believe the probability is high that any one of these alternatives could mitigate the impact of army training operations in the WPAA to a tolerable level for the residents of Waikī'i Ranch. We believe these alternatives (and possibly others) to the proposed WPAA should be discussed in the final EIS.

N39-19 Even with a substantial buffer zone around Waikī'i Ranch, the issue of heavy weapons simulators will still have to be addressed, since our experience has shown that heavy weapons detonation, even at distances of over 5 miles, shakes the ground, rattles windows, and is generally unsettling.

1. Purchase the 23,000 acres from Parker Ranch as originally planned, and establish a 1.5 mile wide buffer zone around the borders of Waikī'i Ranch.

N39-20 Build a combination road / firebreak entirely around the border of the buffer zone. Fence the Waikī'i side of the road, and graze the buffer area with cattle when there is enough rain to promote growth of grass. Manage the area so the cattle are removed during periods of low rainfall. No army training activities would take place in the buffer zone. This buffer with fire break and controlled grazing would reduce the risk of wildfires, allow dust to disperse, and attenuate the noise generated by army training.

2. Modify the purchase of Parker Ranch land to exclude the 1.5 mile buffer zone around Waikī'i Ranch.

N39-21 Build a road / firebreak around the perimeter of the border of the buffer zone. Parker Ranch would continue to graze their cattle in the buffer zone.

3. Purchase land west of the Mamalahoa highway and east of Waikoloa Village.

N39-22 There are large tracts of undeveloped and uninhabited land (see map) west of Highway 190 that are suitable for off-road training using the Stryker vehicle. That area includes portions of the Pu'u Pa Maneuver area and the Recommended Cleanup area. The land is marginal agricultural grazing area, and is sparsely vegetated. The soil is firmer and more compacted than that in the Waikī'i area. The problem of dust generation by the vehicles should be less than in the presently planned WPAA. Since the PTA Trail goes right through this area, there is good access for training. A buffer of several miles can be maintained from Waikoloa Village and still leave a large area available for training.

Responses

N39-18

Future property values are based on several factors that fall outside the purview of the Army action. It would be speculative in nature for the Army to assume either positive or negative impacts on adjacent property values. The discussions and analysis in Sections 8.2, 8.3, 8.5, 8.6, and 8.12 were expanded in the Final EIS. Based on the expanded analysis, the Army changed the determination of effect in some cases.

N39-19

These sections have been revised in light of an additional noise analysis. Noise impact discussions regarding training activities at WPAA have been expanded in Section 8.6 in the Final EIS to include current estimates of helicopter flight activity at WPAA as well as additional information on small arms firing noise. The discussions also include information on the typical extent of annoyance related to the corresponding noise levels. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels. As discussed in Section 8.6, impacts to noise from the Proposed Action at PTA are significant but mitigable to less than significant. Current noise levels are in compliance with the Army standards. If the Army decides to implement the Proposed Action, the Army proposes to establish a minimum 1,000 foot daytime noise buffer around Waikī'i Ranch property and the Kilohana Girl Scout Camp. In addition, the Army will consider training guidelines that minimize nighttime training activities that involve weapons fire or aviation activity within a minimum of 2,000 feet of those properties. The Army will continue to work with affected communities on noise buffers and may adjust the buffer size dependent upon these discussions.

N39-20

If the Army decides to implement the proposed action, the Army proposes mitigation measures to reduce the potential impacts from dust, wildland fires and noise at WPAA. In Section 8.5, the Army has conducted more detailed analysis and incorporated mitigation measures for training at WPAA that would reduce the significant impact from fugitive dust to Waikī'i Ranch to less than significant levels. If the Army decides to implement the Proposed Action, the Army proposes to establish a minimum 1,000 foot daytime noise buffer around Waikī'i Ranch property and the Kilohana Girl Scout Camp. In addition, the Army will consider training guidelines that minimize nighttime training activities that involve weapons fire or aviation activity within a minimum of 2,000 feet of those properties. The Army will continue to work

Re: Proposed Army Trail from Kawaihae Harbor to PTA.

N40-1

We have been alerted by Waikoloa Land Co. that our property can not be used for easements to the Army due to restrictions in the conveyance documents. This apparently puts an end to our discussions on using some of our area to build a new trail.

I have revised the attached drawing of the proposed route to indicate an alternative if you do not use the existing trail.

Coming from Kawaihae and proceeding south across the property of the State of Hawaii-Palekoki Ranch Inc. and at the property line of WVA, veer southeastward to a point above the water company's wellfield along our property line with Parker Ranch, Richard Smart Trust. Then veer almost straight east along the Parker Ranch line to the Mamalahoa Hwy. crossing point now existing as part of the Old Tank Trail. Once you have crossed the Highway you would be on the 23,000 acres you are planning to purchase from Parker Ranch for maneuverability training without having to obtain easements or other arrangements.

I have annotated the new route in purple ink.

Sincerely

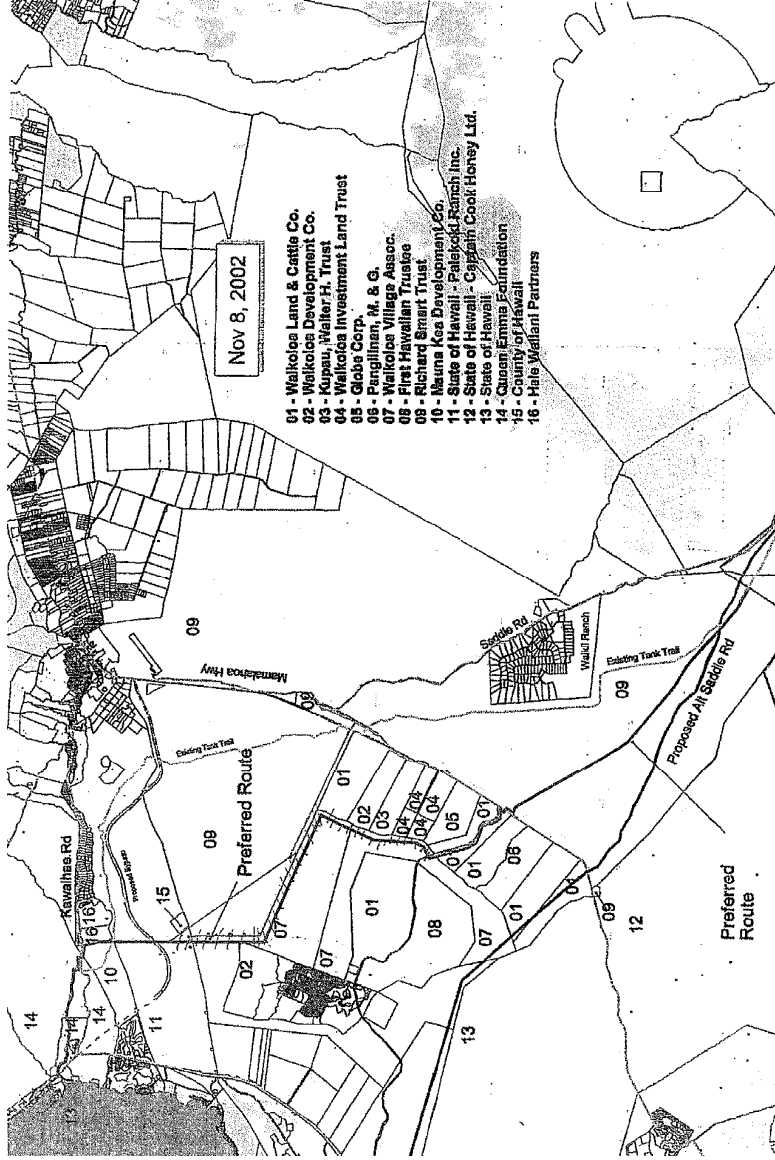

John Schick, CMCA, PCAM
General Manager, WVA

Responses

N40-1

The Army is continuing discussion with Waikoloa Village and all property owners on the potential acquisition of property by the Proposed Action. If the Army decides to implement the Proposed Action, the Army will continue to work with property owners on the final trail alignments. If the proposed trail alignment changes, the Army will negotiate with the property owners on a new alignment and will conduct appropriate analysis and appropriate documentation in accordance with NEPA, ESA, and NHPA.

WEST HAWAII WATER COMPANY

Letter
N41

VIA CERTIFIED MAIL

December 19, 2003

U.S. Army Corps of Engineers, Honolulu District
 Building 230, Room 306
 Fort Shafter, HI 96858

Attention: Ms. Cindy Barger

**RE: DRAFT EIS FOR THE 2ND BRIGADE, 25TH INFANTRY DIVISION (L)
 TO A STRYKER BRIGADE COMBAT TEAM (SBCT) IN HAWAII**

Dear Ms. Barger:

This letter is to inform you of the comments of Waikoloa Water Co., Inc., also known as West Hawaii Water Company ("WHWC"), on the proposed relocation of tank trail for the proposed 25th Infantry Division Stryker Brigade Combat Team as described in the draft EIS dated October 2003. The water wells that provide potable water to Waikoloa Village and Waikoloa Beach Resort are located mauka of Waikoloa Village. The proposed new route for the Pohakuloa to Kawaihae (PTA) Trail traverses (a) the wellhead protection area for these wells, and (b) the area used by WHWC to operate these wells. (See Attachments A and B)

WHWC is concerned about this route for to the following reasons:

N41-1

1. Potential for Well Water Contamination. The Hawaii Wellhead Protection Program [Section 1428 of the 1986 Amendments to the EPA Safe Drinking Water Act] and the Source Water Assessment and Protection Program [Section 1453 of 1996 Amendments of the EPA Safe Drinking Water Act Mandated to Establish a National Source Water Assessment and Protection Program] regulate activities that can be detrimental to drinking water resources. The proposed new location for the PTA Trail falls within both the wellhead protection area for WHWC's potable well fields and the area used by WHWC to operate the wells. Relocating the PTA Trail within these areas would make the wells vulnerable to contamination from fuel spills or other contamination.

N41-2

2. Wind Blown Dust Problems. The proposed new PTA Trail location traverses and runs along adjacent property immediately upwind of WHWC's well field wells. Fugitive dust from vehicles using the trail will cause damage to the well motors and high voltage electrical equipment. This will affect the reliability of water supply for the Waikoloa Village and Waikoloa Beach Resort and increase WHWC's operating costs, which are ultimately borne by area residents.

150 Waikoloa Beach Drive • Waikoloa, Hawaii 96738 • Phone (808) 883-9355 • Fax (808) 883-9768

N41-1

Based on public comment, the Army confirmed the locations of existing wellheads and aquifers in relation to the proposed Kawaihae to PTA military vehicle trail. Based on site investigations, there is no need to relocate the proposed alignment for this trail. In order to mitigate for any potential damage to the wellheads by vehicles breaking down and inadvertently going off the trail, the Army will construct protection devices around the well heads in consultation with the Water Company and land owners. In addition, the EIS analysis has shown that the potential for inadvertent spills from vehicles or vehicle accidents to impact the aquifers is less than significant. However, the Army has a Spill Prevention and Response Plan for all vehicles and vehicle travel. If the Army decides to acquire and construct these trails, this plan will be implemented for these areas as well. If the Army decides to implement the proposed action, the Army will coordinate with the property owners over the location of the proposed alignment. If the coordination results in a change in alignment which results in environmental impacts not analyzed in the EIS, the Army will conduct all appropriate NEPA, ESA and NHPA consultations prior to a final decision on a new alignment.

N41-2

The use of dust control chemicals on unpaved roads is expected to adequately mitigate any impact on the operation of WHWC's wells. If concerns over pump operations remain, a simple enclosure of pump facilities would be sufficient to eliminate further concerns.

Comments

USACE Honolulu District
December 19, 2003
Page 2 of 2

- N41-3** 3. Increased Fire Hazard. The proposed new PTA Trail location traverses and runs along adjacent property immediately upwind of WHWC's well field wells. Because the entire area is dry grassland, it is extremely vulnerable to range fires. Last year over 400 acres of land in this area was burned. Any fire originating from PTA Trail activities near the wells threatens not only WHWC's pumps, distribution system and electrical and mechanical equipment, but also threatens WHWC's ability to provide water to protect Waikoloa Village from fire.
- N41-4** 4. Increased Well Vulnerability. The presence of the PTA Trail near WHWC wells will make them more accessible and vulnerable to acts of vandalism or terrorism. Hence, relocating the PTA Trail near WHWC well fields is contrary to the Public Health Security and Bioterrorism Response Act of 2001.
- N41-5** WHWC believes that the current route of the PTA Trail provides adequate access for the Army's proposed use, without creating the above mentioned problems. Therefore the PTA Trail should not be relocated as proposed.

Sincerely,

Robert Spetich, P.E.
General Manager

Responses

N41-3

The Integrated Wildland Fire Management Plan for O'ahu and Pōhakuloa Training Areas was updated on October 2003 incorporating lessons learned in the Makua fire. As discussed in the Executive Summary as proposed mitigation, the Army will fully implement this plan for all existing and new training areas to reduce the impacts associated with wildland fires. The Army has concluded that the impacts from fire with the implementation of IWFMP would reduce the impacts from fire to less than significant. The plan is available upon request.

N41-4

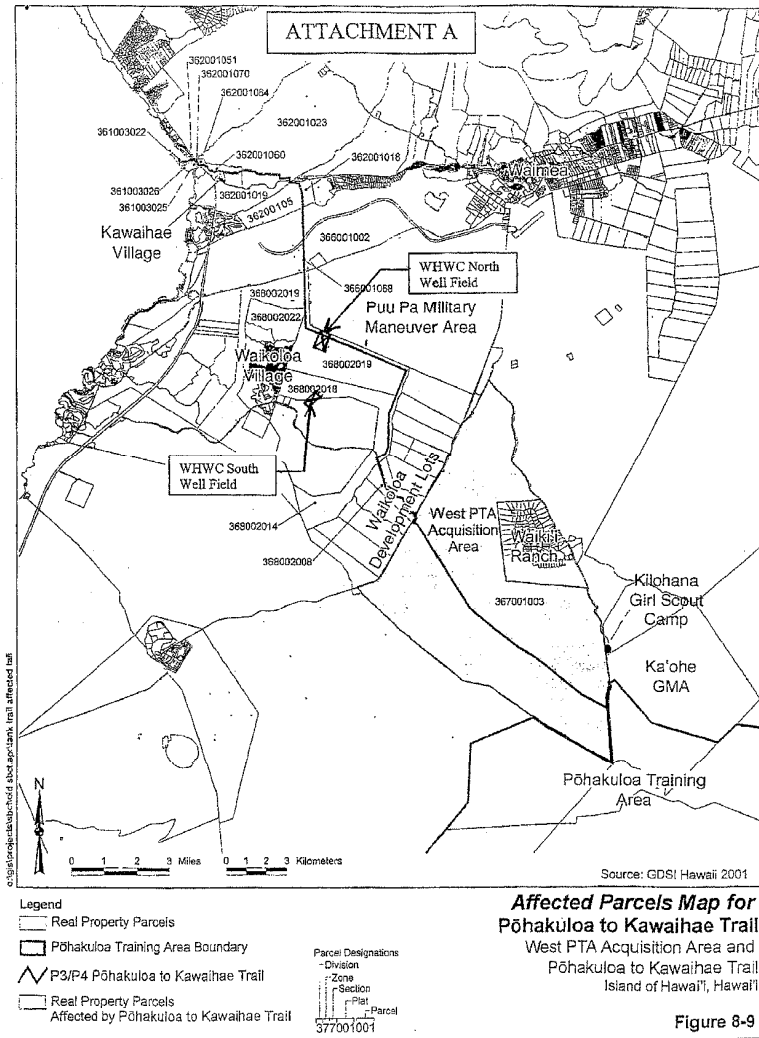

The EIS has determined that there would be no significant impact from vandalism to other facilities by the implementation of the proposed action. If the Army decides to implement the proposed action, gates on the PTA trail will be coordinated with the property owner to prevent unauthorized use, reducing the risk of vandalism to other facilities in the area.

N41-5

To: Shirakata, Gary N POH; Barger, Cindy S POH

Cc: Miyamoto, Tyler B POH; Tran, Uyen POH

Subject: FW: JWT EA - statements in SBCT EIS

Gary and Cindy -- The second sentence is erroneous as identified by WCP.

Cindy - change can be made for the FEIS (plus the project may be completed by then so this section would be revised with new information).

Gary - TT needs to revise the cumulative impacts in the MMR DEIS (believe it mirrored SBCT).

Beth

Subject: JWT EA - statements in SBCT EIS

Hi Beth/Dave:

I noticed that the Draft EIS for SBCT, Chapter 9.0 Cumulative Impacts page 9-11 includes the following statement pertaining to the JWT project:

Waikane Valley Training-Waikane/Kane'ohe (Project 20)
The US Marines are planning jungle warfare training for up to 100 troops in the Waikane Valley near Kane'ohe. The Marines have recently purchased 187 acres (76

hectares) of land for this training and have fenced it off for training. An EA is being prepared, and training will begin upon completion of environmental review (Honolulu Advertiser 2002).

The second sentence of the project description caught my attention for obvious reasons.

RE: DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),
TRANSFORMATION OF THE 2ND BRIGADE, 25TH INFANTRY DIVISION (L)
TO A STRYKER BRIGADE COMBAT TEAM IN HAWAII

Dear Sir or Madam:

We are writing in support of the proposed expansion of the U.S. Army in Hawaii by locating one of their Interim Brigade Combat Teams (IBCT) within the State.

Our comments are directly~ chiefly at the proposed expansion and impacts on the Big Island.

N43-1

- Kawaihae Harbor – we appreciate the sensitivity shown for the multi-use aspects of the harbor and applaud efforts made to work with the community for continued shared use of the area.
- Upgrades to the tank trail from Kawaihae to PTA – we strongly support this effort, which will positively mitigate the impact of military traffic on public roads.
- Upgrades to Bradshaw AAF – these improvements will both enhance the mission capability and overall air-vs-land transportation options.
- Additional range complexes – these multi-use ranges are proposed to reduce costs, maintenance and impacts to the environment as well as facilitate multiple tasks over a smaller area – all of which we support.
- Land purchases adjacent to PTA – we support in concept to enhance training capabilities and know that you will work with neighboring communities, particularly Waiki'i Ranch, to mitigate impacts, especially dust and noise concerns.

N43-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

MILILANI/WAIPIO/MELEMANU NEIGHBORHOOD BOARD NO. 25

c/o NEIGHBORHOOD COMMISSION • CITY HALL, ROOM 400 • HONOLULU, HAWAII 96813

**RESOLUTION CONCERNING THE U.S. ARMY DRAFT ENVIRONMENTAL
IMPACT STATEMENT FOR CONVERTING THE 2ND BRIGADE, 25TH
INFANTRY INTO A STRYKER BRIGADE**

WHEREAS, Neighborhood Board #25 finds that pursuant to the National Environmental Policy Act of 1969, the Department of the Army has prepared a programmatic environmental impact statement (PEIS) to evaluate the potential environmental and socioeconomic effects associated with transformation of the 2nd Brigade, 25th Infantry Division (Light) (ID (L)) in Hawaii into a Stryker Brigade. Twenty-eight projects are proposed for the U.S. Army Hawaii that would provide support structure, facilities, and necessary field training required for a Stryker Brigade Combat Team (SBCT).

WHEREAS, Neighborhood Board #25 fully supports the concept of positioning a Stryker Brigade at Schofield Barracks and appreciates the benefits that such an action would have on Honolulu's economy in general and Central Oahu in particular. However, the PEIS identifies numerous impacts that the Stryker Brigade will have on this area's already over-strained infrastructure that must be addressed and mitigated; and

WHEREAS, Neighborhood Board #25 has placed a high priority on the quality of education in our community, and the Draft EIS – Transformation projects over 1,000 school age children will relocate into our school districts. Our elementary, middle, and high schools are already overpopulated and supporting infrastructure and resources cannot keep pace with the steadily increasing student population; and

WHEREAS, the introduction of over 400 Stryker tactical vehicles (each weighting over 20 tons), as described in the Draft EIS – Transformation, will have a significant impact on our community's already overburdened transportation infrastructure and deteriorating roadways; and

WHEREAS, the Transformation of the 2nd Brigade, 25th Infantry (Hawaii) into a Stryker Brigade will bring fixed wing aircraft (C-130 and C-17), UAV, and more helicopters activity to Wheeler Army Airfield and over the Mililani Mauka and Launani Valley areas,

WHEREAS, the U.S. Army proposes to purchase more local lands to accommodate the new Stryker tactical vehicle and its new technology to enhance SBCT training;

BE IT RESOLVED that Neighborhood Board #25 urges the Army to specifically address actions that it will take to mitigate the adverse effects the Stryker Brigade will have on the community's educational, transportation and real property infrastructure, and calls upon the Governor of the State of Hawaii, the Mayor of Honolulu, all members of the State Legislature and City Council Members to support the mitigation of our above stated concerns in order to ensure the quality of our community life for present and future generations.

N44-1

Responses

N44-1

We thank you for your comment and participation in this public process. Your comment has been noted and has been included as part of the administrative record for this process. In accordance with NEPA regulations, the Army is conducting this EIS in order to identify the direct, indirect and cumulative environmental effects of the proposed action on the ROI. If the Army decides to implement the proposed action, the Army will mitigate all significant impacts in order to minimize the overall environmental impacts of the proposed action.

Comments

- N44-2** **BE IT FURTHER RESOLVED** that Neighborhood Board # 25 urges the U.S. Army to cooperate with the State of Hawaii in providing sufficient resources to plan, design, and construct more classroom space and hire more teachers to accommodate the projected increase in student population before arrival of the military families mentioned in the Draft EIS – Transformation.
- N44-3** **BE IT FURTHER RESOLVED** that Neighborhood Board No. 25 urges the U.S. Army to cooperate with the State of Hawaii and City and County of Honolulu in providing sufficient resources to help State/City/County of Honolulu strengthen, widen, and provide continued maintenance of those public thoroughfares that the Stryker tactical vehicles will frequently convoy and impact during training and/or deployment.
- N44-4** **BE IT FURTHER RESOLVED** that Neighborhood Board No. 25 urges the U.S. Army to coordinate the introduction of Stryker Brigade support aircraft with the Federal Aviation Administration to ensure existing airspace management procedures over the Central O'ahu Region are safe and consistent with proposed transformation use and to coordinate with State/City/County Police, Fire, Civil Defense Agencies to ensure the availability of adequate emergency services in the event of aircraft mishap in Mililani residential community areas.
- N44-5** **BE IT FURTHER RESOLVED** that Neighborhood Board No. 25 urges the U.S. Army to work with the State Department of Land and Natural Resources to ensure compliance with environmental laws concerning Hawaiian cultural sites and the protection of rare/endangered Hawaiian unique species and to develop and have ready plans and programs to restore island training sites to their original conditions (prior to Transformation) once these training sites are declared no longer needed.
- BE IT FINALLY RESOLVED** that copies of this Resolution be transmitted to Hawaii's Congressional Delegation; the Transformation Office, US Army Garrison , Hawaii; Governor Linda Lingle; Mayor Jeremy Harris; the Speaker of House; the Senate President; Senator Cal Kawamoto; Senator Ron Menor; Representatives Marilyn Lee and Guy Ontai; Members of the State Legislature finance committees; Members of the City Council; the Managing Director of the City & County of Honolulu; the County Departments of Environmental Services and Planning & Permitting; the Department and Superintendent of Education; the State and County Directors of the Departments of Transportation; the Chairs of the House and Senate Education, Health, and Economic Development Committees; the State Departments of Defense, Land and Natural Resources, and Business Economic Development & Tourism; the State Office of Planning; the State Land Use Commission; the Board of Water Supply; the Oahu Resource Conservation and Development Council; the Hawaii Director of the FAA; the Leeward Oahu Transportation Management Association; the Honolulu Fire Department; the Honolulu Police Department; the Oahu Civil Defense Agency; and all Neighborhood Board Chairs.

ADOPTED by Neighborhood Board No. 25 at its regular meeting of November 26, 2003, by unanimous vote (22-0-0).

Richard G. Poirier, Chair

Responses

N44-2

The Residential Communities Initiative (RCI) Office, as the lead department for planning Army Family Housing, closely coordinates future student requirements with the State Department of Education. To this end, Keith Nishioka, RCI Project Manager, has been working with DOE District Superintendents Gary Griffiths and Betty Mow. On behalf of the Army, he works with Keith Kameoka from the DOE, to generate School Enrollment Projections with as much accuracy as possible. The Development Partnership plans its demolition/reconstruction/renovation/reallocations years in advance, coordinating with the DOE. In turn, the DOE understands that the Army communities must be advised one year in advance of any changes in school districting. Furthermore, the RCI also works with Heidi Meeker from the DOE's Planning Branch.

N44-3

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

N44-4

The Army will comply with all FAA review requirements.

N44-5

Thank you for your comment and your participation in the public process. Your comment has been noted and has been included in the administrative record for this process. The Army is following all appropriate laws and regulations in the consideration of the Proposed Action.

RE: Public Hearing Testimony
November 5, 2003, Waikoloa Beach Marriott Resort
Draft Environmental Impact Statement
Transformation of the 2nd Brigade 25th Infantry Division (L)
To a Stryker Brigade Combat Team in Hawaii'i

Dear Ms. Barger:

Thank you for providing Parker Ranch with a copy of the Draft Environmental Impact Statement (DEIS) for the Army Transformation to a Stryker Brigade Combat Team in Hawaii'i, dated October 2003. We appreciate the opportunity to provide you with our comments on this draft EIS.

It is our understanding that the proposed Stryker Brigade Combat Team (SBCT) Transformation requires a change in training protocol, as well as an increase in training area to support the transformation of the 2nd Brigade of the Army's 25th Infantry Division. Therefore, the West PTA Acquisition Area (WPAA) is a critical component of the Army's transformation process.

These lands are owned by Parker Land Trust which is a subsidiary of the Parker Ranch Foundation Trust. The Parker Ranch Foundation Trust was created by Richard Smart in 1992 exclusively for health care, education and charitable purposes within the Waimea Community. Beneficiaries of the Trust are North Hawaii Community Hospital, Parker School, Hawaii Preparatory Academy and Hawaii Community Foundation. The assets of the Trust include Parker Ranch land holdings in Hamakua, South Kohala and North Kohala, as well as residential and commercial zoned lands within the village of Waimea.

This responsibility to the beneficiaries of the Parker Ranch Foundation Trust require that the Ranch consider all reasonable options to provide additional income and/or resources to support these programs. It is from this perspective that we are reviewing the SCBT draft EIS, including the possible acquisition of all or a portion of the 23,000 acre Keamuku lands.

Comments

Ms. Cindy Barger
January 2, 2004
Page 2

As you are aware, Parker Ranch, through its former owner, Richard Smart, has welcomed military training activities on its lands. Over 90,000 acres of land, including the Keamuku Tract were used by the Armed Services during World War II and much of our lands are still used for training activities today. We have been and continue to be strong supporters of the military.

N45-1

At the same time, much of the lands that have historically been used by the military have been adversely impacted by the past training activities, especially related to unexploded ordinance. While we appreciate the Army's efforts to clean up these areas, as Trustees, we must proceed with caution in considering expanded training activities and how they may impact Parker Ranch lands.

N45-2

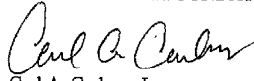

We clearly understand the importance of the Army to undertake a transformation process to meet the needs of a changing environment. In this regard, Parker Ranch has been supportive of the EIS process to identify and assess potential community, cultural, stewardship and environmental impacts resulting from the transformation process with an emphasis on the Keamuku Lands (WPAA). At the same time, we want to be clear that the inclusion of these lands in the EIS review process does not in any way obligate Parker Ranch to sell or lease this area to the Army for training purposes.

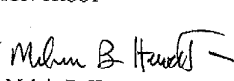

The information provided through the EIS process will be used by the Army and Parker Ranch to determine if these lands are appropriate for training and under what conditions. We are open to discussing a potential acquisition of some or all of these lands, provided that such an acquisition would be consistent with good land stewardship and benefit the Parker Ranch Foundation Trust, its beneficiaries and the greater Waimea Community.

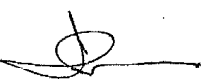

We look forward to the completion of the EIS process and a continuing working relationship with the Army in Hawaii. Please call us if you have any questions on this matter.

Sincerely,

PARKER RANCH FOUNDATION TRUST

Responses

N45-1

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. The Army is committed to cleaning up existing sites in accordance with applicable laws and regulations.

N45-2

The Army understands that inclusion of the possible acquisition of lands that may be owned by Parker Ranch as part of the proposed project does not obligate Parker Ranch to sell or lease these areas to the Army for training.

Colonel David L. Anderson
Commander, US Army Garrison
Fernandez Hall
Schofield Barracks, Hawaii 96857

Dear Colonel Anderson:

On behalf of the Wahiawa Community and Business Association, we wish to express our support for the transformation of the 2nd Brigade, 25th Infantry Division (L) into a Stryker Brigade Combat Team in Hawaii.

Our organization represents the people and businesses of the Wahiawa area. We believe that the proposed transformation of the 2nd Brigade is a valid strategic initiative of the Army. As the community in closest proximity to Schofield Barracks, we recognize that the transformation will have some new and potentially adverse impacts on the people living in this area. However, we believe that the Army will mitigate these effects to the extent feasible. Moreover, we believe that the benefits to our national security from the transformation will significantly outweigh potential negative impacts.

The community of Wahiawa is a patriotic community that has lived side-by-side with our Army neighbors for many years. The relationship between our community and the Army has always been marked by mutual respect, friendship, and support. We endorse the transformation of the 2nd Brigade into a Stryker unit, because we believe it will be good for the Army, our nation's security, and our community.

We are forwarding copies of this letter to our congressional delegation to make them aware of our position on this issue.

Sincerely,

Jack D. Smith
President

Daniel S. Nakasone

N48HAWAII MOTORSPORTS ASSOCIATION INC;
P.O. BOX 1654
HONOLULU, HAWAII 96806

TO: THE U.S. ARMY , SCHOFIELD HAWAII

FROM: MEL HO'OMANAWANUI PRESIDENT

DATE: JANUARY 27,2004

RE: STRYKER BRIGADE

ALOHA,

The HAWAII MOTORSPORTS ASSOCIATION INC; have a few concerns allowing the STRYKER BRIGADE activity into the K-A1 TRAINING AREA. As you already know that the ASSOCIATION is in a Quasi lease with the STATE OF HAWAII you the U.S. ARMY. In the past weve always had a very good relationship even to this present day and hope to continue with what we already have thank you.

The concerns are:

N48-1

- 1- will the entrance from drum road to the KAHUKU TRAINING AREA have a 24/7 personnel physically manning the gate. As it is now the K-A1 and Charlie gates are the main entrances to the area.

N48-2

- 2- we realize that you have purchased the lands for TRAINING except K-A1 area in which we use on weekends and FEDERAL HOLIDAYS and would like it to remain a NO LIVE AMMUNITIONS AREA for the safety of our members.

In regards to our first concern we are trying to limit the access of renegades who trespass on GOVERNMENT lands whether it is motorcycles, mountain bikes, skate-boarders, pig hunters, the general public etc; etc; on week-days and possibly the week-ends to get to the K-A1 AREA.

The HAWAII MOTORSPORTS ASSOCIATION WILL NOT SUPPORT THE STRYKER BRIGADE if our CONCERNS are not addressed.

YOURS TRULY

MEL HO'OMANAWANUI
PRESIDENT H.M.A. INC;

Responses

N48-1

The Army does not expect that there will be any changes to the guard schedule at the K-A1 and Charlie Gates.

N48-2

The Army does not expect that there will be any change in access to area K-A1 or other areas at the Kahuku Training Area except during active live-fire training at the CACTF.

Telephone (808) 438-4812
Facsimile: (808) 438-7801
E-mail: SBCT_EIS@poh01.usace.army.mil

Dear Sir or Madam:

My name is Mr. Ralph K. Makaiau Jr., born and raised in Kahuku Village, board member Kahuku 2000 (economic non-profit), Kahuku Education Alliance Corporation (education non-profit), Kahuku Community Association, Kahuku Hospital, Malama Ohana (Ko'olau Loa communities), Empower O'ahu – Ko'olau Loa Region, (island wide economic non-profit). I am participating as a community champion for Kahuku Village Regional Flooding Mitigation Project and Kahuku Village Association Phase IV Affordable Housing Project.

I did make a statement in your previous public hearing at the Kahuku High and Intermediate Schools cafeteria and I would like to again state that I am in support of furthering training for America's fighting men and women.

I would like to share comment on the "Kahuku Training Area" (KTA) as follows:

Surrounding Land Use

- Considering best practices as an "ahupua'a" (mauka to makai), Table 7-5, 7-6, 7-12 resulting offsite impacts are erosion, drainage, flooding, and water quality. Community networking is strongly concerned about:
 - Environmental - clarity of Kawela Bay waters, Turtle Bay, Kuilima Cove, Kuilima Bay, Bakahan Ocean Outlet, Ki'i Ocean Outlet, Malaekahana Ocean Outlet, Punaho'olapa Wetland, Punamano Wetland, and Ki'i Wetland.
 - Environmental – erosion derived from Stryker exercises is assumed to cause substantial elevation in watershed contamination.
 - Economic – existing business viability with perceived increased flooding.
 - Economic – reasonable new investor cost improvement to land with mountain runoff and flooding impact on Turtle Bay Resort.
 - Cultural – scenic mauka sightlines of rural Hawaii throughout Kamehameha Highway from Ko'olau Loa to North Shore.
 - Housing – elevated cost of affordable housing because land use changes causes fear of further area flooding existing and future.

N49-1

Responses

N49-1

Chapter 7 - Kahuku Training Area in the final EIS discusses the impacts of the proposed project on the resources of the area. The Army has determined that the only significant impacts at KTA are impacts to recreation access at the CACTF facility, soil loss from training activities, impacts to sensitive species and sensitive habitat due to wildfire, and impacts to historic buildings. The Army has determined that there would be no significant impacts on marine resources, local economy, cultural resources, view, housing, education, or transportation as discussed in Chapter 7.

Comments

N49-1
cont'd

- o Education – unimproved Kahuku Schools facilities because of mountain run-off and no accommodation for drainage.
- o Transportation – reduce military use of Kamehameha Highway to KTA.
- o Transportation – “Drum Road” to be paved and available to civilian circle island traffic under emergency extended road closure of Kamehameha Highway. This includes passage under tsunami and hurricane grid lockdowns.

N49-2

Summary: Stryker and EIS process to participate directly in mitigating current Kahuku shoreline flooding. KTA is now the majority land user and must ensure offsite sustainability of local economy and life styles. Ko'olau Loa/North Shore regions may be flooding zones, however they are flood zones created by onsite and offsite owner land user. It is essential that the origins of our source of runoff be accountable to not adding to an already depressed economy and actively participating in mitigating existing conditions.

Archaeological Sensitivity Zones at Kahuku Training Area

- Cultural - will the public have access to sites identified?

N49-3

Ko'olau Loa and North Shore Communities are “depressed” communities. Ko'olau Loa and North Shore Communities want to remain “rural” communities. We do not have the resources to correct the community's infrastructure without sacrificing our life style to urban sprawl. As Stryker needs our jungle/mountain terrain, Oahu's economy also needs to showcase its last surviving jungle/mountain terrain communities. Can and will you help our communities?

Respectfully submitted,

Ralph K. Makaiau Jr.
Vice President, Kahuku 2000

cc. Office of Senator Daniel Inouye, U. S. Senate

Responses

N49-2

Section 7.8 - Water Resource, describes the impacts of the project on flooding. The Army has determined that there will be less than significant impacts to increased flood potential due to flooding. Construction of an all weather Drum road will reduce sediment load to surface waters which would have a beneficial effect on flooding.

N49-3

As discussed in Section 4.10, the Army proposes to continue work with Native Hawaiian communities on access to cultural sites and areas of traditional importance. In addition, an installation wide access protocol is being developed for all Army training lands in Hawaii.

Letter

P1 Dear Ms. Barger

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. I oppose the Stryker Brigade expansion in Hawai'i.

P1-1

I also have concerns about: ITOMOPHOBIA IN THE MILITARY.

U.S. Army

RE: Acquisition of Parker Ranch lands for expansion of Pohakuloa Training Area

Gentlemen:

Please let me introduce myself so that you will know the motivation for my comments.

I was born in Hawaii and have lived in Waikii since 1980. I am a gardener with a number of rare native plants. I am also a hunter and have hiked over all of the terrain you are considering buying. My family and I also spend a fair amount of time camping in Hawaii's forests and remote places. So the uses people make of the land are always important to me.

Personally, I am very proud of the U.S. Armed Forces. I want you to have what is necessary to keep us a free nation and to help keep democracy in the world alive and terrorists and despots at a powerless minimum. However, I do not feel that the EIS adequately addresses the vulnerability of this acreage. I would like to hear from you as to how you would keep this area from extensive erosion.

P2-1

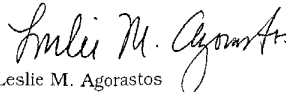

Much of the subject 23,000 acres is very fragile land. It is fragile because it is ash, in many cases 15 feet or more deep. It is also in a very, very dry climate. I have rain records back to 1895. Every decade has at least 5 dry years. The land is also sloped. This combination means that it erodes very easily, unlike your present training area.

As an example, the old tank road would easily become like talcum powder with use and would erode sometimes 1 to 2 feet a year.

Although you plan to make an all weather road from Kawaihae to Pohakuloa, what would become of areas used for maneuvers? How would you or could you mitigate the erosion on this land?

I understand that since this land adjoins Pohakuloa that it is an obvious choice for expansion. It is my sincere hope that you will address the vulnerability of this land prior to any acquisition. If I can help you because of my familiarity with the land, please call on me.

Sincerely,

Leslie M. Agorastos

Responses

P2-1

Please refer to Section 8.9, which discusses mitigation. The Army will develop and implement a Dust and Soils Management and Monitoring Plan (DuSMMoP) for the training area. The plan will address measures such as, but not limited to, restrictions on the timing or type of training during high risk conditions, vegetation monitoring, soil monitoring, and buffer zones to minimize dust emissions in populated areas. The plan will determine how training will occur in order to keep fugitive dust emissions below CAA standards for PM10 and soil erosion and compaction to a minimum. The Army will monitor the impacts of training activities to ensure that emissions stay within the acceptable ranges as predicted and environmental problems do not result from excessive soil erosion or compaction. The plan will also define contingency measures to mitigate the impacts of training activities which exceed the acceptable ranges for dust emissions or soil compaction.

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

COMMENTS: Is the United States and their military going to continue to
pursue their interests in Hawai'i until the islands are
destroyed? Based on Hawai'i's history & the progression of
devastation induced by the US government, this seems like the
only outcome of our future. In my opinion war is outdated & an ignorant answer to all
our disagreements & problems. When will our leaders learn? Open your eyes America
and get to know us. Only then will you understand
why we NEED to preserve our precious lands, water
& culture.

Responses

P5-1

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs.

It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

P6-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. In accordance with NEPA regulations, the Army is conducting this EIS in order to identify the direct, indirect and cumulative environmental effects of the proposed action on the ROI. If the Army decides to implement the proposed action, the Army will mitigate all significant impacts in order to minimize the overall environmental impacts of the proposed action.

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. Project consequences including beneficial effects are summarized in Chapter 2. Based on public comments, the section 8.11 has been revised to better describe sacred sites such as Mauna Kea on the island of Hawai'i and better discuss the potential impacts of this proposed action on those sacred areas.

P12-1

As discussed in Section 1.6 of the Final EIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th ID(L) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID(L) is charged with deciding how best to achieve that directive and provide for military training, readiness and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, an on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D).

Responses

P13-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P13-2

The discussion of the impact of the project on biological resources can be found in sections 4.10, 5.10, 6.10, 7.10, and 8.10 of the FEIS.

P13-3

The air quality impacts of the Stryker Brigade are summarized in Section 4.5 of the FEIS, and discussed in more detail in the Air Quality sections of the installation-specific chapters of the FEIS. The EIS concludes that while some potentially significant air quality impacts would exist, these impacts could be mitigated to a less than significant level.

P13-4

The discussion regarding the need for transformation can be found in Chapter 1 – Purpose, Need, and Scope of this EIS.

Bldg. 230, Room 306
Fort Shafter, HI 96858-5440

Dear Ms. Barger:

P14-1 As a concerned citizen, I would like to express my feelings regarding the plans for housing a Stryker Brigade in Hawaii. The necessity of utilizing thousands of acres at Pohakuloa on the Big Island and land adjacent to Schofield on Oahu for live fire exercises is disturbing to me. These pristine sites may include sites of cultural significance to the Native Hawaiians and use of these lands would do away with valuable conservation land which is needed to preserve our fragile island eco-system.

P14-2 The military in Hawaii have demonstrated in the past that they have been unable to clean up areas used for live fire exercises to make them safe for the general public, e.g. Kahoolawe, as well as for their own military to go back into the area for maneuvers, e.g. Waikane.

I also happen to be a United Methodist and am a member of the Church and Society Commission of Harris United Methodist Church, and I echo the sentiments expressed by our chair, Delores Glover, in her written testimony sent to you, Ms. Barger, and dated December 29, 2003.

Sincerely yours,

Katherine H. Aratani

Subject: Comments on the EIS regarding the Stryker Brigade at Pohakuloa on Hawaii Island

Dear Gentlemen,

P20-1

For some time water has been trucked to the proposed Stryker Brigade training area even before they are encamped there. The water situation is not being addressed promptly or appropriately. The training area must have a completed water system with approved water quality. The water must not come from Waiimea and Hilo to supply this new and expanded facility. They must be completely independent and able to supply water from on base or very near base. Besides being obviously vulnerable to terrorist and regular enemy disruption and stoppage, the water source must be dependable and close. That means the springs on Mauna Kea and maybe even some new drilled wells. Expensive, yes. But defensible and not a drain on sources for the civilian population which can be hard pressed at times to supply its own needs. Drought is a recurring problem that must be addressed by the new base expansion.

I must say I am not a hydrologist. But I can see supply problems already. They must be planned for and solutions found before moving or expanding.

P20-2

Next: I have seen more and more fighter aircraft over our island. This seems to be a function of the new activity at the Pohakuloa training area. I can not ever agree to have these aircraft flying over populated areas. This is Hawaii. It is not now a war zone. It is beginning to sound like one. I do not like it at all.

The same holds true for the choppers of the military. They are loud monsters that intrude on the tranquillity of the island. We are not at war. I do not want to hear war machines every day.

Thank You for listening. Tom Beach

P21-1

I am in opposition to the U.S. Stryker Brigade in Hawai'i. Please stop the military occupation of our islands, Illegal Overthrow and Annexation of Hawai'i by the U.S. has made us not the 50th state but rather the STATE OF OCCUPATION. The U.S. needs to occupy no more of our land. Like a mother has to tell a child to clean up after himself, the U.S. needs a father to teach the child how to clean up after themselves as they have failed to do on Kaho'olawe.... You need to clean up your toys of mass destruction and take them home to your toy box in America, leave Hawai'i alone....

Me ke aloha kupa'a i ka 'aina, ku'u kulaiwi

Sincerely,

Kamanamaikalani Beamer Occupied Kingdom of Hawai'i. (U.S. U.D.)

Responses

P20-1

As discussed in Section 8.14.1, current water demands at PTA (ranging between 3.6 million and 50 million gallons of water per year) are met by trucking in water in 5,000-gallon tankers from Waimea. The increased demand would fall within the range of water demand experienced currently and is not expected to adversely affect supply. Traffic increases would total fewer than two extra truckloads per week.

P20-2

Currently, I do not support the stryker brigade's expansion in the state of hawaii. my biggest concern stems from that of the lack of cleanup that has taken place throughout the state over the last 60 years. Kaho'olawe was recently returned by the navy to but it remains to be littered with debris and unexploded ordinance. what about the other areas that have been used for bombing practice and maneuvers? have these areas been cleaned? it's a simple, basic practice...
"WHEN YOU MAKE A MESS, CLEAN IT UP!!!! Please don't tell me that because the military is who they are that they are above the law!!! If you want more area, clean up your current mess and after you finished cleaning, then we can talk story about acquiring more land.

WHEN YOU CLEAN UP YOU MESS, THAN WE CAN TALK!!

Letter
P23

Dear Ms. Barger

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. Staunchly
Oppose
the Stryker Brigade expansion in Hawai'i.

P23-1

P23-2

P23-3

P23-4

I also have concerns about: The cumulative effects of military expansion throughout the Islands;
the amount of taxpayer money going to new weapons systems when our current physical infrastructure needs investment;
the poor record of the military regarding cleanup of areas used.

P22-1

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

P23-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P23-2

The scope of the EIS is limited to the proposed actions and does not cover the entire Army presence in the State of Hawai'i. Specific cumulative impacts of the proposed action to environmental and socioeconomic resources has been addressed in Chapter 9.

P23-3

Thank you for your comment and your participation in the public process. Your comment has been considered and has been included in the administrative record for this process.

P23-4

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12,

Responses

P25-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P25-2

The Stryker vehicle will probably have different effects in different areas, due to differences in soils, climate, size of the training area, slope, vegetation, etc. The effects will vary within a given range as well as between different ranges where the training takes place. Initial ATTACC modeling of the expected impacts suggests that there will be impacts on vegetation and that these may lead to enhanced erosion. This modeling is a first step in identifying and defining the characteristics of the maneuver areas that need to be monitored over time within the ITAM program. Data will be collected and added to the GIS database so that the actual observed effects of the training on the land, soils, and vegetation cover can be tracked over time. The initial modeling is based on assumptions about the effects of the Strykers on soils and vegetation. But as the actual effects are observed, these assumptions will be replaced with the observed data. At the same time, observed damage will be addressed through implementation of management practices. Areas of damaged vegetation will be replanted, sensitive areas will be avoided, and engineering controls will be implemented to reduce erosion. The effectiveness of these and other measures will be evaluated and tracked. In effect, the ITAM program is an adaptive management program, that seeks to apply focused management practices at appropriate times and in appropriate areas, to maximize the effectiveness of the intervention measures. Implementation of these measures will reduce the impacts, but it is impossible to accurately predict what the impacts may be in 27 years.

P25-3

We do not know at this time when the Army will no longer need specific training lands. However, when it can be determined it will be addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. The Army is committed to cleanup existing sites in accordance with applicable laws and regulations.

Subject: DEIS telephone comments on public meeting/process
Sent: 11/4/2003 11:59 AM **Importance:** Normal

Hi Folks -

Yesterday I received two calls in complaint of the public meetings and process.

1. Bob (didn't leave his last name or telephone number) called to voice his opposition to the restriction of signs, holding public meetings in private facilities and opposition to the arrests.
2. Mrs. Mary Jane Lee called to voice her opposition to the restriction of signs. Mrs. Lee attended the Helemano meetings and will attend the Turtle Bay meetings tonight. She said she is not necessarily against the project but was very disappointed in the Army's decisions about the signs. She requested that at least one additional meeting be held on O'ahu in the a public facility in a convenient, easy to find location. She also recommended that charges be dropped and that an apology be issued by the Army on the arrests and sign restrictions.

thanks

Cindy

P26-1

We thank you for your comment and understand your concern. It was not the intent of the Army to restrict the public through the format and location of the public meetings. Once the issue arose, we worked to correct the situation by working with the other facility locations to allow signs in the actual meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu to have all charges dropped against the individuals involved in the situation. Through these measures and the extension of the public comment period, we believe we allowed sufficient venues for public input including ample opportunity for written comment.

P27-1

P29-2

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

COMMENTS:

Impact on Air Quality: Have you ever looked out of the airplane window while flying into LAX? you notice the permanent cloud of toxants & pollutants that looms over LA? Have you wondered how it affects the inhabitants? It does not "potentially impact" their "quality of life," it kills them. It kills them very slowly. The air that will be polluted in Pohakuloa is already polluted by the emissions from heavy vehicular traffic. Military expansion, the introduction of the Stryker Brigade will increase the emissions your pocket sits by 600 tons. It is irrelevant, the amount of pollution increase. The violence lies in the fact that once pristine air is now polluted due to the imposing existence of military. The air will kill Pohakuloa, the makua of POU Hawaii, slowly & effectively. The violence will not stop. Our air, our people, our land, our existence is being desecrated. Prevention is essential. We want to be able to see the pollution as you can while flying into LAX.

Subject: US Military Off the Big Island!

Hawaii Island has over 50 former military sites. Most contain unexploded ordnance or other hazards. The US Army Corps of Engineers says it will take "centuries" to clean them up at current funding levels. Army actions at Pohakuloa threaten the environment and Native Hawaiian culture. But the Army is pushing ahead with plans to take 23,000 more acres around Waiki'i Ranch.

P31-1

Responses

P30-1

These concerns have been noted. However, available data and analyses indicate that PM10 is the only air pollutant with the potential for creating violations of state or federal ambient air quality standards at PTA. The potential for air quality problems associated with fugitive dust at PTA can be mitigated in a manner that avoids violations of air quality standards. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

P31-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. As a mitigation measure for safety, prior to initiation of any construction activities, USARHAW will employ qualified professionals to perform UXO clearance of the proposed construction area, remove all UXO encountered to ensure the safety of the site, and document UXO surveys and removal actions in full accordance with applicable laws, regulations, and guidance. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

Subject: Re: [livingnation] Who has clear title of the lands the military wants?

The military don't own jack shit. They are the intruders, the occupiers. What they are occupying are lands belonging to our people that have been either condemned by prior thieves and sold to them at rock bottom prices or they came by it via the State and are being leased to them for a \$1.00 a year. Whether or not they are paying that dollar a year is interesting to know, since some of our homesteaders on "lease lands" are being forced to pay fee simple by HHL. Now how is that to be explained?

P37-1

None of the lands that the military are on has clear title, but do we dare risk our lives to reoccupy these stolen or condemned lands that they are occupying? The real owners whose lands were either stolen through condemnation has the right to go back on their ohana land if they can produce their title of ownership, I would think. And if the military don't like it they can take it up with the state. Either that, or the one claiming to have clear title will suddenly disappear and never heard of again. It's already happening.

P37-2

Yes! People need to know that some of our people are mysteriously disappearing on the Big Island, especially those who just happen to see things that they shouldn't. And with this illegal military expansion, I'm sure more will begin to disappear mysteriously and perhaps I will be next because I dare to say and if I do, there will be others who will be brave enough to say too. How many will disappear before the military backs down or gets caught in the act of doing?

Dear Ms. Barger,

I appreciate the opportunity to comment on the July 2003 Stryker Brigade Combat Team Draft EIS. I will be addressing my comments about the sections of the DEIS regarding the Pohakuloa Training Area (PTA), specifically those relating to biology, geology, and cultural resources.

I feel qualified to address those issues because I was born and raised in Honokaa, Hawaii, have lived with the exception of two years, on the Big Island my entire life. For the past 30 years I have worked in the fields of natural and cultural resource management and interpretation. I am currently a consultant in those areas, though much of my work experience has been at Hawaii Volcanoes National Park. For five years in the late 90's there, I served as the Park's Cave Resources program manager, and worked to ensure the integrity of the biologic, geologic, and cultural resources of about 120 Park caves then in our inventory.

I acknowledge the return of Kahoolawe to the State of Hawaii. The ongoing cleanup has cost us \$400 million so far. It amazes me that bombing is stopped on an island without permanent residents, while the bombing and destruction of cultural and natural resources is escalating on an island with a rapidly increasing population. I wonder about trade offs -- we gave you Kahoolawe so we're taking more of Pohakuloa?

While I recognize and appreciate the value of a well trained military force, it seems that training in this particular place, PTA, with listed endangered plant and animal species, with a plant new to science recently discovered, with numerous cultural sites which include many shrines, as well as lava tubes which don't always announce their presence, and with much of its area still unsurveyed so we don't know what's out there, this place, Pohakuloa, is simply the wrong place to practice.

I'm amazed at the incompleteness of the DEIS. I find that I can not make substantial comments when so many reports are "in process". As far as I can tell, these include:

- a Wildland Fire Management Plan
- the ongoing evaluation of the effects of the project on listed Endangered species and federally designated critical habitat
- the report for an archeological survey that was completed in 2002
- additional archaeological surveys
- a survey of Traditional Cultural Properties at PTA to identify Areas of Traditional Importance
- a draft report of an oral history survey of PTA has been completed but not apparently finalized
- surveys of lava tubes for arthropods

P38-1

Responses

P38-1

Summaries of every report, plan, or survey that has been completed since the inception of the Draft EIS have been included and/or referenced in the Final EIS. The EIS does include initial survey results for potential habitat for unique arthropods found in the lava tubes on the island of Hawai'i. If the Army decides to implement the proposed action, the Army will conduct more intensive surveys of lava tubes that have been identified as potential habitat for these unique arthropods. If these unique arthropods are found in lava tubes, the Army would construct projects so as to avoid these areas.

Comments

Responses

P38-1
cont'd

For this last, the DEIS states that "A more detailed survey will be conducted prior to construction to determine presence and extent of the root dependent arthropods." So it seems that as a citizen, I might agree to the approval of this project without knowing, for example, whether or not there are unique arthropods found in lava tubes on the property. I would suggest that because cave resources are extremely fragile, it would be smart and efficient to conduct a complete resource survey, including biological, geological and cultural resources in all caves. Of course it is imperative to pay particular attention to protocols involving the inadvertent discovery of human remains in any of the caves.

The DEIS states that "a new species [of plant], *Tetramolopium consaguinium*" was discovered at PTA. Robert Shaw's report gives the name of the new species as *Tetramolopium diersingii*, with 4 populations totaling less than 400 individual plants. Who knows what else is out there? We likely will have to wait a long time to find out, because places like the impact areas are off limits because of safety hazards associated with unexploded ordnance.

From Robert Shaw, author of the 1997 report "Rare Plants of the Pohakuloa Training Area" cited in the references for the DEIS, in an email to me 110303:

"Apparently there was some confusion in translating information from the little redbook on rare plants at the Pohakuloa Training Area into the FIS. *Tetramolopium consaguinium* is a recognized species that is well established and fairly abundant on the western portion of the PTA. *Tetramolopium diersingii* is a name we have applied to specimens, from the same area, which exhibit several unique characteristics from other *Tetramolopium*. We intended to describe this as a new species, however, adequate material upon which to designate type specimen has not been found and research to differentiate the species genetically has not been funded. Thus, *T. diersingii*, while interesting taxonomically, has no botanical status at this time. It is an "illegal" name because it has not been correctly published, yet."

P38-2

A problem in working with previously unrecognized (new) species, is that it takes time and money to determine what the various species are, be they plants, animals, or other organisms. Until they have a name, they can't be officially recognized or listed. Until they are officially recognized, they can't be considered for things like the Endangered Species list. If they aren't on that list, then anything may happen to their habitat. And it seems that even if they are on the ES list, then actions affecting their status, at least for plants, are mitigable, perhaps by replanting or relocating them. In the case of cave arthropods, what will happen when new species are discovered?

An example of contradictions when specific endangered species are discussed:

- **8.10-120 Biological Resources:** Terrestrial Mammals: The Hawaiian hoary bat (*Lazarus cinereus semotus*) could occur on PTA
- **8.10-132:** Mammals: Lazarus cinereus semotus, Hawaiian hoary bat E, 1996 C. This means that the bat is Federally Listed as Endangered, and its occurrence is confirmed at PTA.
- **Appendix I-1 page 28:** The Hawaiian hoary bat has been recorded at multiple PTA locations, including Bradshaw AAF, which is part of the project ROI

P38-2

This correction has been made to sections 3.10 and 8.10 - Biological Resources.

Comments

When I read three different things (could occur, occurrence confirmed, recorded at multiple locations) about one specific listed Endangered species, and the comments seemingly reflect large variations in populations, I wonder about the accuracy of all other information in the DEIS.

Then I read about possible impacts and mitigation measures. **"The Army seeks to preserve and stabilize the populations of federally listed plants on lands under their management."** and that **"The Army is responsible for maintaining this habitat ... and, by doing so, contribute to the recovery of the species."** Also that a Visitor Center will be built at PTA, adjacent to the new Saddle Road alignment with goals to **"educate people to the value of natural resources and involve them in the preservation and restoration of biological resources on the island of Hawai'i."**

But I learn that **"Construction activity and increased training in the vicinity would have adverse impacts on the habitat, deterring the recovery of the species."** These impacts include increased incidence of fire, trampling by troops on the ground, crushing by heavy Stryker vehicles, the introduction and spread of alien species, impacts associated with ground softening, etc.

So through my reading of the DEIS I gather that at PTA the Army is responsible for contributing to the recovery of Endangered Species, but at the same time, during training exercises will be deterring the recovery of the species. Mitigation efforts will be used where practicable, when feasible, when we can, if appropriate, if possible, etc. I was unable to find a mention that the Visitor Center will address any of the Cultural Resources on the property.

I would like to point out that this is a Training Area, and that most of the trainees seem to be young men in their late teens or early twenties training with heavy, potentially dangerous equipment, and who generally have little or no knowledge of the unique cultural and natural resources of Hawaii. I wonder how I am supposed to trust that these young people will be looking out for the welfare of those resources while being shot at or shooting at targets as part of their training?

Regarding Cultural Resources:

Quoting from the DEIS: **"PTA is rich with archaeological resources". "PTA is part of a larger cultural landscape that includes the sacred mountains Mauna Kea and Mauna Loa and the Saddle area between them."** **"PTA is culturally significant for several reasons".** I find it amazing that Pele is mentioned once in the DEIS. I was not able to find a section of this report which describes the impact this project will have on the cultural practices of people in Native Hawaiian communities.

I am a fourth generation resident of this island. Many who live here have a deep, abiding love for this land, our aina aloha. Watching it bulldozed, bombed, or blown up is a gutwrenching experience. As a friend put it: **"Like watching the flesh being peeled off your mother."** Why aren't those impacts addressed?

Most sites recorded at PTA have been recommended as NRHP eligible. Formal evaluations of many of the sites are now in progress. **"The region has much value for archaeological research and has produced important information concerning bird hunting, trail systems, and short-term living conditions at higher elevations. Reinman et al. claim the cultural resources at PTA are important for addressing issues about Hawaiian prehistory and history in the uplands region, as well as the**

Responses

P38-3

The Army has worked with US Fish and Wildlife to determine measures that would ensure stabilization of the sensitive species and habitats. These measures are discussed in detail in the Biological Opinions for O'ahu and Hawai'i which were released in October and December of 2003. These measures are outlined in each biological resource section of the EIS, section 8.10 concerns PTA. In additions soldiers visiting each area are given pocket information cards and a briefing prior to training to inform them of important resources in the area and the importance of avoiding these resources as well as safety information.

P38-4

Section 8.11 - Cultural Resources, for PTA has been revised to incorporate information included in this comment.

Comments

Responses

- development of Native Hawaiian society. The existence of at least eleven shrines in the area attest to the ritual activity that went on at PTA.
- P38-4 cont'd** Then why does the DEIS also state that Social Research Pacific conducted a field visit to Ahu a 'Umi heiau, calling it "the only heiau in the Saddle area". I wonder what qualifies as a heiau in the eyes of the Army? The Pukui – Elbert Hawaiian dictionary gives the meaning of heiau as "pre-Christian place of worship, shrine; some heiau were elaborately constructed stone platforms, others simple earth terraces." As quoted earlier, the DEIS states that **"PTA is part of a larger cultural landscape that includes the sacred mountains Mauna Kea and Mauna Loa and the Saddle area between them."** It would seem to me that such a sacred cultural landscape would include many heiau for various purposes. Indeed, the DEIS mentions shrines in caves as well as on the surface, and I have visited, read about, and have been told about heiau on the surface at PTA. With much of PTA left unsurveyed for archeological sites, we should expect to find other heiau in the area.
- P38-5** Cultural ignorance is demonstrated by statements such as **"The Ahu a 'Umi heiau is constructed on the barren ash plain"**. That plain, that place full of wonder, where seemingly everywhere is mauka, is blanketed with cinder and native shrubland. That plain is important for many reasons. Among them is the presence of one of the most important sites on this island: the heiau. But also nearby is a named water collection cave, as well as numerous other archeological sites. It is not a "barren ash plain".
- P38-6** The DEIS states that "Potential for unknown resources exists within unsurveyed areas of the PTA ordnance impact area because it in fact has not been surveyed, except for very small discrete areas." Then the DEIS goes on to say that **"There is a very low potential for sites to be found in the northern areas, which are also unsurveyed. These areas are very dissimilar geologically from areas where sites have been found, with substrates of very old Mauna Kea lava flow."** It seems to me that very old substrates, rather than having "a very low potential for sites", would in fact have a very high potential for old sites. In another area of PTA "with an expected low density of sites, 67 sites and over 1,800 excavated pits were recorded."
- P38-7** The DEIS states that **"There would be no noise impacts on Areas of Traditional Importance at Mauna Kea because the noise analysis shown in Section 8.6 indicates that noise contours relating to ordnance use and construction under SBCT would not extend much beyond the PTA boundaries."** I find this statement interesting because from nearly all locations on the North Kona coast between Keahole Point and Kawaihae, as well as at the summit of adjacent Mauna Loa, I have heard the sounds relating to ordnance use when training at PTA is in progress. No doubt these sounds would also be heard at Ahu a Umi.
- P38-8** Facility and range construction involves grubbing vegetation, ground softening, grading site surfaces, subsurface excavation, and movement of heavy construction equipment. All of these activities, particularly "ground softening", would result in direct damage to or destruction of unidentified archaeological resources, or indirect damage by contributing to soil erosion. Cultural resources within lava tubes would be particularly subject to damage as a result of ground softening activities prior to construction. A 1998 review of previous archaeological studies concluded that lava tubes made up 70 percent of all recorded sites at PTA and they remain one of the most common site types found in more recent surveys. Before construction begins, any unsurveyed areas would be surveyed and sites would be evaluated for eligibility to the NHRP. After evaluation,

P38-5

The text has been changed in Section 8.10 - Cultural Resources to incorporate input from this comment.

P38-6

The Final EIS incorporates the archaeological presence/absence surveys results for all areas proposed for construction or training where safety allowed survey access. As discussed in Section 8.11 and in the Final PA in Appendix J, the Army will conduct archaeological monitoring of all construction activities to minimize potential inadvertent impacts to unidentified archaeological sites.

P38-7

Audibility by itself does not make a noise condition a significant impact. The Zone II noise contours in Figure 8-14 define the area in which significant noise impacts occur from the firing of large caliber weapons and detonation of explosives.

P38-8

The cultural resource sections have been expanded to better address potential impacts from the Proposed Action. As summarized in Section 4.11, the Army has changed the determination of project-wide impacts to cultural resources to significant, acknowledging that data recovery will constitute a significant impact. The Final PA in Appendix J outlines the avoidance and minimization measures for cultural resources with data recovery only occurring after avoidance is not possible and after the Army has consulted with SHPO and concurring parties on the proposed treatment.

Comments

P38-8
cont'd

eligible sites would be flagged for avoidance. All projects would be designed to avoid all recorded archaeological sites. If identified archaeological sites or newly discovered sites could not be avoided, USARHAW would mitigate the damage to the sites through data recovery or other mitigation measures determined through consultation, in accordance, with the PA.

I understand that "data recovery" means the mapping and excavation of a site, the extraction of all possible information, then the destruction of that site.

Regarding the geology of the region:

P38-9

The DEIS states "Some isolated vents are also present on the slopes of Mauna Loa, so that the location of vents cannot be predicted." This is true. What I find interesting is that nowhere in the DEIS was I able to find mention of the 1859 Mauna Loa lava flow, which more or less forms part of the southwest boundary of PTA. That flow issued from one of those "isolated vents", started on January 23, 1859, and lasted about 300 days.

P38-10

Too, the DEIS states that on Kilauea "Very infrequently, explosive eruptions occur. Such eruptions are impossible to outrun and can be devastating to everything in their path. It is unlikely that such an eruption would occur on Mauna Loa". Explosive eruptions have in fact occurred on Mauna Loa, evidenced by blocks of lithic tephra strewn about the summit. Those eruptions have been documented by scientists at the Hawaiian Volcano Observatory.

CONCLUSION

During my reading of this DEIS, it became apparent to me that the Army in Hawaii would do anything and everything to accomplish its "Transformation" objective. In doing so, Army operations will be transformed, as will the landscape of PTA. That culturally significant landscape rich with archeological resources, home to Federally listed Endangered plant and animal species, as well as species yet to be discovered or named; which includes the sacred mountains Mauna Kea and Mauna Loa and the Saddle area between them, will be destroyed (transformed) through the use of various mitigation measures which will ensure that the objectives of the Army are achieved.

I submit these comments with aloha, respect, and a bit of frustration, and look forward to your response.

Responses

P38-9

Historic flows are shown on Figure 8-22. The Flow of 1859 is not identified on Figure 8-22.

P38-10

Such explosive eruptions are infrequent. However, we have modified the text to indicate that they could occur. Small fountains and short duration explosive eruptions are more likely than the devastating eruptions referred to in the text. We are not aware of any documentation of pyroclastic flows from Moana Loa.

Cindy S. Barger
SBCT EIS Project Manager
US Army Corps of Engineers
Honolulu District
Bldg. 230, Rm 306 Attn: CEPOH-PP-E
Ft. Shafter, HI 96858-5440

GREETINGS:

Thank-you for this Draft Environmental Impact Statement and for the opportunity to send in written comments. After considering The 2nd brigade in that was selected to transform to an SBCT in the PEIS, There are (2) items I based my written comments on. 1st in ES.3- The Need For The Purposed Action and 2nd in 3.2.1 Introduction/Region of Influence.

The 3 factors stated in ES.3 Need For The Proposed Action states, 1. Its location within the Pacific Rim is a critical Area of Interest for the United States..., 2. Hawaii provides the Terrain and conditions most likely to be encountered in the Pacific Rim..., and 3. The Ease of deploying the SBCT because of proximity to multiple Airbases of suitable. To me this is Absurd.

With more Military expansion in the Hawaiian Islands the Islands will a perfect target for todays New Terrorists that still haven't been caught. I'm sure IT IS an Honor to have been selected out of a long list of locations that are deeply rooted on planet earth. But having the United States of America US Army acquiring another 24,400 Acres to accomodate the Stryker should not be allowed in the Hawaiian Islands.

P41-1

It is essential for North America and her political bodies and her societies of men who have united together and combine their forces, in order to procure their mutual Welfare and Security for its people AS IS other Foreign Nations. But to STRIKE or Deploy from the Hawaiian Islands to anywhere within the Pacific Rim within 96 hours or to place a division anywhere in the Pacific Rim within (5) days or five divisions in thirty (30) days without compensation to the Hawaiian People or Their Hawaiian Government in Unjustifiable. Certain Lands in the Hawaiian Islands that the United States use for certain military actions results in one silver dollar for every sixty-five years.

The 1849 Treaty, A Treaty of Friendship, Commerce and Navigation between the United States and the Hawaiian Islands is the Supreme Law of the Land. The Purposed Action for the SBCT is contrary to the Advancement of the Dejure Kingdom of Hawaii. The used of the 24,400 Acres of lands in the Hawaiian Islands will not help the US Army to deploy their strategic maneuvers any faster in 30 years. I feel that, when the Dejure Kingdom of Hawaii reinstates itself as a Free, Independant Sovereign Nation the SBCT will strike the Hawaiian People in 96 seconds.

P41-2

According to section 3.2.1 Introduction/Region of Influence in the definition of Ceded Lands I would have to object to this definition. There is no such thing as ceded lands. I recommend you change Ceded Lands to Stolen Lands. You reveal that the Republic of Hawaii was annexed, and yes it was. But the Title holder of the Hawaiian Islands is the Kingdom of Hawaii and they were not annexed. Therefore the ownership and jurisdiction of the Hawaiian Islands belongs to the Hawaiian People and their Hawaiian Government.

P41-3

I recommend the brigade does not transform in Hawaii and suggest they transform in Guam or America Samoa or another place in the Pacific Rim.

I do agree to the other five (5) locations for the SBCT and it will help the USA.

Thank-you for considering my written comments and I reserve the right to amend or revise my written comments.

Jackie
Carlisle

Responses

P41-1

There is a relatively large complement of Army, Navy, Marines, and Air Force assets in Hawai'i that are more than capable of protecting U.S. interests from attack. Reorganizing one Army brigade will make relatively few changes to the overall Department of Defense presence in Hawai'i. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

P41-2

We thank you for your comment and your comment has been considered and included into the administrative record for this process. To: sbct_eis@poh01.usace.army.mil.
Subject: The U.S. Army's campaign to expand Pohakuloa Training Area

Dear Ms Barger,

P42-1

This letter is in reference to The U.S. Army's campaign to expand its Pohakuloa Training Area on the big island, adding 23,000 acres of Parker Ranch to form a Stryker Brigade Combat Team (SBCT), a "rapid response" force armed with approximately 400 eight-wheeled armored infantry carriers known as "Strykers." Why must we constantly use the most beautiful islands in the world as grounds to train people to kill? How can we leave behind the deadly, dangerous refuse from this training, when there are laws against tossing a soda can out the window along the highway?

My husband is Hawaiian. His mother married and was brought to the mainland, against the wishes of her family, by a soldier who had been stationed in Pearl Harbor. Shortly thereafter, he left her to care for their five children alone. She never drew a dollar in welfare. Alone, thousands of miles from home, she saw all five children through school by working and paying taxes in good faith to the United States government, six days a week for over forty years. Now, all she wants for herself is to go home, to live out her days in the islands. My husband started working at age 11 and has not been without work since. He and his sisters and brother have all worked all their lives, obeying the laws of this country and contributing willingly to fund all the things that make it great. My husband wants only one thing...to be able to take his mother home. They've shared this dream for thirty years. Is there going to be any home left for them to go to?

What can we do to stop this? Have we learned nothing from any of our past mistakes? What about compassionate conservatism? There is nothing **compassionate** about the current administration, and certainly nothing **conservative** about America's approach to making war.

Please put more effort into making peace and less into making war. Is it not enough that their homelands were taken from them

against their will, and have been controlled without any regard to them ever since? When and where will this aggression ever end? I am becoming more and more ashamed to be an American...doesn't anybody out there care that the land we "annexed" and continue to abuse is sacred to these people? Do we even know the meaning of the word? What can we do? Please make it stop...

Natalie Carter

Louisville, KY 40206

P42-1

As discussed in Section 1.6 of the Final EIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th ID(L) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID(L) is charged with deciding how best to achieve that directive and provide for military training, readiness and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, an on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D).

Letter
P43 Dear Ms. Barger

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. **I oppose the Stryker Brigade expansion in Hawai'i.**

Re: Testimony on Stryker Brigade
November 4, 2003

Aloha kakou and Greetings. My name is Tony Castanha. I am a long-time Hawaiian sovereignty activist and currently a doctoral candidate in the Department of Political Science at the University of Hawai'i at Mānoa. I have been able to read a good portion of the Environmental Impact Statement for Transformation of the 2nd Brigade, 25th Infantry Division to a Stryker Brigade Combat Team in Hawai'i. My recommendation is that the "No Action Alternative" be undertaken for numerous reasons.

P45-1

In Chapter 4 under the "Cultural Resources" and "Human Health & Safety Hazards" sections, I disagree with the findings that "there would be no significant and unmitigable impacts" under the Proposed Action. As we know, the military's track record here in Hawai'i has been atrocious, from the illegal overthrow and annexation of Hawai'i, to the bombing of Kaho'olawe and other areas, to the release of deadly chemical and biological agents in the 1960s, including sarin and VX (*Honolulu Advertiser*, October 9, 2002), to the many federal hazardous waste sites listed by the EPA, to the recent burning of Mākua Valley. Given the above and more, an increased military presence in Hawai'i would logically increase the chances of impacts on cultural resources and human health.

Significant

P45-2

However, the main point of my testimony today focuses on the main justification and basis for military expansion: that of "national defense." In the "Executive Summary," you indicate that the need for transformation to a Stryker Brigade is to provide the United States with "capabilities that meet current and evolving national defense requirements" (ES-3). However, you curiously do not define the meaning of "national defense." Instead, you talk about the goal of being able to "deploy anywhere in the world ... within 96 hours of deployment from Hawai'i" (Ibid.). You also note Hawai'i's strategic location within the Pacific Rim, and how Hawai'i provides "the terrain and conditions most likely to be encountered in the Pacific Rim" (Ibid.). Of course we know the Pacific Rim comprises a vast area of land and sea. So I ask, how can deployment of troops anywhere in the world, and specifically within the Pacific Rim, concern "national defense," which some believe to be of an inherent noninterventionist nature pertaining to U.S. border areas only.

"National defense" and "national security" are in themselves ambiguous terms that can be subjectively interpreted and used, which is probably why you don't define it. I see this Stryker Brigade as an offensive preemptive military strategy. I don't support it because it obviously follows the same precedence of U.S. foreign policy unilateralism, expansionism and imperialism that has shaped the United States since the turn of the 19th century.

Responses

P45-1

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

P45-2

As discussed in Section 1.6 of the Final EIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th ID(L) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID(L) is charged with deciding how best to achieve that directive and provide for military training, readiness and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, an on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D).

Dear Ms. Barger

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. I oppose the Stryker Brigade expansion in Hawai'i.

P46-1

P46-2

I also have concerns about: besides so-called "improving military defense" exactly what types of benefits will this give to the Hawaiian community?

RE: Testimony Against Locating of the Stryker Brigade in Hawai i

Dear Ms. Barger:

I am writing to testify against the proposed stationing of the Stryker Brigade Combat Teams at Schofield Barracks and Pohakuloa in Hawai i. I am a sociologist submitting this testimony as a private citizen.

I am against the proposed stationing of the Stryker Brigade for the following reasons:

P48-1

1) Locating the Stryker Brigade will bring more troops and their families to an already traffic-congested, tight-housing market, tight-educational access area. The leeward and central O ahu areas have experienced tremendous population growth over the past two decades. The transportation infrastructure is already inadequate, and suburban housing development is already located adjacent to Schofield Barracks, and training exercises already are disruptive and potentially dangerous to surrounding communities. To add this many new personnel to an already full capacity would have disastrous effects.

P48-1

An analysis of impacts of the proposed project including the issues noted here and others can be found in Chapters 5-8.

Comments

P48-2

2) This will aggravate the already strained relationships between the U.S. Military, local residents, and Native Hawaiians (re: less than adequate subsidies for public education, for housing, for social services, and especially for historical wrongs). Most military personnel and families are given little or no orientation to the social history of Hawai'i and have no idea of the role the American military has played in the illegal overthrow of the Kingdom of Hawai'i, the confiscation of property during World War II, desecration of lands, and significant historical crimes. These socio-historical live on in the hearts and minds of local residents as well as Native Hawaiians. It already makes for tense encounters; adding multiple thousand more will aggravate the situation.

P48-3

3) The U.S. Army has not had a good record of environmental stewardship the "controlled burn" of Makua Valley was hardly "controlled," and the occupation of prime beachfront areas seem more like expressions of colonial privileges than defense necessity. The promised clean-up of the Kahuku lands has not fully occurred, so the Army's promises are perceived, mostly correctly, as empty promises. In light of this record, desecration of even more lands is unacceptable.

4) Military stations generally do not bring desirable, high quality activities to boost to the economy; its economic contributions are mostly limited to hypermasculinist military culture related activities -- laundries, used cars, bars, strip and/or prostitution-related clubs). Moreover, these kinds of economic activities are often associated with spillover criminal activities (substance abuse, sexual assaults, etc.)

For these reasons, and many more that space will not permit, I ask that the proposed creation of the Stryker Brigade be rejected.

Sincerely yours,

/s/ Joyce N. Chinen, Ph.D.

Responses

P48-2

Thank you for your comment and your participation in the public process. Your comment has been considered and has been included in the administrative record for this process. An analysis of this type is highly speculative and outside the scope of this report.

P48-3

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

Re: Comments to Draft EIS "Transformation of the 2nd Brigade, 25 Infantry Division to a Stryker Brigade Combat Team in Hawaii."

P49-1

1. Map of Pohakuloa Project Overview, Figure 2-10, Page 2-29

Comment: Generally, all place names on all maps should be historically correct with correct Hawaiian spelling, etc.

My specific comment is that "Pu'u Kee" is either a mis-spelled or a "pu'u" I'm not familiar with.

2. On Page 3-3

I have grave reservations regarding your

Definitions

Ceded Land. Ceded lands were either Crown or government lands until 1893, when the Hawaiian Kingdom was overthrown. The successor government, the Republic of Hawai'i, assumed ownership and control of these lands and continued their public use. When the Republic of Hawaii was annexed as a territory of the United States in 1898 [pursuant to the Newlands Resolution], it ceded these lands to the United States, which took ownership of them in fee simple. During the territorial era, the United States set some of the lands aside for military and other public purposes. When Hawai'i became a state in 1959, the United States retained ownership of the ceded lands it needed for military and public purposes and conveyed the remaining ceded lands to the state.

Discussion:

A. The Republic of Hawaii did not have legal title to the so-called (stolen) "ceded lands."

B. The Republic of Hawaii was not the "successor government" of the Kingdom of Hawaii. The Kingdom continues to exist (See next paragraph and "C" below).

If indeed the U.S. has apologized to the Native Hawaiians for the part it played in the "illegal overthrow of the Kingdom of Hawaii on January 17, 1893," said illegality is "void *ab initio*" -- or, in other words, because the Kingdom was illegally overthrown, the Kingdom did not fail to exist -- or, put in another way, the Kingdom continues to exist. See U.S. Public Law 103-150 below.

C. The Newlands Resolution, the result of a failed attempt to "annex" the Kingdom of Hawaii to the U.S., was a domestic instrument of the U.S. and did not have any legal effect external to the territorial confines of the U.S. At the time, Hawaii was not a domestic entity. It was a foreign nation to which the Newlands Resolution had no affect. Therefore, the so-called Annexation of Hawaii never took place and there are no so-called "ceded lands." Annexation can only take place by treaty, and the Newlands Resolution was not a treaty. (Also, see excerpt below)

Figure has been corrected to Pu'u Ke'eke'e

P49-2

We thank you for your comment and your comment has been included into the administrative record for this process. For the purposes of this document, "ceded lands" refers to lands that were "ceded" to the federal government by the State of Hawai'i. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawai'ian Sovereignty are outside of the scope of the NEPA process. We understand that there are several other proposed projects by the federal government and others throughout the state of Hawai'i. We have identified these projects in Chapter 9 of this document. Chapter 9 discusses the cumulative effects of the proposed action and actions proposed by the Army and other entities.

Comments

P49-2 cont'd

E. The U.S. could take over only those rights of the so-called Republic of Hawaii that it had. Because the Republic had virtually no rights because of the illegal attempted overthrow, it had no rights to give to the U.S. So, if the U.S. states that it got something, it really got nothing.

F. Therefore the U.S. did not/could not take over ownership of the so-called "ceded lands" in fee simple.

G. Hypothetically speaking, even if the Newlands Resolution were indeed an effective (legal) document, the U.S. did not take over the so-called "ceded lands" in fee simple. As the Newlands Resolution states, the lands were specially treated, unlike the U.S.'s normal procedure in land theft. The existing laws of the United States relative to public lands shall not apply to such lands in the Hawaiian Islands; but the Congress of the United States shall enact special laws for their management and disposition.

H. The third reason why the U.S. does not and cannot have so-called fee simple "ownership" of the so-called "ceded lands" is found in U.S. Public Law 103-150, dated November 23, 1993, which states in part: "Whereas, the indigenous Hawaiian people never directly relinquished their claims to their inherent sovereignty as a people or over their national lands to the United States, either through their monarchy or through a plebiscite or referendum." Such "cloud" on the so-called "ceded lands" restrict those lands from being characterized as "fee simple." The best that can be characterized for the incorrect use of the term "fee simple" would be some kind of "conditional" fee simple.

I. All of the so-called "ceded lands" were supposedly conveyed to the State of Hawaii by the Admissions Act of 1959, not in fee simple, but in trust. Therefore, characterizing the so-called "ceded lands" as "fee simple" is very incorrect. See excerpts from Admissions Act of 1959 below.

3. I have found no references in all of the Draft EIS to the Highways Act of 1892 which the present Pohakuloa Training Area (PTA) is subject to and, also, the Parker Ranch lands that are being proposed for acquisition. Because of the "Act" all trails, roads, highways, etc., that were in existence in 1892 were declared to be public. These trails, roads, highways, etc., are being illegally treated as non-public entities, and should be open to the public at all times. Although the "federal" U.S. government does not necessarily respect "Native Hawaiian Rights," the rights covered by the Highways Act of 1892 have attached to all trails, roads, highways in and through PTA, and all acquisitions by executive order, purchase, etc., have been acquired subject to the requirements of The Act.

On the other hand, the U.S. Army at PTA cannot get "better" rights than was acquired by the U.S., and the U.S. cannot get "better" rights than was attached to the land upon its acquisition.

Discussion: The Draft EIS should mention the Highways Act of 1892 and state the conditions upon which all PTA lands have been acquired, and/or are being acquired and that the public (and Native Hawaiians) have a right to the uncontrolled use of these (trail, road, highway, etc.) resources. On the other hand, more efforts should be made to ascertain the actual routes of the trails, roads, highways, etc., that are within the PTA, and opened for unregulated public use (as the Highways Act of 1892 prescribes).

Moreover, the ancient trails, roads, highways, etc. are Native Hawaiian cultural sites and objects. And they belong to the Native Hawaiian culture and its practitioners, the Native Hawaiians. As Native Hawaiians are deemed to have the right of self-determination (by International Law and the U.N.), then it is the right of Native Hawaiians to have full non-restricted access to these resources.

4. The "Alternatives" presented for consideration are inadequate.

For instance, many of the alternatives discussed as being non-feasible are non-feasible only because of attached costs that are claimed to be excessive, or because of the lack of material resources to move the equipment from site to site.

P49-3

One example is that if Stryker training were to take place in Alaska, the Air Force would not have sufficient available equipment to transport vehicles from Hawaii to the site of the training. If such an excuse had any validity (truth), then, in the case of an emergency somewhere in the world and the Strykers were needed at these locations, where would the means to transport them to the site of the emergency come from if the Air Force could not adequately do the job in the time of peace.

Responses

P49-3

As discussed in Section 1.6 of the Final EIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th ID(L) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID(L) is charged with deciding how best to achieve that directive and provide for military training, readiness and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, an on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D).

Comments

**P49-3
cont'd**

On the other hand, because equipment is **standard**, with a slight additional cost, a "training" fleet could be kept at whatever site(s) chosen for training and there would be no need to transport equipment, with the men, for training purposes. The only equipment transportation under this scheme would be transport in the case of an emergency somewhere in the world.

P49-4

5. The Draft EIS lacks a full "cultural" component. Such "cultural" component, when it becomes available, must also be subject to public hearings. Are public hearings anticipated for this purpose? A disregard of this item would include a fatal flaw in the Draft EIS process.

P49-5

6. There have been additional equipment (like certain howitzers) that is being discussed that were not part of the present Draft EIS. These "changes" must also be subject to public hearings. Are public hearings anticipated for this purpose? A disregard of this item would include a fatal flaw in the Draft EIS process.

P49-6

6. There have been additional equipment (like certain howitzers) that is being discussed that were not part of the present Draft EIS. These "changes" must also be subject to public hearings. Are public hearings anticipated for this purpose? A disregard of this item would include a fatal flaw in the Draft EIS process.

P49-7

7. However, the most severe criticism of this Draft EIS process has been the failure and total disregard to clean up the "unexploded ordnance" mess that many years of indiscriminate use of Hawaiian lands are left with. In order to be a "good neighbor" and environmentally correct, all suspect lands on Hawai'i and O'ahu islands must be cleaned up before more lands are allowed to be desecrated. A budget to reasonably do such a comprehensive cleanup should be a part of this Draft EIS.

It is noted that the proposed acquisition lands are claimed to be free from future use of explosives. While this "promise" seems reasonable at this time, there may be subsequent times when this "promise" might be broken (as the Army and the U.S. has made it a habit of breaking promises willy-nilly) in the name of national defense or emergency.

In order to give a genuine measure of "good faith" to the "promise" contained in the Draft EIS, this writer suggests that \$10 billion be set aside in trust (with any interest being generated therefrom to be used to provide medical and dental services to Hawai'i's poor) to remedy any "necessary" violations of the "covenants" therein made.

Thank you for giving me the opportunity to make a few comments in this process. If given more time, I'm sure I would want to comment on a few more items. However, I'm sure that if the items that is being brought to your attention here are properly addressed, the Draft EIS would be a stronger and more legitimate document than it currently is.

NEWLANDS RESOLUTION

To Provide for Annexing the Hawaiian Islands to the United States.

Whereas the Government of the Republic of Hawaii having, in due form, signified its consent, in the manner provided by its constitution, to cede absolutely and without reserve to the United States of America all rights of sovereignty of whatsoever kind in and over the Hawaiian Islands and their dependencies, and also to cede and transfer to the United States the absolute fee and ownership of all public, Government, or Crown lands, public buildings or edifices, ports,

Responses

P49-4

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. Without specifics it is difficult to respond to this comment. However, based on public comments, the cultural resource sections have been expanded and revised to better describe the cultural landscape and better discuss the potential impacts of this proposed action on those sacred areas.

P49-5

After the publication of the Draft EIS, the Army announced plans for an enhancement package for SBCTs. The enhancements include an aviation task force, an increase from twelve to eighteen 155mm howitzers in the direct support artillery battalion, and improvements to command, control, communications, computer, and intelligence (C4I) assets. The announcements indicated that the aviation task force would include Comanche helicopters when the aircraft were ready for fielding. In February 2004, the Army determined that no further testing or fielding of Comanches would occur and canceled the Comanche program. The SBCT aviation task force will come from existing 25th ID(L) aviation brigade assets and will result in minor changes to training, primarily some increased aviation training over WPAA in support of units training in that area. The FEIS has analyzed the impacts of the increased aviation training over WPAA and those impacts are minimal. The Draft EIS analyzed the impacts of twelve 155mm howitzers, a change from the eighteen 105mm howitzers currently in the direct support artillery battalion for 2nd brigade. The addition of another six 155mm howitzers was analyzed in the FEIS and resulted in minimal changes to noise impacts and no change in the overall determination of effect. The C4I improvements are not expected to have any impacts on the environment.

P49-6

Overall, the Army has determined that the enhancements are within the original scope of the proposed action as described in the Draft EIS, are minor in nature, and do not require additional public meetings or a supplemental Draft EIS.

years following the admission of Hawaii into the Union, be set aside by Act of Congress or by Executive order of the President, made pursuant to law, for the use of the United States, and the lands or property so set aside shall, subject only to valid rights then existing, be the property of the United States. [Am July 12, 1960, Pub L 86-624, 74 Stat 422]

(snip)

(f) The lands granted to the State of Hawaii by subsection (b) of this section and public lands retained by the United States under subsections (c) and (d) and later conveyed to the State under subsection (e), together with the proceeds from the sale or other disposition of any such lands and the income therefrom, shall be held by said State as a public trust for the support of the public schools and other public educational institutions, for the betterment of the conditions of native Hawaiians, as defined in the Hawaiian Homes Commission Act, 1920, as amended, for the development of farm and home ownership on as widespread a basis as possible for the making of public improvements, and for the provision of lands for public use. Such lands, proceeds, and income shall be managed and disposed of for one or more of the foregoing purposes in such manner as the constitution and laws of said State may provide, and their use for any other object shall constitute a breach of trust for which suit may be brought by the United States. The schools and other educational institutions supported, in whole or in part out of such public trust shall forever remain under the exclusive control of said State; and no part of the proceeds or income from the lands granted under this Act shall be used for the support of any sectarian or denominational school, college, or university.

(g) As used in this Act, the term "lands and other properties" includes public lands and other public property, and the term "public lands and other public property" means, and is limited to, the lands and properties that were ceded to the United States by the Republic of Hawaii under the joint resolution of annexation approved July 7, 1898 (30 Stat. 750), or that have been acquired in exchange for lands or properties so ceded.

US PUBLIC LAW 103-150

NOV. 23, 1993

1

103d Congress

Joint Resolution

To acknowledge the 100th anniversary of the January 17, 1893 overthrow

Nov. 23, 1993

of the Kingdom of Hawaii, and to offer an apology to Native Hawaiians on

(S.J. Res. 19)

behalf of the United States for the overthrow of the Kingdom of Hawaii.

(snip)

Now, therefore, be it

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. ACKNOWLEDGMENT AND APOLOGY.

The Congress -

Responses

Comments

(1) on the occasion of the 100th anniversary of the illegal overthrow of the Kingdom of Hawaii on January 17, 1893, acknowledges the historical significance of this event which resulted in the suppression of the inherent sovereignty of the Native Hawaiian people;

(2) recognizes and commends efforts of reconciliation initiated by the State of Hawaii and the United Church of Christ with Native Hawaiians;

(3) apologizes to Native Hawaiians on behalf of the people of the United States for the overthrow of the Kingdom of Hawaii on January 17, 1893 with the participation of agents and citizens of the United States, and the deprivation of the rights of Native Hawaiians to self-determination;

(4) expresses its commitment to acknowledge the ramifications of the overthrow of the Kingdom of Hawaii, in order to provide a proper foundation for reconciliation between the United States and the Native Hawaiian people; and

(5) urges the President of the United States to also acknowledge the ramifications of the overthrow of the Kingdom of Hawaii and to support reconciliation efforts between the United States and the Native Hawaiian people.

Approved November 23, 1993

Dear Ms. Barger

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. I oppose the Stryker Brigade expansion in Hawai'i.

P50-1

P50-2

I also have concerns about:

Overall negative effect on Hawaii

Thank you for your comment and your participation in the public process. Your comment has been considered and has been included in the administrative record for this process.

P51-2

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

Comments

doctrine of overwhelming dominant power. Key tactical elements are high-tech real time guidance and control systems, precision kill capabilities and light foot-print forward forces (army). Who needs 70 ton behemoth tanks?

P53-6 With national enemies identified as Terror, Drugs and Fanatics being little or less and less associated with states or geo-national entities, i.e. borderless, how is lethal dominance manifested? Do "we" destroy states or geo-national entities to find the needle in enemy haystacks? If so, then what?

Presently, these questions are directly confronted in Afghanistan and Iraq (as well as Columbia, Peru, Bolivia, Ecuador, Paraguay), lurking in destabilized and failed states of Africa and pondered in terms of Syria, Iran, wherever Allah, Shiva or Lenin calls plus North Korea. Some are asking what to do after establishing lethal dominance. Answers?

Reflecting on violence, Hannah Arendt suggests, "The very substance of violent action is ruled by the question of means and ends, whose chief characteristic, if applied to human affairs, has always been that the end is in danger of being overwhelmed by the means, which it both justifies and needs"

P53-7 What is the operational relevance of a Stryker Brigade Combat Team? Will it be new modes of older wars with little probability of happening? Where will there again be sustained combat on land? In cities? Who would dare?

Israel [No. 1 recipient of U. S. Military and other aid, known to possess all varieties of WMD, contemptuous of UN Resolutions, builder of the next Great Wall, No. 3 world exporter of armaments] given its plethora of weapons and sophistication cannot yet stop young Palestinian men and women willing to wrap themselves with explosives.

Arendt says "...rule by sheer violence signals loss of power."

A Stryker Brigade Combat Team (SBCT) is a light footprint forward force and tactical component of Army doctrine designed for rapid deployment (96 hours) to seize and to hold land. Then what?

Presently, the Army is organizing a light infantry of six Stryker Brigade Combat Teams using a new wheeled armored personnel carrier (APC) called "Stryker". Soldiers of all nations call APCs "rolling coffins." Beats walking as long as no one shoots at you.

Hawaii is to base one of these SBCTs, the fifth of six. Four SBCTs are operational. Implementation of these plans means more military presence in Hawaii, more Army impacts, more soldiers, more families, more PX and Wal*Mart customers, more land taken, more construction, more use of existing facilities, more money, more jobs. \$1.5 billion here, \$650 million there, \$240 million locally. Adds up to more than 3 years all Hawaii teachers' salaries. Nearly 700 years of library budgets for all Hawaii.

To detail these impacts, a SBCT draft Environmental Impact Statement (E.I.S.) was released October 3rd 2003. Public comment will be accepted for 45 days (up to November 16th). Public meetings are scheduled from October 28th (Honolulu) through November 6th (Hilo).

Responses

P53-6

There is a relatively large complement of Army, Navy, Marines, and Air Force assets in Hawai'i that are more than capable of protecting U.S. interests from attack. Reorganizing one Army brigade will make relatively few changes to the overall Department of Defense presence in Hawai'i.

P53-7

Section 1.4 - Need for the Proposed Action, describes the relevance of the Stryker Brigade and how it is expected to operate.

Responses

Comments

"To respond with reason when reason is used as a trap is not rational."
 Arendt.
 Weighing 12 lbs., with about 1,100 pages of densely crafted text, graphs, maps and statistics; this E.I.S. overwhelms and buries attempts to read it, much less analyze, digest or interpret. Internal text, footnotes and parenthetical directions point to a myriad of other sources and documents. 40,000 pages of this, 30,000 pages of that, 20,000 pages here and 10,000 pages there . . . ad nauseam.
 Bureaucracies, organizational automatons, like computers, spit out as true whatever falsehood, sophistry and speciousness are fed into them. Actuality is that outside political forces, military doctrine and job market considerations dictate a SBCT for Hawaii. Draped in logical appearing form, money, money, money and more, more, more comes out as patriotic necessity, national survival.
 An apparent failure of rationalism, this ponderous document makes little difference in probable outcome. A decision to implement a Hawaii-based SBCT is unlikely to be decided by Hawaiian concerns, environmental or ecological issues, endangered species, quality of life or community impacts.
 Tactical relevance of the Stryker vehicle, however, may make a difference.
 [Watch, though, efforts to make Defense Secretary Donald Rumsfeld a fall guy for Iraq. Could signal a SBCT cut-back.]
 One of the existing four SBCTs is soon to be deployed to Iraq. Should the Stryker vehicle prove to be yet another rolling coffin when operating under near ideal design conditions and topography, Hawaii may be spared. The Army may back off.
 Critics worry that the Stryker is too lightly armored, therefore vulnerable to RPGs, the near universal, shoulder-fired grenade launchers favored by regular infantry, guerilla and irregular forces world-wide. RPGs are much evident in Afghanistan and Iraq. Child soldiers carry them in Africa.
 SBCT implementation in Hawaii then becomes a political issue. Are money and jobs to be the final determinant. Is Stryker relevance irrelevant?
 Hawaii's Congressional delegation, nominally Democrats, as well as state and local politicians rarely see beyond money. Money also known as Pork and Patronage equals jobs. Jobs and contracts equal support, contributions, perks, profits and tenure.
 No one in politics is saying, "No way!" to SBCT plans for Hawaii. "Beyond local control." "We go with the guys up the line." "With these enemies, we got to do something." Weasel words rampant!
 Enemies and jobs are politicians' aphrodisiacs. Without Communisms, new enemies are needed desperately. Ragheads replace commies. Ice takes over locally. Political strategists know that money and jobs will seduce any community and divert attention from festering sores like education and disappearing private sector jobs.
 In the earlier scoping processes related to SBCT in Hawaii, a series of community meetings on all islands, a total of 283 people were present. More than a million were not. On the Orchid Island of Hawaii, over 140,000 people were not present for these meetings. Peace rallies in Hawaii may draw a couple hundred at most.
 What may be learned? Few people appear to be upset by actualities of SBCT

Comments

impacts in Hawaii. Few people will stand up on Hawaiian, environmental or ecological, endangered species issues. Quality of life, community degradation, more dust, more noise, etc. gets few excited. Impacts on tourism? Ho hum. War? Boring.

As is clear, unless politicians are elected for whom these concerns have as much impact as money and jobs, forget it! Teachers' salaries, libraries, peace, other issues, crying needs and festering sores all take a lesser if not last place. Hawaii speaks?

All of which adds up to a system in implosion, governance gone amok, madness as sanity. Is the American emperor clothed? Who will say?

5) The sum of processes which the military is calling "Transformation" was in process before the current Washington power holders were installed. Iraq I added significant lessons which underlie, in part, Joint Vision 2010 (published in 1996). The overall Transformation process has an interim objective of 2010. Stryker Brigade Combat Systems fall within this interim period.

Transformation, as a whole, targets to 2030-2040. By then it is assumed that Strykers may be obsolete. No newer rolling coffins currently are projected. Planners, to my knowledge, have yet to specify how troops, if used at all, will be moved in this final Transformation configuration.

Subject: Stryker EIS redux

P54-1

Thanks for your response. As E.I.S. go, The SBCT draft is a very good example of the genre as well as wonderfully obtuse.

Have you ever seen a RPG hit a Bradley? The Soviet versions of APCs were toasted time and again in Afghanistan by both US supplied and Soviet versions of RPGs. Soviet troops preferred open trucks to APCs.

Yes, ma'am! One of the difficulties in making informed judgments re: Doctrine is that most of the websites related to such issues, war colleges, etc. are now closed to civilians. For many past years, I could enter into dialogues with military thinkers and gain a more informed appreciation of the issues involved, options being considered, targets (i.e., the enemies of the day). While I am in many ways critical of aspects of military strategies, I also understand the constraints both personal and organizational of staff roles.

Some version of my comment(s) is slated to be a "Viewpoint" in the Nov 16th "Hawaii Island Journal". I say "some version" as I haven't seen the final editing.

Here is what I am hoping will appear:

The Stryker Brigade Combat Team

Money and Madness, Hawaii-Style

U. S. Military strategy, doctrine, is to create overwhelming power and to achieve dominance anywhere, fast. Key tactical elements are high-tech real time guidance and control, precision kill capabilities and light footprint forward forces.

Today's national enemies are named as terror, drugs and weapons of mass

destruction in unfriendly hands. Given that Enemies are less **and** less associated with states or geo-national entities, i.e., borderless, how is **lethal dominance** manifested? Do we destroy states and geo-national entities to find the **needles** in enemy haystacks? If so, then what?

Today these questions are directly confronted in Afghanistan **and** Iraq (as **well** as Columbia, Peru, Bolivia, Ecuador and Paraguay). They lurk in **destabilized and** failed states of Africa. They are pondered in terms of Syria, **Iran** and **North Korea**. Wherever Allah, Shiva or Lenin call could also foster Enemies. Some are **asking** what to do after establishing lethal dominance. Are there **answers**? Classic questions of Just War and Ends and Means intrude.

A Stryker Brigade Combat Team (SBCT) is a light(er) footprint **and** rapid response component of Army doctrine. SBCTs are designed to seize **and** to control **land** until heavier forces can be installed.

What is the operational relevance of a SBCT? Will it be new **modes** of older style wars? Will there be sustained combat, massive maneuvers of **similar forces**? Many suspect that such wars are now minimally probable. Who would **dare**?

Israel [No. 1 recipient of U. S. military and other aid, known to **possess all varieties** of WMD, builder of the next Great Wall, No. 3 world weapons **exporter**] given its plethora of weapons and sophistication cannot yet stop young **Palestinian men** and women willing to wrap themselves with explosives.

Hannah Arendt notes that ". . . rule by sheer violence signals loss of power."

The U. S. Army plans six SBCTs. Hawaii is to base one of **these**. The **Stryker** vehicle is a new eight-wheeled 38,000lb., \$2,000,000 armored **personnel carrier** (APC). Soldiers of all nations call APCs "rolling coffins."

P54-2

Implementation means more military in Hawaii, more impacts, **more soldiers**, more families, more land taken, more use of existing facilities, more **money**, more jobs. Part of overall military Transformation, the Hawaii SBCT will involve \$1.5 billion. Planned construction, etc. within the state will cost about \$650 million including about \$250 planned for Hawaii island.

Assuming a teacher in Hawaii budgets at about \$50,000 including support, \$1.5 billion would buy 30,000 teacher years. All Hawaii's public libraries cost about \$25 million a year to run. \$1.5 billion pays for 60 years of Hawaii libraries.

To detail these impacts, a SBCT draft Environmental Impact Statement [E.I.S] came out on October 3rd. Public comment was first limited to 45 days **and** then **extended** to 90 days now ending January 3rd 2004. Public meetings started on Oahu October 28th and ended in Hilo on November 6th.

Weighing about 12 lbs., in three hefty volumes with 1,100 pages of densely crafted text, graphs, charts, maps and statistics; this E.I.S. overwhelms and buries attempts to read it, much less analyze, digest or interpret. Internal references lead to many thousand pages of other governmental data in turn leading to more thousands of pages.

"To respond with reason when reason is used as a trap is not rational." Arendt

Bureaucracies, organizational automatons, like computers spit out as true whatever is fed into them. Actuality for Hawaii is that outside political forces, military doctrine and job market considerations dictate a SBCT here. Draped in pseudo-logical constructs, money, money, money, money and more, more, more, more comes out as patriotic necessity.

An apparent failure of rationalism, this ponderous document makes little difference in probable outcome. A decision to implement is unlikely to be influenced by Hawaiian concerns, environmental or ecological issues, endangered species, quality of life or community impacts.

Relevance of the Stryker vehicle and the doctrine related to its uses, may make a difference. One of the existing SBCTs is scheduled for deployment to Iraq. Should the Stryker prove to yet another rolling coffin while operating under near ideal design conditions and topography, Hawaii may be spared.

Critics worry that the Stryker is too lightly armored, therefore vulnerable to RPGs, the near universal, shoulder-fired grenade launchers favored by regular and irregular fighters world over.

SBCT implementation in Hawaii then becomes a political issue. Are money and jobs to be the final determinant. Is Stryker relevance irrelevant?

Hawaii's Congressional Delegation, nominally Democrats, as well as state and local politicians rarely see beyond money, aka Pork and Patronage. Money equals jobs. Folks will do anything to stay here. Jobs and contracts equal support, contributions, perks, profits and tenure.

Enemies and jobs are politicians aphrodesiacs. Without Communisms, new enemies are essential. Ragheads replace Reds. Ice takes over locally. Politicians know that money and jobs will seduce any community while diverting attention from festering sores like education and disappearing private sector jobs.

No one in politics is saying, "No way!" "Beyond local control." "We go with the powers that be." "With these enemies, we got to do something." Weasel words.

P54-3

The FEIS is divided into 5 geographical areas making it easier for the general public to focus on impacts the project might have on their community. In addition there is a guide inside the front cover describing the organization of the document, an abstract of the FEIS, and a very detailed Table of Contents. In addition the Executive Summary highlights the important aspects of the proposed project including a project description, a summary of impacts, and proposed mitigation.

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P55-2

As discussed in Section 1.6 of the Final EIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th ID(L) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID(L) is charged with deciding how best to achieve that directive and provide for military training, readiness and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, an on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D).

P56-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P56-2

The impacts on the local infrastructure are described in sections 4.14, 5.14, 6.14, 7.14, and 8.14 in the EIS.

(Complete details on the proposed action are presented in Chapter 2 and Appendix D).

P57-4

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P57-5

Future property values are based on several factors that fall outside of the purview of the Army action. It would be speculative in nature for the Army to assume either positive or negative impacts to adjacent property values. If the Army decides to implement the proposed action, the Army will implement mitigation measures to help keep the proposed action to less than significant levels of impact where practicable.

Subject: Re: The Army on the islands...

Dear Ms. Barger,

My name is Mapuana. I live in California. For years I have researched my Hawai'ian roots and have found that the US military has not only desecrated the land that I and so many others like me hold dear and consider sacred, it has also reneged on certain promises that it made to the people there.

I would like to know why on earth it is so difficult for a government that has full knowledge that to people like me the land is sacred? And when the hell did Lili'uokalani commit the act of insubordination on what was and is still considered as being hers and ours? This is just a replay of 1893, when she was imprisoned inside 'Iolani palace for trying to protect a legacy for those who were to be born after she was gone. The ONLY reason that she did not fight AFTER the fact is because she held the lives of her people as being sacred, and did not wish to lose any more Hawai'ians. You see, when the "settlers" and the "missionaries" showed up, they brought with them their ideals, their habits, their fears, their God (which I know now is NOT the same God that I worship and pray to because my God didn't have an inferiority complex like theirs obviously did!) and their taboos. I don't like being naked and right now your people have made mine feel naked as jay-birds. It really isn't fair. The reason that she didn't fight is because to her it was more important that there be a way to preserve the bloodlines rather than the land. She would later fight for the land, but we appreciate what she did for us, so that we Hawai'ians would live on. To many of us, Lili'u is still the Queen of the Nation of Hawai'i. She will always be, as many of us feel that the people were robbed of the land. I cannot understand why there is no conscience about any of these people who willfully treat us like we do not matter. There is enough bloodshed and bullying going on in the Middle East, and we all feel that it is not needed here on our own soil.

P59-1

I live in the desert, and there is a LOT of room for the army to blow stuff up here. The air force does it weekly, and I am sure that there are Marines who use it as well. Why does the military have to use Hawai'i as it wishes? Do the 'powers that be' really believe that THEY own the rights to what happens to Hawai'i? Please, do tell... I know how the native Americans feel, I know, and I wish to hell that you and your people knew, too.

It is unfair that the government that is supposed to be there to fight for us, as well as all the other people in this nation, is pretty much slapping us in the face, like the sugar planters and the shipping moguls did way "back in the day."

Responses

P58-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P58-2

The effects of the project on the marine environment are described in Section 4.10, 5.10, 6.10, 7.10, and 8.10. Impacts at PTA are described as significant but mitigable to less than significant in the report. There are no impacts reported at the other installations.

P59-1

As discussed in Section 1.6 of the Final EIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th ID(L) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID(L) is charged with deciding how best to achieve that directive and provide for military training, readiness and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, an on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D).

Subject: stryker

To: Cindy Barger

P62-1

I am writing in regards to the Stryker issue that has been discussed, on Oahu, over the past several weeks. I am greatly concerned about the outcome of these test or experiments that are being proposed for the North Shore or Oahu and the Big Island. I am from Kauai but recently moved to Oahu. Kauai is the most lush, green, and tropical area on all of the Hawaiian Islands and I would be outraged and beside myself if even one acre was dedicated to destructive testing, be it short term or long term. So imagine my discontent upon learning that some of the most beautiful and well known areas on Oahu's North Shore would be subjected to the type of damage that Kahoolawe had once endured.

Many people say the damage will be minimal or containable but unnecessary damage is just that. I am sure that any person who has heard of Hawaii, or especially if they have been here, would be just as perplexed at the thought of military testing on these islands, whose main source of income is tourism (a visually stimulated business.)

P62-2

I would like to hear what sort of defense you and your organization has when faced with the questions so obvious to most of us (Test destructive material on beautiful tropical islands and ruin agricultural land or leave the land to the people of Hawaii, perhaps for public or governmental use?)

Thank you for your time. I will await your reply.

Krystal Dawn

Hawaii Resident

P62-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P62-2

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. The Department of Army has taken every step to minimize impacts of the proposed project as described in the EIS while meeting the goals of training. Many mitigation measures have been incorporated into the project to reduce identified impacts where possible. Chapter 4 summarized the potential impacts and mitigation measures.

Letter Keanui Doane
95-728 Kahi Kirihi Pl.
P67 Muli, HI 96759

October 29, 2003

I am writing this as testimony for the DEIS Transformation of 2nd Brigade.

I wear two hats this evening.

The first hat can be described as being an "Army Brat." I was raised and taught to be proud and to be the best citizen that I could be. However, when I grew up to be an adult all that I had believed had all turned to false propaganda. I, speak for myself my three children, my seven grandchildren and all my future descendants. We would require answers to my questions in writing.

P67-1 1) Is the military obligated to abide by the U.S. Constitution? What about U.S. laws? Why is it deemed attempting to exempt environmental laws? Knowing full well contamination of our land will be done with zero efforts to clean-up and yet the military claims to be "good stewards." Who is accountable?

P67-2 2) What impact on our health does your transformation deliver to us? We are constantly reminded it being Americans — hundreds of people exposed to military activity seem to get sick — adamant denial is issued from military + government. Is this problem addressed in DEIS?

P67-3 3) How can anyone justify the "needed" land that the military is attempting to acquire? With the outrageous amount of land already being used by the military and mostly contaminated. You want more land "virgin land" — a world it be possible for human habitation someday? How long do these contaminants remain in the soil. Who is accountable? I firmly object to more land acquisitions.

I, as a taxpayer, that pays wages and pay for military equipment in Strykers — strongly object to this expansion.

4) This expansion is over/here the largest water aquifer on this island of Oahu (also at Pahrump).

P67-1

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

P67-2

The impacts of the project on human health and safety can be found in sections 4.12, 5.12, 6.12, 7.12, and 8.12 in the EIS.

P67-3

Thank you for your comment and your participation in the public process. Your comment has been considered and has been included in the administrative record for this process.

Comments

- 2 -

October 29, 2003

P67-4

What insurance can you give that the expensive exercises will not contaminate our water? Who is accountable should it become poisoned? We as residents will be without water which we need to live, the military can return to their homeland and continue to live. We will not survive. I strongly object to that potential hazard.

P67-5

5) How can we believe what you profess to promise? You are un-trustworthy. Your strategies are transparent - after all we've witnessed your actions for generations. Look at the promises (and court order!) made concerning Makua. Makua is now burnt and all we received was "I'm sorry." Give it back to the rightful owners.

Thru the years, the people have educated themselves - mostly by observing. We also educated ourselves in international laws, after all, we are part of this planet.

Occupations? Ask us - we know all about that! Through the acts of a "few" from Congress that makes decisions for many - it is not what we want - you have heard this claim over & over, time after time. When does this end?

You are in full knowledge that your continue militarization of Hawaii will make us, your "citizens" an absolute target. You bring weapons of mass destruction to our island homes and we object adamantly - you must take those weapons back to the continent of America because after all it is those people that you will protect and only have concern for.

Responses

P67-4

The Army is responsible for any contamination that results from its activities. In the past, the Army has disposed of toxic chemicals to the ground. Much less was known about the effects of this disposal than is now known. While accidental spills and incidental releases cannot be avoided, the EIS describes mitigation measures that are in place to respond to these occurrences.

However, the best approach is prevention, and Army policy is to minimize the use of toxic chemicals, reduce waste generation, contain all waste, and comply with all federal, state, and local environmental regulations to the extent possible consistent with the Army's primary mission. The Army's IRP program, which is modeled on the EPA's approach to investigation and remediation of Superfund sites, is an ongoing commitment to characterize and cleanup contamination from past practices. The long term remedy for groundwater beneath SBMR is an example of this commitment, in which the Army is removing the contamination and treating the water to drinking water standards so that its beneficial uses are not lost. The SBCT program will include many modern facilities that replace older, less protective facilities. These facilities include environmentally protective vehicle wash facilities that treat and recycle water creating less waste and using less water. The wash facilities also serve the purpose of preventing the inadvertent spread of plant species from island to island or location to location. The Army funds many research programs aimed at developing technology and procedures for addressing environmental contamination, as well as technology transfer programs that disseminate information, so that the experience gained can be applied to environmental problems in other sectors.

P67-5

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

October 29, 2003

The second hat I wear is of a free Hawaiian Woman. I am free — I was always free. I inherited this freedom from my ancestors. I love this land of my mother's mother's mother! America does not have a monopoly on democracy — they'd like to think so but the facts tell me otherwise. This is my home, my "dot" on this planet — We belong here and no where else. We will never go away.

P67-6

Your weapons entitles you to become bullies in our homeland. i.e. condemning land for your convenience and expansions. Our land is not for sale and for "the record" it never was. This illegal occupation must end and justice must be afforded to our people. With all that America has done around the world under the guise of "humanitarian measures" — when will the Hawaiians get liberated? We have always welcomed people from around the world, however, it has gotten to the point where we have no say on what is happening to our land. It is evident that our cultures are clashing.

You do secret "testings" with no second thought you're killing us quietly and I know you have absolute knowledge of all this. Who protects us from you? It is not ok to continue to make us guinea pigs anymore. Why is it you continue to ignore our pleas? Whom is justice going to prevail?

Continuous disregard of U.S. Constitution violates Treaties that U.S. and Hawaiian Kingdom. And for the record — the violation of Neutrality Act is a war crime.

P67-7

Expansion of military in Hawaii is not wanted. It is time to leave — take all your misists with you — and leave us in peace.

Keanui Deane

Responses

P67-6

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

P67-7

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P68

To: Department of the Army
US Army Corps of Engineers
Honolulu Engineer District
Fort Shafter, Hawaii

From: Fred Dodge, MD
86-024 Glenmonger St.
Wai'anae, HI 96792

Re: Response to Draft Environmental Impact Statement
Transformation of the 2nd Brigade,
25th Infantry Division (L) to a Stryker
Brigade Combat Team in Hawaii

This DEIS is incredibly huge. Responding fully to it would be very difficult and time consuming. The following is a start.

The military produces a great deal of pollution. The US military is the largest in the world therefore is the largest polluter.

- P68-1 1. No action alternative (p. 2-44) appears to be the best alternative because the legacy force is projected to continue and is the least polluting. Would not this alternative have the least adverse effects in Hawaii ???
- P68-2 2. These are difficult times. Everybody is being asked to do with less. Everybody but the military. Hawaii has especially limited land area – land grabs always affect many other things. Under the circumstances, should not the Army be giving up land instead of acquiring more??
- 3 Health effects:
a. Re propellants (powder bags)
Burn pan residues include lead, DNT, benzene and cyanide (p 3-82).
These are hazardous wastes known to be toxic to the brain, bone marrow, and liver; they can cause cancer and death.
- P68-3 1). When powder bags are detonated to propel ordnances, are not the toxins (“hazardous wastes”) that are released the same as are found in the residues?
- 2). I did not see any mention of Perchlorate which is found in propellants and which is known to cause thyroid disease. Shouldn't this be addressed in this EIS?

Responses

P68-1

This alternative may very well have the least adverse effects but may not be the best to meet the purpose and need of the proposed project.

P68-2

The determination of land requirements for the proposed action was based on the 2002 Range and Training Land Program Development Plan (Nakata 2002).

P68-3

The discussion on page 3-82 refers to the burning after training exercises, of excess propellant. The excess propellant is burned in burn pans that enable the ash residue to be collected after burning and properly disposed. Most of the constituents, except lead, are converted to non-toxic substances by burning. The amount of lead in propellant is small, and unlikely to result in any health effects to military personnel or to the environment.

Comments

P68-4

b. Disposal of ordnance is regulated under RCRA (p 3-82).
 "Specific details... are included in Appendix N-2".
 Appendix N-2 appears to refer mainly to AR 210-21. Is this
 what p. 3-82 refers to? Please send me a copy of AR210-21.

c. Recent range studies (p 4-77) reveal increased levels of
 munitions byproducts, such as lead, RDX (>USEPA) above
 residential and industrial PRG's (preliminary remediation
 goals).

"The proposed increased level of training could elevate
 contamination levels in range soils by 25% over the
 contamination generated by Legacy Force training. Existing
 and potential impacts from ammunition are considered
 significant and not mitigable until live-fire range training
 ceases and a remediation plan is considered."

Yet Table 4-12 (p 4-78) shows ammunition as significant
 but mitigable. Therefore the text and the table are inconsistent.

d. Cumulative impacts. Table 9-3 (p 9-20), reveals significant
 human health and safety hazards under the proposed action
 as well as under the reduced land acquisition alternative.

In summary, the three volume DEIS weighs much and has great length. However it is
 not convincing as to its conclusion. Because of significant health effects (as well as
 increased contamination, dust, noise, and other effects), "no action" would be the best
 alternative.

Letter
P69

Dear Ms. Barger

I am writing to comment on the Army Draft EIS for a Stryker Brigade
 in Hawai'i. This would mean an expansion of 24,400 acres, increased unex-
 ploded ordnance and toxic chemical hazards, harm to endangered species and
 cultural sites, and the unacceptable degradation of our quality of life. **I oppose**
the Stryker Brigade expansion in Hawai'i.

P69-1

(and Military's)

P69-2

I also have concerns about: The Army's complete lack of
viable plans to cleanup and restore lands that they
have leased from the State of Hawaii like Makua Valley &
Waikane Valley. No expansion until cleanup & return
are assured and begun....?

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P70-2

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs.

It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

After the publication of the Draft EIS, the Army announced plans for an enhancement package for SBCTs. The enhancements include an aviation task force, an increase from twelve to eighteen 155mm howitzers in the direct support artillery battalion, and improvements to command, control, communications, computer, and intelligence (C4I) assets. The announcements indicated that the aviation task force would include Comanche helicopters when the aircraft were ready for fielding. In February 2004, the Army determined that no further testing or fielding of Comanches would occur and canceled the Comanche program. The SBCT aviation task force will come

Subject:

I, Lawrence G. Ebel (Bud) (808)696-8164, 84-854 Fricke St., Makaha, Hi. 96792-1914 have submitted testimony at all 4 Oahu public comment hearings. In light of what I witnessed and read about these and other island meetings I wish to add an addendum to my testimony.
The decorum displayed by some ranged from obnoxious to arrogant to insulting to uncivilized to just plain stupid. Throughout, the officers and enlisted personnel displayed an uncommon professionalism and outstanding forbearance in spite of threats, insults, taunts, challenges and unsubstantiated allegations of such a wide range of misconduct as to defy recollection.

P72-1 There is now an active movement to secede a part of Hawaii from the USA and to form a nation of Hawaii. This malcontent has been advanced in the congress for years by the entire Hawaiian congressional delegation. In particular by Senator Inouye. He and Senator Akaka are both members of the Indian affairs committee in spite of the fact that Hawaii has no American Indian tribes, why would they pursue such an assignment unless they wished to ferment the current unrest that now exists here in this state. It is my testimony that the EIS hearings broke down to a platform for secession by some Hawaiians and others and this is directly the result of a policy developed by Senator Inouye and others.

Respectfully submitted by Lawrence G. Ebel

Bud Ebel

from existing 25th ID(L) aviation brigade assets and will result in minor changes to training, primarily some increased aviation training over WPAA in support of units training in that area. The FEIS has analyzed the impacts of the increased aviation training over WPAA and those impacts are minimal. The Draft EIS analyzed the impacts of twelve 155mm howitzers, a change from the eighteen 105mm howitzers currently in the direct support artillery battalion for 2nd brigade. The addition of another six 155mm howitzers was analyzed in the FEIS and resulted in minimal changes to noise impacts and no change in the overall determination of effect. The C4I improvements are not expected to have any impacts on the environment. Overall, the Army has determined that the enhancements are within the original scope of the proposed action as described in the Draft EIS, are minor in nature, and do not require a supplemental Draft EIS.

The safety of the Stryker vehicle continues to be improved as deployment practices continue to evolve. The Transformation process allows for adaptations to equipment and operations to ultimately meet the goals of current, SBCT, and future forces.

P73-1

I protest the apparent prejudicing of the EIS by the comments of Sen. Inoué assuming the Stryker issue is in favor of having the Brigade.

Dear Ms. Barger

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. **I oppose the Stryker Brigade expansion in Hawai'i.**

P73-2

P73-3

I also have questions about: the expense of this project of \$1.5 billion at a time when America faces acute shortages of qualified nurses and teachers. The military sense of social responsibility is almost nil in today's world.

P73-1

Although Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2d Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2d Brigade, 25th ID (L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law. The Department of the Army issued a Programmatic EIS for Army Transformation in 2001, and issued its Record of Decision to implement Army Transformation on April 11, 2002. In that ROD, Lieutenant General David McKiernan confirmed a series of previously announced conversions of 6 brigades to interim brigade combat teams, "subject to appropriate evaluation of potential environmental effects in accordance with the National Environmental Policy Act" (ROD, page 11). The Department of the Army will make a decision whether or not to transform the 2d Brigade, 25th ID(L) in Hawai'i only after a full consideration of all the environmental impacts identified and analyzed under NEPA, weighed equally with considerations of strategic importance, military training and readiness, technical considerations, economic and fiscal considerations, and other considerations mandated by law or policy.

P74-2

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

P74-3

Impacts to birds at PTA and improved mitigation measures have been included in section 8.10.

November 5, 2003
Waikoloa Beach Marriot

Comment on the EIS for Pohakuloa Expansion
Connie Fay
46-4084 Old Mamalahoa Highway
Honoka'a, HI 96727
775-9159

Good Evening. I'm Connie Fay. I live in Ahualoa
, just around on the other shoulder of Mauna Kea from
Pohakuloa. I've lived there off and on since 1974 on a
parcel of land that has trees and plants from the mesic
lowland Hawaiian forest. My post retirement hobby is
removing waiawi and planting Hawaiian plants. I'm a
retired teacher of young children.

I have some questions about the EIS. I'm concerned about
the health impacts of the expanded base. When the wind
blows from Kona, which it has for the last three weeks,
what will be in the particulate matter from the fires and
dust that will blow around to our side of the mountain?
Will there be chemicals? Will there be nuclear
contaminants?

Who will test the air? How often? How quickly will we be
notified that there are contaminants in the air? This
expansion should not take place until all these questions are
satisfactorily answered.

P76-1

The air quality implications of activities at PTA would be generally the same regardless of wind direction. Section 8.12 of the FEIS discusses wildfires at PTA. Most wildfires caused by military training activities are relatively small, and generate correspondingly small quantities of smoke with little potential for health impacts to off-post locations. Most large wildfires in the PTA area originate off-post, and are caused by activities other than military training. As noted in Section 3.12.3 of the FEIS, no depleted uranium munitions are or have ever been used at any USARHAW installation. Ambient air quality monitoring responsibilities rest primarily with the Hawai'i Department of Health. However, the Final EIS notes that the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

Comments

- P76-2** I have asthma, as do many people in my area. I can tell when it's foggy even before I open my eyes in the morning, because I get wheezy.
- Will there be an independent EPA control unit monitoring contaminants with the authority to control environmental "substance abuse?"
- P76-3** I have a similar concern about our food. Many people in my community "eat local." We get produce from our friends and neighbors and from our local farmers markets. We talk about how we grow our food. How will we know what is getting into our food from airborne contaminants from the base?
- P76-4** The report states there will be an increase from 16 to 20 million rounds per year of small ammunition fired. Will there be depleted uranium in the shell casings? What about larger artillery? Isn't the Stryker basically a small, light tank? What ammunition will it be firing?
- Because I haven't been able to read the entire report, I will continue my questions in an expanded letter.
- I'm especially concerned that the funding for this project is part of deficit spending that will impact the future for my daughter and nieces and their children. I have an alternate vision of the future use of the Parker ranch land. I don't have time now to share all of it with you. But it does include making safe environments for these Hawaiian plants.

Responses

P76-2

Ambient air quality monitoring responsibilities rest primarily with the Hawai'i Department of Health. EPA has oversight responsibility to approve the state ambient monitoring program, but does not directly operate ambient monitoring systems. The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

P76-3

Most of the compounds released by munitions use on military training ranges would be present as metal fragments, metal particles, or solid residues of various energetic materials. Small quantities of these materials would be released into the air during munitions firing and detonations. Some of the airborne releases would be carried by the wind beyond military installation boundaries, but the concentrations of these compounds would be too low to have any significant health effects. Weathering, corrosion, and leaching of munitions residues present on military training ranges would result in the slow migration of small quantities of various compounds from surface layers of soil into deeper soil layers, with soluble compounds slowly leaching into groundwater bodies. However, there are no indications that the weathering and leaching process is causing any significant contamination of groundwater resources. Please see the expanded resource discussions in sections 4.5 and 4.12.

P76-4

There will be no depleted uranium munitions used as part of SBCT training. Table 2-9 lists the types and rounds of ammunition to be used. The Stryker will carry various weapons depending on the type of Stryker. There are 10 variations of the Stryker and a description of each can be found in Appendix C, Section B.

P77-2

Chapters 3-10 of the EIS address project impacts both positive and negative on the human environment. In accordance with NEPA regulations, the Army is conducting this EIS in order to identify the direct, indirect and cumulative environmental effects of the proposed action on the State of Hawai'i. If the Army decides to implement the proposed action, the Army will mitigate all significant impacts in order to minimize the overall environmental impacts of the proposed action.

Letter
P79 November 9, 2003 0134

Being born in the United States, I have the constitutional right to protest when the United States is wrong in its action.

I protest now...

This letter is written in response to the

P79-1

"Draft Environmental Impact Statement for Army Transformation to a Stryker Brigade Combat Team in Hawaii." This whole procedure and issue is an arrogant act on the part of the United States.

It is not the right of the U.S. government to make such a request or decision. The Hawaiian Kingdom still exists and it is that nation and its people who have that authority!

I speak for my grandson and future Hawaiian born generations. Enough already -

Enough deployment. Enough war and fear. Enough bullies. Enough bombing the land.

P79-2

In the first paragraph of the 3 volume draft EIS I received, it states "every point on the spectrum of military operations, ranging from intensive combat to peacekeeping duties and humanitarian missions"

P79-1

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawai'ian Sovereignty are outside of the scope of the NEPA process.

P79-2

In addition peace keeping and humanitarian efforts are mentioned on page 1 of the Executive Summary and page 1 of Chapter 1 – Purpose, Need, and Scope. It is clear that peace keeping and humanitarian efforts are important duties of the Army and will continue to be of the Transformed Army.

May 2004

Stryker Brigade Combat Team Final EIS, Hawaii

P-446

P79-2
cont'd

② After that single paragraph, the only description of the need for transformation is so the "army will possess the lethality and speed of the heavy force. "... Mobile, lethal, and survivable " are the words used throughout this report.

I had been disappointed to not see "peacekeeping and humanitarian" mentioned again!

P79-3

We do not want or need more and easier ways to be lethal!

More troops and equipment on the island of Hawaii will have huge impact of the lifestyle we cherish. peace, harmony with nature and other humans.

P79-4

The energy, noise and training is not compatible to my, or my family's spiritual and day to day living!

I say "No," to the Stryker Brigade!
I say "No" to more war, to more aggressiveness. I say "No" to military might.

I say yes to correcting injustices made in the past and healing — with peace and love! Aloha —

P80-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P81-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P81-2

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

P81-3

There is a relatively large complement of Army, Navy, Marines, and Air Force assets in Hawai'i that are more than capable of protecting U.S. interests from attack. Reorganizing one Army brigade will make relatively few changes to the overall Department of Defense presence in Hawai'i.

Comments

Questions & Comments Regarding Stryker Brigade Proposal 10/29/03

Letter
P82

At a time **when** the community is still smarting from the fiasco at Makua, learning **the** truth that **you** are not good stewards of the land, you shove this Stryker Brigade program. You have **erred** in your timing, we are mobilizing, and we will resist **you** on this **every** step of the **way**.

My questions are as follows:

P82-1

1. When **you** depict your division as hardly being able to complete trainings to go **into** battle, how can say you want another program and mission to train your troops in **when** you can't even do your job with all the land you already have?

P82-2

2. Why don't you learn how to clean up the toxic messes you've **already** made instead of destroying more pristine land? Isn't that part of your new mandate of **nation** destruction and building?

P82-3

3. How can you in good conscience have these meetings in private venues where **you** don't allow peaceful protestors with signs and banners, and most **people** have no **idea** where they are located? You swore an oath to protect the Constitution and the Bill of Rights is how we assure the integrity of this document, yet you seem to despise free speech and dissent. This is not the military, we are civilians and we **outrank** you. **You** are to serve **us**, not we serve you and your superiors.

P82-4

4. Hawai'i is the species extinction capitol of the world, and your **plans** threaten more endangered species. We have toxic sites throughout the islands that threaten all our health. The EIS statement you prepared is HUGE and totally inaccessible to lay **people** who don't have time to get the full impact and scope of your project as presented in the EIS. Why don't you extend the time period of the comment line and have more widespread and comprehensive community meetings for a project of such scope and magnitude?

P82-5

5. Traffic is already horrible getting in and out of Wahiawa during rush hour traffic. **This** project would make matters so much worse. Why haven't you made a traffic impact statement like other developers have to do?

P82-6

6. Wahiawa and Mililani communities have already resisted the noise of training and possibility for accidents caused by training so close to people's homes, and there are places we aren't allowed to go throughout Hawai'i not because of training but because of hazards to our health from your toxic training methods. What makes you think other communities won't resist the noise and ecological and safety impact these brigade units will cause? Won't you need to rezone and then end up asking for more land?

P82-7

7. I think you have enough on your plate for training. Why don't you scrap this whole deal? It is more feasible for places with more land and a less tightly integrated ecology. We have such a small amount of land base here and it needs to be treated with the **utmost** respect and any development must have careful scrutiny—something you have utterly

Responses

P82-1

There is a need for a faster reacting lighter force. As situations change in the world the Army must change along with them. The Army is very capable today, but to stay effective they must evolve. The Army Transformation is that evolutionary process.

P82-2

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

Stryker Brigade Combat Team Final EIS, Hawai'i

P-449

P82-7 cont'd and shamefully avoided. The people are part of the land and Creation, this shows to me you are not stewards of the land but marauders of life. How are you going to disprove us?

P82-8 8. Finally, you do your soldiers a disservice by putting such heinous process before us that totally is devoid of democratic principles. They are the ones who will be living, if they live off base, with an increasingly resentful community, that is more and more seeing you as captors and oppressors than employees of an institution that is supposed to work for us and with us. We pay your salaries Mr Anderson, and we expect more from you. You should expect more of yourselves for that matter and not just be a pawn of politics in Washington. You may not even have funding for the Strykers once the Democrats take over the White House. How do plan on better working with the whole community, not just a chosen elite few, on the future of the military in Hawai'i? Is that even a priority? Because it doesn't show in this process.

Ku'e ka noho hewa o Hawai'i Nei
Clean up not build-up!

Stand by your oath, protect the Constitution! Resist affronts to democracy right here right now or else in the process of your work for national self-defense you will destroy what was worth defending in the first place. A republican said that, General Dwight D Eisenhower.

Sincerely,
'Ohana Foley
76 Karsten Drive
Wahiawa Resident

Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

P82-4

The public comment period was extended to 90 days and ended on January 3, 2004.

P82-5

Potential traffic impacts are analyzed in Section 5.7 for SBMR. The level of service for convoy traffic would be C or better (light congestion; occasional backups on critical approaches), assuming worst case conditions, so impacts would be less than significant, and no mitigation is necessary. The Institute of Transportation Engineers recommends that a traffic impact study should be performed if, in lieu of another locally preferred criterion, development generates an additional 100 vehicle trips in the peak direction during the site's peak hour (Institute of Transportation Engineers 1991). Because the proposed action would not meet this criterion, a traffic impact study is not required.

P82-6

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P82-7

As discussed in Section 1.6 of the Final EIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th ID(L) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID(L) is charged with deciding how best to achieve that directive and provide for military training, readiness and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, an on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D).

Draft EIS Review

12/12/03

Letter
P83

by Rollin Frost M.S.

P83-1

My initial reaction to this plan to use PTA for more training, with Stryker vehicles, was concerned primarily for the physical destruction these heavy movers would do to the fragile top crust in this very rare and special environment. I was there in 60-62, Survey and Fire Direction Control, Field Artillery, 25 th. Div. I saw what we did with smaller vehicles, horrible dusty ruts.

I spoke at the public meeting at the Mariott, the top few inches of a new lava flow cools quickly, the faster cooling traps bubbles, tunnels, and fissures, deeper lava that cools slowly, and stays liquid longer gives time for bubbles to escape, and fissures fill. So all the holes that trap soil, moisture, and seeds, is only in that top crust. Remove the crust, crush it maneuvering 40 ton Strykers, and the porous top layer is gone forever. Or at least until Pele covers it all with a new flow, and creates another top "puka" filled crust, if She ever does.

P83-2

In the hostile, rare, and isolated environment of the high, tropical, volcanic desert. no topsoil fills in later, and no life can get a grip on the bare rock, or fine dust. The permanent loss of this special and rare land, plants, insects, animals, birds, and rare habitat, full of wonderful ecological relationships evolved in isolation, is just not worth the temporary advantage to our military. Such permanent loss, for generations and generations, for this "need" to expand training, and save a little transport money, or bring in a few jobs, for a few years! Is there not some alternative?

Toxic dust hazard. Sick Troops.

Chronic Beryllium Disease

Long Term Effects

Carcinogens

Responses

P82-8

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. The NEPA process is required by law to be open and included public comment to the maximum extent possible.

P83-1

After a careful reevaluation the Army determined that there would be a significant impact to soils from training activities primarily on WPAA. Please see Section 4.9 for a summary and 8.9 for details at PTA.

P83-2

It is likely that heavy vehicle tires will damage plants and other biota and create compacted tracks in the maneuver training areas. The EIS identifies this as an impact and discusses the impact in the geological resources and the biological resources chapters. There is currently the potential for damage of the same type due to civilian vehicle use in the area proposed for maneuver training. The EIS discusses the project alternatives. The Stryker vehicle is equipped with rubber tires rather than metal tracks. Maneuver training will result in damage to a percentage of the exposed surface. Under the Army's ITAM program, discussed in the EIS, damage to lands used for military training are evaluated over time, and action is taken to reduce damage if it is observed. While damage cannot be eliminated, certain actions can be taken to reduce or correct the damage. The amount of surface area damaged by Stryker vehicle or other vehicle use could be reduced by limiting the movement of the vehicles to established routes, and avoiding some areas, including areas deemed to be particularly sensitive.

Comments

P83-3 I got a copy of the draft EIS after the public meeting, and everything changed. Not an easy document, it was none-the-less thorough in Army fashion. My 30 yrs. of work in occupational health soon directed my attention to the dust. I remember that terrible dust. The old OSHA Inspector inside me clicked in: was there any free silica in that dust? No data. Probably nobody ever thought to ask. Most DOD folks come from other places and don't realize how glassy lava is.

Recommendation #1: Use personal samplers on some drivers, those behind lead vehicles, and other dusty situations. Look at worst cases first. Do silica workup, and particle size.

After hours, (and more hours), I found reference to soil samples. Discovering Appendix M-1 was encouraging as I had specialized in toxic metals. The data here took some reorganizing, but soon developed into alarming patterns.

P83-4 The high iron, in bold designating exceeded Standards, (thank you EIS authors) reflecting ordinance and it's reduction to smaller particle size by either impact, or heat. Manganese likewise, and to check the ratio of the two, a good way to check sampling. Question: Why sample ENG-DEMO-01 has 10 times more Manganese? Demolish something different?

P83-5 Aluminum seemed higher around fire points than impact areas, so may be by products of combustion (not impact), which argues small particle size, which increases the possibility of getting airborne to impact Artillery, and Stryker crews, depending on wind direction and the location of the intake air supply(if the vehicle is buttoned down). Metallic Aluminum is not found in nature, the metal fume may have significant long term effects.

P83-6 There is a treasure of data in Appendix M-1, but no info on sampling technique, so I decided to go after the really toxic worst metals. Arsenic was there, and some times doubled or tripled from sample to sample. Then suddenly sample R11TANK-01 has roughly 10 times more, and sample R5HGR-2 half that, and R5HGR-4 was a shocking 6,890, roughly 20 times higher than most other concentrations.

Arsenic and it's most common form arsenic tri-oxide is one of those really potent carcinogens, inhale some particles.....cancer 30 years later. Nothing to fool with if it gets airborne.

Responses

P83-3

Lavas from Hawaiian volcanoes are predominantly silica-saturated basalts. The Bishop Museum database on the geochemistry of lavas produced by Hawaiian volcanoes indicates that most lavas are about 20 percent elemental silica by weight. Most of the silica in Hawaiian lavas is chemically combined in the form of metallic silicates (predominantly iron, aluminum, potassium, calcium, sodium, titanium, phosphorous, magnesium, and manganese silicates). Because erupted lavas cool quickly compared to deep magma intrusions, the most of the small portion of silica not bound into silicate minerals should be present as non-crystalline (amorphous) silica glass. Glassy lavas do not have a high crystalline silica content. However, the rapid cooling of erupted lava also suggests that the small amount of crystalline silica which may be formed will be present as very small crystals. Based simply on the composition of parent materials, there is a general expectation that the silica content of Hawaiian soils will be primarily in the form of silicate minerals and non-crystalline silica. The same expectation holds for gravels produced by crushing local rocks. The basic geology of Hawai'i does not suggest any unusual potential for exposure to crystalline silica from soil-generated dust. An EPA assessment of non-cancer health risks from silica exposure (EPA 1996) summarizes data from a 1980 study that evaluated the crystalline silica content of airborne particulate matter in a number of US cities. The EPA report identifies only one particulate matter sample from Hawai'i as having been analyzed for crystalline silica content (US EPA 1996, pg 3-21). That sample, collected in Honolulu, showed both one of the lowest coarse fraction crystalline silica contents reported from the 22 US cities studied (1.2 micrograms per cubic meter) and one of the highest PM2.5 crystalline silica contents reported from the 22 cities (also 1.2 micrograms per cubic meter). Overall, crystalline silica accounted for only 5.2 percent of the mass of the Honolulu particulate matter sample. The Honolulu sample results are consistent with the expectation that most silica in Hawaiian lavas is present as silicate minerals or as non-crystalline silica. The results also are consistent with the expectation that most of the crystalline silica which is present will be in the form of microscopic crystals rather than visible quartz crystals. Although there is little data available on the crystalline silica content of Hawaiian soils, the limited data which is available and the known geochemistry of lavas from Hawaiian volcanoes indicate that there should not be any unusual silica exposure associated with fugitive dust generated by military training activities in Hawai'i. While the microscopic size of crystalline silica in lava-derived dust adds to the relative respiratory hazard, the absolute quantities present in fugitive dust are expected to be small. The respiratory hazard from fugitive dust generated by military training exercises in Hawai'i should not be significantly higher than the respiratory hazard posed by fugitive dust exposure anywhere else in the US.

Comments

P83-6 | Recommendation: #2. Find out how it got there, stop further pollution, **clean** it up, **cont'd** or encapsulate/ cover/ prevent transport.

Lead got my attention next. I used to be quite the lead expert. Lead is **commonly** thought of as "lead poisoning" but in truth is **not** immediately toxic or **debilitating** to adults. Get a sudden large dose of lead, the **common** symptom is a **nightmare**! Children, those who haven't yet developed full **size** skulls, and the "blood/brain barrier" that protects the rest of us, little **kids** and **babies** get a tiny amount of that same lead, however, and it goes straight to the brain and **causes** irreversible **damage** and lowered IQ.

Here's a quote from "Lead Toxicity", my old textbook on **lead**, in its summary and conclusions; "High lead levels were found to **have significant** deficits in IQ, auditory and language processing and attention. **These behaviors**, measured in the laboratory, were supported by the teachers who were **unaware** of the lead status of the children. The chapters that follow provide **ample testimony** to the diversity of lead's mischief, its sources and passages to argue for the **orderly** but rapid removal of this hazard from the human environment." **Herbert Needleman** 1980.

Don't get me wrong, lead in adults is not harmless, but **your** average GI won't report symptoms from the amounts likely **encountered** at **PTA**

A lot of lead has been spread around . Appendix M-1 data **shows** comparable values from the same sample sites, for instance **most** FP (firing **points**?) came in from 500 to 1400 micro-grams per kilogram, enough **alike** to trust the data. Two samples labeled "ambient" were 1,520 and 1,680.

P83-7 | R10-01,02,and 03 came in at 101,000 530,000 and 988,000 ! R11-Tank-03, was 44,400 and 02 at 89,000. Sample R11Tank-01 was an astounding 2,470,000 ! There is alot of lead out there primarily in **Range** samples (where ordinance hits), not around the men. Exactly what kind of **lead** is there is the next question. Big pieces will maybe stay there, but if small, **especially** particles in a metal fume form(the metal was vaporized and tiny crystals **precipitate**), is spread around and migrates. You burn leaded gas, small size dust settles downwind of the street, to trap the unwary toddler, consigning those thumb **suckers** to lifelong "slowness" !

P83-8 | The EIS lists a residential limit,PRG, of 400,000 but in a **practical** sense it's about how easily particles can get airborne so people and kids, can **breath**

Responses

P83-4

Geologically young soils derived from lava and volcanic ash will have naturally high concentrations of many metals. The Bishop Museum geochemistry database demonstrates that Hawaiian volcanoes produce lavas with high natural levels of iron, aluminum, manganese, lead, and other metals. Hawaiian lavas typically are 8 to 10 percent elemental iron by weight (80,000,000 to 100,000,000 micrograms per kilogram); 6 to 8 percent elemental aluminum by weight (60,000,000 to 80,000,000 micrograms per kilogram); and 4 to 7 percent elemental magnesium by weight (40,000,000 to 70,000,000 micrograms per kilogram). The iron content of some Hawaiian lavas exceeds 13 percent (130,000,000 micrograms per kilogram), while aluminum contents above 10 percent (100,000,000 micrograms per kilogram) and magnesium contents as high as 21 percent (210,000,000 micrograms per kilogram) also have been reported. The manganese content of Hawaiian lavas averages 1,250 to 1,740 ppm by weight (1,250,000 to 1,740,000 micrograms per kilogram), while the lead content averages 2 to 6 ppm by weight (2,000 to 6,000 micrograms per kilogram) for most Hawaiian lavas. Kilauea lavas have a lead content averaging 27 ppm by weight (27,000 micrograms per kilogram). Lead contents as high as 25 ppm (25,000 micrograms per kilogram) are reported from the Honolulu series volcanics on O'ahu, and lead contents as high as 140 ppm (140,000 micrograms per kilogram) are reported from Kilauea lavas. Soils derived from lava and volcanic ash also will have high natural concentrations of these metals. As noted in the EIS, munitions use on Army ranges obviously adds additional quantities of numerous metals to area soils. Iron, aluminum, copper, zinc, manganese, lead, and nickel are expected to be the metals added in the greatest quantity. Among these metals, lead, nickel, and manganese would pose the greatest potential health concerns. But as discussed in Sections 5.9 and 8.9 of the EIS, the metals contents of soil samples collected at SBMR and PTA do not pose a significant health risk to Army personnel or to the general public. The EPA industrial use PRG values are not standards; they are merely screening criteria used to flag conditions that may warrant further evaluation. The industrial PRG values are based on health risk screening that assumes 25 years of occupational exposure (8 hours per work day). Army personnel have much shorter exposure periods than assumed in the EPA PRG values. As a result, even the presence of conditions that exceed the EPA industrial PRG values does not automatically constitute a significant health risk to Army personnel or the general public. The EIS concludes that there are few significant health risks associated with troop exposure to soils at USARHAW installations.

Stryker Brigade Combat Team Final EIS, Hawai'i

P-453

**P83-8
cont'd**

it. Metal fumes are different than the soil PRG, metal fumes go below .5 micron and cannot be seen visually (cigar smoke is about 1 micron), metal particles that small stay airborne for hours and hours.

The big question is were the lead particles found generated from combustion ? It takes very little heat to get lead fumes. Little kids who melted lead to make "tin Soldiers" may not have graduated school !

If any significant portion of the lead found, is of that fume nature, it may seriously impact GI's health, and may threaten kids in Waikaloa ! When dealing with lead, it's good to remember that it never goes away, just travels around.

P83-9

Recommendation: #3. EPA type testing for lead downwind. During those extreme wind conditions, perhaps some schoolyard monitors ? Find some replacement ordinance. If there are dense concentrations of lead dust, personnel should be cautioned not to take dusty gear/clothing/boots home where "rugrats" might live.

Now perhaps the most disturbing metal problem that I saw in M-1 data. Beryllium has only recently claimed the "most toxic" title. Quoting from my 20 yr. old text "Fundamentals of Industrial Hygiene" "Beryllium". As recent as 1940 beryllium was thought to be reasonably harmless, but it has since been found to be a toxic agent even in very small quantities. Beryllium is among the most chemically toxic of all elements yet investigated. Acute effects have been brought about in animals with beryllium in quantities in the order of millimicrograms. Field survey evidence shows that still smaller quantities may produce chronic disease in human beings. "Safe" levels of beryllium may ultimately be set well below 1 microgram per cubic meter of air. It has been established that a worker may carry home enough beryllium compound on his clothes to result in illness to some member of his family."

The latest OSHA bulletin on their website, dated 9/2/99:

WARNING !

INHALING BERYLLIUM DUST OR FUMES MAY CAUSE SERIOUS

CHRONIC LUNG DISEASE AMONG EXPOSED WORKERS;

**THIS LUNG DISEASE CAN BE
FATAL.**

P83-5

The laboratory results for the soil sampling program provided an elemental composition analysis, not a chemical speciation analysis. Lavas from Hawaiian volcanoes have an average aluminum content of 6 to 8 percent elemental aluminum by weight (60,000,000 to 80,000,000 micrograms per kilogram), with aluminum levels above 10 percent (100,000,000 micrograms per kilogram) reported from some samples. Aluminum compounds are subject to leaching, especially in acidic conditions. Ordnance use at USARHAW installations will add metallic aluminum and aluminum compounds to range soils. Most of the added aluminum will be fragments of the metal casings of munitions items. Flares and flash devices will generate small quantities of aluminum compounds in the form of fumes and fine particles. The Army's toxic release inventory reports for 2001 and 2002 do not list any airborne aluminum emissions, meaning that airborne releases of aluminum and aluminum compounds were less than 0.5 pounds at any installation. The quantities of aluminum reported from the SBMR samples are noticeably higher than those reported from the PTA soils. A few of the aluminum concentrations reported from SBMR exceed the EPA industrial soils PRG value, but none of the aluminum concentrations reported from PTA exceed the EPA industrial PRG. The industrial PRG values are based on health risk screening that assumes 25 years of occupational exposure (8 hours per work day). Army personnel have much shorter exposure periods than assumed in the EPA PRG values. As a result, the presence of conditions that exceed the EPA industrial PRG values does not automatically constitute a significant health risk to Army personnel or the general public. The EIS concludes that there are few significant health risks associated with troop exposure to soils at USARHAW installations.

P83-6

Natural sources are almost certainly the dominant source of the arsenic concentrations detected in soils at SBMR and PTA. Arsenic is a widely recognized natural constituent of volcanic rocks and of soils derived from volcanic materials. Arsenic is not among the metals routinely tested for in geochemical analyses. The Bishop Museum database does not include any data on the arsenic content of Hawaiian lavas. Data tabulations in the Handbook of Soil Science indicate that the normal range of arsenic found in soils around the world varies from trace quantities up to 97 ppm by weight (Helmke 2000). Average concentrations are typically in the range of 5 to 10 ppm by weight (5,000 to 10,000 micrograms per kilogram), but average concentrations up to 17 ppm (17,000 micrograms per kilogram) have been

Comments

BERYLLIUM CAN ALSO CAUSE LUNG CANCER.

The Sept. 1999 Bulletin lowers the PEL by a factor of 10, to 0.2 micrograms/m. It also gives some uses for this light, hard, non-magnetic, excellent heat conducting metal as jet brake pads, semi-conductor chips, transistors, heat sinks, jet engine blades, and "rocket covers".

Now lets look at sample results on beryllium: The Schofield data was divided into 250-400(range) and 500-800 (firing places) micrograms per kilogram. PTA samples were all twice as high, but had the same relationship, high at firing stations, low out in the impact range. If the beryllium is due to rocket covers, the tubes full of solid propellant, one would expect rocket firing points to be those with max. range, and that seems to be the case. We can say that Fire Points 802 and 804 didn't fire many rockets. Fire points 311, 309, and 420 used them more often. FP420-01 came in at 1,740 ! Schofield sample EngDemo-01 was 1,170. I wonder if they fired the same rocket weapons ?

Seventeen of 41 PTA samples were over 1000. All from fire points. The low values came from range samples. Clearly beryllium pollution occurs when a weapon is fired. THAT MEANS THE MAN FIRING GETS POLLUTED !! The OSHA website gives details of a blood test to find those sensitized to beryllium, and symptoms of exposure.

The question of particle size is of course the main parameter. How easily it gets airborne ? The relatively uniform sample values from each area, argues the pollutant was of fine size and was in the air, so spread evenly over a wide area. If true, this is foreboding indeed as to the level of danger to troops and folks downwind ! Beryllium burns off the rocket tube end, as it takes off it's moving slow and spreads the beryllium thickly, once down range it's moving fast and spreads out the metal fume over much longer distances.

Another interesting possible indicator are the two "ambient" samples RC-01, and RC-02. The high levels, 1,330 and 1,670 were surprising unless "ambient" meant collected over a wider area, probably from the surface, and if rockets were fired there, fine particles floating down onto the surface would make such "ambient" samples richer in polluting particles.

Recommendation: #4. Immediately undertake a program of testing firing crews with personal breathing zone samplers. Define the hazard to employees, oops, I mean Soldiers. This is classic OSHA stuff. Define any civilian exposures. Sample to

Responses

reported from some regions. Arsenic is found as a trace contaminant in the energetic components of many munitions items, but the quantities found are extremely small. There are no readily identifiable uses for arsenic in munitions items, although arsenic has historically been used in pesticides and rodenticides. The arsenic present in munitions items appears to be the result of undesired trace contamination of other materials. The Army's toxic release inventory reports for 2001 and 2002 do not list any arsenic releases, meaning that airborne emissions of arsenic were less than 0.5 pounds per year at any installation. Most of the arsenic contents found in soil samples from SBMR and PTA are within the range of values that would be expected from natural sources. One sample from SBMR MOUT area (the MAC-04 site) had an arsenic content over the EPA residential soil PRG, but below the EPA industrial soil PRG value. It seems unlikely that this high concentration sample is due to munitions use, but it might reflect historical use of arsenic-containing rodenticides. Given that the arsenic content of all samples was below the EPA industrial soil PRG value, there would be no significant health risk to Army personnel or the general public.

P83-7

Munitions use is not expected to be a significant source of metal fumes. Most of the metals content of munitions items is in the casing material. The metals content of propellants and explosives is small. Flares contain relatively higher quantities of metals, especially aluminum. Devices that produce colored marking smokes contain various metal salts, but obscurant smokes have low metals contents. Munitions use will contribute lead to range area soils primarily from the impact of metal projectiles and the detonation of high explosive shells. These sources would contribute lead and other metals to area soils primarily as large fragments of bullets and warheads. Weathering and corrosion processes would lead to gradual leaching of metals into the soil column. Much smaller quantities of lead and other metals would be generated at firing points from the metals content of propellant charges used in munitions items, from metal particles generated by friction of projectile and the gun tube or barrel during weapons firing, and from the weathering and corrosion of any shell casings not collected after firing exercises. The lead in artillery propellants is primarily in the form of lead stearate. Propellant charges for 155 mm howitzers contain less than 0.2 grams of lead in either a 3-unit (3.5 pound) or 5-unit (6 pound) charge. Copper and zinc are the primary metals contained in artillery propellant charges, being present in amounts of 1 to 8 grams per charge. Small quantities of lead styphnate are used in detonators,

Comments

P83-11 | define transport limits. Try to find a training ordinance that doesn't use horribly
cont'd | toxic, persistent beryllium and lead.

P83-12 | There is an unreal quality to this toxic waste problem. That these toxic metal particulates appear, at least some component, to have been born in combustion, and been transformed to their most deadly and easily transported form, invisible to the eye, and able to kill and maim on delayed fuse, years later, a carcinogen that can kill for thousands of years, is it that our only hope that Pele cover it all? How far does the wind carry it?

This Draft EIS has identified some hazards that otherwise may have gone unrecognized for another 50 years, and so is doing it's job. We must follow through. Once the hazard has been identified in the environment, you must test the breathing zones of people to define the danger. It's the people that we are protecting. Test Soldiers now. Some areas may be too toxic for further training.

Finally, an old soldier story: 1960 it was, I was in Basic Training at Fort Ord. May June, in California, and I got Pneumonia! At least that's what I was told. I coughed and coughed, finally blood, then Sarge sent me in, and instead of a rest, I got a shot, and KP for 3 days! I learned later, so many guys got it, they called it "pneumonia hill". I was healthy and never again felt such sudden symptoms, what was it got me and so many others? I remember it was just after some range firing, was it some solid propellant weapon? When I read the first symptom of beryllium.....pneumonia like, etc. I think I had classic beryllium attack! Stretch this beryllium pollution out further, and it may help answer part of the "Gulf War Syndrome" for Veterans.

How does this all affect the proposed project this Draft EIS was created for? There is now evidence of very toxic materials, possibly in very small size particles able to get airborne and endanger the health and safety of soldiers and civilians alike. The possibility of fine lead and beryllium reaching kids down wind is real. Further investigation is needed. To do otherwise is to endanger thousands of GI's, Civilians, and Children.

P83-13 | Recommendation #5. Lead monitors at downwind schools, during live-fire.

Your Servant, Rollin L. Frost

77-6473 Princess Keelikolani Dr. Kailua-Kona, HI. 96740

Responses

blasting caps, and percussion primers. As noted in Section 5.5 of the FEIS, the explosive detonation process is fundamentally different from a combustion process. The detonation process is a supersonic shock-wave process that fragments the exploding material. The fireball accompanying the detonation expands so rapidly that high temperature chemical reactions are quenched very rapidly. The only metal fumes that could be formed from high explosive ordnance would be from metals contained within the propellant, explosive, and pyrotechnic material in munitions items, not from shell casings, warhead casings, or bullets. Flares and smoke devices are the munitions items most likely to generate metal fumes, since activation of those devices is more like a combustion process than a detonation process. The Army's Toxic Release Inventory reports for 2001 and 2002 indicate that airborne emissions of lead compounds was 710 pounds in 2001 and 465 pounds in 2002 for the three USARHAW installations where live firing occurs. For 2001, airborne lead compound emissions were estimated to be 236.6 pounds at SBMR, 466.2 pounds at PTA, and 7.6 pounds at Makua Military Reservation. For 2002, the estimated quantities were 286.4 pounds at SBMR, 157.7 pounds at PTA, and 21.2 pounds at Makua Military Reservation. In contrast, non-air releases of lead and lead compounds were slightly approximately 29 tons per year at SBMR, 2 to 3 tons per year at PTA, and 336 to 873 pounds per year at Makua Military Reservation.

P83-8

Ordnance firing and detonation are not expected to be a significant source of metal fumes. Projectiles can be fragmented when they impact the ground, and metal coverings of high explosive warheads are fragmented by detonation processes. Metals are not vaporized by these processes. Friction between projectiles and the gun tube or barrel generate small particles of metals, but would not generate metal fumes. The only metal fumes that would form in the detonation processes would be from metals contained in the chemical composition of the energetic material itself (propellants, explosives, and pyrotechnics). Shell propellants and explosive materials have very low metal contents. Flares and smoke devices are the items most likely to produce metal fumes. Smoke devices can include various metal salts that color the smoke generated by the device, and the pyrotechnic material in flares also includes various metal compounds. Flares can vaporize a small portion of the aluminum in the flare casing, in addition to the metals that are incorporated into the pyrotechnic material itself. Flares and smoke devices are only a small component of the ordnance items used at USARHAW ranges. Lead is not a major component of pyrotechnic materials.

Comments

Dear Friend: This is about health and safety. I have spent 30 years in Occupational and Environmental Health. What I am presenting here to you is a recent "discovery", that came about when the Dept. of the Army published the EIS on proposed expansions at Pahakaloa (PTA) training Area on the Big Island. They published the results of soil samples from Schofield Barracks, and PTA. Upon examination, the results indicated a serious public health hazard.

Here's the Executive Summary: Two Extremely toxic metals are studied, Beryllium, and Lead. From what I can tell, the beryllium is from burnt rocket tubes. It shows up at firing points. The lead shows up more in range samples and so one infers is a product of ordinance explosions at target. Both toxic metals, or some portion thereof, have been vaporized, and then precipitated into a "metal fume", which is evident by the relatively homogenous data from each sample area. Metal fumes occur in small size like half a micron and less. If these two bad guys are airborne, much damage can occur downwind. A study on Particle Size versus Time to Settle to Ground, is appended so that you may better understand metal fumes. These tiny toxic metals are also perfectly suited to get into your deepest lung niches, and make big health problems.

Toxic metals vaporized by ordinance firing and impacts, the metal fumes are blown on trade winds to downwind schools, IQ levels drops from the lead, and Acute and Chronic Beryllium Disease develops in students and teachers. OSHA info on symptoms, blood tests, long term, etc., are appended. This hazard affects Army, civilian, and those most vulnerable to the lead, school children. The threat to kids and infants is most serious. Research lead and you'll find the experts say there is no safe level! The smallest amount of lead fume reaches those immature brains and catastrophic IQ loss occurs. Think of it like fireworks, poof the blast goes off, a spherical cloud of colorful particles balloons out from the center in colors as they burn, then the leftover cloud of "smoke" drifts off with the wind. In our case the Waihi-Waikaloa corridor is like a wind tunnel, that efficiently carries the "smoke" along to people that doubtless will complain every New Year. The problem for us is that we can't see or smell the metal fumes. The other problem is that the people affected, the small kids, don't show immediate symptoms. And last..... it may happen daily!

The beryllium fume hazard is actually toxic, and acute symptoms can be expected in one of twenty people exposed, but is easily confused with pneumonia, and the necessary blood test is available in only a few labs worldwide. Not easy to diagnose. The metal is much lighter than lead and toxic in much smaller amounts. As the largest exposures are to GI's firing tube/solid propellant weapons, hopefully the Army will do the necessary personal sampling to define that hazard better.

The threat of lead fume showers coming down the saddle to school children in Waikaloa is not just possible, but probable! Only one first response to this hazard is sensible, airborne lead must be monitored at downwind schoolyards now. A program of personal testing with small breathing zone samplers, is also needed on selected kids, nearest and downwind, when firing is on at PTA. Sampling and testing for airborne lead is cheap and easy. Be sure the millipore filter will trap the really small lead fumes, and the lab is certified. The State Health Dept. has large particulate filters on each island. There's one in Hilo that could be used to start a program. If done privately I recommend Inalab in Honolulu. This should be done now. The sooner this hazard is defined, the sooner it will be recognized and then stopped, or vulnerable citizens and children removed from harm. Please help get sampling started.

Rollin Frost MS, Phone 808-322-3584

Responses

P83-9

The Army does not believe there is a need for any special monitoring program for lead. Given the high density of lead, any particles with a substantial lead content would settle much more rapidly than normal dust particles, and thus are unlikely to be transported long distances in concentrations that would have public health concern.

P83-10

Beryllium is a trace component of various munitions items, being present either as part of the alloys used in metal parts or as a trace component of various rocket propellants and other energetic materials. Rocket propellants would be expected to be the primary source of beryllium releases at USARHAW installations. The beryllium found in metal parts would enter the environment within metal fragments from casing materials, and would not be vaporized by munitions use. Only the trace amounts of beryllium found in some rocket propellants would be released in the form of fine particles or metal fumes. Trace amounts of beryllium have been found in some but not all types of rocket propellants. Recent testing by the Army Environmental Center has found very low trace concentrations of beryllium in the M18 red smoke grenade (US Army CHPPM 2000), but not in the M18 green, violet, or yellow smoke grenades. Beryllium has not been detected in other smoke devices. Detectable quantities of beryllium have not been found in artillery propellants. The Army's Toxic Release Inventory reports for 2001 and 2002 do not list any beryllium releases, meaning that cumulative emissions were less than 0.5 pounds per year at any installation. The most likely source for the beryllium found in soil samples from SBRM and PTA is the natural beryllium found in lavas and lava derived soils. Unfortunately, beryllium is not among the metals routinely tested for in geochemical analyses. The Bishop Museum database does not include any data on the beryllium content of Hawaiian lavas. Data tabulations in the Handbook of Soil Science indicate that the normal range of beryllium found in soils around the world varies from trace quantities up to 40 ppm by weight (Helmke 2000). Average concentrations are typically in the range of 0.5 to 2 ppm by weight (500 to 2,000 micrograms per kilogram), but average concentrations of 3 to 6 ppm (3,000 to 6,000 micrograms per kilogram) have been reported from some regions. Thus, the beryllium concentrations reported for soil samples at SBMR and PTA are in a range that could be due to natural sources. While very small beryllium addition would be expected from munitions use at rocket firing points, most of the detected beryllium is likely to be from natural sources. The spatial pattern of relatively

Comments

Responses

higher versus relatively lower beryllium concentrations found in PTA soil samples may simply reflect the differences in natural beryllium levels for soils derived from Mauna Loa lavas versus those derived from Mauna Kea lavas. Most of the firing points are located on the Mauna Kea side of the installation, while the live fire impact area is on the Mauna Loa side of the installation. A difference in natural beryllium content between Mauna Loa and Mauna Kea lavas also would explain the relatively high beryllium concentrations found in the ambient background soil sample. The soil sample locations labeled as “ambient” are locations considered typical of natural background conditions. As is clear from the location of the background sample as shown in Figure M-2 of Appendix M1, the background sample site is unlikely to be affected by military activities. The relatively high beryllium levels found in all of the soil samples may very well reflect the natural variation in beryllium concentrations present in soils derived from Hawaiian lavas. None of the beryllium concentrations found in the SBMR or PTA soil samples even come close to the EPA PRG values. Thus, there is no indication that beryllium exposure at USARHAW installations poses a significant health risk to military personnel or the general public.

P83-11

The EIS has not identified any significant health risks to troops due to exposure to hazardous air pollutants during training exercises. There are ongoing governmental studies for some chemical exposures. If the Army determines that there is a significant health risk to troops due to exposures to hazardous air pollutants during training exercises based on ongoing or future studies, appropriate response measures would be implemented.

P83-12

As noted in response to other comments, ordnance detonation is not a combustion process. It is a shock-wave driven decomposition and fragmentation process that does not convert metal casing materials into metal fumes. Energetic materials are primarily organic nitrate compounds with very low metal contents. The small quantities of metal fumes generated by propellant and explosive compound detonations or by the use of smoke and flare devices would not result in detectable metal fume concentrations in areas outside installation boundaries.

P83-13

The Army does not believe there is a need for any special monitoring program

Comments**Responses**

for lead. Given the high density of lead, any particles with a substantial lead content would settle much more rapidly than normal dust particles, and thus are unlikely to be transported long distances in concentrations that would have a public health concern.

P83-14

Available information indicates that the beryllium concentrations found in soil samples at SBMR and PTA are almost certainly dominated by beryllium of natural origin, not the result of munitions use. Beryllium is a trace component of only a small number of munitions items, being present either as part of the alloys used in metal parts or as a trace component of various rocket propellants and a few other energetic materials. Rocket propellants would be expected to be the primary source of beryllium releases at USARHAW installations, but beryllium has not been found in all types of rocket propellants. The quantities of beryllium found in munitions items is much too small to account for the beryllium content of soils sampled at SBMR or PTA. The beryllium levels found in SBMR and PTA soil samples are all within the range of published data on the natural beryllium content of soils from around the world (Helmke 2000). The differences in average beryllium concentrations between firing point areas and ordnance impact areas at PTA is probably due to the differences in natural beryllium content of soils derived from Mauna Kea lavas versus those derived from Mauna Loa lavas. Ordnance firing and detonation are not expected to be a significant source of metal fumes. The only metal fumes that would form in the detonation processes would be from metals contained in the chemical composition of the energetic material itself (propellants, explosives, and pyrotechnics). Shell propellants and explosive materials have very low metal contents. Flares and smoke devices are the items most likely to produce metal fumes. Lead is not a significant component of pyrotechnic materials or propellants, and is present in only very small quantities in various explosives.

P83-15

Ordnance firing and detonation are not expected to be a significant source of metal fumes. The only metal fumes that would form in the detonation processes would be from metals contained in the chemical composition of the energetic material itself (propellants, explosives, and pyrotechnics). Shell propellants and explosive materials have very low metal contents. Flares and smoke devices are the items most likely to produce metal fumes. Lead is not a significant component of pyrotechnic materials or propellants, and is present in only very small quantities in various explosives. Lead will be found in almost all PM10 samples collected anywhere in Hawai'i, but it will be due almost entirely to the natural lead content of local soils.

Dear Ms. Barger

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. **I oppose the Stryker Brigade expansion in Hawai'i.**

P85-1**P85-2**

I also have concerns about: the legality of clear title to the 24,400 acres of land under the Kahuale of 1848. The land was protected by the Kahuale and we were not able to lose their land. The State of Hawaii does not have clear title to the land. The expansion is illegal.

I am a former ~~employee~~ natural resource manager for the Army's Directorate of Public Works, Environmental Division. My statements and concerns are based on two years of personal experience + over 6 years of the program's history. Should the Army expand, in order to comply with their EPA mandate to "harm no Endangered Species," the Army must guarantee the following:

- 1) Not Harm any endangered species in the 23,000 acres.
→ The army cannot make this guarantee, as will be explained
- 2) Conduct thorough enough surveys to locate all populations of endangered species.

P86-1

→ After 6 years on O'ahu, our staff was still finding rare plants unknown previously, in certain training area for instance Schideia Kaalae in Schofield West Range. The Army will not know where all End. species are.

- 3) Provide adequate staff + funding to manage endangered species on the expanded area.

P86-2

→ Current staff is unable to control threats to endangered species on the land currently used on O'ahu or at Pohakuloa. Fountain grass, an alien weed + major fire threat runs rampant @ PTA. Oahu staff of ~12 manage over 40,000 acres or close to 4,000 acres per staff member. One person cannot manage 4,000 acres.

- 4) Provide access to all endangered species populations for their environmental staff to conduct management activities.

P86-3

→ On O'ahu, staff are prevented from entering

Responses

P86-1

All mitigation will be considered and final mitigation will be outlined in the ROD. Mitigation measures outlined in the USFWS biological opinions include surveys and research to be done on Army training lands.

P86-2

All mitigation measures will be considered and final mitigation will be included in the ROD. Measures agreed to by USFWS and the Army that are included in the biological opinions to reduce impacts to the flora and fauna can be found in sections 4.10, 5.10, 6.10, 6.10, 7.10, and 8.10.

P86-3

USFWS and the Army, through section 7 consultation, agreed to allow additional management days for the Natural Resources Team on certain ranges on O'ahu.

P86-3
cont'd

certain Oahu 'elepaio territories, in Makua Military Reservation, because of high UXO danger, specifically ICM. These same areas may contain other rare plant species native to the dry forest area, all of which are threatened by Army training and are not being managed. In other areas, staff must wear burdensome flack jackets + helmets, are prevented from camping, and therefore are prevented from doing their jobs. If environmental staff aren't doing their job, the Army is not, theoretically, allowed to Allowed to do their. How will things be different @ PTA.

5) Provide a fire management plan that will prevent any future harm to endangered species

→ The Army cannot adequately prevent fires in their training areas. PTA is a very highly fire threatened area. "Live Fire" training guarantees live, wild fire.

The 1995 fire in Makua Valley, the 2003 fire in Makua and Kalua Kaila and Kahanaiki valleys stand as proof that the army does not grasp the danger of fire threat. The recent fire was based on such sheer lack of forethought, and ~~and~~ a total disrespect of fire knowledge as to be gross negligence.

Please address these items in your EIS.

P86-4

P86-4

These comments are on the Integrated Wildland Fire Management Plan and have been passed on to the preparers of that document.

To Whom It May Concern:

P88-1 Expansion of military use of land on this limited-space Island is not in the best interest of inhabitants of O'ahu. I find the proposed further land acquisition contrary to my religion as well as disregarding of the sensibilities of Hawaiian people. Population is increasing and if sustainability is ever going to become possible every bit of land will need to be put into productive use.

It is my understanding that the U.S. military proposes to use heavy vehicles and toxic munitions on the land which they propose acquiring.

P88-2 Please list for us the names and addresses of any lands on which the U.S. military has trained using heavy vehicles and toxic munitions which it has subsequently cleaned and restored to a condition suitable for preexisting range of nonmilitary use.

Thank you.

Sincerely,

Subject: Proposed increase of land use on O'ahu & Hawai'i Island by U.S.
Military for Stryker Training

1/3/04

Cindy S. Barger
 SBCT EIS Project Manager
 U.S. Army Corps of Engineers, Honolulu District
 Bldg. 230, Rm. 306 Att: CEPOH-PP-E
 Fort Shafter, HI 96858-5440

Dear Ms. Barger:

No reply has come to my letter of some months ago as to completed cleanup and
 safe restoration following land-use for American military training.

In Hawai'i, unkept promises have not built up confidence that the proposed
 extension of military-controlled land will bring better results. Island
 communities like ours feel population pressure to a degree that cannot be imagined by
 continental dwellers. In addition, indigenous Hawaiian people are currently
 planning to slowly resume sovereignty, so this is a particularly bad time for
 the United States military to embark on what one must expect to be permanent
 damage to scarce land, some of which has proven very suitable for needed
 agriculture.

P89-1

Is it not possible for the Stryker training, if indeed it is necessary, to be
 done on land, other than an island, which is unlikely to be needed by
 increasing population in the foreseeable future?

Sincerely,

Mary A. Glover, M.D.
 87-226 Holomalia Place
 Wai'anae, HI 96792
 (sent courtesy of e-mail account debbkimba@aol.com)

P89-1

As discussed in Section 1.6 of the Final EIS, the ROD for the Programmatic
 EIS directed the 2nd Brigade, 25th ID(L) at Schofield Barracks, Hawai'i to
 transform to an SBCT. The Commanding General of the 25th ID(L) is
 charged with deciding how best to achieve that directive and provide for
 military training, readiness and facility requirements to meet SBCT
 transformation needs, while enabling the current forces to continue carrying
 out their missions and giving due consideration to environmental factors. This
 decision will be based on the results of this EIS, an on consideration of all
 relevant factors including mission, cost, technical factors, and environmental
 considerations. This EIS considers a reasonable range of alternatives including
 several alternatives that involve transforming and/or training on the U.S.
 mainland. As discussed in Section 2.6, the mainland alternatives were not
 analyzed in detail because they did not meet the purpose and need of the
 proposed action. (Complete details on the proposed action are presented in
 Chapter 2 and Appendix D).

RE: Public Comment on Draft EIS, Oct. 2003

I've been observing Hawaii's political situation for a while now and have come to a conclusion that America is not good for Hawaii. It's nothing more than simply a very bad marriage. The indigenous native Hawaiians, the host culture, is being consumed and betrayed by American politics and culture. The United States Army represents America; its squandering of our land is just one of many parts of America's betrayals to the native Hawaiians. America, the guest culture, is accusing Hawaiians of being racist in their own home; Americans are calling native Hawaiians activist; Americans are filing lawsuits in American courts to stop Hawaiians from exercising their own rights.

Let's face it. America wants Hawaii American. The native Hawaiians are kicking and screaming, "We never wanted to be American!" Truth is, how can America be democratic when America OCCUPIED, and continues to occupy, Hawaii. The history of Hawaii shows that American politicians and America's army are arrogantly driven to attain their own interest --- the army's expansion plans are further proof. It is already acknowledged that the proposed striker training will have an impact on the environment -- more impact on Hawaiian land -- the basis of our cultural beliefs. Don't you get the feeling that these community meetings with the army are just a token legal game at which we are all doing the "American-Wicky-Wacky" hula? Just more "bull".

Maybe the most critical element to this bad marriage between Hawaii and America is Hawaii's value system with it's aina. America will sacrifice Hawaii's land for profit, money, in its decision-making. Hawaii's aina is her legacy and her life. What little we have is precious. Hawaii is just a mere speck in the Pacific Ocean compared to the massive land mass of the United States Continent of America. And this big bully wants more of Hawaii.

So I simply and strongly do not approve of America, America's army and Armed Forces consuming more of my love and my life.

Aloha,

Patrick W. Keauhou Goldstein

Subject: depleted uranium at Pohakuloa?

P91-1

I wish to submit a public comment regarding the expansion of the Pohakuloa facility on Hawaii Island. I am concerned with the possible use of depleted uranium at the training facility. I am aware this cancer causing metal is potentially deadly to the people of this island and would like to know that there is no depleted uranium being used on the island of Hawaii nor will any depleted uranium be used in the future on our island. I look forward to a response.

Concerned Citizen,
Elisha Goodman

To:
Kalani M. Smith, Drum Road Project Manager

Will Chee Planning, Inc. Consultants, EA.

Gentlemen:

Dr. Gordon Smith of ~~the~~ the Honolulu office of the US Fish and Wildlife Service has kindly ~~given~~ me your names and addresses as contacts during the preparation of the ~~EA~~ EA for upgrading Drum Road.

I first learned of this ~~project~~ project in reviewing the Draft EIS for the 2nd Brigade Transformation from the standpoint of karstic and pseudokarstic geology and hydrology, topics in which I have special qualifications. I have submitted similar input for that project. I am the author of "Caves of Washington" and "~~C~~aves of California". Like Hawaii, these states are noted for both karsts ~~and~~ pseudokarsts. I also have published many articles on these subjects. Recent Hawaii articles include "History and status of the Moiliili ~~K~~arst, Hawaii" (Journal of Cave and Karst Science, 1998, vol. 63 ~~no.~~ 3) and "Raw sewage and solid waste dumps in lava tube caves of ~~Hawaii~~ Island" (same, 2003, vol. 63 no. 3).

Currently I am chairman of the on-going Oahu Karsts Project of the Hawaii Speleological Survey. The following relates to potential impact on one part of one karst of Oahu from the transformation of Drum Road. This is the Kahuku-Laie Karst which contains Punamano National Wildlife Refuge, specifically ~~the~~ Punamano karstic springs.

The specific area in question is in the vicinity of "Charlie Road" at Charlie Gate at the intersection with Kamehameha Highway. This location is shown in Figure 7-3 of the DEIS for the 2nd Brigade Transformation.

The flat plain shown in this photograph is part of a wide marine terrace formed partly on carbonates and partly on Koolau basalt. The carbonate portion is part of the Kahuku-Laie Karst. To the north and west it curves around the north end of Oahu as far as Kawela Bay. To the south it extends far past the Kahuku Bluffs (also shown in Figure 7-2), with upland extensions formed of aeolianite and calcarenite ridges.

P93-1

The portion around the Charlie Gate intersection and Punamano Springs is mantled by alluvium so that it is not shown as carbonate on surficial geological maps. This is much like the Moiliili Karst before urbanization. Similar (though probably smaller) karstic conduits almost certainly provide rapid underground flow of surface waters here. Statements in the Transformation DEIS about impermeable "caprock" at this location demonstrate a lack of understanding of karst in general, and specifically about karsts of Oahu.

Because this is a mantled karst, the exact junctions of alluvium, calcarenite and underlying basalt cannot be determined without considerable drilling or excavation, either or both of which also may harm Punamano Spring and its karstic invertebrate life forms. In my opinion, it would be much simpler and much cheaper to reroute the north end of Drum Road to meet Kamehameha Highway somewhere around Kawela Bay where there are no important karstic features.

It is true that a threat to these springs and their fauna already exists from spills on Kamehameha Highway and small side roads here, but your

P93-1

The upgrade of Drum Road is a single and complete project separate and independent from the proposed SBCT in Hawai'i. A separate NEPA documentation is being developed for the upgrade of Drum Road. These comments have been forwarded for consideration in the development of the Drum Road upgrade NEPA document.

Responses

Comments

proposed upgrading of Drum Road at the Charlie Gate intersection would add significantly to this.

Dr. Smith did not mention any previous studies of karstic invertebrate life forms of the Kahuku-Laie Karst in general or the Punamano Springs specifically. If any exist, you can easily obtain the information from Dr. Smith. Such aquatic invertebrate life is characteristic of karst waters, including at least one other Oahu karst.

P93-1
cont'd

If no such studies exist, they must be made as a part of the present EA if you see fit to continue the northern termination of Drum Road in this location. If so, I strongly recommend that you conduct these studies in cooperation with Dr. Smith's staff. These studies should include an environmental assessment of the effects of vehicular spills on each karstic life form identified in your inventory or by others. Dr. Francis Howarth at the Bishop Museum is a specialist in such fauna and would be the logical person to conduct such studies.

Of course, if you move the north end of Drum Road as recommended above, such studies would be unnecessary.

A large and growing geological literature on this type of karst on tropical and subtropical islands is readily available for your easy reference. If you need a further consultant on the geology and hydrogeology of this site, I suggest Dr. John Mylroie at Mississippi State University or Dr. Chris Groves at Western Kentucky University. Both are very knowledgeable about this form of karst and have actually observed it with me in the vicinity of this intersection. Dr. Mylroie has published many papers on this specific subject; Dr. Groves is head of the Hoffman Environmental Laboratory at WKU and also would be an especially valuable consultant.

If I can be of further service, please do not hesitate to call on me. Please place me on your mailing list for this project.

P94

BIOLOGICAL RESOURCES 12-12-03 p1 of 1

Executive Summary p41 "Project-wide impacts from impacts from fire on sensitive species and habitat, and federally listed species and designated or proposed critical habitat would result in overall significant impacts not mitigable to the less than significant level...Impacts on

P94-1

sensitive species from the spread of nonnative species, and impacts from loss and degradation of sensitive species and habitat would be significant and mitigable to the less than significant level on both the installation specific and project-wide level."

Impacts I put in bold are unacceptable.

Executive Summary p 58 To mitigate impact on natural resources from introduction of alien species, a vehicle wash is proposed at Kawaihae Harbor, if utility requirements and space permit

P94-2

Keeping alien species out is extremely important to the Hawaii ecosystem. If the feasibility of the vehicle wash is not known, the EIS is not complete.

P94-1

The discussions in Sections 4.10, 4.12, 8.10 and 8.12 have been expanded in the Final EIS to better discuss the potential impacts of wildland fires. The impact to biological resources from wildland fires has been changed to significant. The mitigation measures proposed, including the updated IWFMP, will substantially reduce the severity of the impact on biological resources but not to less than significant levels.

P94-2

Measures to mitigate for nonnative species introductions are included in each chapter under the biological resources sections 4.10, 5.10, 6.10, 7.10 and 8.10.

Comments

- P94-3** **CULTURAL RESOURCES 12-14-03 p 1 of 3**
Executive Summary p 48 "Construction projects...could result in significant cumulative impacts on cultural resources...there are cultural and archeological resources at Kawaihae Harbor, including an underwater heiau; the harbor deepening and the new highway from Waimea to Kawaihae Harbor could significantly affect these resources. Construction of the new range control building at PTA could have significant impacts on cultural resources, depending on its location."
These impacts are unacceptable
- P94-4** Executive Summary p 51 The State or County is responsible for building a visitor center at PTA to mitigate impact on cultural and natural resources.
A visitor center is not acceptable mitigation for destruction of cultural and natural resources. The EIS must spell out a plan to avoid destruction.
- P94-5** Executive Summary p 59 mitigation for construction impact on "Native Hawaiian traditional cultural properties and traditionally important places...is not likely to reduce the impact on the Native Hawaiian community to less than significant, if such resources are severely damaged or destroyed..."
This is unacceptable.
- P94-6** Chapter 3 p 76 "USARHAW has developed Cultural Resource Management Plans (CRMP) for the cartomment areas of SBMR, Fort Shafter, Kilauea Military Camp, and WAAF...USARHAW is preparing an ICRMP [Integrated CRMP] for management of the Army's one installation with 28 subinstallations in Hawai'i."
The EIS should state whether a CRMP or ICRMP is required for PTA and WPAA. If so, the EIS is not complete without them. They should be included in a new draft EIS which is then put out again for public comment.
- P94-7** Chapter 3 p 77 "consultation on the PA [Programmatic Agreement re historic properties] is ongoing...if the PA is not executed, the Army will follow the procedures at 36CFR 800..."
The EIS is not complete without the final PA or the 36 CFR 800 procedures. They should be included in a new draft EIS which is then put out again for public comment.
- P94-8** Chapter 4 p 70-71 "Potential impacts related to construction...could include destroying or damaging ATIs, [Areas of Traditional Importance] including shrines, archaeological sites, burials, or elements of Native Hawaiian cultural landscapes. Purchasing...the WPAA...and then using [it]...for military training, could limit Native Hawaiian access to and use of sites...for traditional or religious purposes. Mitigation may reduce the impact to less than significant. Construction of FTI [Fixed Tactical Internet] antennas...at PTA may result in visual impacts on cultural landscapes...Facility construction or training area uses would be designed to avoid ATIs and limit visual impacts on traditional cultural landscapes...where feasible. Mitigation for impacts on the cultural landscape could include consulting with the Native Hawaiian community to determine the extent of such impacts and possible means of avoiding or limiting them."
[bold added] The EIS is not complete without impacts spelled out. They should be included in a new draft EIS which is then put out again for public comment.
"where feasible," "could," and "possible" are insufficient.
- P94-9** Chapter 4 p 72 "The Army would conduct surveys to identify and evaluate archaeological sites...Construction of...PTA Trail would result in a potentially significant impact on archaeological resources...Some trail or road construction is projected to go through areas with a high potential for archaeological resources and areas that have not been surveyed for cultural resources."
The EIS is not complete without these surveys. The archaeological and cultural resources should be surveyed, identified, and included in a new draft EIS so the public can comment.

Responses

P94-3

These projects are not part of the Proposed Action. However in Chapter 9, the projects are discussed in association with the Proposed Action as overall cumulative impacts. The Army has determined that the overall cumulative impact on cultural resources would be significant.

P94-4

As discussed in the Executive Summary mitigation measures that are already in existence or unlikely to occur, as part of the NHPA Section 106 consultation, a cultural resource education center is being proposed with the PTA master plan. Since this is addressed through another project, the visitor's center is no longer proposed as mitigation for this action. Additional mitigation measures are discussed in Sections 4.10 and 4.11 for biological and cultural resources.

P94-5

Cultural resource sections have been updated in the Final EIS. The overall impact to cultural resources on a project wide basis is significant. The Programmatic Agreement and other measures will reduce the severity of the impact but not always to a less than significant level.

P94-6

This change has been made to the text in Section 4.11. In 1998 an overall CRMP was developed for all ranges. An HPP was done for PTA, but since WPAA has not been purchased one has not been done. If the Army decides to implement the Proposed Action, all Institutional Programs and management actions will be expanded to any new lands acquired by the Army.

P94-7

The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS.

P94-8

Mitigation measures are now more specific. The ROD will specify which mitigation measures will ultimately be implemented. Text in the FEIS cultural resource sections has been revised to address public comments.

Comments

CULTURAL RESOURCES 12-14-03 p 3 of 3

- P94-10** | Chapter 8 p 182 "Impacts on buildings and archaeological sites can be mitigated by compliance with the provisions of the PA."
It is not clear what the provisions of the PA are, since the PA "may have been revised." The EIS is incomplete without a final PA. The final PA should be included in a new draft EIS which is put out again for public comment.
- P94-11** | Chapter 8 p182 For the eleven FTI antennas, "construction... would be ground disturbing and could result in adverse impacts on archaeological resources. The Army has conducted a survey of the sites to ensure no impacts on cultural resources."
More detailed survey results should be included the EIS.
- P94-12** | Chapter 8 p182 The IDP would be developed in consultation with the SHPO [State Historic Preservation Office], in accordance with the provisions of the PA [Programmatic Agreement]
It is not clear what the provisions of the PA are, since the PA "may have been revised." The EIS is incomplete without a final PA. The final PA should be included in a new draft EIS which is put out again for public comment.
- P94-13** | Chapter 10 p9 "Mitigation for impacts on the cultural landscape could include consulting with the Native Hawaiian community..."
This must read "would" not "could."

Responses

P94-9

As discussed in Section 8.12, all areas that could be impacted by the Proposed Action have been surveyed for presence/absence of cultural resources. The survey results have been included in the Final EIS. In addition, the cultural resource analysis has been expanded and in some cases the determination has been changed to significant.

P94-10

The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS

P94-11

Each specific site was surveyed and no artifacts or surface features were found indicating the presence of cultural resources. However, once construction begins these sites will be bound by the conditions described in the PA to protect any resources discovered at that time.

P94-12

The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the FEIS.

P94-13

Chapter 10 has been expanded to better discuss the potential impacts to environmental justice issues included Areas of Traditional Importance. Mitigation measures including the implementation of the Final PA are discussed. As part of the mitigation, the Army will consult with Native Hawaiian organizations on potential impacts to ATIs.

Stryker Brigade Combat Team Final EIS, Hawai'i

P-471

ENVIRONMENTAL IMPACT STATEMENT PROCESS VIOLATIONS 12-16-03 p 1 of 5 Participation

Executive Summary p 3 "Those having a potential interest in the Proposed Action...were notified and invited to participate in the scoping and environmental impact analysis process."

Not really:

P94-14

Arrests The Army had people arrested at two hearings in Honolulu for bringing signs. Signs were allowed at hearings before the arrests, and later after the arrests. The arrests deprived people of their right to speak, and probably had a chilling effect on participation in the remaining hearings.

Intimidation and harassment The Hilo police left a phone message asking Hilo activist if he planned to be arrested at the hearings. Waikoloa Beach Marriott left him a message that people carrying protest signs must enter through the loading dock. The Marriott passed out a flyer saying "public displays of protest" were not allowed in the hotel

Private facility venues for EIS hearings, where citizens can be ejected at the word of the property owner, and private parties go down the slippery slope of using force to carry out government policies.

Closed-door meetings The Army kept the public out of meetings about expansion.

P94-15

*On May 16, 2002 the Army invited selected business and government people to a meeting and dinner in Hilo. Concerned citizens picketed outside, then entered the meeting and said such meetings must be open to the public.

*The Army again invited a selected group to a another closed meeting where the Army expansion and other land use issues were discussed, on July 16, 2003, in Hilo. This time police barred protesters from entering, and the Army ejected a Sierra Club representative who entered the meeting.

*In October 2003 the Army held an unpublicized press conference in Hilo.

P94-16

Cancelled tour In September 2002 the Army abruptly cancelled a tour of Pohakuloa requested by about 15 community people concerned about the Army transformation plans. The Army said some of the people were unacceptable, but refused to say who.

P94-17

Scoping problems Before the scoping meetings, the Army failed to provide the public with necessary information, to the point that Earthjustice asked that the scoping comment period be extended.

P94-18

Disability accommodation The Army failed to provide adequate accommodation at the November 6 hearing for a Hilo person with a disability.

P94-19

Comment time The comment time was extended, but is still inadequate for groups to explore the ramifications of the proposed action and prepare a meaningful response. There are only 90 days to comment on an EIS that fills three 2-inch books, and proposes the largest Army construction project in Hawaii since World War II.

"Done deal"

CFR Appendix E, (a) "EISs will: ... (4) Serve as a means to assess environmental impacts of proposed military actions, rather than justifying decisions."
Action on Transformation was taken long before the draft EIS came out in October 2003.

P94-20

Senator Daniel Inouye said "he has been assured that Hawaii will get a Stryker brigade" ("Sen. Inouye Says He Was Assured a Stryker Brigade," Associated Press, Hawaii Tribune-Herald, June 20, 2003)

The Army is planning to relocate its Big Island Fire and Emergency Service from Kilauea Military Camp to Pohakuloa Training Area by August 2004... "This decision is directly related to the increased workload associated with PTA's Transformation Plan and the significant number of additional facilities planned" and the many wildland acres which require more firefighting capability (June 24, 2003 letter from Colonel Anderson to Rep. Ed Case)

P94-14

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am. At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs. It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

P94-15

The Transformation program encompasses a number of projects and operations on two islands and requires extensive planning and coordination. Over the past two years, the Army has gone to great lengths to be inclusive of both the public-at-large and the many various groups that may be directly or indirectly affected by the proposed action. Since January 2002, Transformation representatives have participated in approximately one hundred meetings to present information on the program and to discuss concerns and issues that these groups may have. Over a dozen meetings at various locations on O'ahu and Hawai'i were designed specifically for the general public to attend. The purposes of these meetings included general information dissemination, technical discussions on specific topics, discussions of issues and concerns, planning and analysis, etc. In addition, smaller meetings were held to discuss a diverse range of interests on a more focused level. Invitees and specific agendas varied depending upon the particular issues involved, but these meetings have been attended by representatives from federal, state and county agencies; the media; cultural resources, hunting, engineering, conservation and civic groups; neighboring landowners; neighborhood boards; the Boy Scouts,

Comments

ENVIRONMENTAL IMPACT STATEMENT PROCESS VIOLATIONS 12-16-03 p 3 of 5
In 2002-2003 the Army is proposing the largest Army construction project in Hawaii since WWII, including taking 23,000 more acres of Hawaii Island.

These past, present, and future land use plans should all come under one EIS that addresses the cumulative impact of all projects, not separate EISs.

Missing Pieces

Pieces of the draft EIS are missing. This deprives the public of its right to comment. The Army should complete the full draft EIS, then reschedule the hearings and comment period. Here are some missing pieces:

*Executive Summary p 48 Construction of the new range control building at PTA could have significant impacts on cultural resources, depending on its location."
 The EIS must specify the location of the range control building so the impacts can be evaluated.*

*Executive Summary p 58 To mitigate impact on natural resources from introduction of alien species, a vehicle wash is proposed at Kawaihae Harbor, if utility requirements and space permit.
 The EIS must clearly state whether the vehicle wash will exist or not.*

*Chapter 3 p 76 "USARHAW has developed Cultural Resource Management Plans (CRMP) for the cantonment areas of SBMR, Fort Shafter, Kilauea Military Camp, and WAAF... USARHAW is preparing an ICRMP [Integrated CRMP] for management of the Army's one installation with 28 subinstallations in Hawaii".
 The EIS must state whether a CRMP or ICRMP required for PTA and WPAA. If so the EIS is not complete without them.*

*Chapter 3 p 77 "consultation on the PA [Programmatic Agreement re historic properties] is ongoing... If the PA is not executed, the Army will follow the procedures at 36CFR 800..."
 The EIS is not complete without the PA or 36CFR 800 procedures.*

*Chapter 4 p 5 "The Army... will submit a CZM [Coastal Zone Management] consistency determination to the State Office of Planning."
 This should be completed and included in the draft EIS.*

*Chapter 4 p 7 "The Army is considering establishing cooperative relationships... to allow... continued grazing activities at the WPAA, [West PTA Acquisition Area] in conjunction with training..."
 The EIS must address the health risks of beef cattle grazing on land contaminated by chemicals used for dust control and powder from blank ammunition.
 The EIS must spell out how continued grazing will add to the severe erosion which it states the Strykers will cause.*

*Chapter 4 p 18 because the "clear zone and accident potential zones that extend beyond each end of the runway... must be cleared, graded, and free of objects, there is the potential for indirect impact on land use or biological and cultural resources."
 These impacts must be spelled out and included in a completed, new draft EIS.*

*Chapter 4 p 31-32 "An updated ENMP [Environmental Noise Management Program] is in preparation and should be used for exploring feasible ways to reduce the size of existing and proposed Zone III and Zone II noise exposure areas. The ENMP also should explore the feasibility or providing increased acoustical insulation..."
 The EIS must have a completed ENMP, not one that is "in preparation".*

Responses

and other community leaders, to name a few. The 15 May 2002 meeting was held specifically for key leaders from the island of Hawai'i and the invitation list was developed for a discussion aimed at that level. This meeting followed a series of Public Scoping meetings held several weeks earlier to inform the general public and encourage their input. The 16 July 2003 meeting was a specific Land Use meeting for an array of interested parties. Attendees included representatives from the County of Hawai'i, the Economic Development Board, Hawai'ian Homelands, Royal Order of Kamehameha, The Nature Conservancy, Chamber of Commerce, University of Hawai'i at Hilo, a State Representative, State Senators, and, among others, Ms Harden herself from the Sierra Club.

P94-16

We thank you for your comments. We acknowledge the postponement of the proposed meeting scheduled for September 12, 2002. The meeting was postponed due to conflicting mission requirements. The Army contacted the Sierra Club and informed them of the postponement and procedures for them to reschedule. The Army continues to welcome requests for tours of PTA as part of our overall community relations outreach program. In order to protect the safety of those on the tours and the security of Army training activities, accessible locations and tour sizes will be determined on a case by case basis. For more information, please contact the U.S. Army Hawai'i, PTA Public Affairs Office.

P94-17

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable

Comments

- P94-29** | **ENVIRONMENTAL IMPACT STATEMENT PROCESS VIOLATIONS 12-16-03 p 5 of 5**
Chapter 8 p182 For the eleven FTI antennas, "construction...would be ground disturbing and could result in adverse impacts on archaeological resources. The Army has conducted survey of the sites to ensure no impacts on cultural resources."
The survey results must be in the EIS.
- P94-30** | Chapter 8 p182 The IDP would be developed in consultation with the SHPO [State Historic Preservation Office], in accordance with the provisions of the PA [Programmatic Agreement]
The final, not draft, version of the PA must be clearly indicated and included in the EIS.
- P94-31** | Chapter 10 p 9 "mitigation would be developed...in accordance with the provisions of the PA, a draft of which is available in Appendix J."
The final, not draft, version of the PA must be clearly indicated and included in the EIS.
- P94-32** | Appendix N p 2 "Because...portions of the West PTA Acquisition Area and PTA Trail easement...may be subject to the requirements of the FPPA, the Army has requested a farmland determination from the NRCS, which evaluates the impacts of converting farmland areas to nonagricultural use. The determination will include an impact rating."
The EIS must include a completed farmland determination with impact rating.
- P94-33** | **Code of Federal Regulations violations**
The EIS violates the CFR (Code of Federal Regulations.)
32 CFR 651.43 "The EIS should not exceed 150 pages in length (300 pages for very complex proposals)..."
The EIS is about 1000 pages—more if you include the 15 appendices and reference sections.
- P94-34** | **Decision-maker**
The Environmental Protection Agency, or another agency other than the Army, should make the decision on the EIS. The Army should not make the decision on its own EIS.

Responses

laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

P94-18

In regards to disability accommodations at the Hilo meetings, Ms. Harden had requested a well-ventilated room with no carpeting and no air conditioning due to health related issues. The Army held the meetings in a well ventilated room and set up an live video feed of the meetings in the lanai area that was free of air conditioning and carpeting in order accommodate Ms. Harden as well as provide overflow capacity for the Hilo meetings.

P94-19

According to NEPA regulations, the main text of a Final EIS should normally be no longer than 300 pages for proposals of unusual scope or complexity (40 CFR 1502.7). In practice, this recommended page limit is typically exceeded. The main text of this SBCT document is over 1,000 pages in length, but the scope of the proposal, involving twenty-eight projects, acquisition of over 24,000 acres of land on two Hawaiian islands, and the comprehensive and complex evaluation of a multitude of resource impacts on the affected environment on O'ahu and Hawai'i necessitates an impact statement of this magnitude. For reviewers not electing to read the entire main text, the Executive Summary provides a comprehensive impact evaluation overview, including a mitigation matrix.

The public comment period was extended to 90 days and ended on January 3, 2004.

P94-20

Although the Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2nd Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2nd Brigade, 25th ID(L) will transform to an SBCT will be made by the appropriate local commander, subject to

Comments

EROSION & DUST 12-16-03 p 2 of 3

- P94-35** | of the water or in increased rates of sediment deposition in stream channels. These effects are probably occurring under existing conditions, and ATTACC [Army Training and Testing Area Carrying Capacity] results suggest that soil erosion would increase at ...PTA. **It is unlikely to affect surface water quality at PTA** due to lack of perennial streams there."
Sections in bold (! added bold) appear to contradict each other. It seems more likely that water quality will be affected, and this is unacceptable.

Chapter 4 p 53 "ATTACC modeling results suggest that...soil erosion may be significantly increased by training activities under the Proposed Action at...PTA, due to increased intensity of use within limited maneuver areas. Also, the amount of land subject to increased soil erosion would increase at...PTA...The ATTACC modeling results indicate that increased training intensity would severely degrade the condition of the land...due to the degree of severity of the impact indicated by the ATTACC modeling, and because the ability to fallow damaged land may be limited by lack of sufficient mounded maneuverable land area, soil loss at...PTA may be only partially mitigable. Also, soil loss would increase significantly in spite of land management measures under the ITAM program."

Chapter 4 p 54-55 "Soils in training areas, and especially in areas that have not previously been used for maneuver training, such as...portions of the WPAA, [West PTA Acquisition Area] are likely to become compacted by use of tracked or wheeled vehicles, potentially affecting their ability to support vegetation and altering their permeability and moisture retention capacity. Widespread compaction could generally reduce recovery of vegetation cover. Preferred drainage pathways could develop along the compacted linear track left by off-road vehicles, creating increased erosion along the tracks. The impacts of these changes are considered to be significant depending on the amount of land area affected. ATTACC modeling results suggest that a large proportion of the land area in the maneuver areas could be affected...The ITAM [Integrated Training Area Management] Program would be used...to identify land management measures that **might** reduce the impact. The impacts **could** be partially or fully mitigable by requiring motorists to avoid affected off-road areas **if impacts are observed** and be revegetating and **recontouring** affected areas." [bold added]

- P94-36** | "Might" and "could" are not mitigation .Waiting till impacts are observed is too late. Recontouring would add to compaction.

- P94-37** | Chapter 8 p 29 "Projects...would not affect natural resources management areas."
Running tanks and paving parts of the 23,000 acres will affect the areas by denuding them.

- P94-38** | Chapter 8 p 51 "PM10 [inhalable particulate matter] emissions...are easily airborne and are small enough to be inhaled deep into the lungs creating potential adverse health effects. The 429 tons per year...increase in fugitive PM10 emissions generated by military vehicle [sic] at PTA, the likelihood of exceeding the federal 24-hour standard, and the potential impacts to quality of life to Waikī Ranch residents and users of Kīloha Girl Scout Camp combined may result in a significant air quality impact...it is unlikely that...dust control programs would be effective enough to reduce the net increase to a less than significant level."
Jeopardizing the health of children and adults is unacceptable.

- P94-39** | Chapter 8 p 53 "off-road vehicle activity at PTA would increase by 89 percent...the area available for off-road vehicle maneuvers would increase from 8,843 acres...to 31,518 acres...Most of the additional land that would become available for off-road vehicle maneuvers has a very high potential for wind erosion if vegetation cover is reduced...it is unlikely that the vegetation reseeding program in coordination with the ITAM geographic information system and erosion-control and revegetation efforts...could be sufficiently effective to reduce the net increase in annual wind erosion at PTA to a less than significant level."
This increase in erosion levels is unacceptable.

Responses

environmental assessment and other appropriate reviews and compliance with applicable federal law. The EIS chapter on cumulative impacts considering past, present, and future activities has been revised to include additional information of this type in the Final EIS.

The Relocation of the Kilauea Fire Station at PTA is not a part of the proposed action and is undergoing its own NEPA evaluation. This project has been added to Chapter 9 (Island of Hawai'i Project #10) and evaluated as part of potential cumulative effects.

P94-21

Figure ES-4 is provided as an overview of project locations in the Executive Summary. Table 2-4 lists all of the projects and directs the reader to Appendix D for details as does Section 2.3.2. Appendix D provides detailed maps and descriptions of all projects including the proposed range maintenance facility and range control building.

P94-22

As shown in Table ES-23, the proposed mitigation of placing a vehicle wash are Kawaihae Harbor is unlikely to occur because of logistical constraints including the lack of space and lack of utilities. The Army has identified other mitigation measures to reduce the impact of the spread of non-native species. These are identified in Table ES-22 and Section 4.10. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

P94-23

This change has been made to the text in Section 4.11. In 1998 an overall CRMP was developed for all ranges. An HPP was done for PTA, but since WPAA has not been purchased one has not been done. If the Army decides to implement the Proposed Action, all Institutional Programs and management actions will be expanded to any new lands acquired by the Army.

P94-24

The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS.

P-475

- P94-40** **FIRE 12-16-03 p 1 of 1**
Executive Summary p 39 "There would be significant but mitigable long term impacts on surface water quality... from sediment loading following wildfires at...PTA (See Sections...8.8)."
Executive Summary p41 "Project-wide impacts from impacts from fire on sensitive species and habitat, and federally listed species and designated or proposed critical habitat would result in overall significant impacts not mitigable to the less than significant level...
This is unacceptable.
- P94-41** Chapter 2 p 39 "Nonlive-fire exercises use blank ammunition, laser weapons, and simulated artillery and mortar fire with pyrotechnics."
Chapter 4 p 25 "Tracers, flares, and pyrotechnics have the potential for starting wildfires on training range areas. The use of such munitions would increase somewhat under the Proposed Action, with a corresponding increase in the potential for wildfires."
Chapter 8 p190 "Tracer ammunition, which easily starts fires and is one of the most commonly used ammunitions, has started the largest number of fires at PTA."
Chapter 8 p193-194 "...under the Proposed Action, the quantity of ammunition rounds fired during Army training on all Army training ranges in Hawai'i would increase from 16 million to 20 million rounds per year, a 25 per cent increase
Chapter 8 p199 there will be "...a significant increase of ammunition use (an additional four million rounds)... [at PTA but] ...the impact of this increase would not be significant, as management of artillery and ammunition would not change..."
Appendix O p1-1 "In the past, military activities on Army lands have burned areas of native vegetation and threatened the habitat of endangered species of plants and animals."
- Despite the increase in fire risk detailed in the sections above, it seems little will be done to address fire--*
- P94-42** Chapter 4 p 83 "...no FMAs [fire management areas] and wildland fire SOPs [standard operating procedures] have been completed for installations where Transformation would occur."
The EIS must spell out the increase in fire risk and proposed mitigation, including FMAs, SOPs, and fire avoidance efforts.
The EIS is incomplete without the FMAs and SOPs. They must be done and included in a new draft EIS which is put out again for public comment.
- P94-43** Appendix O p1-2 "Prescribed fire will be considered as a viable tool to manage fuels and will be utilized under environmentally appropriate conditions."
Recently a prescribed fire burned out of control in Makua Valley. The EIS must spell out what will be done to prevent a repeat at PTA.
- P94-44** Appendix O p1-4 "The Hawaiian ecosystem is not resistant to, nor dependent on fire... Wildfire is the single largest impact made by military activities in the Hawaiian ecosystem. The use of Army lands must include fire avoidance efforts."
The EIS must spell out the increase in fire risk and proposed mitigation, including FMAs, SOPs, and fire avoidance efforts..

P94-25

CZM Consistency Determination and State of Hawai'i letter of concurrence is included in the Final EIS in Appendix E.

P94-26

Conversion of the WPAA to military use is described as a less than significant impact in Section 8.2.2. However, it is possible that cattle grazing would continue on the WPAA. If the Army decided to implement the proposed action, the Army would weigh the potential of continued cattle grazing on the proposed West PTA acquisition area based on the potential benefits to fire reduction, potential interference with ongoing Army training, and requests of local cattle ranchers. If the Army decided that cattle grazing were appropriate, cattle would be managed so as to avoid any overgrazing and any resulting significant soil erosion. In accordance with Army Regulations 350-4, the mandate of the ITAM program is to manage land for Army training and repair damage incurred by Army training. As part of this mandate, this would also include any related actions such as managing land for grazing or repairing damage caused by the cattle. Continued use of the WPAA for agricultural purposes, consistent with Army use, would result in a less than significant impact on the community. However, as discussed in Chapter 9, the Army acknowledges that the cumulative impact on the conversion of agricultural lands from past, present and reasonable foreseeable future actions would be significant. Any dust palliative used would be "environmentally friendly".

P94-27

Thank you for your comment and your participation in the public process. Your comment has been considered and has been included in the administrative record for this process. These impacts are addressed in Sections 8.2 – Land Use, 8.6 – Noise, 8.10 – Biological Resources, and 8.11 – Cultural Resources.

P94-28

As discussed in Section 3.6, the ENMP program is an on-going Army planning program that is not directly related to the proposed action. As such, the ENMP is not a required element of the EIS process. The EIS incorporates available information from the ENMP, and supplements that information with additional noise analyses related to vehicle noise, helicopter and aircraft noise, and small arms firing noise. Mitigation measures to reduce the impact from noise are identified in Sections 4.6, 5.6 and 8.6.

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-476

- P94-45** | **HAZARDOUS MATERIALS 12-13-03 p 2 of 4**
solutions were more effective and longer lasting than various synthetic polymers or calcium lignosulfonate. Use of chemical dust suppressants would be a feasible method to control fugitive dust..."
The EIS must evaluate hazards from dust control chemicals to soil, water, wildlife, cattle, and people using meat or milk from the cattle.
- P94-46** | **Chapter 4 p 46-47** "The Proposed Action could result in significant chemical residue spills on the surface soils that could affect the surface water quality at...PTA. Accumulation of chemical residues in surface soils or occasional spills that may occur during routine training activities can also contribute to degradation of surface water quality...Recent soil sampling at...PTA provided information about concentrations of explosives, semi-volatile organic compounds, and metals in surface and near-surface soils...The results indicated sporadic occurrence of contaminant concentrations greater than EPA [Environmental Protection Agency] preliminary remediation goals (PRGs)...Concentrations of lead that exceeded residential or industrial soil PRGs in some samples may be due to disintegration of bullets...Concentrations of RDX, [from explosives] and other soluble contaminants, in the samples collected from PTA could affect surface and groundwater but are unlikely to result in significant impacts on these media due to the lack of permanent surface water and the great depth to groundwater."
If contaminant concentrations are already exceeding PRGs, it is unacceptable to add more with more ammunition.
- P94-47** | **Chapter 4 p 49** "Surface water quality may be affected indirectly by increased erosion cause by wildland fires. This could create a significant impact on surface water quality at...PTA...Live-fire training activities on the ranges at...PTA increase the potential for fires...Fires can also generate toxic chemicals that have the potential to enter streams via runoff. Most of these chemicals are naturally occurring, although some may be generated by burning of plastics or other man-made materials."
These effects are unacceptable.
- P94-48** | **Chapter 4 p 49** "Residues of explosives and other constituents of munitions would continue to be deposited on soils on training ranges at...PTA."
The EIS must estimate how much residue is expected with the 25% increase in ammunition use, and evaluate the hazards to soil, water, and wildlife.
- P94-49** | **Chapter 4 p 77-78** "Recent range studies at...PTA have revealed elevated levels of munitions byproducts, such as lead and RDX, [cyclotrimethylenetrinitramine] above USEPA Region IX residential and industrial PRGs [preliminary remediation goal]...This material...is an environmental hazard...the quantity of ammunition rounds fired during Army training on all Army training ranges in Hawai'i would increase from 16 million to 20 million rounds per year, primarily consisting of small arms munitions. The proposed increased level of training could elevate contamination levels in range soils by 25 percent...Existing and potential impacts from ammunition are considered significant and not mitigable until live-fire range training ceases and a remediation plan is considered...in the event any active range is closed and transferred out of DoD control...remediation necessary to mitigate an imminent threat to human health and the environment would be undertaken at such time."
This increase in hazard is unacceptable. The draft EIS needs to include a closure/cleanup plan so Pohakuloa is returned to the state in usable condition. This did not occur with Kaho'olawe.
- P94-50** | **Chapter 4 p 80** "...training operations could contaminate the range with UXO..."
UXO needs to be cleaned up, not spread around.
- P94-51** | **Chapter 8 p 28** People may be evacuated and roads may be closed to clean up unexploded ordnance so the tank trail can be built.
Evacuation and road closures will impact residents severely.

P94-29

In general, the details of archaeological surveys, including locations and contents are kept confidential and made available only to professionals with a need to know and to the impacted native Hawaiians. The results of the site survey have been included in the final EIS.

P94-30

The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS.

P94-31

The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS.

P94-32

The farmland conversion rating forms are included in Appendix E of the Final EIS.

P94-33

The page recommendations for EISs are guidelines and not strict requirements. In practice, these recommended page limits are typically exceeded. An EIS must be long enough to adequately address the important issues as required by the CEQ Regulations. The scope of the proposed action, involving twenty-eight projects, acquisition of over 24,000 acres of land on two Hawaiian Islands, and the comprehensive and complex evaluation of a multitude of resource impacts on the affected environment on O'ahu and Hawai'i necessitates an impact statement of this magnitude. The FEIS is divided into 5 geographical areas with the intent of making it easier for the general public to focus specifically on impacts the project might have on their community. In addition there is a guide inside the front cover describing the organization of the document, an abstract of the FEIS, and a very detailed Table of Contents. For reviewers not electing to read the entire main text, the Executive Summary provides a comprehensive impact evaluation overview, including a mitigation matrix.

P94-34

Under NEPA, the agency proposing the action makes the decision on the action after the EIS has been completed. The Army will make the final decision on the action with the issuance of the Record of Decision.

Comments

HAZARDOUS MATERIALS 12-13-03 p 4 of 4

P94-52 Chapter 8 p 199 "The 105mm cannon on the Stryker mobile gun systems and the 120mm mortar are the only new weapons to be introduced at PTA under the Proposed Action. The amounts of other weapon systems would also be increased with the elevated level of training proposed in the transformation. Although the Proposed Action would generate a significant increase of ammunition use (an additional four million rounds) due to the elevated level of training and expansion in military force, the impact of this increase would not be significant as management of artillery and ammunition would not change...Excess ammunition not used during training [may be transported by]...commercial carrier to...WAAF [Wheeler Army Air Field]"

There will be much more excess ammunition, so there will be significant impact, especially if commercial carriers are transporting some of it. Impacts and mitigation need to be spelled out. All ammunition must be clearly labeled, including depleted uranium. An exemption allows the military to ship DU with "explosive" but not "radioactive" labels. This exemption creates danger for residents, police, fire, and civil defense, and should not apply.

P94-53 Chapter 8 p208 "...no impact on the health and safety of children..."
Dust and noise will impact children at Waiki'i Ranch and Kilohana Girl Scout camp; see DUST and NOISE comments.

P94-54 Chapter 8 p211 "Due to a revision in USEPA regulations, cesspools serving more than 20 people per day must be closed by April 5, 2005"
The EIS should spell out a plan for replacing the cesspools.

Responses

P94-35

The impacts to surface water quality and soil erosion have been expanded to clarify the relationship of the two and associated impacts. There is a potential for erosion to impact surface water without effective mitigation measures. The Army will implement several mitigation measures to control erosion so that soil erosion will not have a significant effect on water quality. See sections 4.8, and 4.9 for a summary of the impacts and mitigation measures for water and soil and sections 5.8,6.8, 7.8, 8.8, 5.9, 6.9, 7.9, and 8.9 for impacts at specific installations.

P94-36

The discussions and analysis in Sections 4.5 ,and 4.9 have been expanded. Based on more extensive modeling and more detailed mitigation measures discussed in Section 4.5 such as the Dust and Soils Management and Monitoring Plan (DuSMMoP), the Army has determined that the impact to air quality from fugitive dust is significant but mitigable to less than significant. The impact to air quality from wind erosion and soil loss from training activities is significant. The proposed mitigation measures will substantially reduce the severity of the impact but not to less than significant levels.

P94-37

As discussed in Section 8.2 and Section 8.10, impacts to land use and natural resources will not be significant. The discussions in Section 8.10 have been expanded to better address potential impacts from the Proposed Action on biological resources. In some cases, the determination has been changed.

P94-38

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

Stryker Brigade Combat Team Final EIS, Hawai'i

P-478

- P94-55** | **LAND USE 12-12-03 p 2 of 3**
Chapter 4 p 5 "The Army...will submit a CZM [Coastal Zone Management] consistency determination to the State Office of Planning."
This should be completed and included in the draft EIS, then comments from the public should be taken again on the complete draft EIS.
- P94-56** | Chapter 4 p 7 A proposed mitigation is "Establishing a citizens' advisory board for O'ahu and Hawai'i USARHAW training lands..."
This is not a viable mitigation, given the Army's track record on boards..Sierra Club Moku Loa group requested a citizen advisory board for Pohakuloa Training Area in December 2002. The Army proposed utilizing the Hawaii Land Use Council for this purpose in March 2003 and said the Army would contact Sierra Club about the agenda and schedule. No contact has been made. Gerald DeMello, Big Island representative to the Land Board; Chris Yuen, director of the Hawaii County Planning Department; and Sierra Club Moku Loa group have never heard of the Council. Major General Olson has not replied to a June 2003 inquiry.
- P94-57** | Chapter 4 p 7 "The Army is considering establishing cooperative relationships...to allow...continued grazing activities at the WPAA, [West PTA Acquisition Area] in conjunction with training..."
The EIS must address the health risks of beef or milk cattle grazing on land contaminated by chemicals used for dust control and powder from blank ammunition. The EIS must spell out how continued grazing will add to the severe erosion which it states the Strykers will cause.
- P94-58** | Chapter 4 p 18 because the "clear zone and accident potential zones that extend beyond each end of the runway...must be cleared, graded, and free of objects, there is the potential for indirect impact on land use or biological and cultural resources."
These impacts must be spelled out and included in a completed, new draft EIS which must then be put out for public comment.
- P94-59** | Chapter 8 p 15 map of "Agricultural Lands of Importance to the State of Hawaii"
It looks like about 75% of the 23,000 acres are agriculture lands of importance. Taking this amount of agricultural land is unacceptable.
- P94-60** | Chapter 8 p 27 "The proposed training land use of agricultural grazing land at the WPAA is not consistent with the land use set forth in the County of Hawai'i General Plan (County of Hawai'i 1989), and the County of Hawai'i Zoning Code (County of Hawai'i 2001b.)...The WPAA would convert two percent of their total designated agricultural lands on the island...to military training land...This would be a less than significant impact."
The EIS must spell out the criteria used to conclude this is "less than significant."
- P94-61** | Chapter 8 p 28 "Construction of one antenna in the Conservation District Resource Subzone, and within the Mauna Loa Forest Reserve, would result in a less than significant land use."
The EIS must spell out the criteria used to conclude this is "less than significant."
- P94-62** | Chapter 8 p 36 "Several of the proposed FTI antennas and support equipment sheds would be within potentially sensitive viewsheds...Although the proposed locations are prominent features from public roadways, they are not unique within the area."
Adding more structures bit by bit will rob the area of its stunning visual quality.
- P94-63** | Chapter 8 p 18 "There would be significant and unmitigable impacts...from the acquisition and conversion of agricultural land for Army use as training areas."
This is unacceptable.

P94-39

Section 8.5 and 8.9 have been expanded to better discuss the potential impacts of the Proposed Action on fugitive dust and soil erosion. Additional mitigation measures have been identified and are discussed in these sections.

P94-40

The discussions in Sections 4.8, 4.9, 4.10, 8.8, 8.9, and 8.10 have been expanded in the Final EIS to better discuss the potential impacts of wildland fires. The impact to biological resources from wildland fires has been changed to significant. The mitigation measures proposed, including the updated IWFMP, will substantially reduce the severity of the impact on biological resources but not to less than significant levels.

P94-41

The discussions in Sections 4.10, 4.12, 8.10 and 8.12 have been expanded in the Final EIS to better discuss the potential impacts of wildland fires. The impact to biological resources from wildland fires has been changed to significant. The mitigation measures proposed, including the updated IWFMP, will substantially reduce the severity of the impact on biological resources but not to less than significant levels. Appendix O has been updated with the current overview of the IWFMP.

P94-42

The discussions in Sections 4.10, 4.12, 8.10 and 8.12 have been expanded in the Final EIS to better discuss the potential impacts of wildland fires. The impact to biological resources from wildland fires has been changed to significant. The mitigation measures proposed, including the updated IWFMP, will substantially reduce the severity of the impact on biological resources but not to less than significant levels. The updated IWFMP is available upon request.

P94-43

Since the publication of the Draft EIS, the Army has updated the Integrated Wildland Fire Management Plan (IWFMP). This update considered the issues surrounding the Makua Valley wildland fire of July 2003 and includes protocols to reduce the risk of a similar fire. As discussed in the Executive Summary, and Sections 4.10 and 4.12, the IWFMP is proposed as mitigation to reduce the severity of the risk of wildland fires. The IWFMP is available upon request.

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-479

- P94-64** MISCELLANEOUS 12-13-03 p 1 of 1
Hawaii Tribune Herald 10-14-03 states 500,000 gallons of water a year will be needed for the vehicle wash.
The EIS must state where the water will come from in this dry area. If it will be trucked in, the EIS must address supply, noise, and traffic problems.
- P94-65** Executive Summary p 34 "Beneficial impacts would be realized at the WPAA from the expansion of public access for hunting during periods when no military training is taking place."
The EIS should state whether Waiki'i Ranch homeowners and users of Kilohana Girl Scout Camp consider more shooting nearby to be beneficial.
- P94-66** Chapter 2 p 41 "UAVs... individual use and frequency has yet to be determined..."
Chapter 8 p 46 Unmanned aerial vehicles are planned.
The EIS must state the number of UAVs, where they will fly, how often they will be used, and address noise and safety issues.
- P94-67** Chapter 8 p 210 "the water supply is now hauled by tanker trucks from the town of Waimea... Excess demand can be supplied by the City of Hilo..."
With additional troops more truckloads will be needed. The EIS should spell out where the additional water trucks will come from, and the impact on noise, air quality, traffic, and County and State expenses for road maintenance.
- P94-68** Chapter 10 p 1 "NEPA requires additional evaluation of the project's impact with regard to... Any irreversible or irretrievable commitment of resources.
The Army Corps of Engineers says it will take "centuries" to clean ordnance from the over fifty former military sites on Hawaii Island. When and if the military stops using PTA and the 23,000 acres, cleanup will probably take "centuries" also. So military use of this land is effectively "irreversible" and "irretrievable." The impact of committing the 50-plus old sites, PTA, and the 23,000 acres to military use... followed by probable centuries of ordnance hazard to the public and possible contamination from deteriorating old ordnance... must be evaluated.
A "nuclear, biological, and chemical vehicle" will be delivered in 2004 (US General Accounting Office Report to Congressional Committees on Military Transformation: Army Actions Needed to Enhance Formation of Future Interim Brigade Combat Teams; May 2002).
The impact of these vehicles must be addressed in the EIS.

P94-44

Appendix O provides an overview of the Integrated Wildland Fire Management Plan (IWFMP). The risks were considered in the development of the IWFMP when developing the specifics of the plan. The IWFMP for O'ahu and Pōhakuloa Training Areas was updated on October 2003 incorporating lessons learned as a result of the Makua fire. As discussed in the Executive Summary as proposed mitigation, the Army will fully implement this plan for all existing and new training areas to reduce the impacts associated with wildland fires. The plan is available upon request.

P94-45

The Air Quality, Water Resources and Human Health and Safety Hazards sections (Section 4.5, 4.8, 4.12, 5.5, 5.8, 5.12, 6.5, 6.8, 6.12, 7.5, 7.8, 7.12, 8.5, 8.8 and 8.12) have been expanded to discuss proposed dust palliative treatments and potential impacts or considerations for their use. If the Army decides to implement the Proposed Action, the Army proposes to use "environmentally friendly" dust control measures that would have less than significant impacts on water resources.

P94-46

Sections 4.9, 4.12, 8.9 and 8.12 discuss the impacts from potential contaminants in soils. The soil sampling showed that contaminants occurred over a range of concentrations, as would be expected. Some of the concentrations exceeded EPA PRGs. However, when taken together, the exposure risks were generally well below the EPA threshold criteria. The soil investigation of the ranges was designed to determine if there is an overall risk of exposure to the public or military personnel by changes in range designs in the Proposed Action. US EPA PRG levels were used as a reference criteria for this analysis. Based on comparison of the investigation results to US EPA PRGs, the human health and environmental risks from the cumulative results of past activities at the ranges appear not to be significant. Some contaminants degrade more slowly than others. Those that degrade more slowly will tend to accumulate more quickly in soils, while those that degrade quickly may decrease, depending on use. The initial sampling of the ranges suggests that explosives degrade quickly relative to the rate of deposition. Lead and some other metals may accumulate over time. However, the rate of accumulation will be slow, and in the case of lead, for example, may be reversed in the future by the substitution of "green" ammunition for lead-alloy projectiles.

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-480

NOISE 12-15-03 p 1 of 2

Executive Summary p 38 "The use of blanks and other training munitions on the WPAA [West PTA Acquisition Area] would produce unweighted peak dB levels in the Zone II range at the Waik'i Ranch and Kilohana Girl Scout Camp near the installation boundary. Ordnance firing and detonations at PTA might also lead to Zone II noise conditions at the Mauna Kea State Park rental cabins. Project-wide impacts from ordnance firing would be significant."

P94-69

This is unacceptable because:

Appendix H p 23 chart shows Noise Zone II "Normally Unacceptable" for "noise-sensitive land uses"

Chapter 2 p 14 "Combat effects, such as smoke and obscurants, noise, and simulated artillery, nuclear, biological, and chemical conditions, are integrated into training..."

The EIS should spell out how this will effects and mitigation for Waik'i Ranch, Kilohana Girl Scout Camp, Waikoloa, and Waimea.

Chapter 2 p 17 "During some training exercises, aircraft may fly at treetop level or lower... This type of training requires up to 20 helicopters flying in tactical formations... Aircraft pick up soldiers in pickup zones and carry them to landing zones."

P94-70

If this will occur at PTA the EIS should spell out the noise levels.

Chapter 4 p 31-32 "Noise levels from weapons firing and ordnance detonations... would cause noise levels to exceed the Army's acceptable noise level criteria... in... PTA... At PTA, the use of blanks and other training munitions on the WPAA would produce unweighted peak dB levels in the Zone II range at the Waik'i Ranch and Kilohana Girl Scout Camp near the installation boundary. Ordnance firing and detonations at PTA might also lead to Zone II noise conditions at the Mauna Kea State Park rental cabins. These noise exposure conditions would be a significant noise impact... An updated ENMP [Environmental Noise Management Program] is in preparation and should be used for exploring feasible ways to reduce the size of existing and proposed Zone III and Zone II noise exposure areas. The ENMP also should explore the feasibility of providing increased acoustical insulation..."

P94-71

These noise levels are unacceptable. If the ENMP is not completed, the EIS is not completed.

The ENMP must be completed and added to the EIS. Then public hearings and the comment deadline should be rescheduled.

Chapter 4 p 33 "...at PTA... up to 400 vehicles could be used during a single exercise. If 400 vehicles traveled along PTA trail in a single hour, resulting noise levels would be about... 75 dBA at a distance of 50 feet... PTA is well over 1 mile... from the Waik'i Ranch development and the Kilohana Girl Scout Camp."

P94-72

Appendix H p 5 "... 75 dBA is "Street sweeper at 30 feet; idling locomotive, 50 ft" Noise levels for the distance of 1 mile away should be specified—now it's just a guess what the levels will be at Waik'i Ranch and Kilohana Girl Scout Camp. It is clear it will be noisier than it is now."

Chapter 4 p 34 "...maneuver activities would be expected to produce hourly average noise levels of less than 55dBA at a distance of about 500 feet..., with brief peaks at 65 to 70 dBA..."

P94-73

As part of the ENMP, the Army should consider establishing a 500-foot... noise buffer at PTA around the Waik'i Ranch property and the Kilohana Girl Scout Camp property and should attempt to minimize nighttime vehicle maneuver activities within 1,000 feet... of those properties."

Appendix H p 5 70 DBA is "300 feet from a busy 6-lane freeway"
65 dBA is "Typical daytime busy downtown background conditions"
55 dBA is "Typical urban residential area away from major streets"

P94-47

The discussions in Section 4.8, Section 4.9, Section 8.8, and Section 8.9 have been expanded to better address the relationship between surface water quality and soil erosion. The Army has determined that the Proposed Action would have a significant impact on soil loss from training activities and a significant but mitigable impact to surface water quality and soil erosion from wildland fires. These sections propose mitigation to reduce the severity of the impacts.

P94-48

These results and their potential affect on surface soil and water pollution are further discussed in Sections 4.8 (Water Resources) and 4.9 (Geology, Soils, and Seismology). The investigation report is included in Appendix M1. While the rate at which metallic lead from bullets would be deposited on the ranges would likely increase by 25 percent overall, the concentrations of lead that would be detected in soil samples taken at some future date would not increase by this amount. There are several reasons for this. The current concentrations of lead in soils are the result of years of past use of the ranges. The lead comes from the gradual weathering and disintegration of bullets in addition to other possible sources of lead in munitions, all of which is in addition to the natural background concentration of lead in the soils. Each year, more bullets accumulate on the ranges, adding slightly to the average concentration of lead present in the soils. Some of the lead is removed with soils through erosion. Some migrates deeper in the soil column. Also, much of the increased use of bullets will occur on small arms firing ranges where the bullets are deposited in small target areas. Therefore, the additional lead projectiles will not be widely dispersed on the ranges. Therefore, it is likely that the rate at which lead is deposited on ranges will decrease, while the concentration of lead in soils will continue to increase for a time, and then decrease when lead bullets are phased out. Since the lead is widely distributed, except in the small arms target ranges, the rate at which concentrations in soils increase in any particular location should be very low. It should also be noted, as mentioned in the EIS, that the Army is evaluating a gradual shift from use of lead-containing ammunition to use of "green ammunition" that does not contain lead.

P94-49

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO

Comments

TRAFFIC 12-12-03 p 1 of 1

Chapter 2, p 16-17 "Per state regulation, military convoys are not authorized to operate on state highways during 'rush hour'...Movements on Saturday, Sunday, and holidays are by special request only. Convoys traveling from Kawaihae Harbor to PTA must get clearance, and vehicles operating on Saddle Road within the boundaries of PTA must not exceed 25 mph. Units must seek permission from the 25th Infantry Division for convoys of 25 vehicles or more. Permission must also be granted from the State of Hawai'i DOT for convoys of six or more vehicles or to move oversized or outsized cargo over state highways. As long as all federal, state, and Department of Defense...regulations are followed **no additional permits are required to move munitions.**"

Chapter 8 p 193 "the quantity of ammunition rounds...on all Army training ranges in Hawai'i would increase from 16 million to 20 million rounds per year, a 25 per cent increase..."

[I added bold type] The EIS should include comments from Hawaii State Department of Transportation and Hawaii County Civil Defense, Police, and Public Works on this policy re munitions.

All ammunition must be clearly labeled, including depleted uranium. An exemption allows the military to ship DU with "explosive" but not "radioactive" labels. This exemption creates danger for residents, police, fire, and civil defense, and should not apply.

P94-74

Responses

accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

P94-50

As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. The Installation Restoration Program is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

P94-51

The Army acknowledges that there may be some impact from these activities but believe it would be less than significant because the likelihood of evacuations or road closures is low and their duration, if required, would be short. Section 8.2 has been changed to reflect this.

P94-52

The Army has expanded the discussion of cumulative impact of ammunitions and UXO to human health and safety in Chapter 9. The Army has determined

Comments

Responses

that in light of past, present and reasonably foreseeable future actions, the proposed action would have a significant cumulative impact on human health and safety hazards from an increase in ammunitions and UXO. All commercial carriers are required to follow strict protocol in the transportation of ammunition to ensure safety. The Army assumes that these carriers are following all requirements for their permits. No depleted uranium has been used or is currently being used on the island. No depleted uranium is planned to be used in the future.

P94-53

Based on agency and public comment, Sections 8.5 and 8.6 have been expanded and additional mitigation measures proposed. With mitigation the impacts from fugitive dust to Waiki'i Ranch and Kilohana Girl Scout camp will be reduced to less than significant. The Army also ran additional noise analysis that incorporated changes to the way training was conducted. The new modeling was based on spreading training over a larger area that resulted in reducing the size of the Zone II contours so that Mauna Kea State Park and the Kilohana Girl Scout Camp are no longer in Zone II. See Section 8.6 for a revised discussion of Noise.

P94-54

Replacement of the cesspools is not within the scope of the Transformation of the 25th ID(L). As discussed in Chapter 9 - cumulative impacts, the Army is proposing an advanced wastewater treatment upgrade as a separate single and complete action. The Army will abide by all appropriate laws and regulations in the proposed development and design of this upgrade.

P94-55

CZM Consistency Determination and the State of Hawai'i letter of concurrence are included in the Final EIS Appendix E.

P94-56

Mitigation measures likely to occur are outlined in the Executive Summary. As shown in Table ES-23, this mitigation measures is unlikely to occur due to limited resources. The Army has identified more feasible and effective measures in Table ES-22 to address the same impacts. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource,

Comments**Responses**

unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

P94-57

Conversion of the WPAA to military use is described as a less than significant impact in Section 8.2.2. However, it is possible that cattle grazing would continue on the WPAA. If the Army decided to implement the proposed action, the Army would weigh the potential of continued cattle grazing on the proposed West PTA acquisition area based on the potential benefits to fire reduction, potential interference with ongoing Army training, and requests of local cattle ranchers. If the Army decided that cattle grazing were appropriate, cattle would be managed so as to avoid any overgrazing and any resulting significant soil erosion. In accordance with Army Regulations 350-4, the mandate of the ITAM program is to manage land for Army training and repair damage incurred by Army training. As part of this mandate, this would also include any related actions such as managing land for grazing or repairing damage caused by the cattle. Continued use of the WPAA for agricultural purposes, consistent with Army use, would result in a less than significant impact on the community. However, as discussed in Chapter 9, the Army acknowledges that the cumulative impact on the conversion of agricultural lands from past, present and reasonable foreseeable future actions would be significant. Any dust palliative used would be "environmentally friendly". Any dust palliative used would be "environmentally friendly" and would be properly applied. Gunpowder is composed of about 75% potassium nitrate, and the rest is inert (charcoal and sulfur). Nearly all of these constituents are used up in the detonation that occurs upon firing. The combustion products of burning gunpowder are gases: nitrogen, carbon dioxide, and sulfur vapor, none of which would not be detectable above background levels in soils or groundwater at the minute concentrations that result from firing ammunition. Nitrogen is the principal constituent of air in the atmosphere, and is required for plant growth. Potassium nitrate is also used in fertilizers.

P94-58

These impacts are addressed in Sections 8.2 - Land Use, 8.6 - Noise, 8.10 - Biological Resources, and 8.11 - Cultural Resources.

P94-59

As discussed in Section 8.2 and shown on the Farmland Conversion Rating Form from NRCS in Appendix E, there are no designated prime or unique

Comments

Responses

agricultural lands at WPAA. Of the 23,000 acres, approximately 16,266 acres are zoned as important by State or local plans. This represents a total conversion of 0.029 percent of agricultural lands in the county of Hawai'i. The Army has determined that this conversion of agricultural land on a project wide basis is a less than significant impact. As discussed in Chapter 9 - Cumulative Impacts, in light of past, present and reasonably foreseeable future actions, there is a significant impact to land use from the conversion of agricultural lands.

P94-60

During the EIS review process, the Army has coordinated with Natural Resource Conservation Service and is compiling with all requirements of the Farmland Policy and Protection Act (FPPA). (See Sections 4.2, 8.2, and Appendix E). If the Army decided to implement the proposed action, the management and use of the West PTA acquisition area would be conducted per federal regulations and guidelines. State regulations and guidelines do not apply to federal actions. However, the Army has considered State policies in its overall assessment of impacts in the EIS. In following FPPA requirements, CEQ guidance and Army policy, the Army has determined that the proposed conversion of West PTA acquisition area is consistent with these regulations and guidance and the impact would be less than significant.

P94-61

Factors considered in determining significance for impacts on land use are discussed in Section 4.2.

P94-62

Visual impacts from construction of FTI antennas are discussed in sections 4.3, 5.3, 6.3, 7.3, and 8.3. The Army has committed to implementing mitigation for visual impacts by screening construction, mimicking surrounding areas, and other means. If the Army decides to implement the Proposed Action, the total number of FTI antennae will be less than what is analyzed in the Final EIS. Of the 25 locations evaluated for construction of the Fixed Tactical Internet antennas on O'ahu and Hawai'i, a maximum of eight will be selected on each island from the locations represented in the EIS. Locations will be chosen based on the most suitable locations for

Comments

Responses

communication logistics and avoidance of environmental concerns such as cultural and biological resources. Cumulative impacts on visual resources are discussed in Chapter 9.

P94-63

Chapter 9 discusses overall cumulative impacts from land use. Although the Proposed Action has a less than significant project wide impact on the conversion of agricultural land, in light of the historical, ongoing and reasonably foreseeable future actions the overall cumulative impact of all actions in Hawai'i is significant.

P94-64

This is discussed in Section 8.14.1. Current water demands at PTA (ranging between 3.6 million and 50 million gallons of water per year) are met by trucking in water in 5,000-gallon tankers from Waimea. The increased demand would fall within the range of water demand experienced currently and is not expected to adversely affect supply. Traffic increases would total fewer than two extra truckloads per week.

P94-65

The beneficial impact in question is with regards to recreational access. As discussed in Section 8.2, access and subsequent hunting would only be allowed in those areas deemed safe for such activities.

P94-66

Impacts on safety, noise, and emissions are addressed in the EIS in all Chapters 4 - 8 in sub sections 4 for airspace, 6 for noise, 5 for air quality, and 12 for human health and safety. As noted in Chapter 2 of the EIS, the Proposed Action would equip the 2nd Brigade with 4 UAVs, each of which would be flown for about 600 hours per year. There would be an average of 600 total sorties per year. Thus, typical sorties would last about 4 hours each. As noted in the Airspace sections of the various installation chapters for the FEIS, most UAV flights would be conducted within existing restricted airspace areas. Any flight activity outside of restricted airspace areas would require compliance with FAA regulations and procedures. Consequently, UAV flight activity would not create any significant safety issues. And as noted in the noise impact sections of the Final EIS, UAV flight activity would not create any significant noise impacts.

Comments

Responses

P94-67

As discussed in Section 8.14.1, current water demands at PTA (ranging between 3.6 million and 50 million gallons of water per year) are met by trucking in water in 5,000-gallon tankers from Waimea. The increased demand would fall within the range of water demand experienced currently and is not expected to adversely affect supply. Traffic increases would total fewer than two extra truckloads per week.

P94-68

NEPA requires that a Federal EIS include a discussion of irreversible and irretrievable commitments of resources that would be involved in the proposed action if it is implemented (40 CFR 1502.16). This refers primarily to energy requirements and conservation potential of the proposed action and alternatives. An EIS should present the energy and material uses that would result from construction and operation of a proposed action and alternatives. Chapter 10 discusses impacts on renewable and nonrenewable energy and material resources and is considered adequate. Impacts on land resources are extensively discussed in Chapters 4-9 of the main text. The vehicles referenced have the capability to identify various reagents, but do not contain these agents. Their environmental impacts are virtually identical to similar vehicle that have been on island for several years.

P94-69

Noise impact discussions regarding training activities at WPAA have been expanded in the Final EIS. Smoke devices used as obscurants or to simulate biological, chemical, or nuclear exposure conditions have minimal noise impacts. Grenade and artillery simulators would have localized noise impacts, but the frequency of their use has not been determined. Noise impacts from these devices could be minimized by maintaining adequate separation from noise-sensitive land uses or by limiting their use during nighttime hours. As discussed in the Final EIS in Section 8.6, the Army proposes to mitigate the impacts from noise at WPAA by implementing a 1,000 foot daytime noise buffer zone and a 2,000 foot nighttime noise buffer zone for training activities. The implementation of these buffer zones would reduce the impact to the Mauna Kea State Park, Waiki'i Ranch, and the Kilohana Girl Scout Camp to less than significant levels. As discussed in Section 8.6, there would be no significant impact from noise associated with the proposed action on Waimea

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-487

P94-70

Low altitude helicopter flights are a routine component of training exercises at PTA. The Proposed Action would extend low altitude helicopter flight activity into WPAA. Section 8.6 in the Final EIS has reanalyzed noise contours based on this change, finding only minimal changes to the noise contours at both PTA and SBMR. For the aviation training, there are no changes proposed in the number of aircraft from what already exists at the US Army Hawai'i's Aviation Brigade. The only change that would occur is a slight increase in aviation training over the proposed West PTA Acquisition Area, as the Aviation Brigade would train along with the SBCT brigade during different training maneuvers. The analysis in the FEIS reflects this change in aviation training over West PTA. As noted in the DEIS and the revised discussion in the Final EIS, potentially significant noise impacts from such training activities can be mitigated to a less than significant level. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels.

P94-71

Low altitude helicopter flights are a routine component of training exercises PTA. The Proposed Action would extend low altitude helicopter flight activity into WPAA. Section 8.6 in the Final EIS has reanalyzed new noise impact discussions regarding training activities at WPAA have been expanded in the Final EIS to include current estimates of helicopter flight activity at WPAA as well as additional information on small arms firing noise. As noted in the DEIS and the revised discussion in the Final EIS, potentially significant noise impacts from such training activities can be mitigated to a less than significant level. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels.

P94-72

The discussion of noise from vehicle traffic on the PTA Trail has been expanded in the Final EIS. The closest point on the PTA Trail to is 1.25 miles from Waiki'i Ranch, and 1.8 miles from Kilohana Girl Scout Camp. Hourly average noise levels from normal convoy traffic on PTA Trail would be about 37 dBA at Waiki'i Ranch and about 31 dBA at Kilohana Girl Scout Camp. These noise levels are comparable to or less than normal daytime background noise levels.

Comments

Responses

While military convoy traffic between Kawaihae Harbor and PTA normally would be limited to no more than 100 vehicles per hour, higher traffic volumes are possible within the WPAA segment of the PTA Trail during training exercise events. If traffic volumes reached 400 vehicles per hour, resulting hourly average noise levels would be about 43 dBA at Waiki'i Ranch and about 37 dBA at Kilohana Girl Scout Camp. These noise levels would be close to normal daytime background noise levels, and thus would not constitute significant noise impacts.

P94-73

Section 8.6 of the Final EIS has a revised discussion of noise impacts from training activities in WPAA. The Army proposes to mitigate the impacts from noise at WPAA by implementing a 1,000 foot daytime noise buffer zone and a 2,000 foot nighttime noise buffer zone for training activities. The implementation of these buffer zones would reduce the impact to the Mauna Kea State Park, Waiki'i Ranch, and the Kilohana Girl Scout Camp to less than significant levels."

P94-74

Text has been modified to identify the location of the following military ammunition regulation. Disposal Of Ordnance Under RCRA. The disposal of ordnance, such as ammunition, is regulated under RCRA. Section 107 of the Federal Facilities Compliance Act of 1992 requires EPA, in consultation with DOD and the states, to issue a rule identifying when conventional and chemical military munitions become hazardous waste under RCRA and to provide for protective storage and transportation of that waste. This rule explains what is considered a solid waste and the rules for handling that waste (i.e., permitting, labeling, storing, transporting, and disposal). The final rule also amends regulations regarding emergency responses involving both military and nonmilitary munitions and explosives (EPA 2002c). This rule establishes the regulatory definition of solid waste as it applies to three specific categories of military munitions: Unused munitions; Munitions being used for their intended purpose; and Used or fired munitions (which can then be termed either exploded ordnance [EXO] or UXO). The rule conditionally exempts the following: From RCRA Manifest Requirements and Container Marking Requirements, nonchemical military munitions waste that is shipped from one military-owned or -operated TSDF to another, in accordance with DOD military munitions shipping controls; and From RCRA Subtitle C storage regulations, nonchemical military munitions waste subject to the

Subject: EIS question

TO: Cindy Barger, SBCT EIS Project Manager

Dear Ms. Barger:
 Please see the news clip below. I'm wondering--If these soldiers stay longer than planned--like the soldiers who stayed in Vietnam 5 years-- who's left to come over and train on the 23,000-acre Pohakuloa expansion area?
 Cory Harden

> <http://starbulletin.com/2003/11/09/news/>
 > Deployment for 25th likened to Vietnam

P95-1

.....In 1965, under the largest airlift up to that point, 15,000 Tropic Lightning soldiers and their equipment were flown to Vietnam during "Operation Blue Light" and remained in Vietnam until November 1970...
 ...Now the 2nd Brigade, with 4,500 soldiers, will be sent to Iraq as early as February, while the 3rd Brigade, with 3,500 soldiers, will leave for Afghanistan in April. Instead of six months, the tours of duty for the two Schofield units were doubled...

...With 12,476 soldiers assigned to Schofield Barracks, less than 4,500 will be left by early summer when the two brigades are deployed...

Responses

jurisdiction of the DOD Explosives Safety Board storage standards. No radioactive munitions (including depleted uranium) have been used or are currently being used on the island. No radioactive munitions are planned to be used in the future. The Hawai'i State Department of Transportation, Hawai'i County Civil Defense, Policy and Public Works were all provided a copy of the Draft EIS and an opportunity to respond. For those state agencies that commented, their comment letters and the Army response are included in Appendix P of the Final EIS."

P95-1

These deployments, while lengthy in some cases, are temporary and are part of Army activities at all bases. The Army is engaged in a wide range of missions around the world requiring all types of forces. There is no information to suggest that Stryker forces would be deployed more often or for longer durations than current forces.

Comments

Dear Ms. Barger

Letter

P96

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. I oppose the Stryker Brigade expansion in Hawai'i.

I also have concerns about:

comments on Army Transformation EIS/ LETTER TO EDITOR

WAIAKEA: MORE ARMY SECRETS?

What's in the Pohakuloa dump? "All the residue from the test pits [at Waiakea Forest Reserve] will be buried in the trash dump at the Pohakuloa Training Area this week" states a 1970 Army memo.

The memo is from a 1988 Defense Environmental Restoration Program report on cleanup at Waiakea after "open-air testing of incapacitating and lethal chemical agents and biological stimulants" conducted secretly in the 1960s.

The Army can't find any records showing what went into the dump and what may have leached out.

But a 1992 Site Inspection on Pohakuloa states "In the past unknown wastes were disposed of in the landfill however no records of contents were kept...There is probably release to the environment due to improper facility design and maintenance...No attempts to contain wastes have been made."

Why is Waiakea information still classified?

P97-1

The Waiakea report is missing "Appendix A (CONFIDENTIAL)" and "Test details" which are in "several classified reports."

The report cites Appendix A after discussing "potential sources of environmental contamination and hazards" and "hazardous/toxic material" and "an operation...to locate and remove all remaining hazardous materials and ordnance..."

The Army says Appendix A is still "classified" almost forty years after the tests.

Why the secrecy around cleanup?

A commander came from DTC (DESERET Test Center, Utah) to help clean up Waiakea, but wanted "his activities kept quiet until we hear further from him." A DTC staff person "stated that DTC should not be affiliated with the project and for this reason all personnel working in the forest would be in civilian coveralls." And the Army made sure "No mention of the DTC would be made."

And more?

The Army talks about 23,000 future acres on our island. Why won't it talk about the past?

Responses

P96-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P97-1

EPA began regulating the treatment, storage and disposal of hazardous materials under RCRA in 1976. All hazardous materials today are transported and disposed of in accordance with applicable federal, state, and Army laws and regulations. We could not find any information regarding the disposal of materials from the test pit at Waiakea Forest Reserve in the early 1970s referred to in this comment.

hello,

P102-1

I am requesting you extend the duration of these very important public hearings on this matter from the allotted 45 days to 120 days.

P102-2

There is simply not enough time to completely evaluate your justifications for this new threat to our island home. As of this moment I am completely opposed to any further increase of military presence here. This is my immediate response based on the long, however polite, history of environmental abuse and public access confiscations with no reasonable justifications beyond lack of imagination and concern.

Thank you for this time.

I am looking forward to presenting a complete position after continued review of your available information.

Dear Cindy Barger:

P104-1

This is a resounding NO for the Stryker Brigade in Hawaii. Go find a desert to destroy with your 20 ton vehicles. Hawaii is a group of islands, most eco-sensitive, and cannot endure more of the military's hi-jinks under the name of national security. The military has done enough damage to Hawaii's nature and way of life over the last 100 years. Please add my name as a protester against increasing any army activity in Hawaii.

I'm a fifty year resident, an honorable discharged veteran and I'm disappointed that the Army thinks it can "fool" those of us that love this aina.

Sincerely,

Dale Hoffmann

P103-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P103-2

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

P104-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. Chapters 3-10 of the EIS address project impacts both positive and negative on the human environment. In accordance with NEPA regulations, the Army is conducting this EIS in order to identify the direct, indirect and cumulative environmental effects of the proposed action on the State of Hawai'i. If the Army decides to implement the proposed action, the Army will mitigate all significant impacts in order to minimize the overall environmental impacts of the proposed action.

P105-2

Section 4.8, 4.9 and Chapter 9 have been expanded in the Final EIS to better address the potential project-wide and cumulative impacts of the Proposed Action on water and soil resources.

P105-3

The impacts of the project on human health and safety can be found in sections 4.12, 5.12, 6.12, 7.12, 8.12 and Chapter 9 in the EIS.

Comments

Letter P106

One of the over 50 current and former U.S. military sites on the Big Island was the Kau Bombing Military Reservation located in Hawaii Volcanoes National Park. Because this site is in the National Park, there is unrestricted public access, which presents a hazard to park visitors and personnel.

Two surface sweeps were done in 1989 but no sub surface investigations were conducted – the military stated there was no need to do that because of the hard lava rock surface and types of ordnances found.

Some of the ordnances found include:

MK 23, 4-pound practice bombs with MK 4 spotting charges (some live)

Napalm bombs and fuzes -expended

2 inch sub caliber aircraft rockets – expended

Five-inch practice rockets – expended

M100 series bomb tail fuze – live

500-pound High Explosive bombs with explosive residue remaining

20-millimeter aircraft machine gun ammunition and expended shell casings

.50 caliber aircraft machine gun ammunition and expended shell casings

100 series bomb fuzes from 1000 or 2000-pound bombs

F-4 air-to-air missile rack

Fragments from all types of exploded ordnance

Two sweeps of the Waikoloa Maneuver Area in the 1940's and in 1954 – “the largest dud clearance ever undertaken” failed to find all the ordnance. According to the Army Corp of Engineers, the technology then and now cannot get it all. Currently the 50 million dollars has been allocated to clean up Waikoloa but it will take 600 to 800 million.

So we are left with the knowledge that two sweeps of an area will not work and despite the many attempts to find out the clean up status of the Kau Bombing Site all we know is “It's to be funded”.

P106-1

The military needs to clean up what it has destroyed before expanding and ruining more of Hawaii nei. Eight wheeled, 19 ton armored vehicles desecrating sacred Hawaiian land, crushing indigenous plants and destroying rare, native bird habitats is simply not acceptable.

As a mitigation measure for safety, prior to initiation of any construction activities, USARHAW will employ qualified professionals to perform UXO clearance of the proposed construction area, remove all UXO encountered to ensure the safety of the site, and document UXO surveys and removal actions in full accordance with applicable laws, regulations, and guidance. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

P109 Sent: Tuesday, September 30, 2003 4:23 PM
 To: SBCT_EIS@poh01.usace.army.mil
 Subject: Re: [demilnet_Hawaii] ALERT! ARMY STRYKER BRIGADE DRAFT EIS
 HEARINGS SCHEDULED

P109-1 Once again, after reading the wordy report, I remain steadfast in objecting the expansion of military in Hawai'i. The negligible, incompetent, arrogant, and derelict behavior merits grave opposition. We know it's been stated many times that Hawai'i and its people are expendable and if anything goes wrong, it won't affect the contiguous 48 states.

It's common knowledge that the military will make a mess, leave its hazardous and toxic materials, and dump it within our territory with adverse effects to our land and people. This genocide will stop for we will continue to protest the military's hazardous and lethal presence within our small country. We are not the private laboratory for the US to experiment in, nor the waste basket, nor should we be the maid service to clean up our lands from the US abuse of it.

P109-2 We read the reports of the Stryker and know it's a lemon and worthless. Bringing it here will just compound the rubbish you will dump here. The C-17 is

P109-3 inadequate to transfer the amount of strykers and their crew feasibly and prone to mishaps, thus creating more of a mess than anything beneficial. O'ahu is

P109-4 already overcrowded and we still depend on our freshwater, land and ocean life for our sustenance. Once our islands are contaminated; you would be responsible to relocated the islanders if the territory is unfit for human habitation. We vehemently reject that option. You've done that to the Marshall and Mariana group of islands, neglected to clean it up, and denied them full medical attention. Many had to come to Hawai'i to get medical at our expense and we have to share our homeland with more people from other areas who have become stateless.

I can't see condoning mass murder and random, wanton destruction to people and lands, you have no business in destroying and depriving a non aggressive people. The WASP doctrine of discovery and conquest; is an insidious, archaic and criminal tenet that holds no water. That kind of thinking was debunked over five hundred years ago. As a Hawai'i National, I demand you cease and desist with your feloniously criminal actions and withdraw from our Nation's territory. We are the ones with clear title to our lands and do not give you permission to use it as you desire, especially when you continue to disregard our rights and disrespect us.

P109-5

 Subject: Re: [hawaii-nation] The Army vs. the Hawaiians

P111-1 After reviewing the scope reports and other info, my opinion has not reversed and I stand opposed to the military expansion in Hawai'i. You must also realize that the US is unlawfully occupying the Kingdom of Hawai'i. The treaties between our countries and with the international community, have acknowledged the laws of neutrality and what it entails. The US has recognized the Kingdom of Hawai'i as a most-favored, friendly, neutral nation. Our Kingdom laws has vested in us the owner in severalty of our lands in allodial. Please go on notice that the US is in violation of our human rights and we seek restitution and reparations for the irreversible tort committed against us. We bona fide subjects of the Kingdom of Hawai'i ask that you cease and desist all unlawful activities within our neutral territory and honor the Laws of Neutrality and the Laws of Occupation. We do not wish to aid and abet in the murderous activities that the US is engaged in.

With sincerest regards for peace,
 Tane

2000 a,b,c; US Army CHPPM 2001 a,b,c,d,e,f) demonstrate that weapons firing points at USARHAW installations are too far from residential or other sensitive land uses to cause any significant health risk.

P113-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P113-2

The air quality impacts of the Stryker Brigade are summarized in Section 4.5 of the EIS, and discussed in more detail in the Air Quality sections of the installation-specific chapters of the EIS. The EIS concludes that while some potentially significant air quality impacts would exist, these impacts could be mitigated to a less than significant level.

P113-3

The Army does not believe that emissions increases associated with the proposed action will cause any measurable increase in respiratory illness among those living or working near USARHAW installations.

P114-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P114-2

We thank you for your comment and understand your concern. It was not the intent of the Army to restrict the public through the format and location of the public meetings. Once the issue arose, we worked to correct the situation by working with the other facility locations to allow signs in the actual meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu to have all charges dropped against the individuals involved in the situation. Through these measures and the extension of the public comment period, we believe we allowed sufficient venues for public input including ample opportunity for written comment.

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. I oppose the Stryker Brigade expansion in Hawai'i.

P121-1

Let me write to let you know that I do not support having a Stryker Brigade here in Hawai'i. Per the army's environmental impact statement, having the brigade here would adversely impact our ground water and environment. How can we allow the military to use more land that they will contaminate to the point where it isn't safe for human use. We don't have that much land. Look at Kaho'olawe, Waikane and Makua just to name a few places where the military has made it dangerous for humans to use. Why can't this brigade be sent to a state that has lots of land. I know that economically it is a good thing for Hawaii to receive so much funding, but what use is funding when it ruins the land. What will be left for future generations.

P121-2

I applaud your efforts to keep Federal monies coming to Hawai'i and I just can't agree with having this Stryker Brigade.

P121-2

As discussed in Section 1.6 of the Final EIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th ID(L) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID(L) is charged with deciding how best to achieve that directive and provide for military training, readiness and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, an on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D).

P122 *sabrakauka@aol.com* wrote:

Aloha Kakou,
I do not support military expansion at Pupukeya/Paumalu, on Hawai'i island, or on Kaua'i. Wilma Holi sent a notice that the military is planning to lock-up an additional 6,000 acres on Kaua'i around PMRF. She cc'd Living Nation but I have not seen it on that list. This military move will close out the farmers.

P122-1 And what about access to Polihale and our sacred sites along the base of the pali and up on the ridge? This is outrageous.

Since I will be off-island on Nov. 13 when a hearing is being held on Kaua'i about this issue I have asked Wilma to speak for me. I do not cater to this military expansionism based on fear. There is far too much being done in the name of national defense and Homeland Security.

P123-1

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

The Army's analysis has determined that there would be no significant impacts on human health and safety that cannot be mitigated to less than significant level. The impacts of the project on human health and safety can be found in sections 4.12, 5.12, 6.12, 7.12, and 8.12 - Human Health and Safety Hazards in the FEIS.

P132-2

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

Re: Stryker Brigade EIS

Dear Ms. Barger:

This is a slightly revised version of my e-mail sent 12/30. If this letter arrives in time, I ask that you answer this letter instead.

- P133-1** 1. How can the "Pentagon approve" the Stryker in Hawai'i before the EIS process is completed?
- P133-2** 2. How does the Army explain inviting people to "public meetings" and then arrest of some for "criminal trespass"?
- P133-3** 3. Shouldn't the EIS process be invalidated, given the denial of those arrested to speak?
- P133-4** 4. Given that O'ahu ranks as one of the most crowded places in the U.S. (Census Bureau), making very high cost of living—especially housing—and 7000 homeless (latest estimate as of 10/28/03), how can you justify military increase of its near-25% of O'ahu land use and its further degradation of Hawai'i's environmental carrying-capacity?
- P133-5** 5. Why should Hawai'i bear so much share of environmental and cultural costs of U.S. military operations?
- P133-6** 6. Given the gross environmental destruction already in Hawai'i (the Marines found the Waikane land it ruined too toxic for its own re-use!), how can the military knowingly propose more? How much ruination of Hawai'i's unique and fragile ecology, Endangered Species, and very limited land will the military decide is enough?
- P133-7** 7. When will the military understand and respect Hawaiian cultural resources, the Hawaiians who take the trouble to advise it, and that Aina is SACRED?
- P133-8** 8. Why does the military not clean up the 1000 contaminated military sites in Hawai'i before even considering taking and destroying yet more land, air, water, and cultural sites?
- P133-9** 9. What security does Hawai'i gain in more toxic land, air, water, and creatures, and for the purpose of destroying more land, air, water, creatures and brothers and sisters elsewhere? Would Hawai'i not be far more secure if the military restored the lands held, then built housing for Hawaiians and/or, where favorable, turned them over for food production?
- P133-10** 10. How can one reconcile Aloha and its peace with the Stryker intent to "be more lethal"?
- P133-11** 11. If Stryker is for urban (civilian) assault, why not train close to the Stryker program decision-makers and not in Hawai'i's few remaining rural areas?
- P133-11** 12. Do the people who would staff the proposed Strykers say that it's unsafe and do not want it?
- P133-12** 13. Would Hawai'i's environment and cultural resources be better off and more secure if the military here contracted rather than expanded? Can you perceive the view that Hawai'i is made a target --and is undeservedly punished on many levels--by the dominating military presence here?
- P133-12** 14. Is "Live lightly on the Earth" far better for Earth and its inhabitants than trying to beating her to death? Why does the military want to further destroy Hawai'i?
- P133-12** 15. Won't the U.S. "win hearts and minds" in Hawai'i and worldwide, and be more secure, if the U.S. military cancels this proposal and instead commits the resources to seeking constructive relations with every nation?

Mahalo for your consideration of my questions, and I look forward to your responses.

Deborah Kimball

Responses

P133-1

Although the Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2nd Brigade 25th ID(L) will transform to a Stryker Brigade, these statement refer to programmatic level decision necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2nd Brigade, 25th ID(L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law.

P133-3

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs. It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the

Comments**Responses**

meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

P133-4

As discussed in Section 1.6 of the Final EIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th ID(L) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID(L) is charged with deciding how best to achieve that directive and provide for military training, readiness and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. P133-9

TAs discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.) The Army continues to make changes to the Stryker vehicle to make it more reliable, effective, and safe. The Stryker will continue to evolve to make it as safe and reliable as possible as part of the Army Transformation process.

P133-10

The Stryker vehicle is designed to operate in urban and rural areas. But has been designed to operate in an urban environment more efficiently than current armored vehicle..

P133-11

As a result of the GAO report and ongoing Army operations, the Stryker vehicles are being modified to fit in C-130 aircraft. Additionally, deployment practices continue to evolve. The Transformation process allows for adaptations to equipment and operations to ultimately meet the goals of current, SBCT, and future forces.

1. How can the "Pentagon approve" the Stryker in Hawai'i before the EIS process is completed?
2. How do explain the Army's invitation to "public meetings" and then arrest of some for "criminal trespass"?
3. Shouldn't the EIS process be invalidated, given the denial of those arrested to speak?
4. Given that O'ahu ranks as one of the most crowded places in the U.S. (Census Bureau), making very high cost of living--especially housing--and 7000 homeless (latest estimate as of 10/28/03), how can you justify military increase of its near-25% of O'ahu land use and its further degradation of Hawai'i's environmental carrying-capacity?
5. Why should Hawai'i bear so much share of environmental and cultural costs of U.S. military operations?
6. Given the gross environmental destruction already in Hawai'i, how can the military knowingly intend to wreak more? (The Marines found the Waikane land it ruined too toxic to re-use itself!!) How much ruination of Hawai'i's unique and fragile ecology, abundance of Endangered Species, and very limited land will the military decide is enough?
7. When will the military understand and respect Hawaiian cultural resources? and Hawaiians who take the trouble to advise it? Can you not understand that "The Aina is SACRED"?
8. Why does the military not clean up the 1000 contaminated military sites in Hawai'i before even considering taking and destroying yet more land, air, water, and cultural sites?
9. What security does Hawai'i gain in more toxic land, air, water, and creatures for the purpose of destroying more land, air, water, creatures and brothers and sisters elsewhere?
10. How can one reconcile Aloha and its peace with the Stryker intent to "be more lethal"?
11. If Stryker is for urban (civilian) assault, why train so far from Stryker program decision-makers, in Hawai'i's few remaining rural areas?
12. Do the people who would staff the proposed Strykers say that it's unsafe and do not want it?
13. Would Hawai'i's environment and cultural resources be better off and more secure if the military here contracted rather than expanded?
14. Is "Live lightly on the Earth" far better for Earth and its inhabitants than trying to beating her to death? Why do you want to further destroy Hawai'i?
15. Won't the U.S. "win hearts and minds" in Hawai'i and worldwide if the U.S. military cancels this proposal and acts only in actual defense?

P134-1

Mahalo for your consideration of my concerns, and I look forward to your responses.
 Deborah Kimball
 1919 Citron St., #710; Honolulu, HI 96826

P133-12

There is a relatively large complement of Army, Navy, Marines, and Air Force assets in Hawai'i that are more than capable of protecting U.S. interests from attack. Reorganizing one Army brigade will make relatively few changes to the overall Department of Defense presence in Hawai'i.

P134-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-517

Letter November 6, 2003

P135

Ms. Cindy Barger
U.S. Army Corps. of Engineers
Honolulu District
Building 230, CEPOH-PP-E
Fort Shafter, Hawaii 96858-5440

Dear Ms. Barger:

The United States entered the Civil War, World War I, World War II, Korean War, Vietnam War, Desert Storm, Afghanistan, Kuwait and Iraq.

From single load rifle to M-16, single engine fighters to jet fighters, helicopters fire power to missiles to patriots to B52 bombers.

The technology of fighting has changed to win and not lose too many lives.

I served with the 52nd Field Artillery, 24th Division in the Korean War. I was issued a carbine and the infantry was issued the M-1, BAR & Bazookas and the mortars. The artillery we had 105 mm and 155 mm and an L-19 air forward observer.

The helicopter, one per regiment was a 2-seater; the pilot and general.

Every country in the world has a military defense to protect their country. From ancient equipment in poor countries to rich countries with high tech equipment to nuclear war heads.

U.S.A. is known for its air power using high tech equipment that no other country has.

P135-1

What we need now is the land mobilization with its high tech equipment. With this in mind, I support the Stryker Brigade concept.

I support their training in Hawaii where we are about the middle of the Pacific. They can mobilize quickly to any part within the Pacific Rim.

Stryker Brigade reminds me of the special team on the Pro football team. They train until they prove themselves to call "Special Team".

It takes a lot of space for training.

The Stryker Brigade will be the "Special Team" defending our fighting force on land.

Roy Kimura
United States citizen and concern veteran

Dear Ms. Barger

Letter
P136

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. I oppose the Stryker Brigade expansion in Hawai'i.

**Letter
P137**

Dear Sirs/Madams;

P137-1

My name is David Klein and I am writing to the US Army in this public comment period to discourage the expansion of the Pohakuloa Training Area.

I lived in Hawaii from 1980 to 1993 and during that time I came to know and understand much about Hawai'i and the history and culture of that place. The US Military maintains control of approximately 10% of the land in the State of Hawai'i. This is far greater than any other state.

The US Military has huge tracts of land in bases in other states, such as Texas. These lands are off limits to civilians and these areas would be better suited for this type of exercise. Ft. Hood in Texas is a huge expanse and could serve as a training area as it is devoid of native peoples or even civilians within the huge confines of its borders.

P137-2

If US Troops are to be housed then it would certainly be better in an environment where there are centrally located and supported by far better infrastructure than that found on the Big Island of Hawaii.

Hawaii is simply too small and too rare a place to support these type of military exercises. The flora and fauna too fragile to withstand this type of expansion.

I have ridden off road motorcycles through the Pohakuloa Training area during the Mauna Kea 200 Enduro in the 90's and am familiar with the arid and high altitude at Pohakuloa. While I recognize this area as similar in some aspects to current battle fronts, there are hills and rocks and valleys at Ft. Hood where I have also ridden off road motorcycles.

Neither area allows civilian motorcycle riders any longer. But Pohakuloa has cultural, natural and geographical rarity that is lacking at Ft. Hood or a number of other currently occupied US Army bases.

Everyone recognizes the beauty in being "stationed" in Hawaii. However, in this case I feel that expanding the Pohakuloa area is not in the interest of the local people, natural environment nor required by unique training opportunities.

I respectfully request that the US Army pursue alternative sites to locate the Stryker Force at.

Respectfully submitted,

David M. Klein, Ph.D.
1700 A #313 Ranch Road 12
San Marcos, TX 78666

P137-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P137-2

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

 Subject: Stryker comments & comment period

P138-1 | Cindy Barger, Aloha,
 Please know that as a Hawai'i Resident, I do not want the Stryker Brigade to be stationed here.

P138-2 | With incidents at Makua Valley such as they've recently been and history of previous devastation on Kaho'olawe (only soon to be returned to the state), and well known other events on O'ahu, the US Military is not the "good steward" of the land it thinks itself to be. We live in a small state on SMALL islands, we've no room for this activity.

For the sake of ALL HAWAII, present and future, please find some large uninhabited desert area, (Nevada, Utah etc) for this unfortunate project and use of MY tax dollars. Why should we fear and prepare for "Foreign attack" when what we FEAR MOST is attack/invasion from our own government; especially in such a form as this?

I surely wish the US Army Corps of Engineers could find some lucrative PEACE PROMOTING, not aggression making projects ALL Americans could support and be proud of.

P138-3 | I would also request that the comment period be extended to at least 90 days.

Thank you for your attention to this matter,
 Respectfully and Patriotically,
 kalotta k

P139-1 | I am writing to express my full agreement with the testimony submitted by the Commission on Church and Society (Commission) of Harris United Methodist Church in opposition to the stationing of a Stryker Brigade in Hawai'i.

P139-2 | **The military's record in Hawai'i of rendering land unsafe for any further use in spite of promises to return the land to its prior condition makes it abundantly clear that expansion of the military land use proposed by the stationing of a Stryker Brigade in Hawai'i would have a serious negative environmental impact.**

Letter P142
 Date: November 4, 2003
 From: Cindy Lance
 To: U. S. Army
 Re: Stryker Brigade hearing at Turtle Bay Hilton

P142-1 I am a native-born Hawai'i resident and I am against the presence of the military on our land. The military already controls 200,000 acres of land in our tiny state and still wants more. I am particularly upset about the pending remake of the 25th Infantry's 2nd Brigade into a Stryker combat team which Senator Dan Inouye promised a home to BEFORE public hearings had been concluded. So much for democracy and the voice of the people being heard!

P142-2 An estimated 28 projects are planned for O'ahu and Hawai'i island which would bring the amount of military-held land to more than 11%. Our land, already in short supply, is a valuable commodity. Our cultural sites are priceless and have deep spiritual value to the Hawaiian people.

P142-3 The health of the people in our state - no matter what their ethnicity - is important, and no amount of jobs and income to our state can negate the effects of the Stryker Brigade's training exercises and return us to good health or replace the loss of historical places and endangered species.

P142-4 Unexploded ordinance, out-of-control fires, and the release of deadly chemicals into our air are not acceptable. Our elderly residents and all those who suffer from respiratory ailments should be guaranteed clean air. The Stryker Brigade will dump more than 13 million pounds of dust into the air we all breathe. That is also not acceptable. From day one, the U.S. military has demonstrated its complete disregard for our land and our people. The state is littered with polluted bays, extinct coral reefs, acres of land that has been bombed, burned and poisoned, unknown quantities of unexploded munitions, and, I suspect, much more that we don't know about.

Enough is enough! Clean up our 'aina, return it to its rightful owners and in the mean time keep the Stryker Brigade out and do away with plans to put them anywhere else. What's harmful in our "back yard" is harmful in all "back yards."

Responses

P142-1

Although Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2d Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2d Brigade, 25th ID (L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law.

P142-2

The cultural resource sections of the EIS have been expanded to better address the importance of and potential impacts to Native Hawaiian Areas of Traditional Importance and sacred sites. As summarized in Section 4.11, the Army has determined that the Proposed Action will result in a significant impact to Areas of Traditional Importance. The Army has identified mitigation measures to substantially reduce the severity of the impact but not to less than significant levels.

P142-3

Thank you for your comment and your participation in the public process. Your comment has been considered and has been included in the administrative record for this process. The impacts of the project on human health and safety can be found in sections 3.12, 4.12, 5.12, 6.12, 7.12, and 8.12 in the EIS.

P142-4

The concern over these issues has been noted. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality

P144

Hi Folks -

Yesterday I received two calls in complaint of the public meetings and process.

P144-1

1. Bob (didn't leave his last name or telephone number) called to voice his opposition to the restriction of signs, holding public meetings in private facilities and opposition to the arrests.

P144-2

2. Mrs. Mary Jane Lee called to voice her opposition to the restriction of signs. Mrs. Lee attended the Helemano meetings and will attend the Turtle Bay meetings tonight. She said she is not necessarily against the project but was very disappointed in the Army's decisions about the signs. She requested that at least one additional meeting be held on O'ahu in the a public facility in a convenient, easy to find location. She also recommended that charges be dropped and that an apology be issued by the Army on the arrests and sign restrictions.

thanks

Cindy

P144-2

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs.

It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

To MS CINDY BECKER 11-6-03
FROM GENE B. LEE, JR. P.O. Box 4964 Hilo, HI 96721
The further use of Hawaiian Lands for War

Mama Kea and Mauna Kea are among the largest in the world.

The book with regard and pride at them. The world, and technology, book with need as to what can be accomplished here.

The astronomy society need to protect our water sources, our environs, and other concerns mentioned the past two to three years.

The politicians and the media need to keep the practice of peace.

allowing the army to further desecrate our lands to practice violence cannot and should not be allowed.

Violence will not and can not reduce the number of enemies and terrorists. It only creates more hatred, more violence, more terrorists on both sides of the equation.

The army are not good stewards of our Hawaiian lands here and in our archipelago. As demonstrated in these hearings to date.

P149-1

Is there a timetable for the occupying army and armed services to vacate our lands? Will this question be addressed?

As Hawaiians we have lived under your brutal rule and were treated as threats @ home, at

P149-1

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

Subject: CLEAN UP NOT BUILD UP, NO POHAKULOA EXPANSION

P153-1

Hawaii Island has over 50 former military sites. Most contain unexploded ordnance or other hazards. The US Army Corps of Engineers says it will take "centuries" to clean them up at current funding levels. Army actions at Pohakuloa threaten the environment and Native Hawaiian culture. But the Army is pushing ahead with plans to take 23,000 more acres around Waiki'i Ranch.

We need military clean up, not build up!

Put an end to military spending!

PUBLIC COMMENT REGARDING THE EIS FOR THE STRYKER BRIGADE IN
HAWAII

The crux of my comment today is based on the attached documents, which I submit as part of this comment.

P155-1

The United States and its military have no jurisdiction here in Hawai'i. Your very presence here is in direct violation of international law, more specifically, the 1907 Hague Conventions IV and V.

The continuity of the Hawaiian Kingdom as an independent State and the fact of prolonged U.S. occupation of the independent State are eloquently explained in the attached document by Dr. Matthew Craven for the acting Council of Regency.

The United States must end its military build-up in Hawai'i and completely leave Hawai'i to put an end the prolonged occupation of the Hawaiian Kingdom.

Kalani Makekau-Whittaker
Hilo, Hawai'i

Responses

P154-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P154-2

The impacts of the project on socio economics are described in sections 4.12, 5.13, 6.13, 7.13, and 8.13 in the EIS.

P154-3

As noted in the FEIS, munitions use on Army ranges adds various quantities of numerous metals, organic compounds, and explosive material residues to soils on training ranges. The Army's Toxic Release Inventory reports for 2001 and 2002 indicate that airborne releases of potentially hazardous compounds from Army training activities totaled about 1.3 tons in 2001 and 1.9 tons in 2002. These emissions, however, were too widely dispersed to have produced any significant air concentrations in areas accessible to the general public. In contrast to airborne emissions, non-airborne residues on training ranges totaled about 33 tons per year in 2001 and 2002. These residues, however, were confined to Army training ranges and have little potential for migration to off-post locations. And as discussed in Sections 5.9 and 8.9 of the EIS, soil sampling at SBMR and PTA shows that concentrations of hazardous compounds in the soils of the training ranges do not pose a significant health risk to Army personnel or to the general public.

P155-1

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process

COMMENTS:

- P156-1 I stand against any military
expansion in the archipelago of Hawaii.
- P156-2 The U.S. has a responsibility to clean up
all ordnance and bases in the islands. Mr.
Rumsfeld, put your money into cleaning up →

the military messes around the world. Stop invading and colonizing other countries and cultures, and public opinion in the world will swing in the U.S.' favor. Terrorism around the world is a reaction to the U.S. policy of bullying any countries or peoples who oppose expansion of the "global economy." Put your resources into world health rather than military and economic domination. In Hawaii, this means stopping all expansions and healing the land and people already injured.

P156-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P156-2

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

Subject: Public comment: Oppose Stryker Brigade on Big Island

To Whom it May Concern:

P157-1 As a taxpaying U.S. citizen, and frequent visitor to Hawai'i, with deep interest in the environmental and cultural health of these islands, I adamantly oppose expansion of military activities on the Big Island, particularly with regard to the Stryker Brigade.

Dangers of unexploded ordnance already abound throughout Hawai'i and the neighbor islands, thanks to shoddy and haphazard practices of the military, and the desecration of spiritual land is inexcusable. What the military proposes is a spiritual, environmental, civic, political and cultural disaster.

I do not support this use of my tax dollars. This is madness. I will be writing to my elected representatives to urge their help in stopping this now.

Sincerely,

Amy Marsh
1510 Francis Street

P158

Honolulu, Hawaii
December 30, 2003

Ms. Cindy Barger
U.S. Army Corps of Engineers – Honolulu
Bldg. 230 Room 306
Fort Shafter, HI 96858-5440

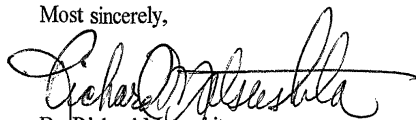

Dear Ms. Barger,

I have read that the United States Army is considering having a Stryker Brigade in Hawaii. This will mean that there will be an expansion of land use for live fire training. This is of great concern to me in that I have seen what has happened to Kaho'olawe for I have participated in reclamation projects with PKO (Protect Kaho'olawe Ohana). I have seen the tremendous impact the military has made on the island. The island will never be restored even with the multi-million dollar attempts by the Navy to clean it up. Every time I go to Kaho'olawe, I weep and feel the hurt of the aina (land).

I am an American and I am proud of my country and have served in the military. We are already the most powerful nation in the world militarily and to want to continue building up our military power does not make sense to me. Let us preserve the land from more destruction in the name of Military Superiority.

P158-1 | I oppose having a Stryker Brigade in Hawaii.

Most sincerely,

Dr. Richard Matsushita
United Methodist Church
Retired

From: Daya Mau [<mailto:smileypapayasoul@yahoo.com>]
Sent: Saturday, November 15, 2003 11:03 AM
To: sbct_eis@poh01.usace.army.mil
Subject: Questions!!

Aloha,

I am wondering about the devastation from bomb practice that went on on Kaho'olawe of the Hawaiian islands.

- P159-1** 1. How many bombs were exploded on Kaho'olawe?
2. Over how long a period of time were bombs being used on kaho'olawe and what type of weapons, posions, chemical warfare, toxic nuclear waste and experimental gases, and other and all hazardous warfare used, and how long will it take before the land is uncontaminated?
- P159-2**
- P159-3** 3. Did all the waste get cleaned up from the bombs?
4. Why is the military not putting more monies to clean up their mess by 2010? or this an unrealistic assumption that this island that was so brutally raped destroyed and contaminated AND STRIPPED of all life force and respect can not come back to life until another 500 years, or otherwise the US military would keep it instead of looking like a 'good guy' by returnign it just in time to now say they want more land to pollute, destroy, contaminate for their STRYKERS.???
- P159-4**
- P159-5** 4. What type of an example can you show to the people of Hawai'i and the rest of the world that you can not only clean up your mess, but, stop making messes and destroying such fertile lush vegetation and vital water sources and resources.
- P159-6** 5. When are you people going to become responsible and respectful to these islands, the Hawaiian people (born here) and those who love these islands and culture.
- P159-7** 6. where do you feel you have the right to take any (more) land to contaminate, poison,

- P159-7 cont'd** | pollute with hazardous and deadly toxic waste and then condemn?
- P159-8** | 7. Will the lands be safe from chemical waste and nuclear waste?
- P159-9** | 8. Is the land on Kaho'olawe clean of those wastes where the bombing took place? Is it safe for people to live on now?
- P159-10** | 9. And what about Makua Valley on O'ahu? The bombing has made the land barren, and is killing wildlife and your ignorance created a wildfire..
- P159-11** | 10. You the military is creating more destruction, contamination to our sacred islands..WHY????
- P159-12** | 11. And what about Wai'akane Valley you stole for 2.mil+\$\$\$ now YOU claim it's contaminated and unfit for anyone, yet you want to have more military practise with our men and boys playing your war games..
It is obvious that you lease buy and take land, ever return free and clear like it was when you first took it over. Then use it to test your toys of destruction-pollution. Poison and hazardous , deathly chemical bombs and sonar experiments in our oceans disorienting and creating mutations in our wildlife under the sea and above..

After a time, when you finish your testing, experimenting, it seems as though you leave that area of land, and ask for more/take more/land in a different area of an island, or on a different island. You are destroying vital indigenious and endemic plants, herbs vegetation not to mention homelands for all wildlife and human life. And sacred burial grounds used as religious ceremonies for thousands of years.
- P159-13** | DO YOU EVEN HAVE A CONSCIOUSNESS OR HEART TO CARE ABOUT LIFE? THIS MAY AFFECT YOURS AND YOUR CHILDREN AND FAMILY. GOD FORBID, BUT, YOUR CHOICES AND DECISIONS WILL BE THE SEED AND YOURS SHALL REAP WHAT YOU SOW..this is history.!!!!
12. When will this stop? When every square foot of every island has been destroyed,by, your unconsciousand mindless careless and thoughtless disrespect for all life.
- P159-14** | 13. What about the people, the `aina(land)? Will you clean up the land from all the debris and excess toxic byproducts, and how much of this toxic waste still remains in the grounds ?? and how many years will they remain as hazardous and

Responses

related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the FUDS program.

P159-6

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. The Department of Army has taken every step to minimize impacts of the proposed project as describe in the EIS while meeting the goals of training. Many mitigation measures have been incorporated into the project to reduce identified impacts where possible. Chapter 4 summarized the potential impacts and mitigation measures.

P159-7

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. In accordance with NEPA regulations, the Army is conducting this EIS in order to identify the direct, indirect and cumulative environmental effects of the proposed action on the State of Hawai'i. If the Army decides to implement the proposed action, the Army will mitigate all significant impacts in order to minimize the overall environmental impacts of the proposed action.

P159-8

No nuclear waste has been used or is currently being used on the island. No nuclear waste is planned to be used in the future. Disposal and handling of chemical wastes are described in section 3.12.2.

P159-9

The bombing of Kaho'olawe is not included in the proposed action and is out of scope of this project. For more information please contact the US Navy and the Kaho'olawe Island Reserve Commission.

P159-10

A separate NEPA document is being prepared for the Makua project and a DEIS will be released soon for public comment. Makua is not part of the proposed Transformation project.

Comments

Will the land be suitable to live on again? If you say yes,</p>
P159-15	<p>15. In how many years will it take for all these chemicals to dissapate and be completely gone ?</p>
P159-16	<p>16. and how long after will vegetation and animal life come back?</p>
P159-17	<p>17. How what percetage now will survive?</p> <p>18. And what is the population now of all living vegetation growing in these areas you want to destroy? all types present? and wildlife, all types present?</p> <p>19. not to mention your bringing in more people to our already overpopulated fragile islands..do your bombings , practises and testings and experiments in your own back yard!!! on your own lands already void of life..in the deserts or maybe nearer Washington D.C.</p>
P159-18	<p>Would you have faith that it is safe enough and not harmful to one's health? Why are you taking more and more land, year after year to practice training if you know what will become of the land after all the practicing and bombing? How will the U.S. benefit from moving 291 tanks onto the hawaiian islands that will take up 24,000 acres of land?</p>
P159-19	<p>Approximately how much devastation has the military already incurred in land destruction and how will this affect the forseen & unforseen health,and welfare of all generations now and yet to come?</p> <p>Where do you see the culture of Hawai'i going? are you intentionally destroying it a little at a time while increasing your claim to over 1/4 of owning our land..we want it back! ALL of IT!! now.</p> <p>Do you care whether the Hawaiian culture is respected and perpetuated in righteousness???</p> <p>I even see the mindless choices and egotistical ideas, of this Stryker Project as destructive to our fragile environment, and unjust to our human rights</p>

Responses

P159-11

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.) The impacts related to Transformation in Hawai'i are described in Chapters 5-8 of the EIS.

P159-12

The US Marine Corps canceled proposed training actions in the Waikane Valley.

P159-13

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

Comments

(under your constitution) where you are infringing upon our free will and rights as universal law.

Another event that will go down in history that is shameful, disgraceful and upsetting to even be called an American without rights now becoming a militaristic state.

The ever increasing upsurge of emotions you are creating within the PEOPLE OF AMERICA when the sovereignty rights, freedom of speech and to rally and gather are taken away by America-land of the free???? governments' decisions and choosing not to listen and understand the government by the people for the people and affecting the innocent minorities and their lands. What will the future hold by bringing so much WAR equipment to such a peaceful place? How are children supposed to grow and succeed in life if their land, culture and education is minimized, if not indirectly taken away completely? Children are our future and if it is \$59 million that will be extinguished from "current Hawaiian health, educational, homesteader programs," how are children supposed to survive in a place where the government values Stryker Tanks over education, plant and animal and all life forms and human life and health? If you say that the government does not feel that way, then why are you destroying millions worth of already existing programs that are for the well-being of the Hawaiian people? If people aren't healthy, and don't learn anything, how do you expect them to contribute to the military or U.S. army in the future? Do you agree that they will be unphysically fit to do so?

P159-20 Why were seven opponents of this project arrested when they attempted to testify at public hearings?

The people have a right to know what is happening to their land that they were raised on and grew to love, cherish and respect. Why are you taking away that right?

Those are all the questions I have right now. But, be sure, there are many more to come. I do expect explanations until I am satisfied that your reasoning for this project is valid and worth the land. Which I am most sure, nothing could ever be worth the land, and I know I am not the only one who feels that way.

Aloha, may you find the strength within your heart and/or soul, consciousness and knowledge to protect the 'aina and the people of the Hawaiian culture. Mahalo for your time, D.

Responses

Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

P159-15

This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate the time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleanup existing sites as required and to prevent new sites to the maximum extent possible.

P159-16

Efforts to reduce harm to vegetation are included in ongoing Army stewardship programs like ITAM, LCTA, and the INRMP. New directives for revegetation are included in the 2003 Biological Opinions for O'ahu and Hawai'i and individual programs are outlined in chapters 5.10, 6.10, 7.10 and 8.10. Species recovery has been taken into account by USFWS in preparation of their biological opinions and measures to ensure stabilization of species potentially affected by Transformation projects are included in their recommendations. However, percentage of survival and recovery rate will depend on individual species and site conditions and cannot be predicted at this time.

P159-17

Specific location information regarding sensitive plant and wildlife species and populations are provided where these species will be impacted. Please see the biological resource sections of each chapter in figures and text 5.10, 6.10, 7.10, 8.10. Additional species information is located in Appendix I.

P159-18

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID

Dear Ms Barger,

P160-1 I disapprove of the Stryker brigade project because it would be detrimental to environmental and social health. There is already way too much military pork in Hawaii. The US is becoming a big murder machine and the term "defense" is a euphemism for that.

Sincerely,
 Sara McCay

P159-20

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs.

It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P161-1

The Surrounding Land Use text identifies Pupukea Paumalu Homesteads adjacent to the west of KTA. The Surrounding Land Ownership text has been revised to reflect Obayashi Corporation as an owner of land adjacent to KTA. The revised text reads, "The land surrounding KTA is owned by James Campbell Trust Estate, the State of Hawai'i, Property Reserve, Inc., Dole Food Co., Inc., City and County of Honolulu, Girl Scout Council, Antonio Narvaez, Comstat Corp., and Obayashi Corporation."

Subject: If possible, could you send me a set of the DEIS documents?

Thanks Cindy.

If possible, could you send me a set of the DEIS documents?

I am at:

Blake McElheny
59-272 Pupukea Road
Haleiwa, HI 96712

Maybe I should pick it up somewhere to save the mailing cost (plus it might not fit in my mailbox).

Let me know what is best for you.

P162-1

One of the reasons I feel the Obayashi information is useful is because they currently have the property for sale (listed with CB Ellis). There have been various plans for intensive residential development on that property that the community has had concerns about.

Perhaps acquisition as a "buffer zone" to the Pupukea/Sunset community could be something to be examined. It could be a proactive way to prevent future potential noise complaints, etc...

Thank you.

P162-1

The Army is considering ACUBs as mitigation for other proposed actions and has met with the commenter. For this action ACUBs were also considered but more feasible mitigation measures were proposed. The mitigation measures proposed are listed in the Executive Summary.

P164-2

SBCT training requirements are not dependent on the use of the Mākua Military Reservation (MMR). While MMR is an integral part of USARHAW training capabilities and historically used by other services, SBCT units could perform dismounted CALFEX training at other ranges. This is discussed in Chapter 1. SBCT may use MMR if the range were available only after completion of the Makua EIS and ROD. The Makua EIS will analyze the potential environmental impacts associated with dismounted CALFEXs for both Current Force and SBCT; therefore, this SBCT EIS does not analyze training impacts of SBCT at MMR.

Letter
P165 Dear Ms. Barger

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. **I oppose the Stryker Brigade expansion in Hawai'i.**

P165-2 I also have concerns about: the environmental standards of training sites, leaving behind irreversible pollution

P165-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P165-2

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws and regulations.

P166-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P166-2

Thank you for your comment and your participation in the public process. A discussion of impacts to cultural resources can be found in sections 4.11, 5.11, 5.11, 6.11, 7.11, and 8.11 of the EIS.

Letter P167 TESTIMONY OF MICHELLE MICHEW November 6, 2003
 RE: US ARMY PROPOSAL TO EXPAND UNITED STATES ARMY RESERVATION - HAWAII

To: U.S. Army

P167-1 1. I object to the proposed expansion of the US Army Reservation in Hawaii. The Army has stated that even if they do not choose to implement the Stryker Brigade, Interim Brigade, they will still gain control over an additional 65,000 acres. This insistence upon increasing the Army's Reservation acreage in Hawaii is unjustified. The Army has other options and they should exercise them. The additional acreage proposed would create a total of 240,000 acres in Hawaii used exclusively by the military.

The Hawaiian community needs those lands to survive upon. Since the U.S. occupation in 1893, the Hawaiian community has been continually denied our rights to our lands, our nationhood, and our right to determine our community's development and future. Expanded U.S. military use of Hawaiian lands limits the ability of the Hawaiian community to use those lands to survive upon.

The local community here need expanded schools, clinics, drug rehabilitation and local economy jobs. Furthering Hawaii's economy on U.S. military development will only decrease our longterm ability to be a productive and self-sufficient community.

P167-2 The proposed Stryker Brigade will damage much needed lands for agriculture and reserves for the people of Hawaii. The U.S. Army should train all of its troops on the continental U.S., which is more cost-effective in the long-run.

2. I also object to the ongoing use of 175,000 acres by the US Army in Hawaii because it has resulted in severe and longstanding negative impacts upon the Hawaiian people. The U.S. Dept. Of Interior held hearings here and determined that the Hawaiian people were illegally overthrown and invaded by the U.S., it's Minister, and military. This means the U.S. presence here in Hawaii is in effect, a military occupation of the Nation of Hawaii.

Your Presidents Cleveland and Clinton concurred that the sovereignty of the Hawaiian people has never been extinguished, or given to the United States. Our Queen Liliuokalani patiently withheld any deliberate transfer of sovereignty to the U.S., and we Hawaiians are still waiting patiently for the United States to end the military occupation of Hawaii.

The Army could revise its Reservation plans for Hawaii that would reflect the U.S. Dept. of Interior findings.

Some suggestions:

- P167-3**
- 1) The Army could start the building of a memorial for the injustice of U.S. military officials in the illegal invasion and overthrow of the Nation of Hawaii in 1893;
 - 2) On behalf of the United States, The Army could formally return historic national landmarks and buildings like the Mauna Ala, the State Justice Building/Old Territorial Building, Washington Place, and the Iolani Palace to a Hawaiian nationals assembly and diplomatic corp for use in deliberating nation-building efforts, diplomacy efforts, and agencies to support and service Hawaiian national citizenry;
 - 3) The Army could assist the Hawaiian national assembly in funding and building a Peacekeeping agency for United Nations personnel to be stationed in Hawaii to investigate and assist the Hawaiian nationals towards nation-building efforts. The United Nations

P167-1

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

P167-2

Thank you for your comment and your participation in the public process. Your comment has been considered and has been included in the administrative record for this process.

P167-3

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

Responses

Comments

- Peacekeeping forces placed here would assure the protection of Hawaiian nationals from ongoing theft, corruption, injustice, and fraud from the U.S. military, politicians, and citizens;
- 4) The Army can support a United Nations sponsored Referendum, similar to the East Timor vote, which would allow Hawaiian Nationals to exercise their basic human right to determine a government of their own choice;
 - 5) The Army can uphold the International Rules of War, respect the provisions of the Genocide Treaty, and do more to protect Hawaiian nationals from ongoing human rights abuses and violations.

For the U.S. Army to promote Freedom of Speech, Justice for the Illegal overthrow of the Nation of Hawaii, is to promote Democracy around the World. American support of Hawaiian freedom, democracy, and human rights to self-determination and sovereignty is America's BEST National Security Option. As a community, we Hawaiians look to America as a bigger, more powerful "brother" who can develop the compassion and consciousness to do the right thing in relation to us, America's "little brother." No more bullying of the Hawaiian people, no more dictatorship of American citizens, their laws and rights. The time has come for the Hawaiian people to be respected for our rights, our laws, and our wishes to live as we want to.

Be All You Can Be, Free Hawaii.

Subject: STYKERS in Hawaii

Dear Ms. Barger,

For the indigenous people of Hawaii, our land--or 'aina--has particular significance to us. In our cosmic story of creation we learn that the land, honua, of these islands is our mother, we know her as Papahaunamoku. In this creation story, the concept of "Malama Aina," or to care for the land, is established as part of the very essence of the entire belief system of Hawaii's native people. This very concept was, and continues to be for many, completely accepted as a part of life. It even goes further than this with the common view of land as a necessity for life, similar to air and water. With all of this made evident and there being no diffinative statement of the true environmental impact of these STRYKER tanks on our land, it should be acknowledged by the U.S. military that they will be greatly indebted to the Native Hawaiian people. The question I pose to you is what or how does the military plan to repay the Native Hawaiian community specifically for the possibly tremendous degradation to our cosmic mother? I know the superficial argument made by the military that proclaims that many new jobs will be created with the stationing of the STYKER units here; however, it can be effectively stated that much more jobs could be created if the government put the same amount of money into social programs for the state. But again, specifically, what will the military do to compensate to the Native Hawaiian people for this complete disregard for our indigenous religion and our very unique island landscape? Thank-you very much for your time and thoughtful considerations.

Aloha Oe,

Chace Moleta
Student of the University of Hawaii at Manoa

Letter U.S. Army Engineers, Honolulu District
P175 Environmental & Special Projects Branch
 Fort Shafter, Hawaii

November 10, 2003

- P175-1** Thank you for the opportunity to express my views to be considered in the proposed Pohakuloa Training Area, Expansion and Transformation. I have been reading and studying the Draft Environmental Impact Statement and am amazed at the information given. The overall impression is that this expansion and continued use of PTA is not good to do, particularly because of the destructive impacts on this environment and ecosystems. The DEIS says the soil erosion, dust emissions, the increased noise and light pollution, the loss of native species and spread of non-native species would increase the dangers of wildfires. Also the DEIS says these would have a significant impact on the communities of Kawaihae, Waikoloa, Waikii, The Girl Scout Camp and Mauna Kea State park. No mention is made on the impact on the Astronomers on Mauna Kea Summit.
- P175-2** The land for your proposed expansion around Waikii is zoned for agriculture and conservation, has never been used by heavy vehicles, training or munitions which would destroy the land, "compact the soil" causing more dust and air pollution and noise so that it would become another wasteland like PTA is now. The DEIS says there will be significant noise with ordinance, vehicle and construction.
- P175-4** The Proposed PTA Trail would have a major impact on all lands, air and lifestyle around it. The DEIS says it would cause flooding of public roadways and adjacent lands because of erosion and silt accumulations. The 1005 heavy duty vehicles going up this trail would have a drastic effect on the nearby communities with the noise and air pollution from emissions and dust, plus the shaking of the earth would also effect Pu'ukohola Heiau National Historic Site which is sacred and must be respected and protected. To quote the DEIS "fugitive air quality and potential health hazards from vehicles and wind erosion would increase 1602 tons per year with no known mitigation". In addition, dangers of construction of the PTA Trail "would be greater due to Unexploded Ordnances along it, and residents may have to be evacuated".
- P175-5** There is so much on this island that is found nowhere else in the world, including species in PTA and the expansion area. The rare plants, birds, the sacred sites, archaeological sites, the magnificent visual panoramas, the Pu'u, the Astronomers all must be protected. The Army has a program now to protect and preserve some of these features, as this booklet shows. The Army should take the next step and really transform PTA. Their goal and purpose should be a showcase of a living national park and a nature reserve. Remove all the munitions, explosives and heavy duty vehicles and restore that rare ecosystem there. The world would be astounded. You could start by immediately canceling the expansion plan and implement an environmental management system with members of the general public, Hawaiian communities, government officials and scientists all with a common goal to restore Pohakuloa to its former beauty. Leave a legacy for future generations.

P175-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P175-2

No impact is expected on astronomers Mauna Kea summit. Dust emissions from construction are localized and temporary and per air quality analysis presented in section 8.5 and Appendix G2, there is no expected change in ambient air quality in the general region. Given the elevation differences between PTA and the Mauna Kea observatories and the feasibility of controlling fugitive dust from vehicle travel on unpaved roads, no significant impact on observatory operations is expected. Predominant wind directions are downslope, away from the observatories. Strong winds from the southwest can occur, but these situations may create other atmospheric conditions that are not ideal for observatory operations.

P175-3

Section 8.9.2 discusses soil erosion and compaction issues as a result of SBCT training activities at PTA.

P175-4

As summarized in Section 4.6, the discuss of noise impacts has been expanded and mitigation measures have been identified. For PTA, these mitigation measures will reduce the impact to less than significant. For O'ahu and SBMR, the mitigation will reduce the severity of the impact but not to less than significant levels.

P175-5

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

Letter Cindy S. Barger, SBCT EIS Project Manager January 2, 2004
P176 U.S. Army Engineers, Honolulu District
 Bldg. 230, Rm. 306 ATTN:CEPOH-PPE
 Fort Shafter, Hawaii 96858-5440

Re: Comments on the Transcripts of the DEIS of the Transformation of the 2nd. Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawaii.

The following are descriptions and quotes from the DEIS for the Expansion of PTA with my comments and questions which should be answered more completely:

Volume 2: Chapter 8:

P176-1

"Construction of a Military Vehicle Trail 30' wide, 30 miles long from Kawaihae to PTA. Partly paved through agriculture lands, stream and highway crossings." There is very little mitigation for the erosion, silt buildup causing highway flooding, the impact on the nearby residences and little mention of the National Historic and Sacred Site of Pu'ukohola Heiau. What mitigation measures will be taken to minimize the impact on our residents and our public roads? What detailed plan will you draw up regarding the Heiau?

P176-2

The DEIS also says "air quality and potential health hazards from vehicles and wind erosion would increase 1602 tons per year with no known mitigation. This would be used by the military "10 trucks and 24 Strykers in convoys every 15 to 30 minutes per trip with 96 vehicles per hour" (Pg. 8.7) will go up this trail. What mitigation will be taken to protect the air quality?

P176-3

This trail would be on designated Conservation Land, Urban Expansion, Residential and Industrial in the Hawaii County General Plan. It is included in the SMA and Shoreline Setback. Will Public Hearings be held to address these requirements?

P176-4

In addition, dangers in the construction of the Trail "would be greater due to Unexploded Ordnances along it and residents may have to be evacuated". What justification would be made for the destruction and danger to the people, land and culture?

P176-5

(Pg. 8-3) Bradshaw Army Airfield extension with full strength paved overruns 150' wide, over a mile long would require clearing, excavation, a mobile asphalt concrete plant, water supply to accommodate C-130 and C-17 aircraft under assault. (Pg. 8-45) "will extend the runway which would affect biological and cultural resources because of paving and clearing for construction of the runway... No mitigation" How can you justify this destruction of the endemic biological and cultural resources here?

P176-6

(Pg. 8-18) WPAA (Acquisition Area) is along the Mamalahoa Hwy., Saddle Rd. and their junction designated in County Zoning as Agriculture. Military maneuvers and use of troops and ammunition is not an accepted use under this zoning. Would you request Public Hearings to have this zoning changed?

Responses

P176-1

Construction of an all weather trail will reduce the amount of silt buildup, erosion and resulting flooding. The road will be constructed and designed utilizing standard design elements and construction techniques to minimize impacts during construction. The military trail will follow an existing right of way through the Pu'ukohola Heiau National Historic Site that is currently being used. There will be no significant impacts to the Historic Site. The Army will continue to coordinate with the National Park Service to avoid any impacts.

P176-2

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. As a mitigation measure, the Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

P176-3

Public hearings have taken place regarding Army Transformation, and are discussed in Appendix B. The Army attempts to comply with local zoning laws but is not required to do so. Conflicts with local land uses are discussed in Sections 4.2, 5.2, 6.2, 7.2, and 8.2.

P176-4

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all r

Comments

- P176-7** (Pg.8-4): "Construction of 28 miles of gravel training roads on acquired property... will consult with nearby property owners to address potential air quality and dust concerns"... "Live firing would be on 750 acres 180 to 245 days per year with less than significant impact except air quality". No one wants their health jeopardized by increased air pollution. How can this be called "less than significant?"
- Presently this land is scenic with beautiful rolling grassy hills often with flocks of wild turkeys, pheasant, owls, Nene and Palila. What justification do you have to destroy this?
- P176-8** 8.1 (pg.8.2): Construction of Tactical Wash Facility to support a 60' long x 12' wide vehicle, Waste water "would be treated". There is no mention of how this waste would be treated. How would this water be treated? Where would the waste and sludge go?
- 8.2 (pg.8-9): Field maneuvers will be on 56,661 acres. PTA is on State designated Conservation District. Would this designation have to be changed with public hearings?
- P176-9** (pg.31): Visual Resources: "landscape has panoramic views between Mauna Kea and Mauna Loa of high quality...with dramatic views..." "Views by the public is by driving by only, without stopping causing no significant visual impact". How can this be true? Photographers, artists and hikers treasure and appreciate these views, including myself and my hiking companions many times. Many photographs and paintings have been made of these scenes. They are astounding, found nowhere else in the world and must be protected.
- 8.3 (pg.8-36): "Antennas would be in sensitive viewsheds on 4 Pu'u hilltops with a high aesthetic value"... "will have a significant but mitigatable impact on visual quality"... The army will "conserve natural features...to the extent feasible". How will the army do this? "to the extent feasible" is vague. Antennas are a major blot on the views.
- P176-10** (pg.8-41): "New facilities will increase amount of outdoor light...PTA will adhere to County Code ...the use of flares, munitions and explosives are not considered detrimental and will try to conduct training at full moon to minimize impact. This would have a major impact on the Astronomy Institute, to "try" is not sufficient. Have you done enough research regarding this impact and consulted with the Institute?
- P176-11** Pg.8.5: There are no air quality monitoring stations close to PTA, only in Hilo and Kona. PTA monitors wind and rain with wind erosion 35% of time. "PTA has events of dust with adverse effects...high wind, fires enough to evacuate Waikii Ranch residents in 1999. Dust by vehicles on unpaved roads and off-road would be permanent. Dust is prevalent because the fine soil is airborne in very weak winds. "Soil loss would be significant" Are you going to install air quality monitoring stations and use the information to avoid adverse effects of dust?
- P176-12** 8.5 (pg.8-54): Emissions from Construction of ranges, vehicles wash, ammunition storage, airfield & trails etc. would be "less than significant".

Responses

relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

P176-5

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

P176-6

As discussed in Section 4.2, the Army has considered conflicts with local zoning laws and policies as factors for significance. Although the local zoning laws do not apply to federal government lands, the Army incorporates these policies where practicable.

P176-7

As shown in Figures 2-10 and 2-11 of Chapter 2 and Figure 8-2 of Chapter 8 in the FEIS, the BAX and Anti-Armor ranges are well removed from the Waikii Ranch area. Artillery firing points at PTA are located at distances of 3 to 14 miles from the Waikii Ranch boundary, with most firing points more than 6 miles from the closest part of Waikii Ranch. Given the small quantities of pollutant emissions generated by munitions use, there is little potential for live fire training to produce detectable air quality impacts at off-post locations. As noted in the Final EIS, the Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

Comments

- P176-12 cont'd** Ordinance Emissions: would increase 70% with small arms, heavy weapons, demolitions, smoke devices, & pyrotechnic devices. "Little risk of creating adverse air quality...less than significant..." How can you say this is less than significant when there is an increase in emissions?
- Engine Emissions: from vehicles would increase 69% & 76% in operating hours. 400 vehicles in a single exercise would increase emissions 128%. "No known violations of State and Federal air quality standards." To say none of these increased emissions are "less than significant" does not make sense because, of course there would be significant difference in air quality because of the increased emissions. How will you mitigate these emissions?
- P176-13** 8.6 (pg.8-61): Noise: "Appropriate Mgt. Actions" will reduce annoying noise at Waikii, Mauna Kea St. Park and Girl Scout Camp from aircraft, helicopters, vehicles, ordinances and live firing exercises. Training will be 1000' away 40 to 60 times a year and the army may build a 500' noise buffer around Waikii and the GS Camp and minimize nighttime training within 1000' of these properties. How can increased munitions noise be acceptable to residents night or day when before they had none?
- P176-14** Pg. 8.66: Maneuvers would occur during day and night, noise would be high 55dBA to 70 dBA "disturbing at night". If kept back 1000' less than significant." Is not noise from maneuvers at night significant?
- P176-15** Pg.8.66 Unmanned Aerial Vehicles flight operations would produce peak noise levels above 85 dBA at less than 300', will mostly be higher to avoid conflict with other aircraft.
- P176-16** 8.6 Ordinance Noise. Mitigation may eliminate Zone II at Mauna Kea State Park, "notification of surrounding communities about night time training exercises would reduce complaints." Is not this a weak assumption?
- P176-17** 8.6 Noise: "No Action" would produce no additional noise impact. Is not this better? Is it fair to take a peaceful life away from the residents and endangered species on land that has never been used for the military before?
- P176-18** Pg. 8.8: Water Resources: 'The Army has rights to 3 freshwater springs owned by the State of Hawaii through an agreement. 6,000 to 100,000 gallons used daily, not used for potable water. All potable water at PTA is trucked in". Several years ago this was considered the finest water on the Island, now it is contaminated and cannot be used . The Army is using our precious resources, our water and land. What will the army do to mitigate this loss?
- P176-19** "Soil contamination at firing points"... "no significant impact from chemicals on ground water...No surface water, no streams, no ground water so no significant impacts from chemicals but may effect flora and fauna ...Any spills would be implemented by Best Mgt. Practice (BMP). Limited data on ground water at PTA, no monitoring wells...Soil
- P176-20** Samples: Semi-volatile Organics detected in soils from explosives, metals munitions.PAH chemicals, benzo, TNT, DNT, RDX, HMX, nitroglycerin, per chlorate are common, none exceeding the industrial soil PRG (Preliminary Remediation Goal). Highest lead from

Responses

P176-8

There is no wastewater associated with the Tactical Vehicle Washes. The water is recycled and separated within the vehicle wash. The separated particulates (such as dirt and oils) are removed on a regular basis and disposed of in accordance with appropriate material disposal laws and regulations. The treatment system is described generally in Section 3.12.

P176-9

Section 8.3.1 updated to reflect this. As discussed in Section 8.3.2, the Army has committed to implementing mitigation for visual impacts by screening construction, mimicking surrounding areas, and other means.

P176-10

Under the Proposed Action, non-training lighting, such as for the ammunition storage area and cantonment, would use low sodium vapor lighting and would mostly be used during the day. It would also be properly oriented and shielded to illuminate specified areas. The use of nighttime lighting devices, such as flares, during training would increase. The use of these devices is not expected to increase dramatically because training with night vision goggles would be conducted in training areas. The increased use of lighting devices for training would mostly be in the WPAA and not in Army areas closest to, for example, nearby observatories, which require dark surroundings during nighttime operations. The Army has not received complaints regarding nighttime light and glare from nearby observatories. Visual impacts would be less than significant with respect to altering nighttime light and glare.

P176-11

The 1999 dust storm event was not caused directly or indirectly by military activities. It resulted from a wildfire that started at an off-post location from non-military causes. The loss of vegetation cover on the WPAA as a result of that fire was the cause of the subsequent dust storm event. The potential for wind erosion and dust generation from the WPAA is recognized in the DEIS. As noted in the Final EIS, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

Stryker Brigade Combat Team Final EIS, Hawaii'i

P-552

**P176-20
cont'd**

Ranges 9,10 &11. "Cancer risk is acceptable under some circumstances". CANCER RISK IS NEVER ACCEPTABLE. What mitigation will the army carry out to lessen this impact?

P176-21

"Wildland fires reduces native plant species & encourages non-native species adapted to fire. Wildfires increase the chance of future fires & considered a significant impact. WFMP (Wildland Fire Mgt. Plan) can reduce the chances to less than significant". Non-native species are increasing now and must not increase to reduce danger of wildfires. What criteria can you give on how the non-native species will be controlled?

P176-22

Pg. 8-108: "Significant soil compaction expected in WPAA (Acquired Land) and will remain so for a long time, leads to increased wind and water erosion... effects vegetation in Waikoloa & Waimea soils because the area has not been previously subjected to a high degree of vehicle use" (no mitigation identified).How will the army save this soil from compaction and erosion?

P176-23

"Soil contaminants are not a significant factor...low risk to personnel...are down range of impact area not accessible or entered by soldiers or public. In Training Area #12 exposure could occur through direct contact or inhalation of dust...not all exposures are unacceptable health risk." What exposures to contaminants are not health risks.

P176-24

Pg. 8-115) 38% of plants on PTA are indigenous or endemic threatened species. There is so much on this island that is found nowhere else in the world, including species in PTA and the expansion area. The rare plants, birds, the sacred and archaeological sites, the magnificent vista panoramas, the Pu'u, the Astronomers all must be protected. The Army should really transform PTA. Your goal and purpose should be a showcase of a living national park and nature reserve. Clean up the munitions, explosives and heavy duty vehicles and restore that rare ecosystem there. The people all honor and respect the Armed Forces and you would win much more public support worldwide. You could start by immediately canceling the expansion plan and implement an environmental management system with members of the general public, Hawaiian communities, government officials, scientists and elected officials all with a common goal to restore Pohakuloa to its former beauty. Leave a legacy for future generations.

Jan Moon
121 Lokoaka Street
Hilo, Hawaii 96720 Phone: 808-935-3475

P176-12

A relatively large change in emissions does not automatically translate into a significant air quality impact. The significance of changes in emissions has been judged in the context of the potential for violations of adopted state and federal air quality standards and the potential health effects of compounds for which there are no ambient standards. Fugitive dust emissions have the greatest potential for creating adverse air quality impacts. The Final EIS includes additional analyses of fugitive dust impacts. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

P176-13

Noise impact discussions regarding training activities at WPAA have been expanded in the Final EIS to include current estimates of helicopter flight activity at WPAA as well as additional information on small arms firing noise. The discussions also include information on the typical extent of annoyance related to the corresponding noise levels. As noted in the DEIS and the revised discussion in the Final EIS, potentially significant noise impacts from training activities can be mitigated to a less than significant level. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels.

P176-14

The Army believes that potentially significant noise impacts from training activities can be mitigated to a less than significant level. The Army recognizes that local residents may not agree with the criteria the Army uses to determine acceptable noise levels.

P176-15

Most UAV flight activity will be at too high an altitude to create any significant noise impacts.

P176-16

In section 8.6 the Army proposes to evaluate nighttime training activities to reduce noise impacts.

Comments**Responses****P176-17**

The No Action alternative may be less environmentally impacting than the Proposed Action but it may not meet the Army's purpose and need. The Army considers all alternatives including the No Action during its final decision process.

P176-18

As summarized in Section 4.8, the Army has determined that the Proposed Action with mitigation measures will have a significant but mitigable to less than significant on surface water quality. Potential contamination of water was included in this analysis.

P176-19

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P176-20

While it might seem that any risk of cancer is unacceptable, the reality is not so simple. Cancer risk is ubiquitous and unavoidable. Exposure to solar radiation (even when indoors), to medical x-rays, to background levels of chemicals and radiation from past and current industrial activities, atmospheric nuclear testing, and nuclear reactor accidents, along with hundreds of other sources of carcinogens, all contribute to low level risks of cancer. There is no way to avoid all risk of cancer. However, compared to many other daily risks that we are exposed to, such as driving a car, the risk of less than one excess cancer in a population of one million represents a relatively small portion of the overall risk that we all willingly accept as part of our daily lives. Practices and mitigations implemented take into consideration established regulatory standards.

P176-21

The outcome of section 7 consultation between the Army and USFWS has resulted in numerous management activities to mitigate any impact to sensitive biological species and habitat. These measures are identified in the individual chapters 5.10, 6.10, 7.10 and 8.10. The IWFMP has been completed and is available upon request. Individual projects to help avoid impacts from fire are outlined under the biological resources chapters (5.10, 6.10, 7.10, and 8.10) and the Hazards chapters (5.12, 6.12, 7.12, and 8.12)

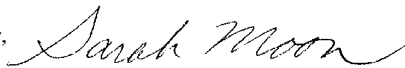

P176-22

Please refer to section 8.9 for discussion on this mitigation. Potential mitigation measures for this impact which would partially mitigate for soil

Comments

- Letter P177** Comments and Questions re: DEIS of the Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawaii
- Dear Sirs, **Vol. 3**
 In Appendix I – 1, Natural History Information for special species found in SBCT ROI pertaining to the Pohokuloa Training Area, I found a list of 25 endemic native Hawaiian Plants found in the PTA and its expansion area. This means they are found nowhere else in the world, some are found only in the Region of Inquiry. I checked the status of these plants with the Manual of the Flowering Plants of Hawaii Vol. 1 and 2, by Wagner, Herbst and Somer, c1990 Bishop Museum. This is the definitive manual on all plants of Hawaii, except ferns. I found that The Plants listed as Federally Listed as Endangered, and/or critically imperiled globally, were accurately reported, some plants are only found in the Pohukuloa Area and some are down to one plant in the area. The Manual of Plants added some new information re: Native plants *Lipochaeta venosa*, and *Isodendron hasake* can be found on cinder cones in the PTA area, Holoholuku, Heihei, and Pu'upa Nohonaohae, Puu Papapa, and a third (not named) to the ENE of Nohonaohae.
- P177-1** These cinder cone areas should be part of a conservation area, protected from mining of the cinder or any forces used in war games. Most of these rare plants have not been studied enough to see if they have any elements that could be substantially be of use to mankind.
- This area is like the Galapagos Islands, different than any other place in the world. Why deploy more ecology destroying armaments, war games and heavy equipment in such a sensitive area? On such a small remote island with the potential for major natural disasters: Earthquakes, eruptions, lava flows, tsunamis, and land subsidence of whole sections of this island?
- P177-2** This is such a rare place of wilderness, why transform it into a training ground for "urban" military training? It is a rare place for many of the sciences, ongoing studies in biology, geology, meteorology, archaeology, astronomy and more. Why close it to these and future scientists, by making dust, and noise, by making this place uglier, less desirable for any other activities, productive and recreational?
- P177-3** 7 out of 14 birds listed as frequenting the PTA and ROI, are Federally listed as endangered. In more than one place in the DEIS, the mention of increased noise and use of explosives, live or not, could critically impact the rare bird populations. More attention must be paid to the Critical Habitat areas, more should be designated.
- P177-4** The US Army Hawaii should definitely implement "an environmental management system to further improve the identification and reduction of environmental risks inherent in mission activities. This would include ecosystem level management for all rare species, pest management, land rehabilitation and maintenance, and fire prevention and suppression." p. 8 → 140 Vol. 2

Sincerely,

Sarah Moon 121 Lokoaka St. Hilo, HI 96720 phone 935 – 3475 November 6, 2003

Responses

compaction would include avoiding sensitive areas or by operating vehicles on roads to limit the amount of surface area subject to the impacts.

P176-23

As summarized in Section 4.8, 4.9 and 4.12, the Army has determined that the Proposed Action will not result in significant impacts to soil contamination.

P176-24

The primary mission of the Department of Army is to protect and defend the United States. A proposal to turn Army lands into a living park or nature reserve is well beyond the scope of this document.

P177-1

Cinder cones at the WPAA will be avoided per section 7 ESA consultation. Please see Section 8.10. Other protection measures for current force training at PTA is covered in the Biological Opinion and available upon request.

P177-2

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process Chapters 3-10 of the EIS address project impacts, both positive and negative, on the human environment. In accordance with NEPA regulations, the Army is conducting this EIS in order to identify the direct, indirect and cumulative environmental effects of the proposed action on the State of Hawaii. If the Army decides to implement the proposed action, the Army will mitigate all significant impacts in order to minimize the overall environmental impacts of the proposed action.

P177-3

As discussed in Section 8.10, the Army is committed to protecting endangered species in compliance with the ESA. Since the publication of the Draft EIS, USFWS issued a Biological Opinion of "no jeopardy" for the Proposed Action and current force activities. As part of this BO, the Army is committed to mitigation measures to reduce the impact on federally listed species. The BO is available upon request.

STRYKER BRIGADE ON BIG ISLAND

P179-1

I BELIEVE THE PROPOSED TANK TRAIL ROUTING IS UNACCEPTABLE.
ROUTING THE TANK TRAIL THROUGH THE POTABLE WATER WELL
FIELDS THAT SERVE WAIKOLOA VILLAGE & RESORT IS A TERRIBLE
IDEA. USING WAIKOLOA ROAD AT ANY LOCATION IS A MISTAKE
AS WELL. AN ACCEPTABLE ROUTE IS NEEDED, THIS IS NOT IT.

Responses

P177-4

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

P178-1

The public comment period was extended to 90 days and closed on January 3, 2004.

P179-1

Based on public comment, the Army confirmed the locations of existing wellheads and aquifers in relation to the proposed Kawaihae to PTA military vehicle trail. Based on site investigations, there is no need to relocate the proposed alignment for this trail. In order to mitigate for any potential damage to the wellheads by vehicles breaking down and inadvertently going off the trail, the Army will construct protection devices around the wellheads in consultation with the Water Company and landowners. In addition, the EIS analysis has shown that the potential for inadvertent spills from vehicles or vehicle accidents to impact the aquifers is less than significant. However, the Army has a Spill Prevention and Response Plan for all vehicles and vehicle travel. If the Army decides to acquire and construct these trails, this plan will be implemented for these areas as well. If the Army decides to implement the proposed action, the Army will coordinate with the property owners over the location of the proposed alignment. If the coordination results in a change in alignment which results in environmental impacts not analyzed in the EIS, the Army will conduct all appropriate NEPA, ESA and NHPA consultations prior to a final decision on a new alignment.

Dear Sirs,

I am Norman Nagamine, an engineer and a small business owner.

I would like to provide my support for the proposed Stryker Brigade being located in Hawaii.

P181-1

P181-2

I believe that Hawaii's economy and our way of life is dependent upon the large military presence in Hawaii. Bringing new units to Hawaii will further benefit Hawaii with all of the additional spending, both short term and long term. We residents who will benefit should not have restrictions placed on the Army, including environmental, historical and other red tape. This means allowing them to use whatever live fire practice they need, use of the roadways, and stationing their men and equipment here. In time of need when they called on to protect us, they will pay with their lives for poor preparation due to excessive restrictions.

If the military were to reduce its presence, we residents and businesses will suffer when the military spending disappears. But then it will be too late to change our minds. Please allow the military to locate their brigade here without restriction since it is us, the residents who will benefit.

Very truly yours,

Norman Nagamine

Dear Ms. Barger:

Thank you for providing a copy of the Executive Summary to the DEIS re Transformation of the 2nd Brigade, 25th Inf Div (L) to a Stryker Brig Combat Team (SBCT) in Hawaii. I want to comment (1) as a citizen of Hawaii County and (2) as a professional technical writer/editor. As a citizen of Hawaii County, I ask the following:

- P190-1** 1. Under ES 8.4 pp ES-48, 2---Why wasn't Federal impact money considered? Considerable money funnels into DOE for each child brought to Hawaii County (or anyplace) because one or both parents work for the Federal government. This would NOT be adverse, rather an economic windfall.
- P190-2** 2. Under ES 9.2 pp ES-50 1---I have considerable experience writing and editing EIS, ES, & FONSI for the Federal government, as well as conducting required public meetings during all phases and I have never seen such blatant language as the sentence beginning, "While the Army will take....." In other words, we (the Army) are complying with NEPA but because this is national defense related, we are only going through the motions because this project is a done deal. Such arrogance! I intend to call this to the attention of Hawaii's Senators and my Representative Mr. Case. I'm as security conscious as anyone, but I don't appreciate having my (the collective my) intelligence insulted in this manner.

As a professional technical writer/editor of more than 20 years, more than 9 with DOD, 12 with Interior (retired as a GS12 and now a consultant), I submit the following comments:

- P190-3** 1. **ALL** writing generated within the Federal government (whether direct or via contractor, whether internal or external) **MUST** conform to the GPO Style Manual. This document does not.
2. I performed a "quick and dirty" copy edit, which I'll gladly share by returning a markup of the copy you provided. I was appalled at the errors and inconsistencies, plus the nonconformance to the GPO. These two quick comments are just the tip of the iceberg.
- P190-4** 3. The main purpose of an editor is to assure that a document reads as though it were written by one person. My trained eye can spot every place in this document that the author (contributor) changed because the document was not edited by a professional editor. I know how much time writing a document like this requires (to say nothing of the research done on each alternative) and time equals money---my tax money. A document with the ramifications of this one should be as close to perfect as possible. I don't think you did your homework when you selected your contractor.

Thank you for allowing me to comment. Please change my mailing address in your database to the one below.

Sincerely,
 Connie R. Orendorf

Responses

P190-1

The Federal Impact money was included in the analysis but it was determined that it does not fully cover education cost or other costs. It helps to lessen the impact but does not provide a substantial beneficial impact.

P190-2

Section 9.2 is to describe the "Relationship Between Local Short-Term Uses of the Environment and Long-Term Productivity" of the proposed project. This is intended to examine this relationship for the proposed project. The full sentence, "While the Army will take whatever actions are reasonable and practicable, to preserve and protect the natural environment under it's stewardship, the necessity of national defense requires the Army to provide the nation with capabilities that meet current and evolving national defense requirements," is a commitment the Army is required to take and "will" take and is a true statement.

P190-3

We know of no such requirement.

P190-4

We thank you for your comments, both general and editorial. Throughout both the development of the draft EIS and the final EIS, the document is reviewed by the contractor's technical editors as well as by government staff. The contractor was selected out of a list of potential firms because of their experience with developing quality EIS documents.

HAULANA HI 96759SIGNATURE: Martin Digiosepo

COMMENTS:

P191-1

more info and tech. data (photos of equipment)
on the FTI system to
be used at SBCT. Interest in
range + freq. system.

P191-1

A complete description of the antennas can be found in Appendix D on pages D-14. An Electromagnetic Compatibility (EMC) study for the SBCT-5 training sites on O'ahu and PTA was conducted. Over 65,500 frequency records were considered in this study from the civil sector and other federal government agencies. Result indicates no significant interference problems should be encountered on O'ahu and PTA during the operation of the Enhanced Position Locating and Ranging System (EPLRS), backbone of the training systems on the FTI Sites.

Stryker Brigade Combat Team Final EIS, Hawaii

P-564

Letter P192

Cindy Barger, SBCT EIS Project Manager
U.S. Army Corps of Engineers, Honolulu District
Building 230 Rm 306, ATTN: CEPOH-PP-E
Fort Shafter, HI 96858-4812

31 Dec 2003

Dear Ms. Barger,

Reference Draft EIS Transformation of the 2nd Brigade 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawaii.

Attached please find my comments (and requests for mitigations) to your reference Draft EIS for Transformation of 2nd Brigade 25th Infantry Division (L).

P192-1

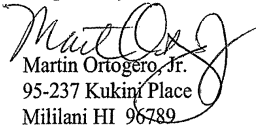

Also included are copies of my verbal comments (at initial Scoping Meeting, 23 Apr 2002), which were not addressed in reference Draft EIS. Additionally, as part of this initial Scoping efforts I FAXed written comments and they were also not included in the reference EIS.

P192-2

Lastly, I've included excerpts of the Mililani-Mauka Residential Community (Final Environmental Impact Statement/February 1987) which have direct bearing on the proposed Transformation. The most key point being that NO noise study was done of the East Range training noise spilling into the Launani Valley and Mililani-Mauka residential communities. It is my hope that a true noise study be done of the East Range/Wheeler AAF from the Launani Valley and Mililani-Mauka residential communities to establish a base line from which noise can be evaluated against State and Federal standards. Obviously, training at East Range has moved greatly from its early days of being a U.S. Army "...bivouac sites..." Also, the number of "...fly by ..." has increased and will increase more with introduction of more helicopters, C-17s, UAVs, C-130s, and possibly other fixed wing aircraft associated with military deployments (i.e., C-5 and C-141s).

Your action in answering my concerns and documented your response in the Final EIS is greatly appreciated.

Respectfully,

Martin Ortogero, Jr.
95-237 Kukini Place

1. Scoping Comments
2. FAX'd Written Comments
3. Comments (29 Oct 2003) Public Mtg on EIS
4. Mililani-Mauka Final EIS Excerpts
5. Written Comments to Draft EIS
(Exec Summary, Acronyms, Chapt 1-5)

P192-1

A fax was received from Mr. Ortogero on May 30, 2002 and was included in the Scoping Comments as were five other faxes from the public. Mr. Ortogero's comments were taken into consideration in the preparation of the DEIS.

P192-2

No additional noise study is planned for the SBER training because both frequency and amounts of aviation noise are expected to remain the same between current and SBCT levels. As there are no changes expected, no noise studies will be performed.

PUBLIC SCOPING COMMENTS FOR IBCT EIS

Leave your comments at the registration table or send it to the address provided below.
Deadline for submittal is: May 30, 2002

Name: Martin Ortogero, Jr Address: 95-237 Kukini Place, Mililani, HI 9678
Organization: _____
E-Mail: raider001@earthlink.net

Respectfully request special emphasis be focused on my below interest item during
your Environmental Impact Study for Transformation in Hawaii

During the environmental study for the Mililani Mauka development NO environmental impact
study or emphasis was placed on Noise from the East Range Training area. Instead, the
portion on Noise(East Range Tng Area) from the Environmental Impact Study for the
Mililani Tech Park was used in its place. This study for Noise in East Range Tng Area
was conducted for 1hour during non-prime time training (I believe 1300-1400).

This is not truly reflective of the noise level in prime period activity at East Range.
Alot of tactics training; equipment; doctrine; resources changed the type of training
thats actually being conducted now. Prime training hours now are between 1900-0800 truly
during the evening and early morning hours. Not only does it involve manpower, vehicles,
chemical (Smoke); but it brings the element of combat support aircraft into play.

With this new training doctrine (changed since 1985 when the Mililani Tech Park study was
done) no real measurement of the impact of training/aircraft noise has been measured
on the Mililani Mauka development. During the hours of 1900-0800 there is minimal noise
from H2 or general community of Mililani Mauka. So the only major noise during those
hours come from the East Range Training Area. During the day, East Range Training area
noise gets overridden by normal community activities and H1.

So, respectfully request special emphasis be focused on the new training tactics (if any)
and new vehicles; and aircraft (i.e. C-130, C-17, and national guard, coast guard, all
services that use East Range) during the prime training periods (1900-0800) on Mililani-
Mauka (existing and approved development areas). Federal and state measurement standards
I assume will be the standard. If not please specify why not.

Thank you for this opportunity to provide an input to your Transformation initiative.

Earl Nagasawa

E-Mail: Earl.Nagasawa@usace.army.mil

MAILING INSTRUCTIONS

1. Flip completed form over and fold on dotted lines
2. Seal bottom edge with tape
3. Provide return address
4. If sending multiple pages, please use an envelope
5. No staples or glue please

P192-3

The Proposed Action will not change the level of training activity undertaken by the Aviation Brigade at WAAF. Consequently, the only changes in training activity that would occur with transformation of the 2nd Brigade involve the mix of vehicle maneuver and dismounted maneuver training. Other aspects of training would remain essentially the same as at present. The Army does not consider changes in the mix of mounted and dismounted maneuver activity to represent a significant change in noise conditions at SBER. The Army currently has no plans to conduct ambient noise monitoring studies at SBMR or in communities bordering SBER.

Verbal Comments Made at Initial Scoping Meeting (23 Apr 2002) at Leilehua High School (also refer to Honolulu Advertiser, 24 Apr 2002, Page 35 where I am quoted)

P192-4

“...what I’d like your EIS to study is the impact of flight safety and noise of aircraft supporting the Army’s Transformation at Wheeler AAF. Particular emphasis on flight patterns (arrival/departure), the increased number of overflights, in-flight emergencies, and the impact on commercial overflight over Central Oahu....”

Note: My above stated concerns were not addressed specifically in the draft WIS. I was one of only four speakers during the community scoping meeting!

P192-4

Aviation safety is addressed in the EIS. Aircraft noise is addressed in the Noise sections.

Comments on Draft Transformation EIS (29 Oct 2003) at Haleomano Plantation

Thank you for the opportunity to make comments tonight on your Draft Transformation document. I will only make a few comments about the Draft EIS, but I will be submitting written comments that are more detail in nature to you NLT 19 Nov 2003.

I just need to confirm the mailing address please. And how will you respond and or address our concerns in the Final EIS? Will there be another public forum or what is your plan?

Before I begin, I'd like to say that I'm making these oral comments to express my concerns about this Draft Transformation EIS, and in written form, as a private citizen and resident of the Mililani-Mauka community.

The Draft EIS is a very detailed document and it appears to be complete, but for the unfamiliar (about Environmental Impact Statements) its very intimidating and challenging document to read. I mean over 1500 pages and figures.... a lot of technical data. Anyway, to me it looks like the U.S. Army has done its homework, as I'm sure it does to others; they identify problem areas; they have plans to fix problem areas; and for the most part there will be a roadmap to fix bigger problems. It's my hope that the State/County governments not only use their technical EIS people in evaluating and analyzing this EIS but also bring in all facets of community planning to reach a bottomline recommendation. Bottomline: We the community residents (Launani Valley, Mililani-Mauka, Wahiawa, Mililani Town, Wheeler AAF, and Schofield) will live with what comes out this project called Transformation...hopefully there will be more good pieces and than bad ones.

I'm almost finished reviewing the document but I do have comments focusing on 3 areas at this time: Airspace Management; Noise; and state/county infrastructure. But first a general comment:

General Comment:

In April 2003, I was one of 4 persons that made verbal comments to the first public scooping meeting at Leilihua High School. So when I reviewed the draft EIS my input was not documented. I only voiced concern focused on aircraft Flight of Safety.... and by the way I will include a copy of my April 2003 statement in my written report. Additionally, I also FAX's a written concern about the increased training noise from the Schofield Barracks East Range which would impact upon the Launani Valley and Mililani-Mauka residential area...and that FAX was not documented in the draft EIS. Now at the April 2003 meeting, COL Waggner assured us that our voiced/written concerns would be documented and answered in the draft/final EIS. And it wasn't. The Final EIS needs to include my voiced concerned and FAX'd written concerns in the appropriate section of the Final EIS Report.

Airspace Management

P192-5

The impacts of training noise on Mililani-Mauka/Launai and other communities surrounding SBMR, WAAF, and East Range were included in the DEIS and it was determined that no significant impacts from noise could be found outside of SBMR and WAAF. A fax was received from Mr. Ortogero on May 30, 2002 and was included in the Scoping Comments as were five other faxes from the public. The word fax has been included in the referenced paragraph in the FEIS.

Comments

- Reference page 4-16, paragraph 4.4 (Airspace): This section lacks a discussion on Physical Hazards. Specifically, there should be detailed discussions on:
- P192-6** Aircraft Operations: A brief description on the *Existing Conditions*. At a minimum, a map should be provided that clearly shows the Aircraft Flight Tracks for Local Helicopter departures; IFR 06 Departure and standard VFR Departures. ... all of which overfly the Launani Valley and Mililani-Mauka residential areas.
- P192-7** Probable Impact: A brief description of the *Wheeler AAF accident potential zone*. There should be some discussion on event of aircraft accident mishap and dump fuel and munitions, i.e., helicopter, C-130, C-17, UAR, etc.
- P192-8** Mitigating Measures: A description of how U.S. Army and other services can work closely with State/County officials to ensure there is safe and compatible air operations.
- P192-9** Recommend the Final EIS have discussion on physical hazards associated with possible aircraft mishap (crash into residential areas of Launani Valley, Mililani-Mauka, or Wahiawa). It is remotely possible that in an emergency situation would result in the release of ordnance or fuel into the residential community area during a training fly-by. Assumption must also be made that C-130 or C-17 could be "fully loaded" with equipment and personnel (to include munitions) during a biannual full training deployment or actual deployment when an aircraft mishap occurs. What is the impact and would state/county police, fire department, and medical personnel respond adequately to such an aircraft mishap. Would state/county and Wheeler AAF resources be sufficient to respond and take all necessary actions to save life and property in event of a major aircraft accident in the Launani Valley, Mililani-Mauka, or Wahiawa areas? The Final EIS must discuss this probability and any plans to adequately address a resolution.
- P192-10** Reference Page 4-16, Paragraph 4.4 (Airspace). EIS demonstrates that fixed-winged aircraft, increased numbers of helicopters, and overflight UAV flight activity will not increase at WAAF and SBMR...however its obvious this NEW activity will increase aircraft activity threefold. If Transformation will increase training than aircraft activity will increase correspondingly. So without a doubt, aircraft noise, movement, and flying will impact the adjacent residential areas to WAAF, Schofield Barracks East ranges and all other Hawaii training areas "touched" by Transformation.
- P192-11** Recommend that Final EIS (for Transformation) be coordinated with the FAA...not just provide them a copy of the EIS. Formal coordination on the Final EIS report is essential to flight safety in the Central O'ahu Airspace Region. The new introduction of large fixed-winged aircraft (C-130 and C-17) plus the UAV flying above and increased number of helicopters in the central O'ahu airspace demands major safety concerns for airspace management and control. It would be prudent to have the FAA review its existing regulations and directives governing airspace management and control of the Central O'ahu region to ensure accuracy, currency, and applicability so flight of safety is maintained. Outdated airspace management regulations, procedures can then be changed accordingly and new processes regulated. With an increased of military helicopters flying training missions over all Mililani/Wahiawa residential areas (helicopters have no flight restrictions except to stay a minimum of 100 feet away from any ground object); new UAV's flying training patterns high above these helicopters; and now large fixed-winged C-130 and C-17s aircraft flying training patterns in and around WAAF.... coupled with civilian helicopters.

Responses

P192-6

An arrival/departure graphics figure from the Pacific Chart Supplement has been added to Section 3.4.

P192-7

This document is an EIS prepared to satisfy NEPA compliance requirements, not an aeronautical study. An arrival/departure graphics figure from the Pacific Chart Supplement has been added to Section 3.4. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. As stated in Section 3.4.2, in the Aviation Safety subsection, all military aircraft fly in accordance with Federal Aviation Regulations (FAR) Part 91, Subchapter F (Air Traffic and General Operating Rules) and Army Regulation 95-1 (Aviation Flight Regulations).

P192-8

As stated in Section 3.4.2, in the Aviation Safety subsection, all military aircraft fly in accordance with Federal Aviation Regulations (FAR) Part 91, Subchapter F (Air Traffic and General Operating Rules) which govern such things as operating near other aircraft, right-of-way rules, aircraft speed, and minimum safe altitudes when flying outside special use airspace. Army Regulation 95-1 (Aviation Flight Regulations) covers army aircraft operations, crew requirements, and flight rules. These regulations have precise requirements for the use of airports, heliports, and other landing areas, local flight rules, and special use airspace.

P192-9

This document is an EIS prepared to satisfy NEPA compliance requirements, not an aeronautical study. An arrival/departure graphics figure from the Pacific Chart Supplement has been added to Section 3.4. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. As stated in Section 3.4.2, in the Aviation Safety subsection, all military aircraft fly in accordance with Federal Aviation Regulations (FAR) Part 91, Subchapter F (Air Traffic and General Operating Rules) and Army Regulation 95-1 (Aviation Flight Regulations).

Comments

P192-11 cont'd small aircraft, state military aircraft, and large civilian airliners.... Obviously the central O'ahu airspace has changed and will "fill up" quickly and dramatically. A "relook" of FAAs governing directives/regulations of airspace environment in the central O'ahu region *and the Proposed Action of Transformation* would ensure the safety and quality of life of all Hawaii citizens living in the Mililani Town, Wahiawa Town, Launani Valley, and Mililani-Mauka areas. _

P192-12 Another concern I had is the concept of use of these aircraft, which the draft EIS is still left unclear. The final EIS needs to clear this up. Will these large fixed winged aircraft be permanently based at WAAF? If not what's the plan in their use? Will they be flown in to pick up troops and equipment for bi-annual, monthly, quarterly deployments? Will they be parked on alert? How long? Will both C-130 and C-17s be flying out of WAAF? How many? Will only equipment be flown out? The final EIS needs to address all these concepts to get a better understanding of flying activities Transformation brings to WAAF and surrounding areas.

Noise

This item covers my concern in the written comments I FAX'd to you.

P192-13 One obvious shortcoming in the draft EIS was how poorly it addresses the interests of the Launani Valley and Mililani-Mauka communities.... and this is done in a very subtle way. Certainly, one would have to have lived on island and specifically in central O'ahu to know that these communities are the fastest growing on-island communities in Central O'ahu...and they border WAAF and SBER. In the Draft EIS when any residential communities around Schofield Barracks are mentioned only Mililani Town and Wahiawa are mentioned. There is very little recognition of the Launani Valley and Mililani-Mauka communities when discussing the impact or potential impact of Transformation from WAAF and SBER. So by omission, you have overlooked a significant sector of people that are right in the middle of Transformation project. For example:

P192-14 Figure 2-3 which describes the geographical lay of SBER is outdated. By that I mean, the Launani Valley and Mililani-Mauka residential areas are represented in its very early stages of development and not in its present day size or footprint. Both communities have grown in footprint/size and population and they now border past the main training areas in SBER. Also, there are three new public schools in the Mililani-Mauka areas...not represented on the map. By having these communities truly represented on your map the appropriate approval authorities of the Final EIS can readily see how noise and aircraft overflights does impact on these communities and schools.

P192-15 All references in the Draft EIS to noise from WAAF and SBER (as a result of Transformation) always describe its impact to Mililani Town (which is way south of the SBER and across H2). No mention is made of noise impact to Launani Valley or Mililani-Mauka. The final EIS needs to address the noise impacts on Launani Valley and Mililani-Mauka areas.

Responses

P192-10

This document is an EIS prepared to satisfy NEPA compliance requirements, not an aeronautical study. An arrival/departure graphics figure from the Pacific Chart Supplement has been added to Section 3.4. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. As stated in Section 3.4.2, in the Aviation Safety subsection, all military aircraft fly in accordance with Federal Aviation Regulations (FAR) Part 91, Subchapter F (Air Traffic and General Operating Rules) and Army Regulation 95-1 (Aviation Flight Regulations).

P192-11

Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated. The FAA has well-defined procedures for remotely operated aircraft such as UAVs. A certificate of authorization would be required at least 60 days prior to the proposed commencement of UAV operations. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. The precise flight paths of the UAVs have not been determined at this time. They will be identified when the Army submits its plans to the FAA when it applies for the FAA Certificate of Authorization for UAV flights.

P192-12

The US Air Force C-17 and C-130s would be based at Hickam AFB or other Air Force bases. As stated in Section 2.3.4, for Deployment Training, SBCT units would be deployed at least twice a year to PTA from Hickam AFB or Wheeler AAF using one or two C-130 aircraft. Individual training scenarios would dictate the requirements. The actual number of aircraft would not affect the conclusions of the airspace use analysis. All aircraft would be subject to air traffic control clearances and instructions, and would follow Army flight regulations and FAR regulations.

P192-13

The reference to Mililani Town and Wahiawa were to give a scope of the area covered, not intended to name all residential areas/communities. Figure 2-3 is

Comments

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-570

P192-15

So I agree with the Draft EIS wherever it states "...that the training noises from the East Range have negligible impact on Mililani Town...."

P192-17

Another subtle example of how Launani Valley and Mililani-Mauka areas are left out of the report is there is no Noise Abatement Program mention in the report for these communities. However, apparently there is one mentioned for the Wahiawa community. In Chapter 4, Page 4-34, Paragraph 1, Line 10-11: The EIS makes reference to establishment of a 1,000 foot (305 meter) noise buffer along those portions of SBER that border residential areas of Wahiawa. However, no such noise abatement program is mentioned for the Launani Valley or Mililani-Mauka communities. The final EIS needs to address this shortfall. Because of the growth and now close proximity of Launani Valley and Mililani-Mauka why isn't there a Noise Abatement Program for these communities?

P192-18

The draft EIS does not address whether a noise measurement was done in the Mililani Mauka and Launani Valley communities to determine what real impact Transformation will have. Especially since there will be an increase in training. To my knowledge no measurement was done of the training noise that come from East Range. This requirement needs to be addressed in the Final EIS so that a Federal/State "noise baseline" can be established for these residential areas. This noise baseline can be used to compare noise infractions to these residential communities.

P192-19

State/County Infrastructure
Transformation will bring an increase in student population to our schools. However, the draft EIS doesn't address how the U.S. Army will plan to help state/county with resources in this area. Our schools are crowded and we need help with resources to accommodate an increase in student population. Not only in buildings and space but in teachers and support staff, and resources to operate a quality school system. The Final EIS needs to address what the U.S. Army intends to bring in this area BEFORE/WHEN Transformation is implemented.

P192-20

The Draft EIS states there will be an increase in vehicles using our highways. However, the draft EIS doesn't address how the U.S. Army will plan to help maintain our highways or widen them to accommodate their vehicles. Our highways and country roads are inadequate for future population growth. Scarce resources make it difficult to maintain. The final EIS needs to address what the U.S. Army intends to bring in this area.

Conclusion

That's all I have now...again I'll have more in my written comments. I want to again thank you for the opportunity to address this forum on the Draft EIS for Transformation. I agree with the concept of Transformation. I believe it's needed for the defense of our country and it's a good concept. And I believe Transformation will be implemented in Hawaii once all environmental issues are adequately resolved.

intended a map to show the location of Schofield Barracks East Range on the Island of O'ahu and it's project feature, not to delineate each community. All impacts of the project, whether noise, air quality, traffic, etc. considered the impacts of all surrounding communities

P192-14

The base maps used in Figure 2-3 and many other maps in the DEIS come from available topographic maps. None of the impact analyses presented in the DEIS used these base maps as the major guide for determining land use conditions near the different installations. The noise impact analyses determined proximity of schools and residential areas around SBMR, SBER, DMR, and KTA from the 2003 edition of The O'ahu Mapbook. Schools in Mililani-Mauka are significantly further from the Zone II noise contour, facility construction site, and off-road vehicle maneuver areas than are on-post schools or schools in Wahiawa.

P192-15

The Final EIS includes references to Mililani-Mauka.

P192-16

The Final EIS includes references to Mililani-Mauka to distinguish that area from Mililani Town.

P192-17

There is a noise buffer zone along the north boundary of SBER because development in Wahiawa encroaches against the SBER boundary. Maneuver training areas in the western portion of SBER are confined to areas north of Wahiawa Reservoir. The area south of Wahiawa Reservoir provides an extensive buffer for the western half of Mililani-Mauka, so there is no need for a separate noise buffer policy in that portion of SBER.

P192-18

No state or federal agencies have any programs for routine ambient noise monitoring in Hawai'i. No special noise measurements were undertaken for the DEIS at SBMR or in surrounding communities. The Army currently has no plans to conduct ambient noise monitoring studies at SBMR or in communities bordering SBER. The DEIS relied on previous noise monitoring data and various noise modeling analyses to evaluate the noise impacts of transformation. In addition to annual average noise contours from large

P192-21 | Reference Page ES-4, Paragraph 4, 1st Sentence: No mention made of public comments submitted to U.S. Army via FAX simile. I submitted a FAX with written comments none of which were mentioned in the draft EIS (Transformation).

Reference Page ES-11, Northern O'ahu Project Overview Map: S7 Fixed Tactical Internet (antennae locations).

P192-22 | Q. No explanation given on the capabilities, range, and encroachment upon residential areas is given about these S7 Fixed Tactical Internet antennas. Assuming these antennas will broadcast past the Schofield Barracks East Range boundaries and "spill" into residential (Wahiawa Town, Launani Valley, and Mililani-Mauka) areas. What is the impact of the spillage of these tactical Internet frequencies on the quality of life of residents in surrounding areas?

P192-23 | Reference Page ES-17, Paragraph 3, Aviation Training: No reference is made to the training use of C-130 aircraft its frequency; type of training flights; "touch and go" landing exercises at Wheeler AAF; engine run up for maintenance; and all noise associated with large fixed wing aircraft. Bottomline: Fixed-wing aircraft activity from WAAF over the Mililani Town; Mililani-Mauka; Launani Valley; and Wahiawa will increase in frequency; duration; and day/night periods. No mention of a "noise abatement" policy for the Mililani Town; Mililani-Mauka; Launani Valley areas.

P192-24 | Reference Page ES-23, Paragraph 3, Line 21-22: EIS states, "...Only 6 C-17 are proposed to be stationed in Hawaii and will replace 4 C-130's currently stationed in Hawaii..."

P192-25 | Q. We can only assume the 6 C-17's will belong to the active Air Force to replace 4 C-130's. But this area is somewhat unclear. Please describe in detail the "...what, where, and how..." the fixed wing (i.e., aircraft like C-130 and C-17) details of Transformation on O'ahu. Discussion: In Transformation we understand there will be interface between the State Air National Guard and active Air Force unit at Hickam. If the State Air National Guard C-130 aircraft are replaced by C-17s how many (combined active duty Air Force and Air National Guard) will be in Hawaii? Assuming that State Air National Guard replaces their C-130's with C-17, how many C-17's will be stationed at WAAF at any given time? Explain the mix. Secondly, explain the concept of stationing aircraft at Wheeler AAF. Will they be placed on "alert" at Wheeler AAF? If so for how long a period? Who will fly/maintain these aircraft? Explain, what if any, the approximate amount of aircraft activity will take place at Wheeler AAF, i.e., flight hours (training and live), touch and go flights; engine runups; etc.

Responses

caliber weapons firing and explosive materials use, the DEIS presents information on noise levels associated with individual aircraft flyover events, individual vehicle passby events, overall vehicle convoy traffic, and small arms firing with live and blank ammunition. Aside from occupational noise exposure regulations, there are no state or federal regulatory programs governing noise generated by Army training activities.

P192-19

As discussed in Section 5.13.2, burdens on local school districts will be mitigated by early Army coordination with school districts and additional funding provided to compensate for each military dependent attending local public schools.

P192-20

The Army is proposing to construct military vehicle trails to reduce the impacts to public roads. Funding for public roads will continue to be coordinated between federal, state and county governments. Hawai'i Department of Transportation is responsible for maintaining the highways and major roads. Minor streets are maintained by the counties. The Transportation for O'ahu Plan 2025 (TOP 2025) and Hawai'i Long Range Land Transportation Plan guide transportation planning to accommodate future growth. Potential traffic impacts are analyzed in Sections 5.7, 6.7, 7.7, and 8.7. Potential impacts resulting from the proposed action would not cause the need to widen highways and local roadways.

P192-21

A fax was received from Mr. Ortogero on May 30, 2002 and was included in the Scoping Comments as were five other faxes from the public. The word fax has been included in the referenced paragraph in the FEIS.

P192-22

Section 4.14, 5.14, 6.14, 7.14, and 8.14 have been revised to include the following information. Army staff have conducted an Electromagnetic Compatibility (EMC) study for the proposed action. Over 65,500 frequency records from the civil sector and other federal government agencies were considered in this study. The results indicate no significant interference problems should be encountered on O'ahu or the Island of Hawai'i during the operation of the Enhanced Position Locating and Ranging System (EPLRS), backbone of the training systems on the FTI Sites.

Comments

Reference page ES-48, 3rd paragraph, Lines 1-2: The EIS refers to the increase in student population to our elementary, middle, and high schools. There would be significant long-term impact.

- P192-26** Q. Our schools (elementary, middle, and high schools) are over capacity now and our student population continues to swell. When Transformation arrives, it will bring 810 more soldiers and their families. Some 1,070 children of school age. Obviously, the state/county will absorb much of this invasion of students by paying for more teachers and temporary facilities. How will the military (i.e., US Army, US Air Force, US Navy, and US Marines) help with this situation of putting more strain on a public school system that's already bursting at its seams?

Other: Some comments were made in the draft EIS of "...very little residential complaints received about the noise coming from the SBER..." However, there are concrete mitigating conditions that need to be addressed, and aren't, that explain why limited residential telephone complaints as described in this report:

- P192-27** a. **There is no institutionalized process for Launani Valley or Mililani-Mauka residents to telephone into US Army (SBER) complaints about training noise.** We have documented examples of the problems with this process. Mainly, because there is no institutionalized process (i.e., phone number to call; feedback from US Army on complaints; no documented process for residents to follow). More importantly, when a call does go thru to the SBER Control Range Officer the individuals receiving the noise complaint don't know what to do with the noise complaint report.
- P192-28** b. **Training has been very limited in the past 6 months prior to the drafting of the EIS because US Army (and other training units) have been deployed.** There has been a very limited use of the SBER training ranges by military units because of real world deployments. So training equated to no noise....and no noise complaints! Check the records on use of the range and compare to the number of noise complaints.
- P192-29** c. **Because there is no institutionalized complaint system residents don't get feedback on their complaints....nor is any adjustments done by the military to eliminate or limit the noise of very low over flights of Military aircraft (helicopter and fix wing).** About 3 years ago, the Mililani-Mauka and Launani Valley Neighborhood Board #35 instituted a community/military Adhoc Committee to address these kinds of issues (really any civilian/military issues in the central Oahu area) but nothing concrete resulted. Minutes were documented and published.

Responses

P192-23

The US Air Force C-17 and C-130s would be based at Hickam AFB or other Air Force bases. Training flights, touch and go landing exercises, engine run up for maintenance would be conducted at USAF installations. As stated in Section 3.4.2, Aviation Safety subsection, all aircraft would follow local flying rules issued by the installation commander. Noise abatement, fly-neighborly policies, or other safety considerations factor into these rules. No additional noise study is planned for the SBER training because both frequency and amounts of aviation noise are expected to remain the same between current and SBCT levels. As there are no changes expected, no noise studies will be performed. If someone in the community has a complaint (noise, dust, etc) they can call the Community Relations Department of the Division Public Affairs Office and file a formal complaint. Currently there is no means electronically (web page) for the public to file a complaint. The Army will consider designing a link or process for filing complaints on the Division website.

P192-24

The impacts of replacing the C-130s with C-17s were addressed in a separate NEPA document prepared by the Air Force. The SBCT can use either C-130s or C-17s for deployment. The cumulative impacts of this and other projects are discussed in Chapter 9 – Cumulative Impacts and is listed as cumulative project number 33. Aircraft activity and impacts associated with Wheeler and Bradshaw Army Airfields are described in Chapters 5 and 8

P192-25

The impacts of replacing the C-130s with C-17s were addressed in a separate NEPA document prepared by the Air Force. The SBCT can use either C-130s or C-17s for deployment. The cumulative impacts of this and other projects are discussed in Chapter 9 – Cumulative Impacts and is listed as cumulative project number 33. Aircraft activity and impacts associated with Wheeler and Bradshaw Army Airfields are described in Chapters 5 and 8.

P192-26

Federal aid will be made available to local schools to compensate for the increased burden through the Impact Aid program. Such aid may take the form of basic support payments, or grants for construction of new facilities to house new students associated with Soldiers located at SBMR. Additional teachers would need to be hired to maintain the current student to teacher ratios.

Comments

P192-30

Mitigation: The US Army needs to explain the current noise compliant process to provide a more equal description of what the public and State must do to address noise complaints from SBER...and what the US Army's feedback process is. Most important is how the US Army noise compliant process addresses complaints about "sister service" users of the SBER that draw noise complaints, i.e., (US Marines, Hawaii National Guard and Air Guards, US Air Force, and US Coast Guard). If the US Army can't address this issue they should state so.

LIST OF ACRONYMS

Page xix, Line 38: Please confirm whether this acronym really represents Hawaii Department of Business, Economic Development, and Tourism. The acronym doesn't appear right.

Page xxi, Line 9: Please confirm use of acronym "East Range" to represent "Schofield Barracks East Range"

Page xxii, Line 19: Please confirm use of acronym "HAZMART" to represent "Hazardous Materials Pharmacy"

P192-31

Page xxiii, Line 26: Please confirm use of acronym "JMC" to represent "Army/Air Force Joint Mobility Center"

Page xxiv, Line 8: Please confirm use of acronym "MACOM" to represent "Major Command"

Page xxvi, Line 6: Please confirm use of acronym "PACAF" to represent "Headquarters Pacific Air Forces"

Page xxvii, Line 14: Please confirm use of acronym "SBER" to represent "Schofield Barracks East Range"

Responses

P192-27

The 25th ID Public Affairs Office, Community Relations Department (808-655-4376) is responsible for handling public complaints about noise, dust, traffic, and other concerns. A spreadsheet program is used to log complaints and to track investigation and follow-up of complaints.

The 25th ID website (<http://www25idl.army.mil/>) posts notices about planned military convoy activity or training activities that may affect public roadways or access to hunting areas.

Section 3.6 of the EIS has been expanded to include a brief description of the existing noise complaint system.

P192-28

All of the noise impact analyses presented in the DEIS were based on full training scenarios assuming troops are not deployed away from Hawai'i. The Army's complaint tracking database was reviewed for complaints logged between November 1999 and July 2002 to determine the types of activities that generate noise complaints. Additional discussion of the Army's complaint tracking system has been added to the Final EIS.

P192-29

The 25th ID Public Affairs Office, Community Relations Department (808-655-4376) is responsible for handling public complaints about noise, dust, traffic, and other concerns. A spreadsheet program is used to log complaints and to track investigation and follow-up of complaints.

The 25th ID website (<http://www25idl.army.mil/>) posts notices about planned military convoy activity or training activities that may affect public roadways or access to hunting areas.

Section 3.6 of the EIS has been expanded to include a brief description of the existing noise complaint system. Additional information on noise complaint patterns has been added to Section 5.6

P192-30

The 25th ID Public Affairs Office, Community Relations Department (808-655-4376) is responsible for handling public complaints about noise, dust, traffic, and other concerns. A spreadsheet program is used to log complaints and to track investigation and follow-up of complaints.

When the Army identifies another agency as being responsible to activity that generates a noise complaint, the complaint information is forwarded to that agency.

Comments

Chapter 1 –Purpose, Need, and Scope (01.1 pdf)

Reference Paragraph 1.9 – Public Involvement (Para 6):

Nothing in the draft EIS addresses my voiced concerns (23 Apr 2003) about “flight safety” in the Launani Valley, Mililani-Mauka, and Mililani/Wahiawa, which occurs because of, increased flight activity brought on by the Proposed Action of Transformation at WAAF. This draft EIS doesn’t address my voiced concern about “flight safety.”

a. On 23 April 2003, at Public Scoping (Leilehua High School) I was one of only 4 persons/groups that voiced concerns for input into the proposed draft EIS for Transformation. My concerns were specifically targeted to “flight of safety” of the C-17 and C-130 aircraft, which would be introduced to WAAF in the Proposed Action of Project Transformation. There were a total of 2 individuals (out of 4) during this community meeting with U.S. Army representatives that voiced concerns about “flight of safety.” (Reference Honolulu Advertiser, dated 24 Apr 2002, Page B5). My specific voiced concern to the meeting was:

“...What I’d like your EIS to study is the impact of flight safety and noise of aircraft supporting the Army’s Transformation at Wheeler Army Airfield. Particular emphasis on flight patterns (arrival/departure); the increased of over-flights; in-flight emergencies; and impact on commercial over-flight over Central Oahu...”

Nothing in the draft EIS addresses my written concerns (30 May 2003) about the noise to the Mililani-Mauka and Launani Valley communities (particular to residents bordering the gulch) resulting from non-live fire exercises at the Schofield East Range Training area brought on by Proposed Action of Transformation. At the Public Scoping meeting (23 Apr 2003, Leilehua High School), COL Waggner stated “...all of our concerns....” would be addressed in the draft EIS. However, Chapter 2 of this draft EIS does not.. Why?

a. On 30 May 2003 as a result of invitation of U.S. Army Public Scoping meeting, officials soliciting community concerns (Public Scoping) about Proposed Action of Transformation, I FAXed written concerns to Mr. Ed Nagasawa (SEE ATTACHED). As a result I received a letter thanking me for my input. (SEE ATTACHED).

The draft EIS (Transformation) does not address what the U.S. Army is going to do about the increased noise to the Mililani-Mauka community. The draft EIS (Transformation) does not address whether any study was done to determine whether the non-live fire exercise training noises exceed those Federal/state noise standards.

Responses

P192-31

As used in this document these acronyms are correct

P192-32

Airspace issues for SBER are addressed in Sections 4.4 and 5.4. Noise issues for SBER are addressed in Sections 4.6 and 5.6. The scoping process helped determine the breadth of the study. The Draft EIS was developed, in part, through the comments received during scoping. The Final EIS will contain your comments on the Draft EIS and the responses to them.

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-575

P192-33

To our knowledge, no such noise study was ever conducted in the Launani Valley and Mililani-Mauka community to measure the noise levels of the Schofield Barracks East Range Training area. The last time the noise issue at the Schofield Barracks East Range Training Area was addressed was in the Feb 1987 Final Environmental Impact Statement "Mililani-Mauka" where the study was deferred. When can the US Army conduct a noise study of SBER from the current Launani Valley and Mililani-Mauka residential areas to determine its detrimental impact on residents. At the minimum, why isn't a Noise Abatement Program instituted for the Launani Valley and Mililani-Mauka residential communities?

Reference Paragraph 1.7 – Cooperating Agencies:

P192-34

No coordination is made with the Federal Aviation Agency (FAA). The Proposed Action states that (Ref Page 2.41; Line 8) "...Deployment training would be similar to the Legacy Force, except SBCT units would be deployed at least twice a year to PTA from Hickam AFB or WAAF using one to two C-17 or C-130 aircraft..."

Since these large aircraft would be used for the first time on a routine basis at WAAF (Central Oahu) this draft EIS should be coordinated with the FAA to determine the impact of flying or stationing C-17 and or C-130 aircraft at WAAF. Because of the very limited control of air traffic (civilian and/or military) over the Central Oahu, the FAA should coordinate on this EIS to determine what this increased air traffic would have on "flight of safety" over the Launani Valley and Mililani-Mauka, and Mililani Town/Wahiawa communities.

P192-33

The Proposed Action will not change the level of training activity undertaken by the Aviation Brigade at WAAF. Consequently, the only changes in training activity that would occur with transformation of the 2nd Brigade involve the mix of vehicle maneuver and dismounted maneuver training. Other aspects of training would remain essentially the same as at present. The Army does not consider changes in the mix of mounted and dismounted maneuver activity to represent a significant change in noise conditions at SBER.

The Army currently has no plans to conduct ambient noise monitoring studies at SBMR or in communities bordering SBER.

There is no formal noise abatement program for Wahiawa. There is, however a noise buffer zone along the north boundary of SBER because development in Wahiawa encroaches against the SBER boundary. Maneuver training areas in the western portion of SBER are confined to areas north of Wahiawa Reservoir. Thus, the area south of Wahiawa Reservoir provides an extensive buffer for the western half of Mililani-Mauka, and there is no need for a separate noise buffer policy in that portion of SBER.

P192-34

Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated. Potential aviation safety issues associated with the C-130s at Wheeler AAF are addressed in the EIS. No C-17 flights are anticipated in nor out of Wheeler AAF.

CHAPTER 2 – Description of the Proposed Action and Alternatives

- P192-35** | Reference Paragraph 2.2, Page 2-4, and Line 28: The statement about SBER that "...all exercises are limited to pyrotechnics and blank ammunition...." Is no correct. Other items are used, i.e. smoke. People, equipment and supplies for training are transported into SBER by helicopter. Aircraft pick up soldiers in pickup zones and ground troops and equipment in battle areas. Aviation assets are incorporated into appropriate training events. Combat effects, such as smoke and obscurants, noise, and simulated artillery, nuclear, biological and chemical conditions, are integrated into training to condition units for operations in a realistic and stressful battlefield environment. NOTE: Field artillery and mortar fires are simulated by pyrotechnics that provide both audio and visual effects. Typically, how many helicopters are required for training exercises in SBER? Table 2-6, Page 2-36 indicates training activities at SBER will include: Airborne (parachute drop), Rotary Wing, and UAV Operations (daylight)...no C-17/C-130 aircraft operations.
- P192-36** | Reference Paragraph 2.2, Page 2-4, Line 29: A statement is made about ".... The Army has established a 1,000 foot (305 meter) noise buffer zone between the boundaries of the range (SBER) and the adjacent Wahiawa residential area..." Why is no similar statement made about the adjacent Launani Valley and Mililani-Mauka residential area, which is on the opposite end of the range? If the U.S. Army intends to establish a noise buffer zone between the boundaries of the SBER and Launani Valley and Mililani-Mauka residential area when will this be accomplished. Please provide planned milestone dates when this project will be accomplished or state why is can't or won't.
- P192-37** | Reference Paragraph 2.2, Page 2-4, Line 30-31: A statement is made about "...blank ammo is not authorized in SBER training areas 1A, 1B, 2, 3A, and 3B...." No map of SBER area...cannot confirm. Does this statement also imply use of live ammo is authorized in other SBER areas?
- P192-38** | Reference Page 2-6, Schofield Barracks East Range Map: The map provided at Figure 2-3 is not current...it's a late 1987 geographic representation of the Launani Valley and Mililani-Mauka residential areas. It doesn't truly represent the current Launani Valley and Mililani-Mauka residential areas that has grown in size. There are also new Middle School and Elementary Schools that is not represented in this map.
- P192-39** | Q. The only significant residential area reflected on this map is that of Mililani Town which located South of the Schofield Barracks East Range Map. Quite a significant residential community now exists Mauka or mountain of Mililani Town. Specifically, Launani Valley and Mililani Mauka. By better representing these communities one can better visualize the impact of increased training (i.e., noise; aircraft; and people) would have on residents living in these areas.
- P192-40** | Reference Page 2-16, Paragraph 2.2.3, Paragraph on Deployment Training: Is it fair to state that "military convoys" will include movement of the Stryker vehicles? How will

P192-35

Smoke is considered a pyrotechnic. Typical training will not include C-130s or C-17s. Additional information on UAV use had been added to Section 2.3.4 under paragraph titled "Reconnaissance Training and additional information on aviation use has been added to Section 2.3.4 under the paragraph titled "Aviation Training" to address this question. No biological, chemical, or nuclear agents will be used in any training exercise. The helicopter training activities will not change at SBER from what occurs under current force training. For information on current force training please contact the 25ID PAO office at (808) 655-1079.

P192-36

There is a noise buffer zone along the north boundary of SBER because development in Wahiawa encroaches against the SBER boundary. Maneuver training areas in the western portion of SBER are confined to areas north of Wahiawa Reservoir. The area south of Wahiawa Reservoir provides an extensive buffer for the western half of Mililani-Mauka, so there is no need for a separate noise buffer policy in that portion of SBER.

P192-37

The same referenced paragraph states that "No live-fire exercises are conducted on SBER . . ." A map of SBER can be found as Figure 2.3.

P192-38

The reference to Mililani Town and Wahiawa were to give a scope of the area covered, not intended to name all residential areas/communities. Figure 2-3 is intended a map to show the location of Schofield Barracks East Range on the Island of O'ahu and it's project feature, not to delineate each community.

P192-39

The reference to Mililani Town and Wahiawa were to give a scope of the area covered, not intended to name all residential areas/communities. Figure 2-3 is intended a map to show the location of Schofield Barracks East Range on the Island of O'ahu and its project feature, not to delineate each community.

P192-40

The Stryker vehicles are designed to travel on public roadways at highway speeds. The highways used for convoy traffic are built to standards to handle heavy vehicles such as the Stryker.

Responses

P192-40 | this vehicle be moved? Will it be transported on a flatbed type vehicle? Will State
cont'd | highways through towns and suburbs be large enough to accommodate this movement,
i.e. through Wahiawa moving to Kahuku?

P192-41 | Reference Page 2-20, Paragraph 2.2.4, Environmental Management: The Army
environmental strategy consists of four pillars, which represent the major areas of
activity: Pollution, prevention, compliance, restoration, and conservation. Why are *noise*
and *flight of safety* not included in these pillars? There is no explanation. It's most
important to note that unlike the other military training areas in the CONUS or Alaska,
the training areas on Oahu are located adjacent to very large (and growing) residential
areas where *noise abatement* and *flight of safety* should be of paramount concern. The
importance of these environmental issues must be at the same level of activity as the
military training activities located adjacent. The public requires a logical answer since
public health and safety are the prime issues.

P192-42 | Reference Page 2-23, Paragraph 2.3 Proposed Action (Preferred Alternative), and Line
10: Reference the statement "...the number of soldiers is expected to increase by 810
and the number of rounds to be fired by 25 percent..." Is it fair to say that
noise/activities at existing training areas will increase by 25 percent?

P192-43 | Reference Page 2-24, Table 2-3, Line 5 (Vehicles): Reference Table states there will be
an increase of "...1,005 emission producing vehicles..." Where in the draft EIS does the
impact of this many vehicles have on state highways and city streets? What impact do
the weight and the continuous use of state highways/city streets have on the safety
conditions and drivability of these roads?

P192-44 | Reference Page 2-37, Table 2-7, SBMR-KTA Columns (Company Level Exercise and
Brigade Level Exercise): No description or maps are provided to describe where vehicles
(Strykers or Trucks/HMMWVs) will travel on Roadways between Schofield and KTA.
Most important as to "where" and time of year traveling due to impact to public travels
on the state/county roadways. Particularly due to amount of military traffic that's
forecasted (i.e., 18 Strykers traveling using 10% Roadways for Company Level Exercises)
and 96 Strykers traveling using 10% Roadways for Brigade Level Exercises and 145
Trucks/HMMWVs using 40% of Roadways). That's a lot of military vehicles being
added to an already overflowing state/county roadway system. And due to the weight and
nature of the vehicles, the damage to state/county roadway system due to "wear and tear"
would be accelerated and costly for state taxpayers. No discussion made about the mode
of operation for movement of these very large and heavy vehicles (i.e., Strykers). Some
explanation is required to better understand the plan of operation so that some
determination can be made about the impact to the environment and properties.

P192-45 | Reference Page 2-43, Paragraph 2.3.5, Continue Environmental Management Programs:
On the island of O'ahu, the Army's Transformation Project is being implemented in
existing training areas that are adjacent to highly dense (and still growing) residential
areas. Central O'ahu is the fastest growing populated area on the island. The bulk of the
Army's Transformation projected action impacts on these training areas and the

P192-41

The Army's environmental strategy is intended to meet specific goals as described in Section 2.2.4. There are other programs addressing noise and flight safety issues. The Army takes flight safety and noise control very seriously. The impacts to these areas are addressed in Sections 4.4, 5.4, 6.4, 7.4, and 8.4 for Airspace and 4.6, 5.6, 6.6, 7.6, and 8.6 for Noise.

P192-42

The impacts on noise of the increased rounds fired are discussed in Sections 4.6, 5.6, 6.6, 7.6, and 8.6 of the EIS.

P192-43

The Army is proposing to construct military vehicle trails to reduce the impacts to public roads.

P192-44

As discussed in Chapter 7.7, a perpetual easement of 27 acres (11 hectares) would be acquired for Helemano Trail and an easement for Drum Road also known as Kahuku Trail) upgrade to KTA. Helemano Trail is shown Figure 2-7 in Chapter 2. The roads are proposed on private plantation roads. Helemano Trail would cross state highways at three locations: Wilikina Drive west of Kamananui Road, Kaukonahua Road west of Kamananui Road, and Kamehameha Highway north of Paala a Uka Pu kea Road. The public would not use the proposed military use road, except for emergencies. Hawai'i Department of Transportation is responsible for maintaining the highways and major roads. Minor streets are maintained by the counties. The Army is proposing to construct military vehicle trails to reduce the impacts to public roads. Funding for public roads will continue to be coordinated between federal, state and county governments.

P192-45

Please refer to Sections 4.6 and 5.6 of the EIS for a summary and discussion of noise impacts. Please refer to Sections 4.4 and 5.4 for airspace.

Stryker Brigade Combat Team Final EIS, Hawaii

P-578

- P192-45 cont'd** encroaching residential areas. During the public scoping meetings, there were concerns voiced/written about the noise and flight of safety concerns.... a very reasonable environmental issue considering the high residential growth of Central O'ahu.
- P192-46** Q. Why is the current Army environmental strategy limited to four major areas (pollution prevention, compliance, restoration, and conservation)? Why not include noise and flight of safety. Noise because of an influx of 1, 008 vehicles; more aircraft activity; 810 more personnel; and increase in training activities using a new 2000 pound attack vehicle? Flight safety because of introduction of very large fixed wing aircraft (C-130 and C-17) into the WAAF and flying over the Mililani Town, Luanani Valley, Mililani-Mauka, and Wahiawa towns.
- P192-47** Reference Page 2-46, Paragraph 2.6.2. Line 10: Reference made to statement on "...piecemeal funded projects..." where NEPA documentation would have to be prepared as each project is identified.
- Q. What examples of projects are being referred to here? Are they out-of-scope of the overall Transformation project? Please provide some examples by location. Assume these are budget driven.
- P192-48** Reference Page 2-50, Paragraph 2.6.3, Line 3: Reference to "...only six C-17s are proposed to be stationed in Hawaii and will replace four C-130s currently stationed there..."
- Q: Where in Hawaii will these six C-17s be stationed? Will the Hawaii Air National Guard be getting C-17s to replace their C-130s? How many? Will they be stationed permanently at WAAF? What is the concept of operations for a real deployment out of WAAF? If SBCT deployment is made from Hickam, how will forces from Schofield get to Hickam? What's the concept plan for aircraft flight training from WAAF (over Mililani, Mililani-Mauka, and Wahiawa areas) to support Transformation? Frequency of flight from WAAF? Table 2-6, Page 2-36 indicates Aviation Training (Airborne (parachute drops; rotary wing; UAV Operations (daylight); and C17/C130 operations) at SBMR and WAAF. Please explain what kind of operations this entails.
- P192-49** Reference Page 2-31, Table 2-5, Line 10 (Aircraft): At SBMR and WAAF, explain the concept plan for upgrading parking apron at Wheeler Army Airfield for C-130 operations?
- Q: What about C-17 operations? What kind of operations? Discuss how long these aircraft would be parked at WAAF? Would they be put on alert status? Or would they be flying in and immediately flying out? Explain why you need aircraft parking for these aircraft at Wheeler for C-130 or C-17 aircraft?
- P192-50** Reference Page 2-31, Table 2-5, and Line 16 (Antennas (fixed tactical Internet): Explain where these antennas will be installed at SBMR and SBMR. Explain environmental

P192-46

The Army's environmental compliance strategy is not limited to these four major areas. Army Regulation 200-1, Environmental Protection and Enhancement, is followed by all Army installations. Noise issues are discussed in Sections 4.6, 5.6, 6.6, 7.6, and 8.6. Aviation safety is addressed in Section 4.3. No C-17 flights are anticipated at Wheeler AAF as part of the Proposed Action.

P192-47

A discussion of these projects and examples are listed in Chapter 9 – Cumulative Impacts under project #31. These projects are not part of SBCT project but are normal upgrades or replacements of existing facilities to be used by current forces.

P192-48

The impacts of replacing the C-130s with C-17s were addressed in a separate NEPA document prepared by the Air Force. The C-17s will be stationed at Hickam as part of the Air Force/Air National Guard assets. The SBCT can use either C-130s or C-17s for deployment. The cumulative impacts of this and other projects are discussed in Chapter 9 – Cumulative Impacts and is listed as cumulative project number 33. Aircraft activity and impacts associated with Wheeler and Bradshaw Army Airfields are described in Chapters 5 and 8. Typical training will not include C-130s or C-17s. Additional information on UAV use had been added to Section 2.3.4 under paragraph titled "Reconnaissance Training and additional information on aviation use has been added to Section 2.3.4 under the paragraph titled "Aviation Training."

P192-49

The improvements to the parking apron at Wheeler AAF is designed to make it strong enough to park C-130s. No C-17s will operate at Wheeler AAF. The US Air Force C-17 and C-130s would be based at Hickam AFB or other Air Force bases. As stated in Section 2.3.4, for Deployment Training, SBCT units would be deployed at least twice a year to PTA from Hickam AFB or Wheeler AAF using one or two C-17 or C-130 aircraft. Individual training scenarios would dictate the requirements. The actual number of aircraft would not affect the conclusions of the airspace use analysis. All aircraft would be subject to air traffic control clearances and instructions, and would follow Army flight regulations and FAR regulations.

Comments

- P192-50 cont'd** impact to the Wahiawa and Mililani-Mauka residential areas (existing and future). New homes and schools will be built in the Mililani-Mauka areas.
- P192-51** Reference Page 2-31, Table 2-5, Line 20 (Personnel): What is impact to existing institutions (schools, housing, etc.) when "...502 spouses and 1,053 children..." are entered into the Mililani and Wahiawa communities? When will this occur and over what time span will it start and end to a "full-up" capacity. What coordination has been made with State/City governments about capacity limits and availability of state/public institutions (elementary schools; high schools; housing; social services; police; fire department; etc.)? If not, when will this occur? Page 2-35 (Paragraph 2.3.4. last sentence) states "...overall strength of the brigade would increase from a projected fiscal year 2004 (3,008) to 3,818 officers and enlisted..." Is this the timeframe we can expect the influx the military families and children to the Wahiawa and Mililani communities?
- P192-52** Reference Page 2-39, Paragraph 2.3.4. and Reconnaissance Training, Line 23-24: This paragraph talks to use of UAVs. Specifically, "...UAV total flying hours would amount to 2,400 hours of flight per year, or 600 takeoffs and landings per year..."
- P192-52** Q. Why has the FAA not coordinated on this draft EIS to determine the impact of flying UAVs in the Central Oahu airspace. Civilian and commercial air traffic traversing the Central Oahu airspace may constitute a "flight of safety" issue when UAV's are flying above training areas. How and Who would manage the UAV airspace over the training areas in late evenings and early morning hours when WAAF air traffic operations shuts down. Would Honolulu International Airport have space control? The draft EIS does not discuss "aircraft crash mishaps" in the Wahiawa or Mililani residential areas should a UAV unexpectedly crash into civilian residential habituated areas due to mechanical malfunction. Has state and local disaster relief agencies coordinated on this EIS to ensure proper plans/coordination are made before real operations commence (i.e., state/county Fire Department; Police; Civil Defense; etc.). No discussion is made about the orbital flight training times, patterns, or procedures of the UAV over O'ahu training areas...particularly over the SBER.
- P192-53** Reference Page 2-41, Paragraph 2.3.4, Deployment Training, Line 9-11: This paragraph states "...SBCT units would be deployed at least twice a year to PTA from Hickam Air Force Base or WAAF using one to two C-17 or C-130 aircraft..."
- P192-53** Q. Will C-17 and or C-130 aircraft be positioned at WAAF? If C-17 and C-130 aircraft will be used to support the Transformation Preferred Action to transport equipment and personnel from Central O'ahu then we can anticipate more aircraft activity (fixed wing) then we have now or ever have. Therefore, the Federal Aviation Agency should be a coordinating agency on this draft/final EIS to determine flight of safety for such activity in the still yet minimum controlled airspace of Central Oahu. Additionally, the state/county civil defense; police; fire department; and other such emergency services agencies should be coordinating on this draft EIS to determine what minimum services would be required in the event of an "in-flight emergency to WAAF" or "aircraft to

P192-50

Please see caption for Figure 2-8 in the EIS. Please refer to Figure 2-7 in the EIS for a depiction of antenna (fixed tactical internet) project sites. Please refer to Section 4.6 of the EIS for a summary and discussion of noise impacts. Please refer to Section 4.12 of the EIS for discussions regarding human health and safety hazards' issues. Please refer to Section 4.13 and 5.13 of the EIS for discussions regarding socioeconomic and environmental justice issues.

P192-51

Section 5.13, Socioeconomics and Environmental Justice, discusses impacts to schools, housing, and other institutions as a result of the additional personnel housed in and around SBMR.

P192-52

Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated. The FAA has well-defined procedures for remotely operated aircraft such as UAVs. A certificate of authorization would be required at least 60 days prior to the proposed commencement of UAV operations. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. The precise flight paths of the UAVs have not been determined at this time. They will be identified when the Army submits its plans to the FAA when it applies for the FAA Certificate of Authorization for UAV flights.

P192-53

The C-17 and C-130 aircraft are US Air Force planes stationed at Hickam AFB. Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record.

Stryker Brigade Combat Team Final EIS, Hawai'i

P-580

P192-53
cont'd

aircraft mishap” and/or major disaster like crash of fully loaded (with personnel, ammunition; fuel; explosives; whatsoever deployed with a functionally ready SBCT) into the Mililani Town, Launani Valley, Wahiawa Town, or Mililani-Mauka residential and schools district. Is the current state/county emergency services capability able to handle such a disaster...a question that must be answered before Transformation becomes a reality. What’s the impact if larger military aircraft (i.e., C-5 or other similar sized aircraft (not C-17)) are drafted into exercise play and load up equipment and personnel at WAAF? Entry into the Mililani-Mauka residential area has a “single point of failure” for vehicular traffic in coming and existing. What’s impact of providing disaster response to Mauka should the aircraft crash take out this bridge? How would disaster relief response quickly to aid residents of Mauka? Does Mauka have enough fire fighting equipment to handle a C-17 or C-130 crash into the residential area? Does the local police and fire fighting departments have expertise, equipment, and personnel to handle exploding munitions in event of a C-17 and C-130 crash into residential areas, when they are carrying a fully equipped load of SBCT force deploying for real world or training exercise? If not, what alternatives are being considered to aid civil police and fire fighting departments? All these kinds of questions and scenarios require coordination with federal/state/county disaster relieve officials before implementing Transformation at Wheeler AAF.

P192-54

Reference page 2-42, Paragraph 2.3.4. Aviation Training, Line 22-23: “individual use and frequency has yet to be determined....” For use of UAVs. Because overflight in the SBER and KAT could endanger the densely populated residential areas (in event of UAV crash or mishap) of Wahiawa, Kahuku, Mililani Town, Launani Valley, and Mililani-Mauka areas coordination with the Federal Aviation Agency is imperative to ensure only orbital tracks and UAV training is conducted in a safe manner, not over highly populated, and during periods of low commercial overflight over Central O’ahu.

Q. Why isn’t the Federal Aviation Agency a coordinating agency on this aspect of the draft EIS for Transformation – Preferred Action? There is no discussion as to how UAV flights would be managed or controlled when used in training flights; particularly over highly populated residential areas. Coordination is necessary with Federal/State/Country disaster relief agencies to ensure they understand the nature of UAV over flight (for training) that will be introduced (by Transformation) into the Central O’ahu and northern shore areas of O’ahu. This so they can plan, budget, train, and prepare for possible disaster caused by a UAV crashing into a highly populated residential area or school (elementary, middle, or high school).

P192-54

The precise flight paths of the UAVs have not been determined at this time. They will be identified when the Army submits its plans to the FAA when it applies for the FAA Certificate of Authorization for UAV flights. Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated. The FAA has well-defined procedures for remotely operated aircraft such as UAVs. As stated in Section 5.4.2 in the Aviation Safety subsection, a certificate of authorization would be required at least 60 days prior to the proposed commencement of UAV operations. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action “might have” an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record.

Chapter 3 – Affected Environment Overview

Reference Page 3-4, Paragraph 3.2.2. (Resources Overview), Line 17-30, Schofield Barracks East Range: This paragraph describes what borders the Schofield Barracks East Range. However, it does not describe the highly populated areas of Launani Valley, Mililani Technology Park, or Mililani-Mauka that all borders Schofield Barracks East Range...only mentions "...Mililani Town..." Mililani Town (proper) is on the very southern part of the SBER...bordering WAAF at some points. Only Launani Valley, Mililani Technology Park and Mililani-Mauka really border the SBER.

- P192-55** Q. Mililani-Mauka is a Castle & Cooke sub-division that never really had a "noise" assessment done for the Final EIS for the Launani Valley/Mililani-Mauka residential community (Feb 1987) (See attached applicable portion of this study). This is a highly planned community and one of the fastest growing communities on the island of O'ahu. Because of its high density, it recently was rezoned into separate areas. The states newest Middle School is located there. Already the Mauka Elementary School (boasted to be the most modern elementary school) is located in Mauka. And a new elementary school (Mauka I'ke) will soon be occupied. Why was Mililani-Mauka not included in this draft EIS? Complaints of noise and low flying helicopters/aircraft that "overfly" into the Mililani-Mauka residential area have historically been a concern to residents.

Reference Page 3-12, Paragraph 3.4.1, Introduction/Region of Influence, 3rd Paragraph: Reference here is made to FAA. However, why would this draft EIS not be coordinated through the FAA?

- P192-56** Q. Why wouldn't the final EIS for Transformation be coordinated with the FAA. The Transformation – Preferred Action (and other alternatives) are new requirements and implement new strategies which the FAA should coordinate on. During the Final Mililani-Mauka EIS, there was much concern expressed by coordinating agencies of overflight of fixed-winged aircraft (small OV-10) over the newly developing residential community of Mililani-Mauka/Launani Valley. That was in 1987 timeframe with much smaller aircraft. Now Transformation is bringing in much larger aircraft (C-130 and C-17) to fly over a much larger (and still growing) residential community. The FAA and other similar state/federal agencies should review and comment/coordinate on the proposed alternatives for Transformation to ensure Flight of Safety and compliance with updated FAA Regulations...for safety and benefit of the public.

- P192-57** Reference Figure 3-1, Page 3-14, O'ahu Airspace Region of Influence (ROI): No figure to compare against the supporting narrative in the text.

- P192-58** Reference Table 3-1, Page 3-15, Special Use Airspace in the O'ahu Airspace ROI: There is no Airspace ROI map to compare Table 3-1 against.

P192-55

The Final EIS includes references to Mililani-Mauka to distinguish that area from Mililani Town.

P192-56

Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated.

P192-57

A reference to Figures 3-1 and 3-2 have been added to the discussion of the Region of Influence in section 3.4.1 –Introduction/Region of Influence.

P192-58

Airspace ROI map is provided in Figure 3-1.

Chapter 4 – Environmental and Socioeconomic Consequences Overview

Reference Page 4-8, Paragraph 2 (Construction of FTI in a Conservation District): EIS states that under the Proposed Action 5 of 25 new antennas would be constructed within the Conservation District: "...three on SMBR...."

P192-59

Q. Two of these new FTI antennas will be installed in SBER, which borders Launani Valley, Mililani-Mauka, and Wahiawa. When these FTI antennas are transmitting there will be "spillage" FTI broadcast into the residential areas. What is the impact of this spillage on the quality of life of residents in adjacent residential communities (i.e., Launani Valley, Mililani-Mauka, and Wahiawa)? For example frequency complications and their impact on: critical life assisting equipment like heart pacers; fire alarm systems; burglar alarm systems; televisions; radios; animals (like dogs) who are able to hear high frequency noise; household appliances; and other equipment considered quality of life appliances. Because of the uniqueness of the geographical layout of SBER and bordering residential communities it would be inappropriate and inaccurate to assume end results of other already similar documented FTI tests (done elsewhere) and standard measurement formulae. A separate and documented test of FTI in the SBER is necessary to ascertain impact(s) on surrounding community's quality of life and documented in the Final EIS.

Reference Page 4-8, Paragraph 4 (Impacts on Land use During Construction Activities): EIS doesn't address spillage of environmental unsafe chemicals or fluids into the land, i.e., battery acids; vehicle fuels, oils, radiator coolants, hydraulic fluids, metallic shavings, diesel fuel, etc.

P192-60

Q. The Final EIS must address how the U.S. Army will prevent and clean-up environmentally damaging fluids that drain or are accidentally spilled (onto lands proposed for use by the Proposed Action of Transformation and other alternatives) by construction crews and military personnel during training.

P192-61

Reference Page 4-8, Paragraph 5 (Training Changes on Lands Currently Used For Legacy Force Training), and Last Sentence: The last sentence states "...maneuver areas would remain the same; therefore, introducing the Stryker is not considered a land use change..." This is a true statement...introducing the Stryker is not considered a land use change... However, the title of this paragraph focuses on *Training Changes* and this paragraph in the Draft EIS – Transformation provides and inadequate response. This paragraph should describe *how* the training differs between Legacy and Stryker training.

P192-59

Section 4.14, 5.14, 6.14, 7.14, and 8.14 have been revised to include the following information. Army staff have conducted an Electromagnetic Compatibility (EMC) study for the proposed action. Over 65,500 frequency records from the civil sector and other federal government agencies were considered in this study. The results indicate no significant interference problems should be encountered on O'ahu or the Island of Hawai'i during the operation of the Enhanced Position Locating and Ranging System (EPLRS), backbone of the training systems on the FTI Sites.

P192-60

Spill preventative measures are explained in section 3.12.2, 5.12, 6.12, 7.12, and 8.12.

P192-61

Chapter 2 and Appendix C discuss changes in training techniques as compared with current training practices.

May 2004

Stryker Brigade Combat Team Final EIS, Hawaii

P-583

P192-61
cont'd

Q. The Final EIS must describe the "...*how the Stryker training will be done and explain how Legacy training differs...*" Agree with you that there is no change in the land. By describing how Stryker and Legacy training differs one can ascertain the impact to the land. I can only assume that training for Stryker deployment and combat tactics are *different* from Legacy's deployment/combat tactics.

Reference Page 4-8, Paragraph 6 (Beneficial Impacts. Impacts on Natural Resources Management and Recreational Land Use). The Draft EIS doesn't address *how the U.S. Army will actively manage the natural resources* other than animal population, which is implied by letting local hunters continue to use the lands.

P192-62

Q. How will the natural resources be monitored, maintained, protected, and managed? What kind of cleanup programs will the U.S. Army institute to fix damage to the natural resources as a result of Transformation? How will U.S. Army managers interface with Federal/State/County experts and environmentalist to ensure the natural resources are being maintained in as best quality method as possible. How will the U.S. Army management programs and results of these programs be evaluated to determine its adequacy and sufficiency of corrective actions? How often will this evaluation be completed and by whom and to whom will evaluation results go to? How will the State/County governments be informed on these results? Will they be permitted to evaluate the program and "fix" actions?

Q. The Final EIS needs to categorically address the above. Hawaii's natural resources are very limited and thus the most important asset of our country.

P192-63

Reference Page 4-9, Paragraph 4 (Less Than Significant Impacts), Conversion of Agricultural Land to Training Land: EIS states "...under the RLS Alternative, the entire 100 acres would be used for construction and use of a motor pool; none of the area would be available for continued agriculture, and conversion of the land would be permanent and irreversible land use change..." Further, EIS states, "... Therefore, the impact of this conversion to overall land use is less than significant...."

Q. Anytime you convert the land, thru permanent man-made changes, to permanent and irreversible land use change is a very dramatic event. The Final Draft EIS does not address how this land will be cleaned up when Transformation is terminated and/or when the U.S. Army departs these lands. Nor does the Final Draft EIS address what kind of environmental management control program will be instituted to maintain and control the integrated of the environment and lands. It's as if "the land will die because of the permanent change and there's nothing that can be done." If so, this is unacceptable to the State/County governments and peoples of Hawaii. Land resources are very scare. If the U.S. Army someday decides to return all these lands, these 100 acres would be "dead" and unusable to future generations.... this Final EIS states that is the case! How will the Final EIS address this unacceptable finality?

P192-62

Army natural resources management policies and protocols are set forth in the Integrated Natural Resources Management Plans and the Integrated Training Area Management protocols, discussed in Section 2.2.4. We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

P192-63

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-584

P192-64

Reference Page 4-9, Paragraph 6 (Construction of FTI in a Conservation District). I previously addressed this issue. My concern is the FTI transmission "spillage" into the surrounding/bordering residential communities (Launani Valley, Mililani-Mauka, Wahiawa, and Mililani Town)?

Q. What's impact, of the two FTI antennas and systems operating in the SBER, to the quality of life in the bordering residential communities? The Final EIS needs to address this issue clearly since it's a quality of life, health, and potentially life threatening issue.

Reference Page 4-9, Paragraph 7 (Land use During Construction Activities): I previously addressed this issue earlier. Please provide a clear response to my concerns.

Reference Page 4-10, Paragraph 1 (Beneficial Impacts), Impacts on Natural Resources Management and Recreational Land Use: I also previously addressed this issue earlier. I had major concerns in the lack of an outline U.S. Army plan to implement and manage a program to manage natural resources and recreational land use. Please provide a clear response to my concerns.

P192-65

Reference page 4-10, Paragraph 2 (No Action Alternative), Line 4: The EIS states "...However, the level of training would change occasionally in response to this requirement and, as a result, the land uses of these areas may change..."

Q. No explanation of why, how, or a description in the level of training change is provided in the Draft EIS. The Final EIS needs to explain this paragraph in a much clear manner. What type of training would be changed? Please provide a description and outline its impact to the environment as requirement by existing Federal/State/County environmental laws.

Reference Page 4-11 thru Page 4-12, Paragraph 4.3 (Visual Resources), Paragraph 4.3.1 (Impact Methodology), Lines 5-7: In this section the Draft EIS states "...Visual resource components typically are measured in terms of the amount of change in design elements, such as form, line, color, texture, and scale in the landscape...." This paragraph is very descriptive of how the U.S. Army will mitigate changes in the land portion described in the Preferred Alternative and other alternatives.

P192-66

Q. The Draft EIS does not specifically address potential mitigation measures to the changes that will take place as a result of *land erosion run-off into fresh water lakes, streams, and the ocean*. Using the stated visual impact assessment methodology, particular effort must be made to monitor, manage, and correct (fix) the massive earth run-off that will result when the land is turned up by heavy military vehicles, construction, and dramatic movement (as result of disruption by Transformation maneuvers) run down into fresh water streams and lakes and ultimately the ocean. The visual changes would go from its natural colors to earth red or brown. The massive earth run-off would kill valuable fish life and coral (in the ocean) and kill these valuable natural resources. The damage that will result will be permanent. The Draft EIS needs to address the potential mitigation

P192-64

Section 4.14, 5.14, 6.14, 7.14, and 8.14 have been revised to include the following information. Army staff have conducted an Electromagnetic Compatibility (EMC) study for the proposed action. Over 65,500 frequency records from the civil sector and other federal government agencies were considered in this study. The results indicate no significant interference problems should be encountered on O'ahu or the Island of Hawai'i during the operation of the Enhanced Position Locating and Ranging System (EPLRS), backbone of the training systems on the FTI Sites.

P192-65

After the publication of the Draft EIS, the Army announced plans for an enhancement package for SBCTs. The enhancements include an aviation task force, an increase from twelve to eighteen 155mm howitzers in the direct support artillery battalion, and improvements to command, control, communications, computer, and intelligence (C4I) assets. The announcements indicated that the aviation task force would include Comanche helicopters when the aircraft were ready for fielding. In February 2004, the Army determined that no further testing or fielding of Comanches would occur and canceled the Comanche program. The SBCT aviation task force will come from existing 25th ID(L) aviation brigade assets and will result in minor changes to training, primarily some increased aviation training over WPAA in support of units training in that area. The FEIS has analyzed the impacts of the increased aviation training over WPAA and those impacts are minimal. The Draft EIS analyzed the impacts of twelve 155mm howitzers, a change from the eighteen 105mm howitzers currently in the direct support artillery battalion for 2nd brigade. The addition of another six 155mm howitzers was analyzed in the FEIS and resulted in minimal changes to noise impacts and no change in the overall determination of effect. The C4I improvements are not expected to have any impacts on the environment. Overall, the Army has determined that the enhancements are within the original scope of the proposed action as described in the Draft EIS, are minor in nature, and do not require a supplemental Draft EIS.

P192-66

USARHAW will continue to implement land restoration measures identified in the INRMP. Mitigation measures to control erosion include, but are not limited to, implementation of the ITAM program to identify and inventory land condition using a GIS database; coordination between training planners

Comments

P192-66
cont'd

measures for not only the Preferred Alternative for Transformation and all other alternatives for the island of O'ahu and Big Island of Hawaii. Massive disruption of earthen sites at very large civilian residential development sites in Hawaii has resulted in tremendous dirt run-off into fresh water lakes and the ocean. The Final EIS-Transformation must address this critical area and the detrimental impact potentially possible to O'ahu and Big Island Hawaii natural resources.

Reference Page 4-12, Paragraph 4.3.2 (Factors Considered for Impact Analysis), Line 3-6: The Draft EIS states, "...These procedures served to outline the visual impact assessment process as undertaken for this project. The evaluation of potential impacts was based on each project's potential to alter the visual character of the *project area*..."

P192-67

Q. The Final EIS must not limit the "...project area..." to the listed training areas on Oahu and Big Island of Hawaii when mitigating visual resources. The Final EIS for visual resources must extend the confines of the training ranges or post and base in its report to nearby fresh water lakes/springs/streams, fresh water table, and nearby oceans. As stated above, earth runoff resulting from rain or U.S. Army's washing of military equipment and vehicles will ultimately end up in local fresh water lakes and streams and the ocean. The rain and or water's natural drainage and man-made drainage systems force this to happen. The Final EIS-Transformation must extend the visual character of the Proposed Alternatives and other alternatives to include all fresh water lakes and streams and the oceans and reefs. The small surface areas of the island of Oahu and Big Island of Hawaii dictates that our fresh water lakes/streams/springs, and ocean waters/coral reefs be effectively managed by ensuring their visual natural appearance is not destroyed permanently for future generations use.

Reference Page 4-13 thru 4-15, Summary of Impacts, and Table 4-1. The Draft EIS-Transformation does not address visual impact to fresh watered lakes and streams or ocean reefs and waters. See above discussions.

P192-68

Q. The Final EIS-Transformation must address the detrimental impact to visual resources as result of disrupted and loosen earth (i.e., cited training areas as result of heavy military vehicles, live fire exercises, construction, etc resulting from Transformation) would **runoff into fresh water lakes/streams/springs, underground fresh water tables, and nearby oceans** because of rain and U.S. Army's washing of military equipment. This runoff would kill fresh water vegetation and fish and turn the spring and lakes into smelly mud holes. The runoff into the oceans would suffocate the coral reefs and kill it along with the fish that feed off it and provide food to larger fish. The mitigation actions to protect fresh water lakes/streams/springs, fishes, and ocean water/reefs, coral life, and maintaining the natural resources visual appearances of the locations of the Proposed Alternative and other alternatives of Transformation must be stated in the Final EIS.

Comments

P192-69

Reference page 4-16, Factors Considered for Impact Analysis: The Draft EIS does not address the significant impact of introducing newer aircraft (i.e., UAV, C-130, and C-17) into the Central Region of O'ahu airspace.

Q. The Final EIS needs to address and mitigate the introduction of newer aircraft (i.e., UAV, C-130, and C-17) into the Central Region of O'ahu. At a minimum, as part of this described mitigation is the mandatory coordination of the Final EIS with the Federal Aviation Agency (FAA).

Reference Page 4-16, Paragraph 44.2 (Factors Considered for Impact Analysis), and Second paragraph: The Draft EIS states, "...public concerns expressed during the scoping process were also considered in the impact analysis. These concerns included aircraft traffic impacts, the number and types of aircraft used, altitudes flown, preferred flight patterns, risks to the community from the use of helicopters, and air and aviation safety..."

Q. My voiced and written concerns that I voiced and FAX'd a copy of were never address in this Draft EIS. I discussed this in my cover letter, in the attached written comments, and provided another copy of my input to the April 2002 scoping meeting at Leilihua High School. Please provide a response in your Final EIS to my questions.

Reference page 4-16, paragraph 4.4 (Airspace): This section lacks a discussion on Physical Hazards of Airspace. Specifically, there should be detailed discussions on:

Aircraft Operations: A brief description on the *Existing Conditions*. At a minimum, a map should be provided that clearly shows the Aircraft Flight Tracks for Local Helicopter departures; IFR 06 Departure and standard VFR Departures....all of which over fly the Launani Valley and Mililani-Mauka residential areas.

P192-70

Probable Impact: A brief description of the *Wheeler AAF accident potential zone*. There should be some discussion on event of aircraft accident mishap and dump fuel and munitions, i.e., helicopter, C-130, C-1 UAR, etc.

Mitigating Measures: A description of how U.S. Army and other services can work closely with Federal/State/County officials to ensure there is safe and compatible air operations.

P192-71

Recommend the Final EIS have mitigation discussion on physical hazards associated with possible aircraft mishaps (i.e., offsite crash into residential areas of Launani Valley, Mililani-Mauka, or Wahiawa). It is remotely possible that an emergency situation would result in the release of ordnance or fuel into the residential community area during a training fly-by. Assumption must also be made that C-130 or C-17 could be "fully loaded" with equipment and personnel (to include munitions) during a biannual full training deployment or actual deployment when an aircraft mishap occurs. What is the impact and would state/county police, fire department, and medical personnel respond adequately to such an aircraft mishap? Would state/county and Wheeler AAF resources be sufficient to respond and take all necessary actions to save life and property in event of a major aircraft accident in the Launani Valley, Mililani-Mauka, or Wahiawa areas? The Final EIS must discuss this probability and any plans to adequately address a resolution.

Responses

P192-69

Potential aviation safety issues associated with the C-130s and C-17s at WAAF, and the proposed use of UAVs, are addressed in the FEIS. Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated. The FAA has well-defined procedures for remotely operated aircraft such as UAVs. A certificate of authorization would be required at least 60 days prior to the proposed commencement of UAV operations. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. The precise flight paths of the UAVs have not been determined at this time. They will be identified when the Army submits its plans to the FAA when it applies for the FAA Certificate of Authorization for UAV flights.

P192-70

This document is an EIS prepared to satisfy NEPA compliance requirements, not an aeronautical study. An arrival/departure graphics figure from the Pacific Chart Supplement has been added to Section 3.4. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. As stated in Section 3.4.2, in the Aviation Safety subsection, all military aircraft fly in accordance with Federal Aviation Regulations (FAR) Part 91, Subchapter F (Air Traffic and General Operating Rules) and Army Regulation 95-1 (Aviation Flight Regulations).

P192-71

The Army has an excellent safety record, as described in Section 3.4. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident.

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-587

P192-72

Reference Page 4-16, Paragraph 4.4 (Airspace). EIS demonstrates that fixed-winged aircraft, increased numbers of helicopters, and over flight UAV flight activity will not increase at WAAF and SBMR...however its obvious this NEW activity will increase aircraft activity threefold. If Transformation will increase training than aircraft activity will increase correspondingly. So without a doubt, aircraft noise, movement, and flying will impact the adjacent residential areas to WAAF, Schofield Barracks East ranges and all other Hawaii training areas "touched" by Transformation.

Recommend as part of the mitigation in the Final EIS (for Transformation) that it be formally coordinate with the FAA...not just provide them a copy of the EIS. Formal coordination on the Final EIS report is essential to flight safety in the Central O'ahu Airspace Region. The new introduction of large fixed-winged aircraft (C-130 and C-17) plus the UAV flying above and increased number of helicopters in the central O'ahu airspace demands major safety concerns for airspace management and control. It would be prudent to have the FAA review its existing regulations and directives governing airspace management and control of the Central O'ahu region to ensure accuracy, currency, and applicability so flight of safety is maintained. Outdated airspace management regulations, procedures can then be changed accordingly and new processes regulated. With an increased of military helicopters flying training missions over all Mililani/Wahiawa residential areas (helicopters have no flight restrictions except to stay a minimum of 100 feet away from any ground object); new UAV's flying training patterns high above these helicopters and now large fixed-winged C-130 and C-17s aircraft flying training patterns in and around WAAF.... coupled with civilian helicopters, small aircraft, state military aircraft, and large civilian airliners.... Obviously the central O'ahu airspace has changed and but will "fill up" quickly and dramatically. A "relook" of FAA's governing directives/regulations of airspace environment in the central O'ahu region **and the Proposed Action of Transformation** would ensure the safety and quality of life of all Hawai'i citizens living in the Mililani Town, Wahiawa Town, Launani Valley, and Mililani-Mauka areas.

P192-73

Another concern I had is the concept of use of these aircraft, which the draft EIS is still left unclear. The final EIS needs to clear this up. Will these large fixed winged aircraft be permanently based at WAAF? If not what's the plan in their use? Will they be flown in to pick up troops and equipment for bi-annual, monthly, quarterly deployments? Will they be parked on alert? How long? Will both C-130 and C-17s be flying out of WAAF? Will the Air Guard eventually transition to C-17s and all we will see in the future are C-17s? How many? Will only equipment be flown out? The final EIS needs to address all these concepts to get a better understanding of flying activities Transformation brings to WAAF and surrounding areas.

Reference Page 4-17, Paragraph 4.4.3 (Summary of Impacts), 3rd paragraph (Less Than Significant Impacts...Change in En Route Airways or IFR Procedures).

P192-72

Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated. The FAA has well-defined procedures for remotely operated aircraft such as UAVs. A certificate of authorization would be required at least 60 days prior to the proposed commencement of UAV operations. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. The precise flight paths of the UAVs have not been determined at this time. They will be identified when the Army submits its plans to the FAA when it applies for the FAA Certificate of Authorization for UAV flights.

P192-73

The US Air Force C-17 and C-130s would be based at Hickam AFB or other Air Force bases. As stated in Section 2.3.4, for Deployment Training, SBCT units would be deployed at least twice a year to PTA from Hickam AFB or Wheeler AAF using one or two C-17 or C-130 aircraft. Individual training scenarios would dictate the requirements. The actual number of aircraft, where they are stationed, or for how long, would not affect the conclusions of the airspace use analysis. During flight operations, all aircraft would be subject to air traffic control clearances and instructions, and would follow Army flight regulations and Federal Aviation Regulations. Whether or not the Air Guard will eventually transition to C-17s, and how many, is not known at this time.

Chapter 5 – Schofield Barracks Military Reservation/Wheeler Army Airfield

P192-74 Reference Page 5-1, Paragraph 5.1 (Introduction): This Chapter and throughout the Draft EIS all specific reference to the impact to the SBER (Schofield Barracks East Range) is done so in a very “fragmented” manner. If the author of the Draft Transformation EIS were to put all references about SBER in one section you would have enough for a separate chapter.

P192-75 Mitigation: Explain why the Draft EIS on Transformation, in describing the environmental impact to SBER, is spread out all through the draft report? There are “...bit and pieces of the environmental impact statement of SBER, described in almost every chapter of the Draft EIS – Transformation. However, SBER is not addressed wholly by itself. Why? There is enough activity in SBER (as a result of the Preferred Alternative to Transformation) that would justify it being a separate chapter. Also, why doesn’t this Chapter 5 also identify SBER in the title of the Chapter?

Reference Page 5-4, Paragraph 5.1.1. (Proposed Action – Construction), Construction of Tactical Vehicle Wash Facility, 1st Paragraph, Last Sentence. The Draft EIS states “...The Wash rack would be sited on previously disturbed lands on Higgins Road on SBER...”

P192-76 Mitigation: Although the wash rack would be sited on “...previously disturbed lands...” The Draft EIS – Transformation report doesn’t explain what is going to be done to capture harmful chemical and fluids that would be washed off the tactical vehicles and find its way into fresh underground water tables; fresh water lakes; fresh water springs; or into the land; and finally into the open ocean and sensitive coral beds through run-off. Secondly, the Draft EIS – Transformation does not explain what the U.S. Army actions are to clean up the environment (fresh water lakes, springs, underground water tables, land, and open ocean/coral reefs through run-off) once they have declared the SBER lands to be of no more use for military training purposes?

P192-77 Reference Page 5.4, Paragraph 5.1.1. (Proposed Action – Construction), Upgrade Wheeler Army Airfield for C-130 Aircraft. The Draft EIS – Transformation doesn’t address C-17 aircraft which will also be used for the Proposed Action. Secondly, The C-17 will ultimately replace the C-130 aircraft.

P192-78 Mitigation: This paragraph discusses the strengthening of taxiways and parking pad to “...accommodate C-130 staging operations off the proposed life cycle of WAAF...” Previously, the U.S. Army went on record that no fixed wing aircraft would be based at WAAF. Explain what is meant in this paragraph by “...staging operations...” Will the C-130 and C-17 aircraft be kept for unspecified periods of time on an “...alert status...” ready for loading or already pre-loaded and waiting in the aircraft parking area on alert/ready for immediate launch. Or will these fixed winged aircraft be flown in for deployment exercises and loaded with equipment/personnel then flown out? Or will these

P192-74

The DEIS was divided into 5 geographical areas making it easier for the general public to focus on impacts the project might have on their community. In addition there is a guide inside the front cover describing the organization of the document, an abstract of the DEIS, and a very detailed Table of Contents. In addition the Executive Summary highlights the important aspects of the proposed project including a project description, a summary of impacts, and proposed mitigation.

P192-75

The DEIS was divided into 5 geographical areas making it easier for the general public to focus on impacts the project might have on their community. In addition there is a guide inside the front cover describing the organization of the document, an abstract of the DEIS, and a very detailed Table of Contents. In addition the Executive Summary highlights the important aspects of the proposed project including a project description, a summary of impacts, and proposed mitigation.

P192-76

As discussed in Sections 5.14.2 and 8.14.2, filtered water would be reused for the vehicle wash. Water is continually reused with no wastewater disposal. Solids from the water are separated in the vehicle wash, removed and treated with EPA approved bioremediation methods so that the solids may be used with existing soils on Army lands. A water/oil separator is included in the vehicle washes. The oil from the vehicle washes is disposed by a contractor in accordance with all appropriate laws and regulations. We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a BRAC, the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

Comments

- P192-78 cont'd** fixed wing aircraft be permanently stationed at WAAF? Please explain the concept of operations for the use of fixed wing aircraft (C-130 later to be replaced by C-17) at WAAF. What will be the number of aircraft (helicopters, C-130, C-17s, C-141, C-5, and UAVs) fly by over the Launani Valley, Mililani-Mauka, Mililani Town, Wahiawa Town? This includes administrative, logistical, training, and transit flights.
- Reference Page 5-5, Paragraph 5.1.1. (Proposed Action – Construction), 1st Paragraph, Line 3-5. This paragraph discusses the installation of two TFI antennas in the SBER area.
- P192-79** Mitigation: The TFI antennas would be affixed to "...existing utility poles, towers, or buildings...total height would range from 25 feet to 102 feet..." If these antennas were to be affixed to an already existing structure the total height would be the combined length of the antenna and the height of the structure it is affixed to. So the total height of the antenna (once affixed) would be more than 25 feet...and in some instances higher than 102 feet if the existing structure was quite high. Secondly, what is the impact of TFI transmission "spillage" into the bordering residential communities (Mililani Tech Park; Launani Valley; Mililani-Mauka) on quality of life (life maintenance equipment; television; radios; cell phones; phones; burglary alarm systems; schools; etc.)
- Reference Page 5-8, Table 5-1 (SBCT Project Impacts Under the RLA Alternative at SLBR), 1391 Project #57416 – Tactical Vehicle Wash Facility – East Range: The Draft EIS – Transformation lists this proposed project as having "...Less than Significant..." environmental impact. Explain why?
- P192-80** Mitigation: Request clarification as to justification for listing each item as less than significant impact to the environment. Supporting questions are listed next to each topic:
- P192-81** a. Land Use: The proposed Tactical Vehicle Wash Facility – East Range will wash environmentally damaging chemicals/fluids from these tactical vehicles into the land and damage it indefinitely. Environmentally damaging chemicals/fluids such as: vehicle fuels (gas/diesel/JP Series); battery fluids; vehicle coolant fluids; hydraulic fluids associated with earth moving vehicles or larger towing vehicles; etc., will seep into the ground and environmentally contaminate fresh water table, fresh water lakes, fresh water springs, the ground, kill fish and birds (that drink this contaminated water), and open ocean areas and associated nearby coral reefs. There is no mention as to what the U.S. Army will do to prevent this environmentally damaging and animal life threatening fluids/chemicals from contaminating the land. Please mitigate how this would be prevented and address all "...clean-up actions..." of these environmentally dangerous fluids/chemical once the U.S. Army declare the SBER is no longer needed for training and they leave these training areas.
- P192-82** b. Visual Resources: Explain why there would be "less than significant" impact to visual resources when land runoff would contaminate nearby fresh water lakes

Responses

P192-77

The impacts of replacing the C-130s with C-17s were addressed in a separate NEPA document prepared by the Air Force. The C-17s will be stationed at Hickam as part of the Air Force/Air National Guard assets. The SBCT can use either C-130s or C-17s for deployment. The cumulative impacts of this and other projects are discussed in Chapter 9 – Cumulative Impacts and is listed as cumulative project number 33.

P192-78

C-130s or C-17s will be used for infrequent deployment training as described in Section 2.3.4 "Deployment Training" in the EIS. The aircraft will not be stationed at Wheeler or Bradshaw Army Airfields. They are part of the Air Force/Air National Guard assets and as such will be stationed at Hickam. The aircraft using WAAF will be the same as current aircraft except that up to two C-130 or C-17s would be deployed to PTA twice a year from WAAF. A maximum of 4 additional take offs and landings per year. The impacts of aviation use at WAAF is described in Chapter 5.

P192-79

The total height would range from 25 to 102 feet including whatever they are attached to. A more detailed description of the FFI antenna can be found in Appendix D pages D-15 and D-50. An Electromagnetic Compatibility (EMC) study for the SBCT-5 training sites on O'ahu and PTA was conducted. Over 65,500 frequency records were considered in this study from the civil sector and other federal government agencies. Result indicates no significant interference problems should be encountered on O'ahu and PTA during the operation of the Enhanced Position Locating and Ranging System (EPLRS), backbone of the training systems on the FFI Sites.

P192-80

A summary of the findings can be found in Chapter 4 and a more detailed analysis and background for impact determinations can be found in Chapters 5-8.

P192-81

As discussed in Sections 5.14.2 and 8.14.2, filtered water would be reused for the vehicle wash. Water is continually reused with no wastewater disposal. Solids from the water are separated in the vehicle wash, removed and treated with EPA approved bioremediation methods so that the solids may be used

Comments

- P192-82 cont'd** and springs; the vegetation (dust/fluids from vehicles); and runoff into nearby open ocean and coral reefs. Without some process to catch all the loose dirt and mud from these tactical vehicles, the dirt on these vehicles would be rinsed off into fresh water lakes and springs, vegetation, and Open Ocean and coral reefs and cause a discoloring of the visual resources of SBER and where ever the runoff would go. Mitigate how this situation would not happen and why there would be "less than significant" impact to the environment. Explain the U.S. Army clean-up program when the SBER training areas are declared no longer required for training or the U.S. Army decide to leave.
- P192-83** c. Air Quality: This proposed wash facility for tactical vehicles once in operation would create some dust and fumes to rise into the air. These fumes could possibly contaminate the air near the residential communities adjacent to the SBER (either Wahiawa, Launani Valley, Mililani Tech Park, and Mililani-Mauka). Residents who have respiratory health problems will be adversely impacted by the contaminated air caused by this proposed tactical vehicle wash facility. Mitigate how the U.S. Army will prevent adjacent residential communities from being impacted. Particularly those afflicted with chronic lung and breathing problems. Particular attention must be addressed to those elderly and very young residents who will be most impacted. Mitigate how this situation would not happen and why there would be "less than significant" impact to the environment particularly to those residential communities immediately bordering (Wahiawa, Launani Valley, Mililani Tech Part, Mililani Mauka, retirement community in Mililani Mauka) of SBER. Explain the U.S. Army clean-up program when the SBER training areas are declared no longer required for training and or when the U.S. Army decides to leave these areas.
- P192-84** d. Noise: The proposed Tactical Vehicle Wash Facility would create noise associated with personnel working, vehicles moving around in the facility, and high power water hoses or washing facilities in operation. The noise would not only disturb protected species birds and animals in the SBER adjacent areas but also it would disturb the adjacent residential communities (Wahiawa, Launani Valley, Mililani Mauka, retirement communities, etc.). Mitigate how the U.S. Army will prevent adjacent residential communities and endangered animals/birds from being adversely impacted by these noises. The noises from this vehicle wash facility combined with the normal training noises and aircraft flying overhead (helicopters, fixed wing aircraft, public aircraft, highway noise from H2 freeway) all combined to make it damaging to adjacent residential communities and schools. Mitigate how this situation would not happen and why there would be "less than significant" impact to the environment particularly to those residential communities immediately bordering SBER (i.e., Wahiawa, Launani Valley, Mililani Mauka, schools, retirement homes, etc.).
- P192-85** e. Traffic: The proposed tactical vehicle wash facility could create a traffic problem. Possibly traffic congestion caused by an unreasonable number of

Responses

with existing soils on Army lands. A water/oil separator is included in the vehicle washes. The oil from the vehicle washes is disposed by a contractor in accordance with all appropriate laws and regulations. Institutional programs discussed in Section 2.2.4 address hazardous waste management. Clean-up has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. The Army is committed to cleanup existing sites in accordance with applicable laws and regulations

P192-82

USARHAW will continue to implement land restoration measures identified in the INRMP. Mitigation measures to control erosion include, but are not limited to, implementation of the ITAM program to identify and inventory land condition using a GIS database; coordination between training planners and natural resource managers; implementation of land rehabilitation measures identified in the INRMP; monitoring of the effectiveness of the land rehabilitation measures; evaluation of erosion modeling data to identify areas in need of improved management; and implementation of education and outreach programs to increase user awareness of the value of good land stewardship. Implementation of these mitigations to reduce erosion and related impacts on soil and water resources would also alleviate related impacts on visual resources.

P192-83

The vehicle wash facility would be a minor source of vehicle engine emissions, but it would not be a source of significant fugitive dust emissions. The wash facility would remove dirt, mud, and dust from military vehicles, thus preventing those vehicles from tracking dirt and mud onto paved roads where it could be re-suspended as fugitive dust. Since the high concentrations of vehicle traffic in the Honolulu area have not caused federal or state air quality standards to be exceeded, there is no reason to expect the much more limited vehicle traffic at the vehicle wash facility to create any air quality problems from vehicle exhaust. The Army has no plans to leave existing installations in Hawai'i. Available clean-up technologies change over time, and there is no reason to expect that current technologies would not improve in the future. Consequently it would be premature and unproductive to develop closure and clean-up plans at this time.

Comments

P192-85
cont'd

vehicles waiting in line to be clean will impact the normal traffic patterns of Kamehameha Highway and H2 Freeway. Mitigate how the U.S. Army will not let this occur nor impact the residential communities bordering the SBER (i.e., Launani Valley, Mililani Tech Park, and Mililani Mauka).

P192-86

- f. Water Resources: The proposed Tactical Vehicle Wash Facility will wash environmentally damaging fluids and/or chemicals (i.e., fuels, battery acids or fluids, brake fluids, hydraulic fluids, oils, lubricating oils, radiator coolants, metal shavings from damaged vehicles, broken glass, etc.) in the fresh water aquifer; fresh water tables; fresh lakes and springs; and into nearby open ocean, bays, and close coral reefs. These dangerous fluids and chemicals will (over a long period of time and if unchecked or cleaned) will kill off the fresh water fish, plant life in the fresh water lakes and springs, ocean coral and fish life, and kill endangered animals and birds that live in the SBER. Mitigate how the U.S. Army will prevent this situation from happening. Explain why the damage to water resources would have "less than significant" impact to the environment or nearby adjacent residential communities (Launani Valley, Mililani Mauka, Mililani Tech Park, Wahiawa, schools, and retirement homes). Explain how the U.S. Army will clean up the water resources once they declare the SBER is no longer required...how will water resources be returned to its original state.

P192-87

- g. Geology and Soils: Explain why there would be "less than significant" impact to Geology and Soils when tactical vehicles wash their environmentally damaging fluids and chemicals (fuels; brake fluids; battery acids and fluids; hydraulic fluids; paint; oils; vehicle lubricating oils; radiator coolants; metal shavings from damaged vehicles caused by minor accidents, broken glass, etc.) off and they seep into the ground to contaminate the soil indefinitely. These very contaminants would also seep into the ground and into the fresh water aquifers and water tables irreparably damaging the fresh water sources. Also, these lands would be contaminated forever and would have to be removed from the SBER. Mitigate how this situation would not happen and why there would be "less than significant" impact to the environment. Explain what "clean up" measures the U.S. Army will take when they declare the SBER no longer required for training purposes.

P192-88

- h. Biological Resources: Explain how the proposed tactical vehicle wash facility will not adversely impact the biological resources of adjacent residential communities (Launani Valley, Mililani Mauka, Wahiawa, schools, and retirement communities, etc.) when this facility will release harmful fluids, chemicals, dust, harmful drinking water, congested traffic, noise, etc.) Especially those of child bearing females and young males. Contaminated water and air would be the chief cause of being harmful to humans. Mitigate why there would be "less than significant" impact to this resources if the U.S. Army will clean up this resources after they declare the SBER no longer required....or before they leave the area.

Responses

P192-84

Noise from operation of the tactical vehicle wash would clearly be less than noise from the construction activities required to build the facility. As discussed in the DEIS, even the noisiest stage of construction activity at the vehicle wash facility would not have a significant noise impact on the closest noise sensitive areas. Consequently, operational activities at the vehicle wash facility, which would have noise levels less than construction activities, would not have a significant noise impact on the nearest residential communities. The closest residential areas of Wahiawa, which includes Wahiawa Middle School, are almost one-half mile away. The closest residential areas of Mililani-Mauka are almost one mile away.

P192-85

No significant impact would occur from the vehicle wash facility. As stated in Section 5.7.2, this facility is relatively isolated and located in SBER. The capacity of the facility would be 10 vehicles per hour, which is below the threshold for impact.

P192-86

There is no wastewater associated with the Tactical Vehicle Washes. The water is recycled and separated within the vehicle wash. The separated particulates (such as dirt and oils) are removed on a regular basis and disposed of in accordance with appropriate material disposal laws and regulations. The treatment system is described generally in Section 8.14

P192-87

Thank you for your comment, it will be entered into our administrative record. For impact methodologies and impact analysis, for geology and soils, please refer to section 4.9. The wastewater would be treated, as described in the Public Services and Utilities sections for each installation (see for example, Section 5.14, for SBMR). For hazardous materials and hazardous wastes management, please refer to Section 12 of Chapters 4-8.

P192-88

Wastewater runoff or discharge issues will be dealt with as appropriate through federal and state clean water provisions. These regulations are detailed in Appendix N.

Comments

- P192-89** i. Cultural Resources: Mitigate how this item is impacted. What's the resolution?
- P192-90** j. Human Health & Safety Standards: If the proposed tactical vehicle wash facility contaminates those resources essential to animal and human life (i.e., water, air, land, noise, etc.) the U.S. Army must mitigate how this will be prevented. And how the U.S. Army will clean up the SBER after it decides the tactical vehicle wash facility is no longer needed. What processes or facilities will be incorporated with installing a tactical vehicle wash facility to prevent contamination (into land and water resources), runoff, or release into the air of the SBER and those areas residential communities bordering the training areas particularly the tactical vehicle wash facility.

Reference Page 5-9, Table 5-2 (SBCT Project Impacts Under the RLA Alternative at SBMR), 1391 Project # 57416 (Tactical Vehicle Wash Facility): Concerns listed exactly same as those reference above in Table 5-1 (SBCT Projects Impacts Under the Proposed Action at SBMR).

- P192-91** Mitigation: Mitigate those exact "line items" listed as concern in Table 5-1 above. The same issues listed for mitigate for this line item (Tactical Vehicle Wash Facility) must be carefully mitigated and explained. Additionally, the U.S. Army must explain (in each listed category) its proposed clean up program once they declare the SBER is no longer useful to their mission and/or they depart the area.

Reference Page 5-10, Paragraph 5.1.3. (Public Scoping Comments). I attended the April 2002 public scoping meeting, on SBCT project activities at SBMR and WAAF, at Leilihua High School and was one of 4 individuals/groups that orally made a presentation. My verbal presentation is attached to these written comments...and the Honolulu Advertiser also captured it the next day. Secondly, I FAX'd written comments about my concerns for the noise that will be generated at SBER from the increased training (Stryker generated). I have also attached a copy of this written comment.

Mitigation: Mitigate why my orally presented concerns were not listed in the Draft EIS – Transformation specifically in Paragraph 5.1.3. or anywhere else applicable to public scoping meeting comments. Also, mitigate why my written concerns (which I FAX'd) were not listed in the Draft EIS –Transformation specifically in Paragraph 5.1.3. or anywhere else applicable to public scoping meeting comments. I will attach a copy of these two items to this written report.

- P192-92** a. Oral Comments at Leilihua High School (April 2002): My comments were concerns about aircraft mishaps and the ability and adequacy of Federal/State/County emergency services (i.e., police, fire department, emergency medical services, communications, evacuation plans, etc.) to handle aircraft mishaps and accidents into the large residential communities of Mililani Technical Park; Launani Valley; Mililani Mauka, 2 elementary schools, a middle school, a retirement homes. I also addressed the need to "coordinate" the Draft and Final EIS with the Federal Aviation Agency (FAA) to ensure the proposed

Responses

P192-89

The Army, SHPO, and ACHP have completed the PA that addresses these issues. The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS.

P192-90

Each new facility will be under federal requirements for construction that take into consideration the human health and safety standards of the proposed project.

P192-91

The Army designs all of its projects, including those in this proposed action, in accordance with Executive Order 13123 "Greening the Government through Efficient Energy Management" (June 2001), Executive Order 13101 "Greening the Government through Waste Prevention, Recycling, and Federal Acquisition" (September 1998), and Department of the Army Engineering Technical Letter 1110-3-491 "Sustainable Design for Military Facilities" (May 2001) and the U.S. Army Corps of Engineers Sustainable Project Rating Tool (SPiRiT). These documents and tools provide design guidelines and standards for sustainable development - addressing water resources, energy and atmospheric resources, indoor environmental quality, material and other resources.

P192-92

NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that affect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated. The FAA has well-defined procedures for remotely operated aircraft such as UAVs. As stated in Section 5.4.2 in the Aviation Safety subsection, a certificate of authorization would be required at least 60 days prior to the proposed commencement of UAV operations. The precise flight paths of the UAVs have not been determined at this time. They will be identified when the Army submits its plans to the FAA when it applies for the FAA Certificate of Authorization for UAV flights.

Responses

- P192-92**
cont'd
- alternatives (particularly the introduction of C-130, C-17, and UAV into the Central O'ahu Regional airspace) would be safe. See attached comments.
- b. FAX'd Written Comments: My written comments addressed the concerns of the large bordering residential communities (Mililani Tech Park, Launani Valley, Mililani Mauka, retirement communities, and 3 schools) to noise generated by the stated increased training planned for the Stryker Brigade...including Legacy Training by all components of DoD and State national/air guards.
- P192-93**
- Explain why they were again not listed and why COL Wagnor (U.S. Army Facilitator) promises of including all presenters' comments and addressing them were not in the Draft EIS Transformation. The U.S. Army must explain how this or future presented oral or written comments to the Draft or Final EIS – Transformation will be included as public records.
- Reference Page 5-11, Paragraph 5.2. (Land Use), Paragraph 5.2.1. (Affected Environment/Recreation), (Land Use) – Schofield Barracks Military Reservation, Last Sentence. This last sentences reads "...SMBR consists of the Main Post and SBER (Schofield Barracks East Range)..."
- P192-94**
- Mitigate: Why is the SBER included as part of the SMBR for the Draft EIS - Transformation? The proposed alternative of the Draft EIS – Transformation states a lot of training and construction activity will occur at SBER. The Draft EIS – Transformation description of SBER activities rightfully must stand on its own and not be "buried" throughout the entire Draft EIS –Transformation. The stated level of training activity in the proposed alternative will rise in the SBER...significantly higher than it is now. As with most other training areas on the island of O'ahu they are listed by name in the Draft EIS – Transformation...very visible...except for SBER. Why is it so difficult to find anything impacting the SBER in one location?
- Problem: Although the level of construction activity and training in SBER is very very high the specifics about what activities; its training levels; helicopter operations/training activity levels, fixed wing (C-130, C-17, and UAV) airspace operation are spread out over the entire report. Bits and pieces can be found throughout the report as opposed to being in one section or chapter. Finding all of them throughout this entire report is very very difficult. This method of describing the SBER activity because of Stryker does not meet the intent of the EIS process. Explain the rational for this. Recommend a separate Chapter be dedicated to the proposed action and activities in SBER so as to make it more easily accessible to the public.
- P192-95**
- Reference Page 5-17, Table 5-5 (SBER Project Areas and Land Uses), SBCT Project Title, "FTI": The Draft EIS – Transformation report in this table does not list the FTI Antennas to be installed at SBER.
- Mitigation: Table 5-5 must be updated to reflect the FTI antennas (2) to be installed at SBER. The U.S. Army must developed clean-up programs or plans to

P192-93

A fax was received from May 30, 2002 and was included in the Scoping Comments as were five other faxes from the public. The word fax has been included in the referenced paragraph in the FEIS.

P192-94

Most of the construction activities are occurring at SBMR not SBER. The only major construction activity is a washrack to be built on a previously disturbed site on Higgins Road. Section 5.1.1 – Proposed Action in Chapter 5 – Schofield Barracks Military Reservation and Wheeler Army Airfield described all the construction activities for SBMR and SBER. In order to reduce the volume of the document the overall project description can be found in Chapter 2 – Description of the Proposed Action and Alternatives. Those parts of the action and activities proposed for SBER can be found in Section 5.1.1 – Proposed Action in Chapter 5 – Schofield Barracks Military Reservation and Wheeler Army Airfield.

P192-95

Table 5-5 listed the FTI antennas to be installed at SBER in two locations as East Range 1 and East Range 2.

remove these projects when the U.S. Army determine use of the SBER is no longer needed. All environmentally sensitive materials must be removed and the land restored to its original state before its management oversight responsibilities are returned to the State/Country. Explain the clean-up programs or plans in the Final EIS – Transformation.

P192-96

Reference Page 5-17, 3rd Paragraph (Schofield Barracks East Range), and Lines 3-6: These lines describe the type of training (Legacy) on going at SBER. The paragraph Doesn't specify that SBER be used for legacy training by all component services and State national and air guards for training. The Marines and Air Force also use the SBER training areas for their legacy training.

Mitigation: Rewrite this paragraph to clearly describe all users of the SBER training facilities. Also state that all services and state national and air guard units make much use of helicopters. Secondly, as stated in my written comments the prime hours of training appear to be between 1900 – 0830 hours...a period when there is no other competing noise (i.e., ambient noise from H2 Freeway or residential community residents in the Mililani-Mauka, Launani Valley, and Mililani Tech Park areas...the only noise thus come from the on-going training in the SBER training areas.

Reference Page 5-27, Paragraph 5-2 (Land Use), 3rd Paragraph (Schofield Barracks East Range) on the Page, 1st Sentence: The Draft EIS – Transformation states "...land uses surrounding SBER include urban, military, forest, and agriculture..."

P192-97

Mitigation: This paragraph is incomplete. Also adjoining (BOARDING is a more descriptive word) are: Mililani Technology Park; Launani Valley residential area; Mililani-Mauka residential areas; Mililani Mauka Middle School; Mililani Mauka Elementary School; and Mililani I'ke Elementary School; and lastly a retirement community. The Final EIS – Transformation must include this information to correctly reflect the extent of residential communities that border the SBER. Without this information would incorrectly describe how close the new Castle & Cooke community development project has grown.

P192-98

Reference Page 5-27, Paragraph 5-2 (Land Use), 3rd Paragraph (Schofield Barracks East Range) on the Page, Last Sentence: The Draft EIS – Transformation states "...Land south of SBER includes forest agricultural lands, and Mililani Town. This is also not an accurate description of the area adjacent to SBER.

Mitigation: This paragraph is incomplete. Also adjoining (BORDERING is a more descriptive word) are: Mililani Technology Park; Launani Valley residential area; Mililani-Mauka residential areas; Mililani Mauka Middle School; Mililani Mauka Elementary School, and Mililani I'ke Elementary School; and lastly a retirement community. The Final EIS – Transformation must include this information to more accurately describe what borders the SBER. The residential community that borders the eastern and mauka side of SBER is the Mililani Mauka,

P192-96

Section 2.2 acknowledges the use of SBER by other military groups for training, including the Marines and other Army units. Section 5.2.1 has been updated to bring this into accord.

P192-97

Section 5.2.1 discusses land uses adjacent to SBER, and has been revised to include a reference to residential and commercial uses.

P192-98

Section 5.2.1 discusses land uses adjacent to SBER, and has been revised to include a reference to residential and commercial uses.

P192-98
cont'd

Launani Valley, Mililani Tech Park; and 2 Elementary Schools and a Middle School; and a retirement community.

Reference Page 5-30, Table 5-13 (Summary of Potential Land Used and Recreation Impacts at SBMR/WAAF), Impact Issue – “Construction of FTI in a Conservation District”: The Title of this Table doesn’t reflect the inclusion of SBER. Also, the Draft EIS – Transformation (specifically this reference Table) reflects that the Proposed Action will have “...Less than Significant...” environmental impact. The impact of using a FTI in the SBER so close to a major residential community area has not been thoroughly investigated or tested. The FTI transmission “spillage” into the Launani Valley, Mililani Mauka, its retirement community, 2 elementary schools, and the middle school can possibly have a detrimental impact on the quality of life of this large residential areas. As previously describe in other sections of this report.

P192-99

Mitigation: The FTI transmission “spillage” so close to the Launani Valley, Mililani Mauka, Mililani Tech Part, 2 elementary schools, 1 middle school, and its retirement community may have a life threatening impact on elderly residents who rely on life assistance machines that are essential to life sustainment, i.e., will FTI transmission spillage into the bordering residential communities turn-off life sustaining medical devices such as heart pacers; lung machines; etc. Any such device that is operated by computer device. Secondly, the impact of the FTI spillage could also impact detrimentally on the overall “quality of life” of this large residential community, i.e., will FTI transmission spillage “turn-off” TVs, electronic appliances, burglary alarm systems, electronic clocks, traffic signal lights, etc. A thorough study of the effects of continued FTI transmission “spillage” bombarding the Lanai Valley, Mililani Mauka, Mililani Tech Part, 2 elementary schools, 1 middle school, and its retirement community must be completed and included in the Final EIS – Transformation before any action is taken to install FTI antennas in the SBER. Finally, the Title of this table needs to specify “...SBER...” It is misleading not to include SBER in the Title of Table 5-13.

P192-100

Reference Page 5-30, Table 5-13 (Summary of Potential Land Use and Recreation Impacts at SBMR/WAAF), Impact Issue – Impacts on land use during construction activities... The Draft EIS – Transformation states impact “...less than significant...” for the Proposed Action. I’ve argued quite extensively about the impact to land use of the Proposed Action.

Mitigation: The Final EIS – Transformation must explicitly explain how it was determined that the land use by Transformation (Stryker Training) for training will have “...less than significant...” impact to the land use. How was this determination made? The constant use of the lands in SBER; its abuse and its contamination with indefinite impact, will result of Stryker type training in SBER.

P192-101

Reference Page 5-34, Paragraph 5.3 – Visual Resources, Paragraph 5.3.1. – Affected Environment, 2nd Paragraph (Landscape Character) – Schofield Barracks Military Reservation: This paragraph describes SMBR but does not include a description of

P192-99

For ease of reading, “SBMR” in the EIS includes the Main Post and SBER. Section 4.14, 5.14, 6.14, 7.14, and 8.14 have been revised to include the following information. Army staff have conducted an Electromagnetic Compatibility (EMC) study for the proposed action. Over 65,500 frequency records from the civil sector and other federal government agencies were considered in this study. The results indicate no significant interference problems should be encountered on O’ahu or the Island of Hawai’i during the operation of the Enhanced Position Locating and Ranging System (EPLRS), backbone of the training systems on the FTI Sites.

P192-100

Factors considered in determining significance for impacts on land use are discussed in Section 4.2. Because SBCT training activities will not differ substantially from current training activities at SBER, there would be no significant impact on land use as a result of training activities.

P192-101

SBMR is used in the EIS to refer to both the Schofield Barracks Main Post and Schofield Barracks East Range. The general description of the visual quality of SBMR includes SBER. The Army has not purposefully omitted any references to SBER. The DEIS was divided into five geographical areas with the intent of making it easier for the general public to focus specifically on impacts the project might have on their community. In addition there is a guide inside the front cover describing the organization of the document, an abstract of the DEIS, and a very detailed Table of Contents. In addition the Executive Summary highlights the important aspects of the proposed project including a project description, a summary of impacts, and proposed mitigation

Stryker Brigade Combat Team Final EIS, Hawai'i

P-596

P192-101
cont'd

the SBER. This is a perfect example of how the Draft EIS – Transformation purposely omits any reference to SBER when it should...thereby scattering throughout the Draft EIS – Transformation information pertinent to the SBER. Why is SBER scattered over the entire report in this Draft EIS – Transformation? Clearly, a description of the landscape character of SBER should have been included in this paragraph.

Mitigation: Include a description of the SBER in this paragraph since throughout the Draft EIS – Transformation, SBER is clearly stated to be part of the SBMR. Ensure this discrepancy is corrected in the Final EIS – Transformation.

P192-102

Reference Page 5-37, Table 5-14 (Summary of Potential Visual Resources Impacts at SBMR/WAAF), and Title: The title of this Table in the Draft EIS – Transformation should include SBER. SBER is a part of the SBMR as clearly stated throughout the Draft EIS – Transformation.

Mitigation: Include SBER in the title of Table 5-37 since it is a part of SBMR.

P192-103

Reference Page 5-37, Table 5-14 (Summary of Potential Visual Resources Impacts at SBMR/WAAF), "Impact Issues." An Impact Issue not listed but should be is "Water runoff of land caused by rain or drainage of water." I provided a lot of discussion on the probable runoff of loose soil/land, by rain or washing facility, which is damaged by the tactical Stryker vehicles and other tactical vehicles then subsequently dumped into fresh water lakes and springs, and into nearby open ocean and associated coral reefs. This terrible impact will kill fresh and ocean water fish; choke fresh water rivers, lakes, springs, as well as oceans and associated coral reefs. A lot of this terrible runoff impact can be seen anywhere in the Hawaiian Islands where a lot of new residential developments have begun. A similar water runoff result probably will happen near the SBER where damaged lands will abound with loose dirt and soil. This loosen dirt and soil becomes very susceptible to water runoff.

Mitigation: Explain how the U.S. Army will make this impact "...less than significant..." Explain in the Final EIS- Transformation what processes and precautions will be taken to preclude a major runoff of hundreds of cubic tons of rich agricultural soil into fresh water lakes, rivers, and springs....and into our open oceans and coral reefs. Also explain what procedures and precautions will be taken to prevent unnecessary killing of animals and fish (fresh and ocean) resulting from runoff. Lastly, explain in the Final EIS – Transformation how the U.S. Army will clean up the runoff damage after they declared that training in the SBER is no longer required. Explain how the clean up will be conducted before the U.S. Army leaves the SBER.

P192-104

Reference Page 5-48, Paragraph 5.4, Sub-paragraph 5.4.1 (Military Training Routes), First Sentence: The Draft EIS – Transformation states "...Although there are no formal, published military training routes in the SBMR airspace ROI, the A-311 Alert Area is used for helicopter training exercises, with an average of 3,500 helicopter

P192-102

SBMR is used in the EIS to refer to both the Schofield Barracks Main Post and Schofield Barracks East Range.

P192-103

USARHAW will continue to implement land restoration measures identified in the INRMP. Mitigation measures to control erosion include, but are not limited to, implementation of the ITAM program to identify and inventory land condition using a GIS database; coordination between training planners and natural resource managers; implementation of land rehabilitation measures identified in the INRMP; monitoring of the effectiveness of the land rehabilitation measures; evaluation of erosion modeling data to identify areas in need of improved management; and implementation of education and outreach programs to increase user awareness of the value of good land stewardship. Implementation of these mitigations to reduce erosion and related impacts on soil and water resources would also alleviate related impacts on visual resources

P192-104

After the publication of the Draft EIS, the Army announced plans for an enhancement package for SBCTs. The enhancements include an aviation task force, an increase from twelve to eighteen 155mm howitzers in the direct support artillery battalion, and improvements to command, control, communications, computer, and intelligence (C4I) assets. The announcements indicated that the aviation task force would include Comanche helicopters when the aircraft were ready for fielding. In February 2004, the Army determined that no further testing or fielding of Comanches would occur and canceled the Comanche program. The SBCT aviation task force will come from existing 25th ID(L) aviation brigade assets and will result in minor changes to training, primarily some increased aviation training over WPAA in support of units training in that area. The FEIS has analyzed the impacts of the increased aviation training over WPAA and those impacts are minimal. The Draft EIS analyzed the impacts of twelve 155mm howitzers, a change from the eighteen 105mm howitzers currently in the direct support artillery battalion for 2nd brigade. The addition of another six 155mm howitzers was analyzed in the FEIS and resulted in minimal changes to noise impacts and no change in the overall determination of effect. The C4I improvements are not expected to have any impacts on the environment. Overall, the Army has determined that the enhancements are within the original scope of the proposed action as described in the Draft EIS, are minor in nature, and do not require a supplemental Draft EIS.

May 2004

Stryker Brigade Combat Team Final EIS, Hawaii

P-597

P192-104
cont'd

movements per month..." However, there are at least flight departure and arrival routes published. If you refer to the Final EIS – Mililani Mauka Report (Feb 1987), which is filed with the State Environmental Quality Agency, you will find the arrival and departure flight routes from WAAF. They do give helicopter and fixed wing VFR and IFR routes and headings. Appears that these are formally documented routes and I believe the FAA is a coordination agency on that Final EIS – Mililani Mauka Report. This draft EIS doesn't address "visiting" military units that use SBER.

Mitigation: The U.S. Army should at a minimum include all aircraft (helicopter and fixed wing) routes from and into WAAF (by Hawaii based units and visiting military units that use SBER). More particularly, the training routes for Noise Abatement for the Wahiawa and Mililani Mauka, Luanani Valley, Mililani Tech Park, and the Mililani Town should be included in the Final EIS – Transformation so as to explain where these routes and abatement program exists.

P192-105

a. Noise Abatement Programs: As I noted in a previous chapter of this Draft EIS – Transformation, only a Wahiawa Noise Abatement program appear to exist. A noise abatement program for the Launani Valley, Mililani Mauka, Mililani Tech Park, and particularly for the 2 elementary and 1 middle school need to be developed.

P192-106

b. Helicopter – Minimum Flying Altitude: Particularly important that flight training routes be published and be made visible since helicopters have no minimum flight altitude to comply with except to being a minimum of 100 ft above the nearest ground object. This is my most important concern.... a military helicopter with a very low almost unrestricted flying altitude (virtually no restrictions)...flying air training maneuvers over the very large residential communities (Launani Valley, Mililani Tech Park, Mililani Mauka)...during the daylight hours AND VERY DANGEROUSLY AT NIGHT!!! I believe two helicopters crashed into each other, last year at the Kahuku Training Range, at night with pilots wearing night vision goggles.

- (1) The U.S. Army needs to mitigate how they will maintain control of these helicopters during training maneuvers; at night; carrying heavy loads external to helicopter (artillery pieces; conex; etc....what are the restrictions of carrying extremely heavy external loads during training maneuvers over residential and school areas?); and the process and procedures for WAAF air traffic control or the FAA to monitor and control helicopter flight compliance with altitude restrictions. Understandable, that helicopter flight altitude restrictions are not monitored. However, if Transformation will increase helicopter flight operations at SBER and over Launani Valley, Mililani Tech Park, Mililani Mauka, 2 elementary and 1 middle school; a retirement

P192-105

There is no formal noise abatement program for Wahiawa. There is, however a noise buffer zone along the north boundary of SBER because development in Wahiawa encroaches against the SBER boundary. Maneuver training areas in the western portion of SBER are confined to areas north of Wahiawa Reservoir. Thus, the area south of Wahiawa Reservoir provides an extensive buffer for the western half of Mililani-Mauka, and there is no need for a separate noise buffer policy in that portion of SBER. The schools in Mililani-Mauka are much further from the maneuver training areas in SBER than are most schools in Wahiawa.

P192-106

As states in Section 3.4.2 in the Aviation Safety subsection, helicopter traffic pattern altitudes over land are set at least 700 feet (not 100 feet) above ground level. The may fly lower over the ocean. Helicopters do not conduct air training maneuvers over residential communities. The two serious mishaps, including the cited collision, are acknowledged in the revised Section 3.4.2. Overall, however, the Army's aviation safety record over O'ahu has been excellent. As stated in Section 3.4.2, in the Aviation Safety subsection, all military aircraft fly in accordance with Federal Aviation Regulations (FAR) Part 91, Subchapter F (Air Traffic and General Operating Rules) which govern such things as operating near other aircraft, right-of-way rules, aircraft speed, and minimum safe altitudes when flying outside special use airspace. Army Regulation 95-1 (Aviation Flight Regulations) covers army aircraft operations, crew requirements, and flight rules. These regulations have precise requirements for the use of airports, heliports, and other landing areas, local flight rules, and special use airspace.

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-598

P192-106
cont'd

community, and Wahiawa...then the U.S. Army needs to strictly control helicopter flight operations at SBER.

- (2) The U.S. Army needs to mitigate how it will control other services, State Army National Guard, State Air National Guard, and Coast Guard airspace users of SBER to comply with Transformation airspace SBER procedures. Currently, the U.S. Army is not designated the "Executive Agent" for the military airspace in the Central O'ahu Region....to best of my knowledge...this needs to be discussed thoroughly in the Final EIS-Transformation report. Therefore, as host service for SBER and central O'ahu (military), the U.S. Army must mitigate how it will control airspace to ensure FAA operations and procedures are current and complied with by all military and state users of the SBMR ranges (to include SBER). Currently, to my knowledge no such management process or activity exists with respect to managing other services or State Air/Army National Guard assets. Also, the Mililani Mauka, Launani Valley Neighborhood Board was briefed that the WAAF Air Traffic Control Operations Center (Tower) terminates operations at 2200 hours in the evening...and Honolulu International Airport (or FAA) does not assume airspace management responsibility for the airspace primarily used by the military over the Central O'ahu Region. Then who does? Again, Flight of Safety (especially over the large and expanding Launani Valley, Mililani Tech Park, Mililani Mauka, proposed Koa Ridge (etc), Mililani Town, Wahiawa, existing schools, and medical facilities) is a very important "quality of life" issue for all residents. Critical that all the above issues be mitigated in the Final EIS – Transformation Report.

P192-107

P192-108

- (3) As stated above, a Military Executive Agent (presumably the U.S. Army) must be formally designated (possibly by Commander, USPACOM) and be given the responsibility and authority to manage the military routes and training airspace (SBMR, SBER, etc.) over Central O'ahu for military aircraft (all services/agencies) to include State/Country air guard and army guard aircraft. The process and procedures in doing this must be in accordance with current and updated FAA procedures. FAA, military, and all state military users need to form a partnership for flight of safety as the Central O'ahu Region airspace quickly "fills up." Critical that all the just stated in this paragraph be mitigated in the Final EIS – Transformation Report.

P192-109

- (4) This Military Executive Agent (presumably the U.S. Army) must develop and institutionalize a process whereby nearby residents (Wahiawa, Launani Valley, Mililani Tech Park, Mililani Mauka, Mililani Town, schools, and retirement home) can report and get feedback on helicopter (s), fixed wing aircraft (i.e, C-130, C-141, C-5, C-17, Caribou, etc.), and now the UAVs violators of airspace rules and flight safety procedures over SBMR, SBER, and Central O'ahu Regional (specifically that

P192-107

As stated in Section 3.4.2, in the Aviation Safety subsection, all military aircraft fly in accordance with Federal Aviation Regulations (FAR) Part 91, Subchapter F (Air Traffic and General Operating Rules) which govern such things as operating near other aircraft, right-of-way rules, aircraft speed, and minimum safe altitudes when flying outside special use airspace. Army Regulation 95-1 (Aviation Flight Regulations) covers army aircraft operations, crew requirements, and flight rules. These regulations have precise requirements for the use of airports, heliports, and other landing areas, local flight rules, and special use airspace. In addition, Wheeler AAF is covered with Class D airspace, with a ceiling of 3,300 feet. Within this airspace all aircraft operations are subject to air traffic control clearances and instructions when the control tower is open (0600-2200 M-F). When Wheeler AAF tower is closed, the Class D airspace reverts to Class E or Class G airspace. Being "uncontrolled" does not mean that pilots have total freedom to operate as they please in or around these airports. The FAA visibility and cloud separation minimums still apply to VFR aircraft, as do radio communication responsibilities and the traffic pattern procedures.

P192-108

The Army will manage these areas with the FAA in accordance with established rules. There would not be a significant increase in the number of flights to warrant a Military Executive Agent.

P192-109

As stated in Section 3.4.2, in the Aviation Safety subsection, all military aircraft fly in accordance with Federal Aviation Regulations (FAR) Part 91, Subchapter F (Air Traffic and General Operating Rules) which govern such things as operating near other aircraft, right-of-way rules, aircraft speed, and minimum safe altitudes when flying outside special use airspace. Army Regulation 95-1 (Aviation Flight Regulations) covers army aircraft operations, crew requirements, and flight rules. The Public Affairs Office at SBMR can accept an initial complaint and is the point of contact throughout the process. Persons with reports of noise or aircraft flying too low should contact the Public Affairs Office at (808) 655-1079 as soon as possible. Receiving reports within 15 days after the incident is important to ensure FAA flight data is available to support the investigation. Reports received after that time will still be investigated, but identification of the specific activity involved may be difficult to determine.

Comments

Responses

P192-109
cont'd

airspace the military currently are responsible for now (and in future as outlined in the preferred action of Transformation) and uses primarily in day-to-day and training movements. These are aircraft or helicopters that violate: unsafe flight practices; altitude restrictions; external carrying practices; etc. No such institutionalize process currently exists to my knowledge and feedback on corrective actions taken by the military is never provided. It is very critical that all that's just stated in this paragraph be mitigated in the Final EIS – Transformation Report.

P192-110

- (5) Air Traffic Control: The draft EIS states the SMBR ROI is managed by the Honolulu Air Traffic Control Center and the WAAF Tower. Who manages military airspace/traffic after the WAAF Tower is closed. With an increased in flight training to accommodate the Transformation this issue needs to be addressed for flight of safety concerns.

Mitigation: Answer who manages military airspace/traffic in Oahu Central Region after WAAF is closed (2200 hrs). What's the impact of increased WAAF Control Tower operations?

P192-111

Reference page 5-49, paragraph 5.4.2. (Environmental Consequences), Table 5-16, Impact Issues: "Change to a Military Training Route".

Mitigate: Clarify what change in military training route implies...no where in the draft EIS does it talk about this. What's the EIS impact. Why wasn't this discussed in detail?

P192-112

Reference page 5-49, Paragraph 5.4.2. (Environmental Consequences), Table 5-16, Impact Issues: "Aviation Safety." There is a lack of sufficient discussion on this item. I raised community concerns during the initial scoping meeting but your draft EIS didn't answer my concerns.

Mitigation: This issue really needs to be explained in detail especially with the introduction of UAV's and C-17s. The draft EIS doesn't address it sufficiently as I earlier stated in my written and verbal comments. The FAA needs to partner with the US Army to make the aircraft operations portion of the Transformation workable.

P192-113

Reference page 5-50, Proposed Action (Preferred Alternative), No Impacts (Reduction in Navigable Airspace). This paragraph discusses the lack of requirement for new or modified special use airspace associated with the Proposed Action.

Mitigation: With the introduction of UAVs, C-130s, C17s, and more helicopters and an increase of training...why not partner with the FAA to ensure the flying ops tempo is managed safely and correctly. A requirement to update old existing FAA regulations and procedures for the WAAF area of operations may result which is a good thing not only for the surrounding communities but for the US Army and all military

P192-110

When the Wheeler AAF control tower is closed, the Class D airspace above the airfield reverts to Class C or G airspace. However, being "uncontrolled" does not mean that pilots have total freedom to operate as they please in or around these airports. The FAA visibility and cloud separation minimums still apply to VFR aircraft, as do radio communication responsibilities and the traffic pattern procedures.

P192-111

Change to a MTR implies a change in either its course or altitude. As stated in Section 3.4.2 (Military Training Routes and Number of Aircraft), there are no formal, published MTRs on O'ahu.

P192-112

The Aviation Safety issue is adequately addressed in Section 5.4.2 given the elaborate airspace management procedures in place, and the Army's excellent safety record on O'ahu. Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated. The FAA has well-defined procedures for remotely operated aircraft such as UAVs. As stated in Section 5.4.2 in the Aviation Safety subsection, a certificate of authorization would be required at least 60 days prior to the proposed commencement of UAV operations. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. The precise flight paths of the UAVs have not been determined at this time. They will be identified when the Army submits its plans to the FAA when it applies for the FAA Certificate of Authorization for UAV flights.

P192-113

The FAA has well-defined procedures for remotely operated aircraft such as UAVs. As stated in Section 5.4.2 in the Aviation Safety subsection, a certificate of authorization would be required at least 60 days prior to the proposed commencement of UAV operations. Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated. The FAA has well-defined procedures for remotely operated aircraft such as UAVs. As stated in Section 5.4.2 in the Aviation Safety subsection, a certificate

- P192-113 cont'd** | services impacted by Transformation. Please coordinate your proposed flying training/operations plans with the FAA.
- P192-114** | Reference page 5-50, Proposed Action (Preferred Alternative), Change to a Military Training Route. This doesn't address new introduction of UAVs or C-17s since they obviously weren't around then. What about larger aircraft, i.e. C-5 or C-141s?
Mitigation: Please mitigates training routes for UAV.s, C-17s, C-5s, and C-141 aircraft...they're new so I know you don't have training routes for them.
- P192-115** | Reference page 5-50, Proposed Action (Preferred Alternative), Restriction of Access to Airport/Airfields. This paragraph doesn't address C-17s operations or larger aircraft like the C-5.
Mitigation: Please mitigates C-17 or larger aircraft operations.
- P192-116** | Reference page 5-51, Proposed Action (Preferred Alternative), Aviation Safety. This paragraph doesn't identify the C-17 or larger aircraft just the C-130.
Mitigation: Clarify what has been done to coordinate existing and proposed flight operations of C-17s and UAVs at WAAF with the FAA. Confirm that flight of safety is not an issue with the FAA with regards to proposed concept of flight operations at WAAF. Address the increase of helicopter operations and numbers of helicopters. Clarify how local and State emergency services (fire, police, hospital agencies) can sufficiently respond to an "unlikely" major aircraft accident in the Launani Valley and Mililani-Mauka residential communities.
- P192-117** | Reference pages 5-52, Paragraph 5.5 (Air Quality), paragraph 5.5.1. Affected Environment: With the increase of training flying (introduction of C-17s and UAVs), hundreds of military vehicles, and firing (live and blanks), its inconceivable to think that air quality will not be impacted...it will.
Mitigation: What arrangements and plans are being taken to continually measure the impact of Transformation on air quality standards? What arrangements and plans are being taken to manage air quality?
- P192-118** | Reference page 5-52 and 5-53, paragraph 5.5.2 (Environmental Consequences) Summary of Impacts: This paragraph states "...PM emissions from military vehicle use at SBMR, the likelihood of exceeding the federal 24-hour standard, and the potential impacts to quality of life to surrounding communities combined may result in a significant air quality impact at SMBR under the Proposed Action..."
Mitigation: Mitigate PM emissions to Launani Valley, Mililani-Mauka, Mililani Tech Park, Mililani Town, and Wahiawa Town.

of authorization would be required at least 60 days prior to the proposed commencement of UAV operations. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. The precise flight paths of the UAVs have not been determined at this time. They will be identified when the Army submits its plans to the FAA when it applies for the FAA Certificate of Authorization for UAV flights.

P192-114

UAVs are addressed in the Aviation Safety subsection. Since there are no existing or planned MTRs, it would not be appropriate to address UAVs or C-17s under this subheading.

P192-115

Text has been changed to include C-17s. The conclusion of the airspace use analysis does not change with this addition.

P192-116

The DEIS addresses the extent to which air quality would be impacted by the Proposed Action. Additional discussion of fugitive dust issues has been added to the Final EIS. The Final EIS conclude that air quality impacts can be mitigated to avoid any significant impacts. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. As noted throughout the DEIS, there would be no meaningful increase in training flights under the Proposed Action.

P192-117

The DEIS addresses the extent to which air quality would be impacted by the Proposed Action. Additional discussion of fugitive dust issues has been added to the Final EIS. The Final EIS conclude that air quality impacts will be significant but will remain within the below the ambient PM10 standards. As

- P192-119** Reference page 5-53, Table 5-17, Impact Issues: Wind erosion from areas disturbed by military vehicle use (Proposed Action)...equates to "less than significant..."
- Mitigation: This not consistent with paragraph 5.5.2. Request mitigation. Reference page 5-54, 3rd paragraph, first sentence: "...resulting in a minor increase in dust from wind erosion..."
- Mitigation: This statement is based on what assumption. The SBER and SBMR are very windy locales. Please clarify.
- P192-120** Reference page 5-54, 3rd paragraph, last sentence: "...would result in a small increase in overall aircraft emissions associated with that facility..." Transformation is introducing more helicopters and C-17s...and maybe more larger aircraft.
- Mitigation: This statement is based on what? Whats the concept of operations for the fixed wing aircraft at WAAF? If we know what the concept of operations are we can determine what the impact of aircraft emissions will be to the residential communities and to the environment and its inhabitants.
- P192-121** Reference page 5-56, 3rd paragraph, last sentence: "...use of synthetic dust control chemicals might prove to be a more appropriate mitigation strategy..."
- Mitigation: Explain the impact to the environment and critical resources of the synthetic dust control chemicals, i.e., fresh water streams, lakes, underground water tables, and open oceans.
- P192-121** Reference page 5-58, 2nd paragraph, last sentence: "...consequently, air quality impacts from munitions use under the Proposed Action are considered less than significant.
- Mitigation: This is based on what? Please explain. What will happen to the resultant pollutants that is absorbed by fresh water streams, lakes, underwater tables, and open oceans. What about the animal life that will breath these toxic fumes...they have lower tolerance levels. Whats impact on human new borns and not yet born?
- P192-123** Reference page 5-58, last paragraph, 2nd sentence: "...off road activity in SBMR would increase 64%..." "...this increase in off road vehicle activity would reduce vegetation cover in the affected maneuver areas..." How will US Army "fix" the wind erosion once the US Army determines training at SBMR is not required? Whats the plan?
- Mitigation: What are US Army plans to "fix" environment back to its original state once US Army determines training at SBMR is not required.
- P192-124** Reference page 5-60, 1st paragraph (Emissions from increase aircraft operations). Lots of explanations required here. There would be a tremendous increase in helicopter operations. This paragraph doesn't identify C-17s, UAVs, or larger aircraft. It doesn't even discuss the "concept of operations" for the larger fixed winged aircraft. There will

mitigation the Army will develop and implement a Dust and Soils Management and Monitoring Plan (DuSMMoP) for the training area. The plan will address measures such as, but not limited to, restrictions on the timing or type of training during high risk conditions, vegetation monitoring, dust monitoring, soil monitoring, and buffer zones to minimize dust emissions in populated areas. The plan will determine how training will occur in order to keep fugitive dust emissions below CAA standards for PM10 and soil erosion and compaction to a minimum. The Army will monitor the impacts of training activities to ensure that emissions stay within the acceptable ranges as predicted and environmental problems do not result from excessive soil erosion or compaction. The plan will also define contingency measures to mitigate the impacts of training activities which exceed the acceptable ranges for dust emissions or soil compaction.

P192-118

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. As a mitigation measure, the Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

P192-119

SBMR and SBER have very low average wind speeds. Data from automated weather stations on both the main post and at SBER show that wind speeds rarely exceed the threshold velocity for wind erosion. The mean hourly wind speed at SBMR is 4.3 mph, with the most frequent wind speed being 2 mph. The mean hourly wind speed at SBER is 4.7 mph, with the most frequent wind speed being 3 mph. The highest wind speed recorded in 3 years of data at SBMR was 23 mph. Wind speeds at SBMR equaled or exceeded the threshold for wind erosion for only 55 hours over a 3 year period. The highest wind speed recorded in 2 years of data at SBER was 21 mph. Wind speeds at SBER equaled or exceeded the threshold for wind erosion for only 41 hours over a 2 year period. While direct dust generation from vehicle traffic is a concern at SBMR and SBER, wind erosion is not a significant issue.

Responses

- P192-124 cont'd** | be an increase in aircraft operations. Therefore, there will be a corresponding increase in aircraft emissions, i.e., air quality, noise, etc.
- Mitigation: How will you maintain the current quality of air and noise with the increase in aircraft operations. What are your plans and strategies to address this? How will it be continually managed and corrected? How will you coordinate with State and Federal agencies to ensure air quality is maintained? What's base line?
- P192-125** | Reference page 5-61, second paragraph with discussion on "controlled burns."
- Mitigation: Demonstrate how US Army intends to "control burn."
- P192-126** | Reference page 5-61, third paragraph with discussion on "...other emission from personnel increase..." This paragraph doesn't address the increase in family members and the private vehicles (estimated at 2 per family) they own.
- Mitigation: Address private vehicles for military sponsored families.

P192-120

Transformation would not introduce any more helicopters at WAAF. One or two C-17 or C-130 aircraft (from Hickam AFB) would typically be used when troops deploy from SBMR to PTA for training purposes. A few added fixed wing aircraft flights per year would not cause measurable air quality impacts to areas surrounding SBMR.

P192-121

Additional discussion of dust control chemicals has been added to Section 5.5.2 of the Final EIS. There are very few environmental hazards associated with the recommended dust control agents (calcium chloride and/or magnesium chloride solutions). These chemicals are considered virtually nontoxic in normal use; their toxicity is comparable to that of table salt. Dust control compounds would be applied directly to unpaved roadways and parking areas, and thus would have no effect on areas used by cattle or wildlife. Normal use of these compounds does not pose any risks to fresh water ecosystems, groundwater supplies, or the ocean.

P192-122

Evaluations of emission rates from munitions use, such as the Mitchell and Suggs (1998) report cited in the DEIS, show only small quantities of emissions from ordnance firing and detonation. The Army's annual reporting of hazardous pollutants released by training activities indicate low cumulative air emissions of hazardous compounds, mostly associated with particulate matter. The Army Environmental Center has on-going programs to determine emission rates from munitions use during military training coupled with dispersion modeling studies to evaluate the potential for air quality impacts at locations near military training facilities. Health risk assessments completed to date (US Army CHPPM 2000a,b,c and US Army CHPPM 2001a,b,c) show no significant health risks for either short term or long term exposure to emissions from weapons firing points for hypothetical residential locations within a few hundred meters (600 to 1,200 feet) of the firing points of major weapons. Firing points at USARHAW installations are much further from off-post residential locations than the distances assumed in the health risk assessment studies.

P192-123

The Army has no plans to leave existing installations in Hawai'i. It would be premature and unproductive to develop closure and restoration plans at this time.

Comments**Responses****P192-124**

As is clearly stated in Chapter 2 of the DEIS (page 2-41 and Table 2-5), there would be no change in helicopter numbers at WAAF and no change in the frequency or times of operation for helicopter flights as a result of the transformation process for the 2nd Brigade. C-17 aircraft would be based at Hickam AFB, not WAAF. And as stated on page 2-41 of the DEIS, the 2nd Brigade would deploy to PTA approximately twice a year, using one or two C-17 or C-130 aircraft for each deployment. Troops would board the aircraft either at Hickam AFB or at WAAF. A few added C-17 or C-130 flights each year could not create any meaningful air quality impact. As explained on page 2-41 of the DEIS, there would be approximately 600 sorties per year by UAVs, distributed among several USARHAW installations. Most UAV launches and recoveries would occur inside existing restricted airspace areas over USARHAW ranges, not at WAAF, BAAF, or other airfields. Given that the Shadow 200 UAV has a small (38 horsepower) gasoline engine, the added UAV flight operations would not have any significant air quality impact.

P192-125

The Army's Wildfire Management Plan is discussed on pages 3-90 through 3-92 of the DEIS. Additional discussion of wildfire management issues for SBMR is presented in Section 5.12 (pages 5-209 through 5-211).

P192-126

As noted in Table 3.13 of the DEIS (page 3-95), the Wahiawa and Ewa census districts had a combined population of about 310,698 in 2000. The addition of 810 new military households was estimated in the DEIS to create a net population increase of 1,312 adults and 1,053 children. Assuming that the net increase in total household vehicle travel would be proportional to the net increase in population for the Ewa and Wahiawa census districts, the added military households would generate a 0.76 percent increase in vehicle traffic and emissions compared to existing conditions (including the SBMR-related travel already noted in the DEIS). This is too small an increase to have any significant air quality impact. The actual impact would almost certainly be less than this, since vehicle ownership is strongly correlated with household income and type of housing. Vehicle ownership rates are lower among lower income households and among those living in rental housing or condominiums (US Department of Transportation, Bureau of Travel Statistics 2003); both of these conditions would be prevalent among the added military households.

Subject: Stryker Brigades Proposal

Dear Ms. Barger,

As someone who has followed the transformation of Hawaii's natural environment, and taught courses on that topic at UH Manoa, for almost twenty-five years, I believe that I can comment on the EIS connected with the proposed Stryker Brigades from a position of some authority.

P196-1

I have read the draft EIS carefully and, judging it in the light of the military's effect on the natural environment of this state over the past several decades, I reach the clear conclusion that the project would constitute a further unmitigated disaster for the natural environment and thereby for the cultural and physical health of a large segment of the state's population.

P196-2

I know I speak for many of my colleagues and student in expressing vehement opposition to this proposal.

Yours respectfully,

Graham Parkes

Cleaned up in the Wahiawa-Makua lands? or anywhere in Hawai'i?

Responses

P201-1

The comment period has been extended another 45-days to January 3, 2003.

P201-2

Please contact EPA for a list of hazardous waste sites in Hawai'i and the progress made on cleanup.

P201-3

This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. The Army is committed to cleanup existing sites in accordance with applicable laws and regulations when they are no longer needed. It is too speculative at this time to estimate when any one site would no longer be needed.

P201-4

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

To: cindy barger
Subject: Army Transformation Deadline still unfair

Aloha, allow me to convey this information to you and some of the Neighborhood Boards in reference to the January 3, 2004 deadline the Army has set for public testimony. I just spoke to Geri Meade of Sunset Beach on the phone about this and she referred me to Kathleen Pahinui, chair of the North Shore Neighborhood Board who has no e-mail address on Board's site. I feel the Neighborhood Boards should be addressing and taking a stand on this important issue. If they already have I don't know about it.

The Boards are all out for the holiday recess until after the Jan.3 deadline. How do I get this information to them and ask for response to meet the deadline? I made photocopies of the first publication listed at my own expense-2 copies left. How do I disseminate to all the Boards so it doesn't cost me a lot more money? I am trying my best to get out this information to as many people as possible when it should have been a priority of Sen. Akaka and Sen. Inouye since August, 1990, when the following hearing was held.

P202-1

How do we as mere citizens respond to the autocratic methods employed by Senator Inouye, Senator Abercrombie, Senator Akaka, Sec. Donald Rumsfeld, and our own state government, etc., approving the Army Transformation before the public response period is even over? Is this the democracy that American soldiers are dying for in the Middle East? When is the Army going to spend money decontaminating the toxic waste sites already in existence according to the following report dated August, 1990 which Senator Inouye didn't think it important enough to attend at the time? What does the motto of the State of Hawaii mean to Sen. Inouye and Army: UA MAU KE EA O KA AINA I KA PONO, The life of the land is perpetuated in righteousness?

At the hearing held at Turtle Bay Resort on Dec. 4, when I asked the three Army representatives seated at the table if we could go to their home communities and unload toxic wastes, Mark said he was from

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P201-6

Please contact the US Army Corps of Engineers FUDS Program Manager for past clean up efforts.

P202-1

Although Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2d Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2d Brigade, 25th ID (L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law. The Department of the Army issued a Programmatic EIS for Army Transformation in 2001, and issued its Record of Decision to implement Army Transformation on April 11, 2002. In that ROD, Lieutenant General David McKiernan confirmed a series of previously announced conversions of 6 brigades to interim brigade combat teams, "subject to appropriate evaluation of potential environmental effects in accordance with the National Environmental Policy Act" (ROD, page 11).The Department of the Army will make a decision whether or not to transform the 2d Brigade, 25th ID(L) in Hawai'i only after a full consideration of all the environmental impacts identified and analyzed under NEPA, weighed equally with considerations of strategic importance, military training and readiness, technical considerations, economic and fiscal considerations, and other considerations mandated by law or policy.

Stryker Brigade Combat Team Final EIS, Hawai'i

P-612

P202-2

New Jersey and it was already polluted. Is Sen. Inouye and the Army striving to have this for Hawaii too? What is in our drinking water? What are the MTBE levels in our drinking water throughout the state? We need answers now before the three thousand ton Strykers begin to deposit thousands more gallons of this in our land and water along with all the other contaminants they will leave behind as silent killers. What are the contaminants and their quantities in our water now to use as a comparison to the worsening status the Strykers will bring into the new lands the Army wants to acquire?

P202-3

Concerning the hazardous waste sites in our islands, at least 138 currently uncleaned sites that belong to the Army, Army Transformation and Stryker Units in Hawaii and the recent public hearings conducted by Army personnel: When the Army has studied, incorporated and addressed the crucial information contained in the following documents, and also made these two publications published by federal government departments available to all of Hawaii's citizens, then the Army might be able to come up with a meaningful, legitimate Final EIS that does not insult our intelligence, our health, our islands, our water, our air, our children, and future generations of Hawaii's citizens:

1. FEDERAL HAZARDOUS WASTE SITES IN THE STATE OF HAWAII: COMPLIANCE, CLEANUP AND WASTE MANAGEMENT, HEARING BEFORE THE COMMITTEE ON GOVERNMENTAL AFFAIRS UNITED STATES SENATE ONE HUNDRED FIRST CONGRESS SECOND SESSION AUGUST 29, 1990 (U.S. GOVERNMENT PRINTING OFFICE, WASHINGTON, 1992, ISBN 0-16-039033-8);
2. RECOVERY PLAN FOR KOOLAU MOUNTAIN PLANT CLUSTER, AUGUST, 1996 (PUBLISHED BY U.S. FISH AND WILDLIFE SERVICE, PORTLAND, OREGON);
3. RECOVERY PLAN FOR WAIANAE MOUNTAIN PLANT CLUSTER, AUGUST, 1996 (PUBLISHED BY U.S. FISH AND WILDLIFE SERVICE, PORTLAND, OREGON);

P202-2

A great deal of information on the subject of water quality is available to the public in widely published reports by public agencies. The EIS provides some information about the existing groundwater conditions in the project region. For example, groundwater beneath SBMR has been impacted by TCE from past Army waste disposal practices. As described in the EIS, the Army is addressing this groundwater contamination through long-term pumping and treatment. MTBE is a constituent of gasoline formulations, and was introduced in gasoline to reduce air pollution. Stryker vehicles operate on diesel, rather than gasoline. Diesel fuel does not contain MTBE.

P202-3

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

Comments

Dear Ms. Barger

Letter
P203

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. I oppose the Stryker Brigade expansion in Hawai'i.

P203-1

P203-2

P203-3

I also have concerns about (1) the cost of clean-up to be paid by future generations; and (2) the relatively short comment period.
 Make for considering my views?

Re: Draft EIS (Stryker Brigade)

Dear Ms. Barger,

This comment is in response to Colonel David L. Anderson's postcard of 4 November 2003. In that communication, Col. Anderson acknowledged my concerns about long-term environmental damage by the proposed Stryker Brigade Combat Team in Hawai'i. And he invited additional comments on The Draft Environmental Impact Statement "Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawaii."

If the Department of Defense (DoD) proceeds with the proposed Army Stryker Brigade, does this decision respect the rights of unborn generations? DoD experiences with extended live-fire exercises on three islands in the Western and Central Pacific leave me skeptical. These three cases are as follows:

- 1) In Okinawa, Japan, many land parcels occupied by U.S. military facilities since the 1940s and 1950s still may not be returned to their individual lawful owners (even if the DoD wished to do so) because undiscovered unexploded ordnance renders these areas unsafe for agricultural, industrial or recreational use by Okinawan civilians.
- 2) Despite the Navy's clean-up efforts, Kaho'olawe Island will likely be recovering from a half-century's live-fire and bombing damage for decades to come.
- 3) Recently local journalists have reported that 105 mm and 75 mm artillery cannons, mortars, bazooka rockets, rifle grenades and other weapons fired in Waikane Valley in Windward O'ahu during a thirty-seven year period (1939-1976) have rendered Waikane Valley unsafe for U.S. Marine Corps personnel training missions. (See Gregg K. Kakesako, "Waikane Valley Plans Dropped; The Marines Cite Safety Concerns in Deciding Not to Use the Valley," *Honolulu Star-Bulletin*, 13 November 2003, online edition, <http://starbulletin.com/2003/11/13/news/story1.html>.)

Lack of foresight imbedded in the history of those experiences suggests that introducing a Stryker Brigade on O'ahu or on the Big Island is to limit the environmental prospects of future generations.

Mahalo for considering my views.

Sincerely,

Vincent Kelly Pollard

"The views of nature held by any people determine all its institutions". Ralph Waldo Emerson

Through the years we have come to know the military institutions in Hawaii quite well through the bombing of Kaho'olawe, the fires at Makua, waste from nuclear powered submarines dumped in Pearl Harbor, oil spills, sonar effects on whales and seals and other environmental mishaps. The military has not always been a good citizen nor a good caretaker for this fragile eco-system we call home. You now come asking to acquire 23,000 acres on the Big Island and 1,400 more acres added to the 27,000 acres at Schofield Barracks to accommodate 310 new eight-wheeled Stryker combat vehicles. Is there **no** end to the appetite of you people? You tell us we need you because you will create jobs in a distressed economic time. You do not tell us about the disturbance you will bring us with an increase of military personnel, the destruction of habitat that will effect water, land, biological resources and the archeological cultural sites of great importance to our first people the Hawaiians.

P205-1

P205-2

P205-3

Who pays for this for the future? The \$693 million is just the beginning. We will be paying for this and more and when you are finished. Then you will be coming back to ask our children to pay.

I say no, no way. Go back to Pennsylvania and let the people there learn about your destructive ways. We in Hawaii have had enough.

EIS Stryker Brigade

Dear Senator,

- P206-1 | We are opposed to the Stryker Brigade coming to Hawaii. Over the years while you have been in office you have benefited Hawaii. At this time it is important to look at the overall picture of the Hawaiian Islands. Things are changing. We are being overrun with people from the Mainland and Worldwide and life is becoming more and more difficult as land prices soar for the Native People and long time residents who are priced out of the chance to have a home. The Brigade will bring more families and add additional burdens on land use. Every acre of land that is taken out for use by the military makes it harder on the local people.
- P206-2 |
- P206-3 | It seems to me that Camp Pendleton with its huge acreage of under used land could serve as a headquarters and help California with its budget difficulties. I would certainly help alleviate the burden on the taxpayers if the Brigade were kept on any one of the bases in California. Hawaii's finances are improving. Let's save the beauty of the Islands for the residents and the tourists.

Sincerely,

Marilyn & Ed Pollock
Box 312

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. Chapters 4.2, 5.2, 6.2, 7.2, and 8.2 - Land Use/Recreation discuss the impacts of the project on land use.

P206-3

As discussed in Section 1.6 of the Final EIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th ID(L) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID(L) is charged with deciding how best to achieve that directive and provide for military training, readiness and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, an on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D).

Aloha,

- P207-1** | Please extend the duration of the public hearings on the above matter from 45 days to 120 days. I feel strongly that we as the residents of Hawaii need at least 120 days just to evaluate this issue.
- P207-2** | The residents of Hawaii are very tired of the military's record of environmental abuse and accountability. We are also increasingly concerned about unjustifiable restrictions to OUR beaches and outright confiscation of not only public beach access but also of residents actual land!
- P207-3** |

As a taxpayer I expect to be fully informed on exactly what the military is planning to do.

Thank you,

Mrs. Jenifer H. Prince

P215-2

P215-3

WHAT funds will be allocated to
Health SERVICES to AFFECTED Communities?

Responses

P215-1

Perchlorate was included in the analytical suite for the soil samples collected from the ranges at PTA and SBMR. Perchlorate was not detected. The results of the soil investigation are presented in Appendix M-1.

P215-2

Transformation of the 2nd Brigade would not result in significant dust generating activities in the Waianae area. Dust generated at SBMR would be controlled through a combination of dust control chemical applications and/or the potential use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

P215-3

As discussed in Section 4.12 and 4.14, the Army has determined that the Proposed Action will not have a significant impact on human health and safety hazards or on public utilities and services. In addition, it is not standard practice for the Army to allocate funds to health services outside of the military services programs.

COMMENTS:

P215-5

Will Air Quality Be tested before
during & after training?

P215-6

Ongoing air Quality testing for
contaminants entering the Waianae Community?

Responses

P215-4

No studies are scheduled for the Waianae community as they are outside the ROI for Public Safety and Health Hazards evaluation.

P215-5

The Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Army has no plans for any other air quality monitoring at training areas.

P215-6

The State of Hawai'i does not have any air quality monitoring stations in the immediate Waianae vicinity. The closest monitoring stations are in the Barber's Point area at West Beach, Makaiwa, and Kapolei. The Army has no plans to monitor in Waianae as part of this project.

Subject: Military Occupation Not Authorized

This e-mail goes out to anyone with a normal brain, because it seems to me that most 'Americans' and there supporters that support occupation and illegal immigration into the Hawaiian Islands cant hear or don't have a brain.

This information is meant for our Hawaiians/ Kanaka Maoli, families, friends, all Countries/ Nations to see and to be aware of the documented deviance, fraud, conspiracies/TERRORISM on record which affected/affects Hawaii and the World today.

P216-1

Your millitary expansion is unauthorized and the people dont want it! The only people that have ever terrorized me, my lands and fellow Hawaiians and our supporters have been the U.S. Millitary, Honolulu and other Police agencies around hawaii, City & County of Honolulu and other so called county governments, State of Hawaii and others whom where formed after 1893 and the illegal overthrow!

Joseph Rodrigues
Kapahulu, Hawaii
Hawaiian Nation (Occupied Status)

P216-1

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

Letter
P217Testimony of Noelle Rodriguez, Ph.D.
Sociology, Hilo CC.

There's an enormous temptation for Americans to view the expansion of the military as an increase in our collective security. The sacrifice of \$300,000,000 and 23,000 acres might be worth it if it were a genuine and needed contribution for our protection as a nation. The temptation is to trust the military experts and the judgment and intentions of the Bush administration. That those in charge are good and wise. That we can relax and trust them.

But the legitimacy of the military (and the Bush administration) is in shambles on this island—and in the world. This delegitimation is a result of years of abuse by the military. The outrage that the ^{many} military dump sites have not been cleaned up is enough to turn us against the idea that the military are responsible or concerned with our protection. But add to that the ^{secret} test sites of chemical and biological weapons that made us into guinea pigs in the 1950s, the 1960s, the 1970s and who knows what they've done that's still classified.

Responses

Comments

But add the deligitimacy of the actions of the Bush administration that in the last 3 years have meant great losses in America's wealth, moral integrity and global reputation.

The invasions and occupation of Afghanistan and Iraq have not only not furthered America's security — they have obviously fueled the fires of terrorist rage. That has put Americans in great danger — Then why did we do it? It deflected attention from the Saudi Arabian sources of 9-11 terrorism and the appalling connections between the Bin Laden family and the Bushes.

The Iraq invasion was the shameful opportunism using 9-11 to justify the imperialist intentions of the neo-conservative's New American Century statement. Pure imperialism. ~~A~~ Cynical players, only interested in the corporate plutocracy, these neo-conservatives who are running the nation are undermining Americans.

The Bush administration has not shown respect for the well-being of the American workers — they increasingly grow impoverished. And even the military has been mistreated by this administration.

Comments

Responses

- The Bush administration has cut back medical treatment for reservists in Iraq.
- The Bush administration has cut back on hazardous duty pay for the military.
- The Bush administration has held back body armor for our troops in Iraq.
- And the Bush administration's tax plan does not give tax child allowances which impacts on the very low paid soldiers.

No - we do not trust the military
No - we do not trust the Bush administration
No - we do not want the strykers on our island.

Thank you!

Letter P218

Aloha,

My name is Nani Rogers and I live on Kauai where our lives are being impacted by U.S. military presence, i.e., the Pacific Missile Range Facility (PMRF) and Koke'e Satellite Tracking Station, making us a potential target island in any aggressive act against the United States and its military forces.

I have been made aware of your Draft EIS on proposal to bring a Stryker Brigade to Oahu and Hawaii island. I also have been made aware that you will not be holding any hearings on any of the rest of the islands that will definitely be impacted, and not just Oahu and Hawaii island! Your process is flawed because of that.

P218-1

After reviewing the EIS and its 3 volumes, I feel that it is unfair that we are given more time than 40 days to make comments or ask questions. I hope that you will understand this concern and agree with us. All we are asking is for the comment period to be extended to 90 days. We understand that this request has already been made by the Sierra Club. We support their request.

P218-2

Also, for the record, I am against more land grabs of acres and acres of our lands, my objections are based on all the present damage and desecration already done that we all still need to deal with. You should clean up your mess first, before expanding your damage to our lands any further.

P218-3

I object to your EIS proposal for Hawaii to undertake the impacts of bringing your Stryker brigade here. There is not enough studies done in your

P218-4

EIS to address our cultural concerns and responsibilities to the health of our lands and our people. Please take your training and bombing exercises some place else....please

P218-5

Can you or would you support these request? I will be anxiously awaiting a response to my questions and concerns from you.

Sincerely,

Nani Rogers

P218-3

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

P218-4

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process

P218-5

The Army is receptive to receipt of any additional information as part of their ongoing management efforts. We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process

Responses

P219-1

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am. At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs. It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

Subject: STRYKER BRIGADE

P224-1

My name is Leilea Satori a resident on Maui Hawaii. I'm writing to ask that you please extend the comment period of the ENVIRONMENTAL IMPACT STATEMENTS (DEIS) FOR THE STRYKER BRIGADE COMBAT TEAM (SBCT) from the minimum 45-days to at least 90 days so that the community has adequate time to review this 1,000 page, 3- volume document and thoughtfully respond. The deadline for comments is Nov. 19th
Thank you. Leilea Satori

Responses

P223-1

These concerns have been noted. However, available data and analyses indicate that PM10 is the only air pollutant with the potential for creating violations of state or federal ambient air quality standards at PTA. The potential for air quality problems associated with fugitive dust at PTA can be mitigated in a manner that avoids violations of air quality standards. The Army would implement an Off-Road Maneuver Dust and Soil Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

P224-1

The comment period was extended to 90 days and ended on January 3, 2003.

P231-2

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

Comments

Cindy Barger,

**Letter
P232**

A quick question....yesterday I received from you a draft EIS in conjunction with proposed 'Stryker' training on several locations in Hawai'i. How and why have I been sent a copy of this report?

P232-1

Aside from not knowing (or remembering whatever the case may be) how I ended up with this (well written and researched) report, I do have some very serious reservations on what the US Army (hence the Federal gov) is planning on doing in any event. I am a Kanaka Maoli from Hilo, Hawai'i, and a Kamehameha School graduate. I am most concerned about the present condition of Pohakuloa, and any future plans which continues to destroy our lands, some of which are very sacred to our Hawaiian heritage.

I will comment formally over the next week or so. Your intro indicated a deadline for comments of 19 November 2003.

I am now resident in London, England where I work for an international organisation. I do return home each year to the Big Island where a group of us do hike (huaka'i) the trails of Mauna Kea and Mauna Loa. Last year we were escorted through a portion of Pohakuloa by the base commander on our way to Kiholo after climbing to the summit of Mauna Kea from a starting point on the Hamakua coastline.

We all love the land, we are part of it. Without our land and ocean we are basically nothing! This is something which you and others are unable to comprehend. Everytime a bomb is dropped or howitzers fire live projectiles, it is destroying our land. The very frustrating thing is the military is consistently BAD at cleaning up their mess.

The recent fiasco in Makua Valley is just another event which clearly indicates to the local people, the ones who care that is, that the military has no concern for domestic issues in conjunction with any of their operations throughout Hawai'i. The US Army's strategic plans mandate creating the infra-structure within Hawai'i to facilitate personnel and training of the Stryker machines. Regardless of what public sentiment may be against these plans, the project will be implemented nevertheless.

Sincerely,

Kawaipuna

Responses**P232-1**

Thank you for your comment. The impacts of this project on cultural resources at Pōhakaloa are included in Section 8.11.

Comments

- Letter** Cindy,
P233 Very glad this extension has been provided to all concerned parties.
- P233-1** You must now realize that people are against the army's plans of SB intro into the Hawaiian environment. Where are you from? What if this very same exercise was happening in your own back yard. How would you feel? There is much more land on the continent which would be far better for training exercises.
- P233-2** I continue to be very upset and frustrated over WHY the military continues to use our lands for war games. Hawai'i has such a limited supply of land, and much of it has very special and significant meaning/value for us as Hawaiians. You're destroying everything you touch. SB practice on the Pohakoloa station will increase the damage to the aina which has already been going on for years. That whole area up on the slopes of Mauna Kea is a disaster! And if you left tomorrow the land would not be much good in its current state. It is dangerous and polluted from military munitions training.
- P233-3** One other point. You and your group are holding these so-called community gatherings to obtain input, but just last week the SB financial package was approved and passed in Washington! Don't know why you're even bothering with any further community meetings...the decisions have already been made. You must think we are ignorant when it comes to the tactics being deployed, and the political implications.
- P233-4** Look at the land, understand our relationship with it and you'll then understand why we DON'T WANT THIS PROJECT TO GO AHEAD! It is our land. But then as a people we are not high on the military's list of priorities, our concerns do not form part of your strategic intent, and you will continue to do exactly what you want to, when you want to and how you want to. We (Hawaiians) are a disturbance to your plans, and I'm sure that if it was politically acceptable you'd rather have us all one island behind a string of barbed wire looking out at the world while you and your military machine continues to destroy and pollute our 'home'.

Damn it I'm upset!!

Kawaipuna

p.s. let me make a few more points so you don't think I'm just some Hawaiian who was born yesterday. I spent my military with the USMC. First Forest Recon to be exact....I served 2.10 years in VNam, trained on Okinawa for additional 'skills development', got all the awards including a Purple Heart with 2 clusters, etc., etc. So I know the military, and not much has changed except for my position on its presence in my home arena. I have been and continue to be heavily involved in strategic marketing, and I have several degrees all at master level. I am a graduate of the Kamehameha Schools, and I was born and raised in Hilo, Hawai'i (a short step from Pohakoloa!). I would like nothing more than to see your backs as you leave Hawai'i. And more and more people are beginning to feel the same way.

If Dr. Kekuni Blaisdale has the intestinal fortitude to stand up to your plans, then you must surely realize that for a man of his professional standing in the community making the sacrifice he did on your first meeting has got to bring home a very serious and unavoidable message to you and your superiors: we don't want the SB in Hawai'i; take it elsewhere.

Please understand, you are polluting/destroying our land. And don't give me the excuse of how the SB project falls into a greater picture which is more important than a few people. I'm not sure that sacrifice is one I am willing, along with many, many others, to make at this point in my life. Certainly not when it hits at the very heart of Hawaiians, the land and the sea, our maunas and the destruction which is an ongoing and consistent program with the military.

P233-3

Although the Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2nd Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2nd Brigade, 25th ID(L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law.

Cindy,

Letter
P234

Mahalo for the advisement.

On a related subject I have recently heard of a commercial put out by the military (USMC I believe) which illustrates a group of [marines] charging Mauna Kea with one individual clearly holding some explosives in his hand. Many people are very upset with this...the implications are clear: the perception from the local end is no respect for us nor our land...you are willing to destroy 'at will' what is a permanent part of all Hawaiians' lives: our maunas, especially Mauna Kea. Long-term when you eventually pull-up stakes and leave, the land will be so riddled with dangerous munitions, so damaged with years of extreme mis-treatment so as to render it useless for us for many years. I'm not sure you understand, or maybe you do, the long-term implications of your actions in the here and now. And if indeed you do, then this increases the severity of your actions to the full extent of a played out human tragedy, Hawaiians losing out yet again in their attempts to voice and act on issues which severely influence their way of life. The military's EIS does not cover adequately, accurately, nor include the necessary scope which would then provide the true picture of what is going on on most of our lands currently under military 'occupation'.

P234-1

Also recently I have received word that people are hearing construction type explosions up near the base of Mauna Kea. What is going on in this case? If the military is in the process of constructing some type of underground gasoline bunker, or armory, then this should also be included in the EIS document? [We should have full visibility on whatever you're doing on our lands] I do and many of my peers feel the same way as well. Matter of fact now that we have the 'scent' of yet a further EIS issue, I am assured that the proper questions will be asked/tailed during future SB public meetings. Expect this information to be exploited on our end.

P234-2

P234-3

I continue to become more and more concerned over the lack of understanding of the military in what 'you' are proposing and the environmental impact of these machines upon OUR LANDS. The spiritual

P234-4

side is even more profound and I wouldn't expect you to understand the ramifications in this area, however I would expect you to at least, in the minimum, to respect our heritage and culture which apparently you don't.

Kawaipuna

P234-1

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore, approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

P234-2

All projects associated with the proposed transformation are included in Table 2-4.

P234-3

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. Chapter 4 of the EIS discusses the environmental impacts associated with the proposed action.

Fort Shafter, HI 96858-5440

ATTN: CEPOH-PP-E

Dear Ms. Barger:

Thank you for this opportunity to offer comments on the Army Draft EIS for the Stryker Brigade in Hawai'i. Actually, I find it impossible to address the particulars of the EIS because I totally

P237-1

- reject the plan of Stryker Brigades and
- reject, therefore, stationing a Brigade in Hawai'i.

I have read that the Bush Administration is carrying out a fundamental shift in national defense from a "threat-based strategy" to a "capabilities-based approach." Rather than organizing the Armed Forces to counter specific military threats against identifiable enemies, the United States now seeks to defeat any conceivable type of attack by any adversary at any point in time from now into the far-distant future. President Bush has stated that "America is following a new strategy. We are not waiting for further attacks. We are striking our enemies before they can strike us again." (Honolulu Star Bulletin, 10/17/03) Pre-emptive strikes can only be interpreted to become perpetual war, and the Bush Administration is operating in pursuit of permanent military supremacy.

These Hawaiian islands are strategic, yes, but let it be said over and over again that this is the homeland of the Kanaka Maoli, whose independence as a sovereign nation was stolen by the United States. It is unconscionable that the U.S. has not only occupied and used vast quantities of another nation's lands for its own military purpose and now plans long term use to pursue permanent military supremacy. The President says, "We will not be permanent peacekeepers. This is not our strength or our calling." No, U.S. military forces must be "agile and lethal." How can he or any other American who hears this say, "God bless America."

It is insult and injury of the highest order upon the Hawaiian people whose spirit is of Aloha. If you can resonate with anything that has been said, don't you feel a gut-wrenching hurt?

I say to us all, "Resist." Refuse to support the strategy of military "transformation" designed to destroy all life, except those who have wealth. The growing disparity between the rich and the poor in the world calls us to transform the world in ways that preserve life and liberty for all people. That is the American ideal by which we were raised. Let us not destroy it.

Respectfully,

June Shimokawa

Responses

P237-1

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

Subject: Comments Regarding Stryker Brigade & Military Expansion

ATTN: Miss Cindy Barger

Aloha,

I'm grateful for the opportunity to provide comments regarding this highly impacting proposal. This has a double sword effect on me because I served in the U. S. Coast Guard and I'm very proud and tuned in to my ancestors, heritage and culture.

I served about 10 years active duty in the Coast Guard and in my tenure I earned the highest and most prestigious medal that you can obtain. It's also the mission statement of this branch of service and I proud to say that I am (1) of only about 150 Coast Guard's Men to receive this honor. It is the COAST GUARD MEDAL earned for extreme heroism during a Search & Rescue (SAR) mission and is in same standing as a Bronze or Silver Star, Navy Cross, Legion of Merit and many other known decorations.

I understand readiness and necessity to train however, given the proposal to expanding land acquisition leaves me with great reservations due to the already enormous land assets that the military already has.

Having said this I now address my heritage side. Despite my feelings of both good and anger, the problem starts within my Ohana and I can't totally channel it to the military however, that doesn't mean that I totally forget the military.

I am here to provide comments on a specific project named DMR but will always be called by it's rightful God Given and family name called KAWAIHAPAI.

This is the beginning of my beloved Grandfather (David Peahi Keao Jr)'s family. In 1850 during the time of the Mahele my Great-Great-Great-Great Grandfather Isoba Keahilele formed a hui (group) and brought land from King Kamehameha III and was awarded as an original patent. Thru generations my ancestors practiced Malama Aina and it flourished richly up until the time during the time and tenure of my Great-Great Grandfather (Kaaemoku Kakulu) who was the KONOHIKI of Kawaihapai. As previously mentioned, both the KAI & AINA produced

Responses

Comments

bountiful food substance. My Great Grandmother (Clara Napuakekau Kakulu) was a very special keiki (child) of which she was a great beneficiary and owner of several pieces of land within Waialua Moku. Much GREED & JELOUSY evolved within her Ohana to conspire to take away and erase her and her father Kaaemoku Kakulu. The outcome was devastating to both. My Great-Grandmother became an out-patient at Kalihi Hospital while years later her father Kaaemoku Kakulu had the aina he loved greatly taken from him which was prior to WWII. He was never allow to even visit his land again.

My Grandfather was raised at Kawaihapai and gained much from his Grandfather. These included Fishing and Kalo cultivation.

He was awarded the Silver Life-Saving Medal from the Commanding Officer of Schofield Barracks in 1940 for rescuing an infantryman from drowning at Kawaihapai Beach. Also he helped build the airfield and was well known in the community for his carpentry.

Prior to land acquisition of Kawaihapai, the Bishop Museum in 1933 (Archaeology of Oahu/McAllister) and 1940 (The Hawaiian Inter/Gandy) interview my Grandfather's Father (David Keao), Grandfather (Kaaemoku Kakulu) and Grandmother (Annie Keahipaka) and was later consulted by Bishop Museum in the early 1990's for information about Waialua and Kawaihapai.

This tells me that the military was well aware of the Hawaiian Historical , Cultural, Spiritual and Geographical features of Kawaihapai prior to western habitation and military occupation.

Furthermore, I believe that the mana'o shared by MY KUPUNA were ignored which resulted with desecration and included burials of some are my ohana.

I'd like to note the Bishop Museum is supported by the Lovell Dillingham Trust,

It wasn't enough to acquire and desecrate sacred aina but to replace it's geographical identity similar to adoptions when Hawaii was a Territory.

This showed me the Political, Social and Racial Prejudice of an entity that I have served proudly.

I promised my Grandfather to make things PONO and that is why I waited and is now law to activate the airport's Rightful & God Given name KAWAIHAPAI AIRFIELD in honor of not only my Kupuna but all that lived at Kawaihapai. This is an excellent opportunity for the Army to make things

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-643

Comments

PONO.

I continue to strive to make things PONO with the Army and do hold it accountable for their actions.

...ere are also psychological impacts regarding past actions and methods executed for land aquisition. The Kawaihapai Military Reservation (ORIGINAL NAME) was done in a similar fashion thru easements which taspired to a considerable amout of acres.

As stated, training is essental and understand what readiness implies however if this trail must be done then my comments are simple: "STAY ON THE ROAD OR NO ROAD AT ALL"

The existing cane haul roads were originally designed to accomidate the unique Cane Haulers (Turn -A- Tow) which are similar to large earth movers used in minning which is much larger and heavier (approximately 100 tons fuly loaded and 30-40 tons empty) .

The love for my Grandfather and his ancestors great and much signs and messages have been sent from ancestors thru Ke Akua that the connection is there and getting closer to making things Pono is near and THEN AND ONLY THEN will the Aina and Na Kupuna be happy and return to a well served sleep.

Much accidents and incidents have been encumbered for approximately 65 years which resulted in some fatal fatalities. Some others including myself know why.

P238-1 PUT THE NAME (KAWAIHAPAI) BACK ON THE AIRFIELD. RESPECT IS THE KEY. Remeber Sacred Land to Some; Cursed Land to Others.

Lastly I Sincerily and Humbly request from the Army that I be permitted

P238-2 (1) ONCE A MONTH be able to get (1) DOZEN RED GINGERS from Schofield Barracks and or Fort Shafter to take as HOOKUPU for my Kupuna at the Cemetery. This would continue the Pono Process.

Thank you for your time. Malama Pono

Subject: Army Intruding on Hawaiian Lands

Dear Sir,

And I use the above term loosely! I was in the U.S. Army for five and a half years, three and half in Korea. I am extremely patriotic to the goals of this country to help other countries, but also extremely opposed to the desecration and denigration of my homeland. After seeing the devastation and denigration of the Native Americans during the expansion of the "White Man's" country, I feel the same outrage of the white power brokers who think that they have the right to do anything to a peoples who cannot defend themselves--Is this what I went to Korea for? With all the places that are suitable for maneuvers, why is Hawaii the only place to expand their programs. I even remember the degrading and prejudice statement of our president, Bush (senior), who said there was no such thing as Native Hawaiians, that Hawaiians were just a group that someone made up. This is the statement of a leader in these United States, and now they want to expand their destruction of lands dear to us Native Hawaiians. Just imagine if the shoe was on the other foot, and the haoles had to be in the same position of losing their land--there would be picketers, banners, newspaper reporters, congressional hearings, etc. But because we are a dying race, the Army does not give a rat's a__ about all the protesting. Read our History and know why there is resentment from the Native American community. You haoles feel "we are more powerful than anyone" so let's do what we want to do!! If it comes down to choosing, even though I have fought for this country, I will side with my people, the Hawaiians and the Native Americans every time. Even now as the Native Americans are reaping the benefits in the casinos on their lands, there are powerful "white men" who are extremely jealous and want to take it away from them.

As my children grow up in this perverse society, I hope I am teaching them the difference between right and wrong, and the difference between patriotism and greediness, the difference between the white man's aggressiveness and allowing people to grow unopposed. We all know that the powers in Washington ignore the will of the people and do only for the rich and powerful. Even our so-called Secretary of Defense is siding with the white power structure.

P244-1 As a last statement, with many of my comrades from previous wars in my family, DON'T EXPAND YOUR WAR MACHINES INTO NEIGHBORHOODS OF MY NATIVE HAWAII! If you take a poll right now in Hawaii, you will be shocked to see that even non-Hawaiians will vote against YOU! Why don't you use the vast open lands in California or even TEXAS, or NEW Mexico to expand your project. You need to read the outlandish reasons Hawaii was annexed to the U.S., but the real TRUTH, the real reason, IS MONEY GRUBBING HAOLE(S) (not to protect the Islands). Now, you want to aggrandize the disenfranchised Hawaiians away from their "aina" (land) just as you did to the poor Native Americans. Most Hawaiians have no love for the power grubbing haoles and this will only aggravate the situation. The U.S. Army has never, ever kept their treaties with any disenfranchised groups throughout history, DON'T DO IT AGAIN!!

As it is written on our crest, "Ua mau ke ea o ka aina i ka pono" The life of the LAND is perpetuated in righteousness, not expediency. Stop destroying the LAND (aina)!!

May God show you the right path to choose for the people and not for the ARMY!!

I'm not sure if this is where comments are made? If not I would appreciate my comments be forwarded to the right entity.

P245-1 My name is Robert Soares. I have lived on O'ahu my entire life, or 33 years. Basically I'm opposed to any military expansion in Hawai'i. Since the illegal overthrow of the Hawaiian Monarchy executed with the backing of United States Marines, the U.S. military has done whatever it's wanted here. Hawai'i is so tiny yet bears such an incredible load in relation to it's size, in terms of land given/taken for military uses. Our islands have already lost so many of it's indigenous peoples and endemic animal and plant species to foreign invaders of all types. How much must be lost, how much land must be taken, when will enough be enough? We have finite not infinite resources in Hawai'i. It is not a matter of "not in my backyard," our backyards are full of trash and social consequences caused by the huge military presence in Hawai'i. Kaho'olawe, Makua Valley, and Pearl Harbor are easy examples of places people couldn't or still can't go to. Pollution, extinction, and no access for local residents are easy to appreciate consequences of this huge presence. I personally have not been able to hike Kolekole pass, sunbathe on Kaneohe Marine Corp base, or paddle canoe in Pearl Harbor.

I'm pau (finished).

To the military, legislators, and editors:

P247-1

Hawaii Island has over 50 former military sites. Most contain unexploded ordnance or other hazards. The US Army Corps of Engineers says it will take "centuries" to clean them up at current funding levels. Army actions at Pohakuloa threaten the environment and Native Hawaiian culture. But the Army is pushing ahead with plans to take 23,000 more acres around Waiki'i Ranch.

I live in the Keaau area and have personally adopted the Haena area site. This area is a spectacular piece of coastline complete with a pristine bay and native flora and fauna--including an endangered Nene Area Reserve. All of these old military sites should be cleaned up before any thought of expanding into other pristine and endangered areas.

Please, we need military clean up, not build up!

Letter

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

P251-1

I attended the public meeting in Makaha on Oct 30. While there I had a chance to talk with some of the staff (one on one), but had a difficult time getting a definitive reassurance. They directed me to the EIS web site. I just finished scanning and reading selected sections. I am writing you for further clarification. First of all I do not question the justification for the Stryker training in Hawaii. I am not even sure why you have to go through the lengthy justification. It does not seem to me that these strategic/political arguments belong in an EIS let alone made part of public debate. This seems to be a matter for the Army alone to decide.

This being said I do have questions on the the Army's use of land for training purposes.

P251-2

1) Very little is said about the replanting and rehabilitation of land after being exposed to explosives/fires. I expected much more to be mentioned or referenced in how you will rehabilitate the land.

What is even more troubling is the statement on page 4-55.

"No threat to general public from munitions constituents relate to range use because there would be no public access."

P251-3

It seems to me this is a major part of the army's role. In Bosnia, Afghanistan, and Iraq that is exactly what is being done. Area's that have been exposed to explosives are being rehabilitated. Europe and the Pacific Islands were seriously damaged by explosives during WW2. These areas too were made habitable again. Why then are places like Kahoolawe, Waikane, Makua and Stryker training area not? I expect the army to be able to make these lands habitable. It seems to me that this should also be part of army training.

I expected the following:

-Vegetation should be reasonably restored on a continuing basis.

-Ordinance and explosive residue should be removed on a continuing basis to an exceptable standard.

P251-4

-Public access should continue.

I get no sense of any this from the EIS or from my discussion with staff at the Makaha meeting.

P251-5

2) I saw no mention of Makua in the EIS. Did I miss something?

Please reply or direct me to sources that will address these points in detail.

Responses

Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

P251-1

The Transformation of the 2nd Brigade 25th Infantry Division (L) to a Stryker Brigade Combat Team will require substation construction projects with the potential for significant impacts which require the preparation of an EIS under the National Environmental Policy Act.

P251-2

The mitigation table in the Executive Summary and Chapter 4 outline specific actions the Army could take to address these concerns. Additional information can be found in Section 5.10, 6.10, 7.10. And 8.10.

P251-3

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable

The user wrote:

As a Big Island college student studying in Massachusetts, I both deeply saddened and alarmed to hear news of the immense changes taking place on our island, which has rapidly transformed within the past few years. I have returned home after 4 months away, only to find that the landscape has completely shifted from the one I remembered. More and more tracts of land were recently bought by developers for luxury resorts, turning once public land into a privatized sector which excludes locals from access, and caters to those of higher socio-economic class; chain stores have been constructed in place of our local businesses. The Army advertises that it's intention is to serve both local communities and the nation, yet increasing the size of the already-vast Pohakuloa training area cannot possibly result in anything positive for the island's residents, and will only further exclude and divide the island's residents and lands. Excluding protesters and holding so-called "public!

- P252-1** " hearings already indicates that this decision does not place any priority on the residents. Like the other changes to the island, the expansion of the army's presence in Pohakuloa is unwanted.
- P252-2** Both ecologically and culturally, the training camp will impact an already fragile environment and marginalized culture. While volunteering on Kaho'olawe this past summer, the army's negligence to restore training areas to their previous state was readily apparent. In the EIS draft, it was stated that "reasonable notice is provided to...Native Hawaiian organizations when proposed actions...may restrict future access to ceremonial use of, or adversely affect the physical integrity of sacred sites." This "physical integrity," while perhaps not a priority to the US Army, is a priority to residents who have lived and must continue to live with the environmental and social side effects, and those who place any value on the irreplaceable cultural and aesthetic resources that will be irreversibly impacted by the Army expansion.

Thank you, Aileen

Responses

laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

P251-4

As summarized in Section 4.2, the Army proposes to continue to work with the public on public access as safety and mission allows. As summarized in Section 4.10, the Army continues to implement measures to stabilize sensitive species habitat and will incorporate requirements from the Biological Opinions issued by USFWS. As summarized in Section 4.12, the Army will clear UXO prior to construction activities and will manage training lands in compliance with regulatory requirements, clearing UXO after training events as appropriate.

P251-5

SBCT training requirements are not dependent on the use of the Makua Military Reservation (MMR). While MMR is an integral part of USARHAW training capabilities and historically used by other services, SBCT units could perform dismounted CALFEX training at other ranges. This is discussed in Chapter 1. SBCT may use MMR if the range were available only after completion of the Makua EIS and ROD. The Makua EIS will analyze the potential environmental impacts associated with dismounted CALFEXs for both Current Force and SBCT; therefore, this SBCT EIS does not analyze training impacts of SBCT at MMR.

P252-1

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs.

Comments

Responses

All individuals were advised that they were welcome to enter the facilities without the signs.

It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu’s prosecutor and all charges were dropped against individuals involved in the situation. All of the individuals who were arrested had the opportunity to participate in subsequent meetings and most of them attended and provided public comment.

P252-2

Chapter 4.8 summarizes the impact of the Proposed Action at PTA and surrounding areas.

P252-3

Please see Section 8.11 for a discussion of the impacts of the Proposed action on cultural resources at PTA. Kaho‘olawe is a Navy project. For more information please contact the US Navy and the Kaho‘olawe Island Reserve Commission.

To: sbct_eis@poh01.usace.army.mil
Subject:

Please include attachment as my comments to the SBCT DEIS. Thank you.

COMMENTS ON SBCT DRAFT EISJanuary 2, 2004

- P253-1** 1. Page 8-1: Runway Upgrade/Extension, Bradshaw Army Airfield. Runway will be extended from approx. 3700 ft to 5600 ft. Page D-48: Figure D-24 indicates a primary surface width of 1000'x4200' with clear zones of 1000'x2500' at both the east and west end of the primary surface. Page 8-45: Change in Enroute...The proposed new runway will require clear zones. People intensive uses are to be discouraged. This should not preclude public game bird hunting.
- P253-2** 2. Page 8-4: Training: SBCT training is scheduled for 180 to 242 days annually. This does not account for additional units of the 25th Div (L), Marine Corps, National Guard, Army Reserve, and the SBCT unit in Alaska. How many days are really available for public hunting? Table 8-1 also does not address the above. There should be a practical minimum of public hunting days, which also addresses the main purpose of the military training.
- P253-3** 3. Page 9-17: Saddle Road Realignment: The areas in close proximity to PTA are recognized as major public hunting areas. Page 8-8: Public Scoping Comments: DEIS does not adequately address stated concerns brought up at the Scoping Meetings in the area of public hunting, animals in relationship to loss of habitat, and the effect of flight patterns on game animals.
- P253-4** 4. Page 8-10: Figure 8-1: The DEIS does not address the simultaneous use of the Pu'u Pa Maneuver Area with WPAA and PTA. If this is a possibility, then it should definitely be addressed in the cumulative impact section of the DEIS.
- P253-5** 5. Page 8-16: It appears public hunting access to the training area is limited to the year 2006. Yet in the scoping meetings and informal meetings, every indication was that public hunting would be allowed with no time limit. The DEIS should clarify this.
- P253-6** 6. Page 8-16: When specifically is access to the military training area allowed for dog training?
- P253-7** 7. Page 8-17: Table 8-5: Archery is generally not used for bird hunting.
- P253-8** 8. Pages 8-27 and 9-21: Conversion of Agricultural Land to Training Land: It is not appropriate to negotiate the continued use of grazing WPAA with a single private entity. If anything, grazing rights should be bid competitively, should the Army be successful in the purchase of the WPAA parcel.

Responses

P253-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process

P253-2

Hunting access is based on mission activities at PTA.

P253-3

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process

P253-4

Pu'u Papapa will not be used for maneuver training. It is off limits to off road maneuver use. After it has acquired WPAA, the Army plans to construct about 28 miles of gravel training roads, the location of which are as yet undetermined. The Army would comply with all applicable environmental statutes, including but not limited to NEPA, the ESA, and the NHPA, in determining the location and potential impacts of these roads before construction, The Army would also consult with adjacent property owners and other interested parties on the location of the proposed training roads in order to address and resolve potential air quality and dust concerns.

P253-5

Public access policies and procedures are developed as part of a five-year review and evaluation period to determine continuity of policy. The EIS has been revised to note this.

P253-6

Any public access to Army installation lands would be mission dependent. Please contact the PTA PAO for information on public access to that installation.

P253-7

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process

Comments

- P253-9** 9. Pare 8-29: Impacts on...Land use. There should be additional public hunter check in stations for the expanded WPAA/PTA area. At present, there is only one check in station from public highways, at mile marker 36. The hunting areas would start at mile marker 30 on Saddle Road and would continue to the western end of Saddle Road (mile marker 54), then continue from mile marker 6 on Mamalahoa Highway westerly to mile marker 14. This is a total of 32 miles with only one check in station.
- P253-10** 10. Page 8-43: Military Training Routes: There are no formal published aircraft training routes in the PTA air space ROI. There should be some established criteria, such as those established Wakii Ranch, to mitigate aircraft noise in the adjacent State Game Management Areas.
- P253-11** 11. Page 8-45: Change in Enroute....: During the public scoping process, it was stated a number of times, that VFR was to be used by aircraft using BAAF. There has been no justification in the DEIS to using IFR, and it should be addressed.
- P253-12** 12. Pages 8-53 and 8-111: Additional Mitigation 2: Reseeding of WPAA is proposed as a mitigation option. Yet in Page 8-105 and 8-106, revegetation at adjacent PTA has been determined unsuccessful. There should be consistency in the mitigative alternatives.
- P253-13** 13. Page 9-22: Cumulative Impacts on...Recreational Land Use: The impact of the Saddle Road Realignment and the BAAF expansion should be included in the EIS.
- P253-14** 14. Page 9-31: Water Supply: The DEIS does not quantify what the total demand will be at PTA, including potable water needs for the troops in the cantonment area. It also assumes water to be continued to be trucked to PTA, and all water comes from areas that have abundant freshwater. This is not true if the source of water is from Waimea or Waikoloa. Page 8-87: Groundwater: The section does not adequately address ground water resources. There is basal water. A comparative cost analysis should be made to determine the economics of ground water pumping versus hauling water at a minimum of \$30 per thousand gallons. Adequate quantities of water is a prerequisite of the successful use of PTA and WPAA.
- P253-15** 15. Pages 8-67 and 8-72: Noise from Vehicles and Aircraft: The section should address the impact of noise on game mammals and birds thoroughly.
- P253-16** 16. Page 9-41: Impact on Terrestrial Wildlife: The DEIS states noise levels are not expected to increase to such a degree that it would be harmful to terrestrial life. Activities limited to this area would most likely affect nonnative species adapted to stressed or nonnative environments. There is no scientific work that can justify these statements in a military training environment.

Responses

P253-8

The WPAA is used primarily for grazing, and the Army may continue to make it available for such purposes pending training schedules and negotiations with local ranchers.

P253-9

The Army and the Department of Land and Natural Resources will work together to develop better hunting access if the proposed action is implemented.

P253-10

As stated in Section 3.4.2, Aviation Safety subsection, all aircraft would follow local flying rules issued by the installation commander. Noise abatement, fly-neighborly policies, or other safety considerations factor into these rules.

P253-11

This section addresses instrument approach procedures for those situations where IFR would apply.

P253-12

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. Mitigation measures that have been proposed can be found in the Executive Summary, Chapter 4, and the various sections of Chapters 5, 6, 7, and 8.

P253-13

The Saddle Road Realignment project is discussed in Chapter 9 - Cumulative Impacts. The Bradshaw Army Airfield expansion is part of the Proposed Action and is included in Chapter 8 - Pōhakuloa Training Area.

P253-14

The increased demand on the PTA water supply would be approximately 8,500 gallons per day, which is well within the range of water currently supplied by trucking in from Waimea. The Army has in the past considered drilling a well to supply water for activities at PTA, however the cost of such a well was found to be prohibitive.

Sent: Wednesday, October 29, 2003 5:09 PM

To: SBCT_EIS@poh01.usace.army.mil

Subject: Stryker public hearing

Cindy Barger,

P254-1

Please extend the comment period from the minimum of 45 days to 90 days so that the public has time to review the large Draft EIS regarding the Stryker Brigade in Hawaii.

Sincerely, Gabriela Taylor

5620 Keapana Rd. Kapaa, Hi. 96746

Responses

P253-15

As discussed in Appendix H1, noise by itself rarely has much effect on terrestrial wildlife. Terrestrial wildlife are much more sensitive to visible activity than to noise. Unless specific noises become associated with direct harassment or harm, most terrestrial wildlife ignore common noise sources.

P253-16

The Army has conducted several studies to determine how training activity noise affects endangered species. One of those studies involved the endangered O'ahu 'Elapaio at Schofield Barracks. The study (VanderWerf et. al. 2001), conducted with review by the US Fish and Wildlife Service, found no impact on the behavior or breeding success of birds which nested in close proximity to artillery firing points at SBMR.

P254-1

The comment period was extended to 90 days ending January 3, 2004.

P255

My name is Stephen L. Thomson. From 1967 to 1969, I was serving in the U.S. Army as an Officer with the Third Armored Cavalry Regiment. I was responsible, among other duties, for the maintenance of our armored equipment which included 9 M-60 tanks, and 9 M-114 Personnel carriers. I have extensive experience with the damage that track equipment can do to the natural landscape and terrain. I have seen the damage to the environment that the military inflicts on any environment that involves the testing of heavy equipment and munitions.

I am all too aware of the attitude of non-concern that is present in the military mindset in regard to the consequences of the field testing of heavy munitions, maneuvers, equipment testing, troop training. The military has a dismal record in this matter. Promises are made that are insincere in the full awareness that these promises for environmental protection and responsibility will not and cannot be met. The consequences of extending the available terrain by 23,000 acres is a matter of the greatest concern to me. This area is a World Heritage Site. That should be enough reason, in itself, to deny any expansion in this matter. These are the two largest volcanoes on Earth, and considered to have the highest meaning and significance to the Hawaiian culture. This is seen by them as an act of unimaginable barbarism and non-concern for what is sacred to them. The fact that this issue is seriously being debated and considered, is a matter of shame, insensitivity, and irresponsibility to all those who are involved. The consequences are monumental. The issue is simple. The decision that must be made in this matter is to deny the military permission to further expand its testing of equipment, and to consider how all testing of munitions and equipment may be brought to a halt on a "World Heritage Site." This means that it is a sanctuary that is the responsibility of humanity for stewardship. This is the meaning of the designation, "World Heritage Site." How then, can such a matter even be seriously considered and debated? This is the real question that I would ask you to ask yourselves in this moment.

These words are being read by a member of Global Hope due to my inability to attend this evening's assembled forum.

Thank you for your time and consideration.

Stephen L. Thomson
Assistant Instructor, Hawai'i Community College
email: thomson@hawaii.edu

P255-1

The proposed lands to be acquired are not part of a World Heritage Site. The Hawai'i Volcanoes National Park is listed as a World Heritage Site. The EIS evaluated the impacts of this land acquisition.

1450 Aala St. #2204
Honolulu, HI 96817

October 30, 2003

Lt. Col. Anderson
25th Infantry (Light)
Schofield, HI 96857-5000

Dear Col. Anderson:

It seems that our military has become an empirical force separate from the people; an entity that makes its own rules, lives by its own will and stands outside the law of the people who pay the taxes for its existence. It commands its own land, housing, stores, transportation. It can destroy life, botanic or otherwise, both abroad and at home with only the minutest input from the people.

It appears as an empire growing in size and strength and threat to the entire planet. You confiscate land for maneuvers, to practice war games and leave the land ravaged, polluted and dangerous.

It all reminds me of another time when people had to humble themselves in obedience or be arrested. A German General was shot by his own military of WWII - for disagreeing with the man in charge whose name I need not repeat. I was there shortly after that war while my father worked with the Occupation in the winter of 1946/47 when the Rhine was frozen near Eltville. The General's house stood on an island in the middle of the Rhine - like a large gravemarker.

And a friend, a German Methodist was sent to a camp to be exterminated because he wrote a satire about the regime. By a miracle he was helped to be free and came to the US where he then helped our own intelligence service. It was a different time. We were part of a liberation force.

Being arrested for writing a satire is not so much different from being arrested for holding up a pathetic little sign in front of a force that has munitions beyond anything imaginable during WWII.

What is our ever increasing need for power? Power hunger starts small but is never stilled. It's already intensified so that dominion over plants and animals on this planet is not enough. It seems that dominion over the universe will be a not-so-distant goal. Conquer space, heaven and hell and the stars?

Destroy life on this planet as we know it?? No matter how greedy we are for power and successful in our quest to destroy, we still remain tiny hapless mortals who will soon be consumed by flames or eaten by worms.

P259-1

So why not help to preserve life and land on this overpopulated planet? Additional forces? A "Stryker" force? On this fragile, tiny, traffic choked island? God help us!!

Thank you for letting me "speak". Aloha,

Rosemarie Tucker

COMMENTS:

P264-1

I am opposed to PTA expansion. The army has a history of littering Hawaii with ordnance. This would expand 25,000 acres of grassland into more contaminated land. Soil compaction & wildfires will be ongoing issues.

P264-2

Dust is already terrible will be worse with more vehicles. This is not in the interests of the Big Island as it will take rather than give anything positive.

P264-3

The mitigation suggests watering the roads. Watering down areas involves another issue, the source of the irrigation water.

P264-4

What is UXO? not explained next to the mitigation

In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

P264-3

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P264-4

The DEIS does not recommend the sole use of simple water sprays for dust control on unpaved roads. Use of synthetic dust control compounds such as calcium chloride solutions are recommended because they are more effective and because they greatly reduce the use of available water supplies.

SBCT Draft EIS Public Comment Card

NAME: Bette Van Overbeke or ANONYMOUS (please circle)ADDRESS: 12-423 OLE'OLEPahoa, HI 96778SIGNATURE: Bette Van Overbeke

COMMENTS:

P265-1

I am opposed to PTA expansion. Agricultural pastureland should not become another site littered with ordnance. The army has a poor history of clearing ordnance. I personally found military ordnance while diving near Richardson's

P265-2

Park in 1987.

P265-3

Soil compaction and wildfire as well as dust are already a problem at PTA. This expansion will compound the problem. Watering down the area is suggested as mitigation but this will probably take a lot of water which will have to be trucked into the area.

This expansion is not in the interests of Hawaii as it will take from the land and the people rather than give anything positive.

Responses

P264-5

UXO is explained in section 3.12.3. The mitigation to human health and safety are described in sections 4.12, 5.12, and 8.12. As a mitigation measure for safety, prior to initiation of any construction activities, USARHAW will employ qualified professionals to perform UXO clearance of the proposed construction area, remove all UXO encountered to ensure the safety of the site, and document UXO surveys and removal actions in full accordance with applicable laws, regulations, and guidance. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

P265-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P265-2

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

 GENERAL COMMENTS

P266-1

Review Process
 The information contained in the DEIS is inaccurate in several important aspects, particularly the population of Oahu Elepaio that occur within the action area and the amount of critical habitat reported for the palila and the Oahu elepaio. Because this information was not portrayed accurately, the public has not had, and will not have, the opportunity to comment on the potential impact of the proposed action on these important biological resources. These errors presumably will be corrected in the Final EIS, but the public will not be able to comment on the correct information. This represents a serious flaw in the environmental review process.

P266-2

Antennas and the Threat to Migratory Birds
 In several sections the DEIS states that "the construction and subsequent presence of FTI antennas would not significantly affect migratory birds..." but there is insufficient information provided to determine whether this statement is accurate. In North America the species affected by antennas, towers, and other tall structures are primarily land birds that migrate at night, but in Hawaii the primary species impacted by these structures are seabirds that make daily movements between the sea and upland nesting areas, such as the Wedge-tailed Shearwater (*Puffinus pacificus*), the dark-rumped petrel (*Pterodroma sandwichensis*), and the Newell's shearwater (*Puffinus auricularis newelli*). Lighting is known to attract and disorient these seabirds, and they are known to become injured during collisions with antennas, towers, utility lines, and other structures. The DEIS states that 25 new antennas are proposed under the proposed action, five of which would be located in the Cons!ervation District, but no information is provided about the specific locations of these antennas, their height, position relative to surrounding vegetation, and whether they will

Responses

P265-3

Please see sections 8.8, 8.9, and 8.10 for a discussion of the impacts of the project on water and soils, and for a discussion of wildfires.

P266-1

The locations of 'elepaio habitat was provided by and reviewed by the US Army biologists working on the installations and biologists for the US Fish and Wildlife Service. In October 2003, the US Fish and Wildlife Service issued a biological opinion of "no jeopardy" for the proposed action on the islands of O'ahu. The results of this biological opinion have been included in the Final EIS by reference. The biological opinion is available upon request.

P266-2

Full descriptions of the antennas are given in Appendix D. Impacts to migratory birds are discussed fully in chapter 5.10, 6.10, 7.10, 8.10.

Comments

Responses

P266-2 cont'd	be guyed or lighted. This information must be made available in order to adequately assess the potential impact of proposed towers on migratory birds.
P266-3	<p>Effects of Fire</p> <p>ultae DEIS assumes that the impact of fires at SBMR will be reduced to less than significant, and relies on Section 7 consultation with the USFWS and the actions prescribed in the Wildland Fire Management Plan as evidence that this will occur. However, the terms of the consultation were not made available, and the Wildland Fire Management Plan is not yet complete, was poorly described, and has not been effectively implemented, making it impossible to judge whether the threat from will in fact be effectively reduced. There have been numerous fires caused by military training at SBMR for many years, and these fires already have destroyed habitat needed by the Oahu Elepaio. If fires continue to destroy forest habitat at SBMR, it can be expected that the Elepaio population there will decline and eventually disappear, possibly jeopardizing the continued existence of the species. The threat from fires caused by military training must be more thoroughly addressed, the actions designed to reduce the threat of fire must be more fully described, and more effort must be made to prevent fires from escaping the impact area at SBMR.</p> <p>SPECIFIC COMMENTS</p> <p>Pg. 3-63, par. 2; Resource Overview. The DEIS inappropriately characterizes the ROI as being "largely made up of disturbed areas, with minimal natural communities." It also is untrue that "the vast majority of species inhabiting these areas are non-native." Portions of the ROI are very disturbed and support mostly nonnative species, but other portions of the ROI contain among the least disturbed natural communities left in Hawaii, and are home to a large number of unique and imperiled native species. The nature and value of the biological resources present in portions of the ROI should be portrayed more accurately so the potential impacts to these resources can be more accurately assessed.</p> <p>Pg. 3-65, par. 2; Critical Habitat. The acreage given for the amount of Oahu elepaio critical habitat in the ROI (1,147 acres) is incorrect and much too small. There actually are 1,913 acres of critical habitat at SBMR, 2,266 acres at SBER, and 4,349 acres at KLOA. In Figure 3-13, which shows critical habitat in the ROI on Oahu, the area indicated as critical habitat for the Oahu elepaio actually is the current range of the Oahu elepaio, not the critical habitat. The Army and Tetratech were informed previously that they were using incorrect information for Oahu elepaio critical habitat, and Tetratech was provided with the correct information, but this known error was not corrected. The potential impact of the proposed action on elepaio critical habitat has not been adequately analyzed. This error must be corrected, and the potential impact of the proposed action on elepaio critical habitat must be reassessed.</p> <p>Pg. 3-65, par. 2; Critical Habitat, Fig. 3-15. The area indicated in Figure 3-15 as critical habitat for the palila is incorrect. The palila critical habitat area is much larger than shown in Figure 3-15. It is not clear if the acreage of palila critical habitat within the ROI on Hawaii is correct, but the correct palila critical habitat should be overlaid on the ROI, and the potential impacts to palila critical habitat must be reassessed.</p> <p>Pg. 4-7; Conversion of Agricultural land to Training Land. The DEIS states that "the estimated 535 acres of pineapple land (which will be lost) is approximately 0.005 percent of the USDA designated agricultural land on Oahu..." This statement cannot be correct because it would mean that there are 10,700,000 acres of USDA designated agricultural land on Oahu, an island that is only 388,00 acres in size. This statement is misleading and must be corrected.</p> <p>Pg. 4-62, 63; The DEIS states that "WFMP (Wildland Fire Management Plans) are being developed to minimize the probability of fire," and that "WFMP's and their mitigation value are described in section 4.12.3," but the treatment of WFMP's in section 4.12.3 is confusing and provides only a brief, superficial description of fire management actions. Section 4.12.3 (pg. 4-81) states that "The WFMP, Pohakuloa and Oahu training areas, was undeveloped," but later states "no FMA's (Fire Management Areas) or wildland fire SOP's (Standard Operating Procedures) have been established." It is impossible to assess whether the WFMP will effectively minimize the impact of fires without more information about the WFMP and the actions it prescribes. The WFMP should be completed as soon as</p>

P266-3

The Integrated Wildland Fire Management Plan for O'ahu and Pōhakuloa Training Areas was updated on October 2003 incorporating lessons learned in the Makua fire. As discussed in the Executive Summary as proposed mitigation, the Army will fully implement this plan for all existing and new training areas to reduce the impacts associated with wildland fires. The plan is available upon request.

P266-4

The text was changed to incorporate this request.

P266-5

Text was changed to incorporate this request. Mr. Vander Werf was notified on 7/14/03 that the correct information was not received in time to incorporate into the DEIS.

P266-6

This figure shows an overview of critical habitat. Acreage that overlaps the ROI is noted in the lower left corner. Effects on Palila critical habitat are discussed in section 8.10.

P266-7

Text revised to read, "The estimated 535 acres (219 hectares) of cultivated pineapple land is approximately 0.67 percent of the total USDA designated agricultural land on O'ahu and 2.8 percent of the total area in pineapple production in the state (Statistics of Hawai'i Agriculture 2004). Similar text on page 5-31 (last paragraph) also revised. Similar text on page 5-33, under the Reduced Land Acquisition Alternative revised to read, "The estimated 98 acres of cultivated pineapple land is 0.1 percent of the total USDA designated agricultural land on O'ahu and is 0.5 percent of the total area in pineapple production in the State (Statistics of Hawai'i Agriculture 2004). Similar text on page 4-9 (last paragraph) also revised.

P266-8

The Wildland Fire Management Plan is finalized for the Islands of O'ahu and Hawai'i and are available upon request. The information in these plans has been incorporated into the EIS where appropriate.

May 2004

Stryker Brigade Combat Team Final EIS, Hawaii

P-668

P266-8 cont'd	possible, and relevant aspects of the WFMP should be discussed in the EIS so the potential impact of fire can be adequately assessed.
P266-9	Pg. 4-63; Regulatory and Administrative Mitigation 2. The DEIS states that "The Army is in Section 7 Consultations with the USFWS to ensure that the proposed action would not jeopardize the continued existence of federally listed species or adversely modify critical habitat." However, on pg. 4-63 (par. 1) the DEIS states that "it is not within the Army's ability to prevent and contain all fires." These two statements from the DEIS are not consistent. If fires are not controlled at SBMR, then it is unlikely that Elepaio will persist in the area. The Army should make more effort to minimize the effects of fire. If it proves impossible to completely contain fires within the impact area, then the Army must mitigate this impact on critical habitat by restoring native forest suitable for elepaio.
P266-10	Pg. 4-64; Additional Mitigation 3. The section on spread of nonnative species fails to mention the brown treesnake (<i>Boiga irregularis</i>), which is a serious threat to birds and the environment throughout Hawaii and the Pacific. Specific measures should be added for preventing the introduction of the brown tree snake to Hawaii by military aircraft from the Mariana Islands.
P266-11	Pg. 4-65; Threat to Migratory Birds. The DEIS states that "the construction and subsequent presence of FTI antennas would not significantly affect migratory birds species known to occur in the SBMR ROI," but no information is provided about the location, height, structural features and position of such antennas. Without this information the potential impact on migratory birds cannot be assessed.
P266-12	Pg. 5-31; Impact 1; Impacts on natural resource management and recreational use. The DEIS states that the proposed project would result in a significant impact to the management of natural resources on 100 acres within the SRRA that are intensively managed by the Nature Conservancy of Hawaii. The DEIS further states that as mitigation for this impact, the Army is considering allowing continued access to these. Consideration of continued access does not amount to mitigation; the Army should firmly commit to provide continued access for the Nature Conservancy to manage the valuable natural and educational resources on these lands.
P266-13	Pg. 5-148; Sensitive Habitats; Critical Habitat. As described above, the acreage given in the DEIS as critical habitat for the Oahu elepaio is incorrect. In Figure 5-37 the area marked as elepaio critical habitat is actually the current range of the elepaio. The critical habitat area is larger.
P266-14	Pg. 5-158; Environmental Consequences. The DEIS states that "the Army and the USFWS have not yet agreed on a final SBCT ROI for biological resources," and that "changes to the present ROI ...could alter the qualitative and quantitative analyses." In order to accurately assess the potential environmental impacts of the proposed action, the area that potentially will be impacted must be identified. Moreover, boundaries of the present ROI appear in some cases to be too small. In particular, the boundaries of the ROI at SBMR sometimes fall inside the installation boundary. It is not clear how resources inside the installation could not be influenced by the proposed action.
P266-15	Pg. 5-161; par. 1. The DEIS states that "firing and mortar points are located to ensure the maximum range of the weapon would not overshoot the impact area." This statement is false and misleading; the maximum range of many weapons used at SBMR does allow for overshoot of the impact area, and numerous rounds land outside the impact area. These rounds regularly ignite fires outside the impact area, and the percussion from high explosive rounds may kill listed species and negatively affect other biological resources. Natural resource management activities outside the impact area require an EOD escort because of the presence of unexploded ordnance. It must be made clear that the firing points and maximum range of weapons used at SBMR do not preclude rounds landing outside the impact area, and that this occurs regularly. This is a significant impact (contrary to the information presented in table 5-25), but it has not been adequately addressed, and no mitigation measures are proposed to minimize this impact.
P266-16	Pg. 5-161, par. 3. The DEIS states that "there is no assurance that fires or other threats associated with the proposed action would not reach or otherwise threaten

P266-9

The text has been changed to incorporate this response

P266-10

The text has been changed to incorporate this response

P266-11

Full descriptions of the antennas are given in Appendix D. Impacts to migratory birds are discussed fully in chapter 5.10, 6.10, 7.10, 8.10

P266-12

In response to comments received early in the EIS process, USARHAW reoriented QTR2 such that the SDZ would no longer impact any lands with the Honouliuli Preserve. Army will grant TNC personnel and TNC-sponsored personnel daily, controlled access to the TNC-managed lands along a route to be determined by the Army in consultation with TNC for as long as they have legal right to use of the affected property for conservation/stewardship purposes. Access controls will be developed and implemented to ensure the safety of all personnel and will consist of notification by TNC to the Army prior to entering Army lands and notification by the Army to TNC of any unusual activities that may present, or appear to present a danger to TNC personnel in the area. The boundary will be signed to prevent unauthorized use/trespass.

P266-13

This figure has been corrected.

P266-14

The final Biological Opinion has been issued and the ROI was jointly set by the Army and the USFWS and have been included in the FEIS. The impacts of the proposed project in relation to the ROI at SBMR are discussed in Section 510.

P266-15

While the maximum range of the weapons may indeed exceed the impact area reduced loads are used to insure the rounds stay within the range. In addition the surface danger zones for ranges is determined such that the chance of anyone round traveling out of the range is one in one million. The Army has evaluated the risks and has determined that the impacts from stray rounds is less than significant.

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-669

- P266-16**
cont'd
- populations of listed species within the SBMR ROI." This statement contradicts later statements (p. 5-162, bullet 5) that indicate "section 7 consultation and regulatory and administrative mitigations...would help reduce the impact to a less than significant level." The preceding statement above suggests that it may not be possible to reduce the impact to the less than significant level. As described above, it is not possible to assess whether the WFMP or other mitigation actions will be effective or sufficient without more information about the nature of those actions. If fires continue to affect Oahu elepaio at SBMR, the long-term persistence of the elepaio population is in jeopardy.
- P266-17**
- Pg. 5-163; par. 1. The DEIS states that "twenty `elepaio (sic) have been identified within the SBMR ROI." This number is in error. The actual number of elepaio estimated to occur within the SBMR ROI is 340 (VanderWerf et al. 2001), indicating that the potential impact to elepaio is much greater than portrayed in the DEIS.
- P266-18**
- Pg. 7-82; Sensitive Wildlife Species, par. 1. The DEIS states that "the latest USFWS and survey information on sensitive species and habitat in the SBCT ROI has been incorporated into this evaluation of biological resources." This statement is false. There are numerous errors about the current status of sensitive species and habitat in the DEIS. The DEIS clearly does not contain "the latest" information from the USFWS. For example, the DEIS seriously under-represents the population size of Oahu elepaio and the amount of elepaio critical habitat within the SBCT ROI. This previous statement is misleading, and particularly egregious considering that the correct information has been provided to both the Army and TetraTech, but this information was not used.
- P266-19**
- Pg. 7-88; Critical Habitat. The DEIS states that "there is no federally designated or proposed critical habitat for wildlife within the KTA ROI," which is true, but the DEIS fails to mention that 4,449 acres within the KLOA ROI are designated as critical habitat for the Oahu elepaio. In chapter 7 of the DEIS numerous sections discuss resources and impacts in the KTA ROI, but the KLOA ROI is neglected.
- P266-20**
- Pg. 8-118; Terrestrial Mammals. The DEIS states that "the Hawaiian hoary bat (*Lasiurus cinereus semotus*) could occur on PTA." Surveys have shown that the Hawaiian hoary bat is known to occur on PTA (Jacobs 1994). The status of the bat must be corrected.
- P266-21**
- Pg. 8-118; Birds. This section of the DEIS fails to mention the federally endangered dark-rumped petrel (*Pterodroma phaeopygia sandwichensis*), which is known to occur at PTA. The petrel is included in other portion of Chapter 8 of the DEIS.
- P266-22**
- Pg. 8-136; Critical Habitat. As described above, the area presented in the DEIS as palila critical habitat is incomplete, the designated critical habitat (109,000 acres) is much larger than depicted. This error must be corrected and the potential affect of the proposed action on palila critical habitat must be reassessed.
- P266-23**
- Pg. 8-147; Threat to Migratory Birds. The DEIS states that "the construction and subsequent presence of FTI antennas would not significantly affect migratory birds species known to occur in the SBMR ROI," but the DEIS does not mention the potential effect of antennas on the endangered dark-rumped petrel at PTA. The potential impact to the petrel from antennas and towers that will be constructed at PTA, and any other installations should be added and adequately assessed.
- P266-24**
- Appendix I-1, pg. I-1-23; *Chasiempis sandwichensis* ibidis. The information about the status of this species at SBMR is severely incomplete, and the information it does contain is in error. Approximately 340 elepaio are known from SBMR (VanderWerf et al. 2001), or 15% of the total population, which is not mentioned in the DEIS. Contrary to statements in the DEIS, SBMR is not in the southern Waianae area, Puu Hapapa is not in SBMR, and elepaio are not currently known from the Schofield-Waikane Trail.

P268-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. We understand that the proposed impact will have an effect on the entire State of Hawai'i. These impacts have been addressed in the document, specifically in the socio-economic sections. However, the individual SBCT actions are proposed on the islands of O'ahu and Hawai'i. Because the direct effects of the actions would occur only on these islands, the Army determined that public meetings at these locations would be the most appropriate. Any impacts to the island of Maui would be indirect and less than significant. In addition, the residents of Maui would be able to submit written comments on the document. Written comments carry equal weight to verbal comments submitted during the public comment period.

Army Transformation
Draft Environmental Impact Statement
Comments by Carol Wilcox
November 1, 2003

Thank you for the opportunity to testify.

P270-1

It seems that this proposal to base a Stryker Brigade in Hawai'i is part of a much larger proposal, one that is already in motion. And one that will result in the militarization of Hawai'i on a scale that has not been seen here before, even in the years prior to and during World War II.

What supports this conclusion is that this DEIS is not discussing the "If" of the Stryker Brigade, but the "How." It is no coincidence that recently there have been two 50 year contracts proffered for military housing development and repair, one for seven billion dollars and one for one billion dollars. (One would think that might require an EIS.) The Navy is poised to station an Aircraft Carrier at Pearl Harbor, bringing with it 5000 personnel, plus support ships, dependents and so forth, and most likely necessitating the revitalization of Barbers Point for the air wing. (Will we see an EIS?) Wheeler Air Force Base is being readied for the arrival of a fleet of C-17s, needed to move the Stryker force around. In addition, there is untold amount of increased investment in the Missile Defense System at Barking Sands, on Kauai.

What does this mean for Hawai'i? It is reasonable to expect that this militarization will impact every aspect of our lives in Hawai'i, from our civil liberties to our housing cost, our economics, our social justice, our culture, our environment. And, if we proceed as in the past, these promise to be predominately of negative impact to Hawai'i environment, citizens and future generations.

P270-1

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

Comments

P270-2

This Army Transformation/Stryker Brigade DEIS is segmenting a larger project, which is the massive militarization of Hawai'i. This DEIS does not deal with the impact of either the segmented or the larger project on the basic infrastructure of Hawai'i, such as water and watershed resources, solid and waste water disposal, toxic material disposal, alien species, and so forth. Rather than address how Army Transformation will deal with these issues in isolation, it makes more sense for the Department of Defense to articulate some overarching principals, mandatory guidelines, that would establish ethical and practical guidelines for all military branches and endeavors on these lands.

For example, one of these principals might be: The military is committed to proactively protect, preserve and restore Hawai'i's environment.

There is no reason that this cannot happen concurrently with uses proposed by the DOD, and it would be excellent practice for those occasions when our troops occupy foreign soil. Now we're talking transformation!

P270-3

For instance, on the subject of Water. Hawai'i water demand even now exceeds it's supply. The growth of the military coupled with existing water use practices will only make this worse. New decisions and goals are needed.

The goal could be that: "The military will not increase it's demand on the water resources of Hawai'i, and in fact will set benchmarks to reduce it's use by 10 percent per year over the next five years, regardless of the size of military buildup. To achieve this, the military, in all of its operations, will implement the accepted measures of conservation and alternatives, and consider innovate new ways to conserve, restore and protect the water resources of Hawai'i."

For example:

- *Require water saving devices in all military housing and buildings.
- *Require all irrigation to be with "gray" water
- *Require dual gray water and potable water systems on all bases
- *Require gray water to be used in all dust control projects
- *Restrict use of pesticides, chemicals and fertilizers over known aquifers
- *Require vegetated corridors around all streams
- *Prohibit toxic or nuclear activity around all streams
- *Prohibit point source pollution in all streams
- *Protect watershed recharge areas
- *Develop rain catchment systems
- *Build a treatment plant for Honolulu wastewater in the mauka lands, producing water for military requirements while helping O'ahu deal with it's wastewater treatment problems and contributing to recharge of the aquifer.

With solutions like this, the military would give back; Hawai'i's land and people would reap some benefit.

P270-4

Similar goals and benchmarks should be developed relative to the use of electricity (get off the grid), gas and diesel (how about H-power), air conditioning (use those trade winds), solar heating, pedestrian-friendly communities, green space requirements, protection from alien species, policy on chemical, toxic and nuclear materials, and solid waste management.

P270-5

In conclusions, I would like to suggest that this Draft Environmental Impact Statement is deficient in that it segments a larger action, and does not admit or address the reality of the planned and imminent increased military presence in Hawai'i. This Draft EIS should be revised to include overarching principals, goals and practical applications for the environmental protection of Hawai'i. Malama 'aina, malama pono.

Responses

P270-2

This EIS is addressing the specific action of Transforming the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team. The impacts of all past, present, and reasonably foreseeable future projects, not just the Army's, in the ROI is discussed in Chapter 9 - Cumulative Impacts.

P270-3

We thank you for your suggestions. Many of these measures are currently considered as best management practices for all Army projects and some were considered as mitigation measures for this project. The more region wide suggestions are outside the scope of this project.

P270-4

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

P270-5

An evaluation of the scope proposed by the commenter is outside the scope of this project.

Subject: Re: Stryker EIS Public Testimony

Re: Stryker EIS Public Testimony
"Stop Pohakuloa's Occupation"

I haven't bothered to read the Stryker/Pohakuloa draft environmental impact study. I'd rather not sully my precious time. Other than the latest corporate whitewash, it has no news to offer. However, I plan to testify at the Pohakuloa EIS public hearings in November.

P271-1 Big Islanders have known for years what's up there — a sacred place. We've witnessed depleted uranium and other weapons of mass destruction our weekend warriors toss around with reckless abandon. Should some choose to refute my claim, then give us Geiger counters and free access to the firing range.

Living on Mauna Kea, I heard the bombs' reports and saw red-cindered smoke blot out Hualalai. I felt my 'aina rattled by volcanic battle.

P271-2 The short-term economic benefits to the Big Island from the War Machine will forever, for all practical purposes, pollute tourism, fishing and agriculture — the mainstays of our local economy.

The STRYKER is a NIMBY issue - Not In My Back Yard! An urban assault vehicle, it's designed to ride roughshod through the Third World's narrow slums. It will kill more civilians than terrorists, guaranteed.

Were a global survey taken today, the U.S. would win, starving hands-down, as the most morally bankrupt country on earth. Morality aside, the fact remains - a preponderance of mankind lives, & dies, in fear of us. We export more WMD than anyone.

The unheralded, grassroots Antiwar Movement must run rampant war out of here — and only hope its next victims of aggression can stop it, over there.

Only peace and preservation can save us. Only we can wreck our 'aina. Peace begins at home.

P271-3 Get U.S. ordnance off my island.

PO Box 2334
Kealahou, Hawaii 96750
(808) 328-2663
DWnews@aol.com

Responses

P271-1

No depleted uranium has been used or is currently being used on the island.
 No depleted uranium is planned to be used in the future.

P271-2

If the Army approves this project, the Army will mitigate the adverse environmental impacts of the proposed action to the extent practicable.

P271-3

Ordnance removal on lands that are no longer under military ownership is not part of this proposed action but is handled through the Formerly Used Defense Program (FUDs). For information on FUDs projects and clean up status on the island of Hawai'i, you may contact Mr. Chuck Streck, the FUDs manager at the U.S. Army Corps of Engineers, (808) 438-6934.

Subject: Shock and Dismay

Aloha Congressmen,

- P273-1 I am horrified that a Stryker Unit is slated to be based on these tiny islands whose land is so fragile and so limited. Why is it necessary to train with huge urban assault vehicles on the not-very-remote and eroding hills of Hawai'i?
- P273-2 nel? How can you justify allowing the military to take any more of our precious resources for destructive purposes that lead to destruction of the entire resource? What about our ground water? Kaho'olawe, Waikane Valley, Makua Valley, and Pohaku Loa can never again be used freely for peaceful pursuits. Even the military won't go into Waikane Valley, so polluted with military debris is that once most lovely of valleys. Please - NO
- P273-3 MORE EXPANSION OF MILITARY ACTIVITIES IN HAWAII!

Thank you and aloha,
Abby Williamson

P272-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P273-1

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.) The EIS evaluates all the impacts of the Proposed Action on the resources of Hawai'i.

P273-2

Groundwater is discussed in Sections 4.8, 5.8, 6.8, 7.8 and 8.8 of the EIS.

P273-3

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

The user wrote:
Aloha,

P274-1

I am deeply concerned about Pehalulua on the Big Island; I have four times the concern for the Stryker Brigade coming to Kahuku. We have a fragile aquifer and an ever expanding need for fresh water. If we add a new brigade of even heavier vehicles than those that already despoil the land, they will kill even more vegetation, erode even more top-soil, and create even more dust, thereby continuing to seriously compromise the integrity of our forest watersheds and our living reefs.

P274-2

I think the EIS I reviewed at Turtle Bay is not an adequate study of the long-term impacts vis-a-vis O'ahu's water supply.

O'ahu's water table is already approaching saline pollution and potential depletion. How does the advent of further deforestation protect the water we need to provide for our tourist industry, let alone agriculture and household use? O'ahu continues to experience urban development but the aquifers do not expand. We who live here are not served by short-sighted destruction of resources and we too are part of the nation that the military says it is protecting.

P274-3

The military destroys beyond redemption every area they use for live-fire training and damages ecological balances with its maneuvers. The training ground above Kahuku is already causing flooding from the erosion of the land by heavy vehicles. The military has not attended to solving the problem they have caused in Kahuku any more than they have been able to clean up the explosive detritus in Waikane Valley, Makua Valley and Koho'olawe, to mention only the most well known areas of military travesties.

There are many remote areas of the continental United States (the Nebraska "bad lands" come to mind) the use of which would not endanger vital resources or people's lives as does the devastation of the shrinking natural resources of small islands in the middle of the Pacific. What good is it to increase our "national security" if we destroy the land on which the nation and it's residents depend?

P274-4

Why are we training troops in urban assault vehicles on remote Pacific islands? Why not erect mock villages and cities in the continental deserts and destroy those?

Terrorism is as old as mankind and will not be "defeated" in a "war on terrorism." This "war on terrorism" strawman simply fuels the excitement and determination of an international underground force of anarchists.

Please rethink these issues.

Mahalo and Aloha,
Abby Williamson

Responses

P274-1

The impact of training including maneuver training with the Stryker vehicle for Kahuku is evaluated in Chapter 7.

P274-2

While the issue of finite water resources and the need to protect the existing resources is a central issue for citizens of Hawai'i, the Transformation project is not expected to significantly increase demand for water on O'ahu, and will reduce some existing impacts through construction of modern facilities with lower potential for pollution, and more efficient use of water resources.

P274-3

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

P274-4

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. Gentlemen;

Re: Stryker Brigade transformation

P275-1 After reviewing the draft EIS for the transformation of the stryker brigade, what appears obvious is that the preparer of the draft disregarded the Hawaii environmental laws pertaining to the protection and preservation of endangered and rare species and their associated ecosystem.

P275-2 The DEIS also disregards the laws pertaining to the preparation of environmental impact statement in accordance with Hawaii's laws. The foregoing consideration is especially important considering that almost all of the land north of Lava road on PTA is in a conservation district and the greater portion is state lands leased to the military. Much of the increased activity will also require a CDDA according to the lease and state laws.

P275-3 I am also disappointed in the total avoidance of the military's preparation of the DEIS and their avoidance of the endangered species management plan (later renamed to endangered species management report) and the areas that have been designated as biological significant areas. Also the finding of endangered species within the impact and training areas and the avoidance of the species and their associated ecosystem is not addressed in the DEIS. The military has been aware for some time that significant amounts of endangered species exists in the impact area despite the fact that a complete survey of the impact area for endangered species has not been completed.

P275-4 The opening line of the executive summary states that the secretary of the army articulated in October 1999, the need for the transformation of the second brigade to a stryker force. It appears obvious that all of the activities on going at PTA and the surrounding area is to meet the requirements of that articulated purpose. Yet the DEIS only covers the activities on the military base rather than totality of the impacts. The realignment of the Saddle Road, extension of the runways at PTA, the Puainako extension in Hilo, the construction of new quarters and headquarter's building, the bypass road in Waimea and Waikalua, the construction of a gravel road from Kawaihae to PTA, and the transformation of the harbor at Kawaihae appear to be part and parcel of the transformation process. Therefore, the public is entitled to know the totality of the impacts under the environmental impact laws of the state of Hawaii and NEPA.

In the DEIS, you chose to cover only the impact that the transformation process will impact on PTA rather than the totality of the impact on the Island of Hawaii. This attempt to subvert the laws of the State of Hawaii by the bifurcation of the various projects and the impact

Responses

decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

P275-1

Thank you for your comment. As discussed in Section 4.10, the Army considered impacts to state sensitive species and local, regional and state plans, policies and regulations in the evaluation of potential impacts to biological resources. As shown in Table ES- 21, the Army would implement several mitigation measures to assist in the protection of sensitive species such as those listed under state law as well as those species listed under the federal ESA.

P275-2

Army Transformation is a federal project, not a state project, and is therefore not required to comply with state law regarding environmental impact studies. However the Army attempts to comply with local zoning laws whenever feasible. Conflicts with local land uses are discussed in Sections 4.2, 5.2, 6.2, 7.2, and 8.2.

P275-3

The Endangered Species Management Plan Report was used in the writing of the biological resources sections as noted in chapters 5.10, 6.10, 7.10, and 8.10. Additionally, USFWS has released directives to the Army in the form of Biological Opinions for Army Installations on O'ahu and Hawai'i that describe efforts that must be taken to ensure stewardship of the sensitive species on Army controlled land. These measures include additional research and surveys though few surveys are conducted in Impact Areas because of the danger to the researchers of unexploded ordinance.

P275-4

The realignment and improvement of Bradshaw Army Airfield and the construction of the military trail from PTA to Kawaihae are part of this project

Comments

**P275-4
cont'd**

the bifurcated projects will have on our community is not acceptable since the community will be given only smaller doses of the totality of the impact rather than the impact of the entire project on the community. That totality of the impacts is necessary for the community to recognize the affect of the project and that will enable them to choose whether that is the type of community we want here on the Island of Hawaii. The DEIS should therefore, be redone to truly inform the public of the true nature of your project and the impact it will have on our community.

P275-5

The DEIS suggests that 23,000 acres will be acquired for training areas for roadway and training purposes. Yet there are no plans indicating where the roadways and training areas will be located. There is also a conspicuous absence of any survey to find the location of any endangered species or rare plants found in Pohakuloa for any of the support facilities. Since almost all of the proposed construction in appendix D for PTA is proposed for lands owned by the State of Hawaii and leased to the military, and since those lands are in areas designated as "conservation" the military must meet the requirement of the Hawaii Endangered Species Act and Hawaii's requirement for environmental impact statement including the requirement for conserving and protecting Hawaii's endangered species and their associated ecosystem. There is also a need to obtain a Conservation District Use Authorization (CDUA) from the Board of Land and Natural Resources.

P275-6

It also appears that you are asking for a carte blanche authority to do whatever you propose to do in order to transform the second brigade to a stryker force without completing a survey of the cultural and environmental surveys necessary to indicate the total impact of your project. Based on your DEIS, those who give their approval and support do so without obtaining sufficient information and only express their bias.

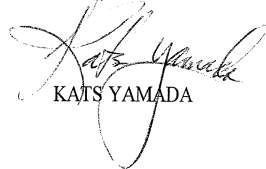

P275-7

A few years ago, the military spent some time to prepare the endangered species management plan and the ecosystem management plan. Those plans also designates biological significant areas for preservation and protection. Now, only a few years later those plans are being totally disregarded. The degradation of the biologically significant areas started with the designation of PTA-1, Saddle Road realignment through several biologically significant areas.

P275-8

Incidentally, your maps are wrong. They fail to include the palila critical habitats in training areas 1, 2, 3, 4, 10, and 11. These are all in the protective subzone of the conservation district. In closing, I would just like you to know, although you might be able to subvert NEPA through the various waivers, no such mechanism exists for the laws of the state of Hawaii and when you apply for a CDUA, I will be there.

Aloha,

KATS YAMADA

Responses

and will be constructed whether or not the SBCT project goes forward. These projects are discussed in Chapter 9 – Cumulative Impacts as appropriate.

P275-5

The 23,000 acres will be divided up into training areas for scheduling purposes only. The training to be done on any one training area will not be substantially different than any other. The internal training roads cannot be determined until training commences. A separate NEPA document will be completed at that time. Section 8.10 describes the endangered species along with maps showing their location for WPAA and PTA. Thank you for your comment. As discussed in Section 4.10, the Army considered impacts to state sensitive species and local, regional and state plans, policies and regulations in the evaluation of potential impacts to biological resources. As shown in Table ES-21 the Army would implement several mitigation measures to assist in the protection of sensitive species such as those listed under state law as well as those species listed under the federal ESA.

P275-6

Many surveys were conducted as part of the cultural investigation. The results are described in Sections 5.11, 6.11, 7.11, and 8.11 for each of the installations. Further surveys will be conducted as required by the PA if the project goes forward. The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS.

P275-7

The Endangered Species Management Plan Report was used in the writing of the biological resources sections as noted in chapters 5.10, 6.10, 7.10, and 8.10. Additionally, USFWS has released directives to the Army in the form of Biological Opinions for Army Installations on O'ahu and Hawai'i that describe efforts that must be taken to ensure stewardship of the sensitive species on Army controlled land. These measures include additional research and surveys though few surveys are conducted in Impact Areas because of the danger to the researchers of unexploded ordinance. The Saddle Road Realignment project is not an Army project but a State Project.

P275-8

Figures that include Palila critical habitat have been updated with information from USFWS.

Stout, Brian (Inouye)

P278

From: Virtual World Developers, Inc. [virtual@ihawaii.net]
Sent: Friday, December 26, 2003 2:13 PM
To: Inouye, Senator (Inouye)
Subject: No Strykers on Hawaii Island please

Honorable Senator,

P278-1

The Big Island is not that "BIG". The strykers practising "live arms training" on Hawaii Island is not a POSITIVE for us here. There are still live ordnance left in Waimea at my children's school from WW2. Tourists (an important part of our local economy) come here for peace of mind. One of the largest resort areas in Hawaii is within 15 miles of

P278-2

the proposed expansion of the training area. Closing off of our local pier at Kawaihae for "security" reasons after the army expands their presence is not a plus. Having "fast

P278-3

strike" vehicles flying over the fragile desert environment, creating dust-storms, and that contains near extinct species, as well as Archaeologically sensitive areas is not to anyones' benefit. Please allow this big fish to fry somewhere else. I for one do not want a larger military presence where I call home, in the name of economic or anti-terroristic security. There are better economic programs for us to follow here. Please stay away from D.C. long enough to re-acquaint yourself with the local concept of respect for the "aina". You have done many wonderful things as our representative. Send the Strykers to areas in the mainland desert already reserved (and destroyed), and far from population centers, where they can train. I for one (as a 20 year simulation developer) do not believe in Live Ammunition Training "because". This is a huge waste of money and a danger to all. Non-live munitions can be used in the electronic battlefield to everyone's agreement, other than weapons manufacturers.

P278-4

Please keep up your good work

Jim Zampathas

P288-2

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawaii was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawaii petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawaii entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawaii, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawaii in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

Bldg. 230 R., 306 ATTN:CEPOH-PP-E
Ft. Shafter, HI 96858-5440

Dear Ms. Barger,

P295-1

I have prepared comments to the draft EIS (DEIS) for the Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawaii, that I would like you to include in the formal review of this document. Unfortunately I had considerable difficulty finding the mailing address to send my comments to (I ended up calling on the phone), as it was not clearly listed on the CD I received nor your website. There are several addresses to receive more information from, but not where to send comments to. A simple phrase such as "send comments to" at the beginning of all documents would help.

P295-2

My main concern about the Transformation is for the native Hawaiian plant communities of the Pohakuloa area. These dry, relatively intact native shrubland communities are not found in such large self sustaining tracts on any other island in our State. Feral ungulates and the US Army have taken their toll on what is left of these plant communities at Pohakuloa. I realize some fencing has been done, primarily to protect some rare plants (described as "emergency exclosures" on page 8-117 of the DEIS), but it seems that federally protected individual species are the only concern. My concern is for the native plant communities that include the Threatened and Endangered (T&E) species as well as many other rare "sensitive" species. There has been inadequate protection of these plant communities by the US Army to date. Many fenced areas have been too small to adequately protect self sustaining native plant communities within. I fear the "Transformation" will only abuse newly acquired Keamuku lands that contain native plant communities, as well lands already controlled by the army. On page 4-65 of the DEIS under "Additional Mitigation 4", using "ITAM and LCTA" (neither acronym is listed in your glossary nor index) would "determine the optimum training rotation to maximize vegetative regrowth". It is possible that waiting for native plant communities to recover in this very arid environment could mean a rotation schedule that is much longer than the average age of the people training there. Also, alien plant invasion will be a huge problem in native plant communities that are damaged by vehicles.

I am not opposed to the army using former Parker Ranch Lands that have already been converted to alien grasslands. However, the DEIS on page 8-115 refers to the Keamuku parcel as containing a "unique vegetation community in the lower southern end of the parcel, specifically *Styphelia-Osteomeles-Dubautia* shrubland, a lowland mesic shrubland community".

P295-2

Chapter 8.10 - Biological Resources discusses the impacts of not only Federally listed species but other "sensitive species". In response to public comments a reanalysis was done of impacts to biological resources and the Army has determined that the project would have a significant impact on sensitive species and sensitive habitat at PTA. The acronyms ITAM and LCTA are included in the acronym list. The impacts of the potential for the introduction of alien species is also included in this chapter and the impacts are considered significant but mitigable to less than significant. The rotation of training was dropped as a potential mitigation measure.

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-690

P295-3

I am opposed to any native plant communities in that area being used for training and they should be fenced off to keep out all ungulates. Assuming the PTA Trail must run through this area, I will expect local Big Island botanists to be consulted to choose the route that will have the least impact.

P295-4

I have learned that the PTA Trail may be re-routed onto the pahoe-hoe substrate on the SW portion of the Keamuku parcel. The map provided on your website does show what plant communities the trail will pass through, therefore the public cannot assess the trail's impact. Based on what I have heard, I am opposed to the apparent proposed route since there are many remnant patches of native plant communities that even contain T&E species. The PTA Trail must be kept on the Mauna Kea Ash substrate in already degraded pasture lands. Page 8-113 of the DEIS states "Degradation of habitat due to physical activities around PTA Trail would have the greatest potential impact on the area due to the nature of activities proposed and allowed in their vicinity". I do not see additional cost of maintaining the road as an excuse to put the Trail on the pahoe-hoe instead of the ash substrate. If the Federal government can spend 87 billion dollars in a foreign country improving infrastructure (in part), it can spend a few million right here in Hawaii to maintain a road and protect Hawaii's irreplaceable natural heritage.

P295-5

With respect to alien species exclusion and control, a statement on page 4-64 under "Additional Mitigation 3" is not reassuring. Regarding a vehicle washing facility at Kawaihae Harbor, it is imperative that such a facility be built. Without it, no Transformation should take place. I expect that before the final EIS is done, a site at Kawaihae harbor must be secured. I believe the ecological damage that could be done to our state by moving alien species off Hawaii island far out weighs any benefits the US Army gains via this proposed Transformation. I am surprised there is no discussion regarding decontamination of military vehicles coming to the island of Hawaii. When, where and how is this done? Accidental movement of alien species is always a "two way street".

P295-6

I am pleased to see that the Army has consulted some Invasive Species Council (page 4-63) regarding mitigating alien species problems that will surely get worse. Can I assume this is the Hawaii Invasive Species Council? If so, please state it. Only local Hawaii alien species experts are qualified to properly address most of your ongoing and potential problems.

Thank you for soliciting input to the proposed Transformation. I hope you find my comments useful. I have seen a lot of good work done by the DPW Environmental Division at Schofield Barracks so I hope Pohakuloa Training Area will get the same level of protection of native Hawaiian habitat.

Sincerely,

Patrick Conant

c. University of Hawaii Environmental Center

P295-3

As mitigation at all installations the Army proposes to fence or flag where practicable any sensitive plant community from activities that may take place in the ROI. The Biological Opinion outlines fencing for the majority of the sensitive species. USARHAW will evaluate if additional fencing may be necessary.

P295-4

The Army will implement all the terms and conditions defined in the Biological Opinion issued by the USFWS for current force and SBCT proposed actions at PTA including the construction of the PTA military trail. These measures will help avoid effects and compensate for impacts on listed species that would result directly and indirectly from implementation of the proposed action. Since the areas included under the BO includes significant populations of sensitive species and sensitive habitat they will benefit from it's implementation.

P295-5

All vehicles will be washed prior to deployment to the island of Hawaii from Oahu. In addition all vehicles will be washed prior to leaving PTA. The construction of an additional vehicle wash at Kawaihae Harbor is not feasible because no land is available, there is no water source and it was determined that washing prior to leaving PTA represent very little threat to transporting alien species since the vehicles will be traveling to Kawaihae Harbor by road and all weather trail.

P295-6

Yes this is the Hawaii Invasive Species Council. This is included in the mitigation measures for all installations.

Director Transformation
U.S. Army Garrison, Hawaii

Dear Sir:

I have reviewed the three volumes of this Draft EIS from the standpoint of karstic and pseudokarstic geology and hydrology, topics in which I have special qualifications. I am the author of "Caves of Washington" and "Caves of California". Like Hawaii, these two states are noted for containing both karsts and pseudokarsts. I also have published many articles on these subjects. Recent Hawaii articles include "History and status of the Moiiili Karst, Hawaii" (Journal of Cave and Karst Science, 1998, vol. 63 no. 3) and "Raw sewage and solid waste dumps in lava tube caves of Hawaii Island" (same, 2003, vol. 65 no. 1).

In reviewing the list of preparers of this DEIS, I recognized no name of anyone who has published papers on either of these subjects or who participates in scientific activities on either topic. Both topics are almost completely overlooked in this DEIS and these omissions must be corrected in the eventual EIS. I am submitting separate statements for relevant karstic and pseudokarstic topics.

Currently I am chairman of the on-going Oahu Karsts Project of the Hawaii Speleological Survey. The following relates to potential impact on one karst of Oahu from this proposed project: the Kahuku-Laie Karst which contains Punamano National Wildlife Refuge, specifically the Punamano karstic springs (Figure 7-1).

P305-1

To the best of my knowledge, no other Hawaiian karst would be impacted by this project. But vehicular spills at the north end of Drum Road are likely to drain directly and quickly to this group of protected springs.

P305-2

I am especially dismayed about two factors in the DEIS in this context. One is that there is virtually no detailed information about the upgrading of Drum Road in this critical area. The other is that there is repeated mention of another DEIS covering this topic which has not been disseminated to persons with special knowledge and concern for this subject. Please rush me a copy of this additional DEIS if it has been published. If appropriate, I will then submit a supplemental statement.

P305-3

The area in question is in the vicinity of the intersection of "Charlie Road" and Kamehameha Highway. This is shown in Figure 7-2. The flat plain shown in this photograph is part of a wide marine terrace formed partly on carbonates and partly on Koolau basalt. The carbonate portion is part of the Kahuku-Laie Karst. To the north and west it curves around the north end of Oahu as far as Kawela Bay. To the south, it extends far past the Kahuku Bluffs (also shown in Figure 7-2) and Waiapuka, with upland extensions formed of aeolianite and calcarenite ridges. The portion around this intersection and Punamano Springs (as in the case of Waiapuka) is mantled by alluvium so that it is not shown as carbonate on surficial geological maps. This is much like the

P305-1

Impacts resulting from spills because of use of Drum Road are discussed on page 7-51 of the EIS.

P305-2

As acknowledged in the comment, the impacts of the upgrade of Drum Road are discussed in a separate document. This EIS only evaluates the impacts of the future use and maintenance of the completed road.

P305-3

This discussion is regarding Drum Road. The upgrade of Drum Road is a single and complete project and independent from SBCT in Hawai'i. A separate NEPA document is being developed for the upgrade of Drum Road. These comments have been forwarded for consideration in the development of the Drum Road upgrade NEPA document.

cont'd**

Moilili Karst before urbanization. Similar (though probably smaller) karstic conduits almost certainly provide rapid underground flow of surface waters here. Contrary statements by at least one of your preparers about impermeable "caprock" demonstrate a lack of understanding of karsts in general, and specifically about karsts on Oahu.

Because this is a mantled karst, the exact junctions of alluvium, calcarenite and underlying basalt cannot be determined without considerable drilling or excavation, either or both of which also may harm Punamano Spring and its karstic invertebrate life forms. In my opinion, it would be much simpler and much cheaper to reroute the north end of Drum Road to meet Kamehameha Highway somewhere around Kawela Bay where there are no important karstic features. It is true that a threat to these springs and their fauna already exists from spills on Kamehameha Highway and small side roads here, but your proposed upgrading of Drum Road at the "Charlie Road" intersection would add significantly to this.

It is my impression that there have been no studies of the karstic invertebrate life forms of the Kahuku-Laie Karst in general or the Punamano Springs specifically. If I am incorrect about this, you can easily obtain this information from the Honolulu office of the U.S. Fish and Wildlife Service. Such invertebrate aquatic life, however, is characteristic of karstic waters including at least one other Oahu karst.

If you see fit to continue Drum Road to the intersection cited above, rather than rerouting it as suggested, I must insist that you somehow obtain an inventory of this karstic biota and conduct an environmental assessment of the effect of vehicular spills on each species present. Dr. Francis Howarth at the Bishop Museum is a specialist in such fauna and would be the logical person to conduct such studies.

A large and growing geological literature on this type of karst on tropical and subtropical islands is readily available for your easy reference. If you need a further consultant on the geology and hydrogeology of this site, I suggest Dr. John Mylroie at Mississippi State University or Dr. Chris Groves at Western Kentucky University. Both are very knowledgeable about this form of karst and have actually observed it with me in the vicinity of this intersection. Dr. Mylroie has published many papers on this specific subject; Dr. Groves is head of the Hoffman Environmental Laboratory at WKU and also would be an especially valuable consultant.

If I can be of further service, please do not hesitate to call on me. Please send me a complete copy of your final EIS relating to this project.

Mr. Ronald Borne
Director Transformation
U.S. Army Garrison, Hawaii

Dear Sir:

I have reviewed the three volumes of this Draft EIS from the standpoint of karstic and pseudokarstic geology and hydrology, topics in which I have special qualifications. I am the author of "Caves of Washington" and "Caves of California". Like Hawaii, these two states are noted for containing both karsts and pseudokarsts. I also have published many articles on these subjects. Recent Hawaii articles include "History and status of the Moiliili Karst, Hawaii (Journal of Cave and Karst Science, 1998, vol. 63, no. 3) and "Raw sewage and solid waste dumps in lava tube caves of Hawaii Island" (same, 2003, vol.65, no. 1).

In reviewing the list of preparers of this DEIS, I recognized no name of anyone who has published papers on either of these subjects or who participates in scientific activities on either topic. Both topics are almost completely overlooked in this DEIS and these omissions must be corrected in the eventual EIS. I am submitting separate statements for relevant karstic and pseudokarstic topics. This one concerns the latter.

Currently I am chairman of the on-going Koolau Range Lava Tube Project of the Hawaii Speleological Survey. The following relate to one pseudokarstic area in the Kawaihoa Training Area on Oahu and one or more pseudokarstic areas in the Pohakuloa Training Area on the island of Hawaii. To the best of my knowledge, no other Hawaiian pseudokarst would be impacted by this project.

P306-1

In general terms, this DEIS is broadly lacking in relevant data and analysis of impacts of the proposed transformation on geological resources of lava tube caves and related features, and of their contents. Some consideration is given their cultural values, and their biological resources are mentioned briefly albeit incorrectly. But their volcanological, hydrological, mineralogical, paleontological, educational, recreational and economic resources and values are omitted almost completely. This is unacceptable in federal environmental assessments; all these are well known and should not have been omitted by your preparers. They are essential parts of all environmental assessments of this type.

P306-2

Further, some misleading misstatements are present. These include (p. 4-65) the false idea that the only interstitial organisms meriting protection are "root-dependent arthropods". Another section (p. 3-52) incorrectly states that only at the water table do

P306-3

lava tubes transmit ground water. See my 2003 "Raw sewage and solid waste dumps in lava tube caves of Hawaii Island" (Journal of Cave and Karst Studies, vol. 65, no. 1).

These general factors have specific application to the two pseudokarstic areas cited above:

P306-4

1) tube-bearing pseudokarstic areas in Pohakuloa Training Area containing the numerous

Responses

P306-1

The EIS identifies the lava tube resources described in this and following comments. The EIS is not intended to be a thorough technical review of all resources. Differences of opinion may exist concerning the value of the specific lava tubes or "pseudokarsts" in the context of the resource areas indicated in the comment.

P306-2

The text referenced in the comment is one of several "additional" measures to mitigate the impact of "Loss and degradation of sensitive species and habitat." In addition, the primary mitigation for this impact is identified as Section 7 consultation with USFWS. Native root-dependent arthropods were specifically called out based on site-specific initial surveys conducted by an entomologist in lava tubes in October 2002, which resulted in an initial determination of which native or sensitive species are likely to occur. Neither the comment nor the literature cited in the comment indicate which other species should be specified. It should be noted that the focus of the EIS is on federally listed species and species of concern that are likely to be impacted by the project. Not all species present are likely to be impacted by the project.

P306-3

This was not the intention of the referenced text. It is meant to describe regional groundwater flow in a very general way, and is not specifically focused on lava tubes. In the geology, soils and seismicity section of the final EIS (page 3-43), lava tubes are described as a conduit for surface water and groundwater, without reference to the water table.

Stryker Brigade Combat Team Final EIS, Hawai'i

P-699

- P306-4 cont'd** lava tubes cited as archaeological sites and any others which may be present.
A present administrator of Pohakuloa Training Area -- Mr. Jon Giffin --has extraordinary expertise in recognition and evaluation of resources and values of lava tube caves. He has immediate access to skills of numerous volunteers with experience in these fields. This expertise can and should be made available for these environmental assessments at little or no cost to the United States Government, and included in the final EIS.
- P306-5** 2) a currently unidentified section of Kawaihoa Training Area containing the lava tube cave identified (p. 7-114) as site 50-80-04-5635. Caves in this general area are potentially of special importance biologically and paleontologically. Dr.s Storrs Olson and Helen James (U.S. National Museum Department of Ornithology) have specifically asked me to investigate such caves for evidence that they may have been used by raptors. Such bird remains potentially are very important in completing scientific knowledge of fossil and subfossil avians of Oahu and the Hawaiian Islands as a whole.
- P306-6** The lava tube caves of the Koolau Range also are of special geological interest because of their unusual age: about two million years.
- P306-7** Because of my current study of lava tube caves of this range, I am willing to perform the necessary studies of this and other caves of this training area at no expense to the federal government -- provided (1) that at least one representative of the training area accompanies me at all times, and provided (2) that the study takes place on one or two days in January or February 2004.
If I can be of further service, please do not hesitate to call on me.

cc: Dr. Storrs Olson

P306-4

The EIS identifies known pseudokarst features ["pseudokarst" in this environment generally is synonymous with "lava tube." Pseudokarst is a geologic feature that resembles karst but is not the result of solution processes.] Both are discussed in terms of protection of biological and cultural values. These features are not geologically unique, and are randomly distributed throughout the islands. Due to restricted public access to PTA, these features do not have recreational value. Their principal scientific value is in the biological and cultural resources that may be associated with them. As described in the EIS, these features are surveyed and receive protection through avoidance. The project is not expected to have significant impacts on lava tubes that are identified as having significant biological or cultural resource value. In general, the project would not impact lava tubes. Many lava tubes probably exist in PTA and at locations on Oahu that have not yet been identified, and may never be identified, since they may be overlain by subsequent lava flows or other deposits. The Army will continue to make use of personnel resources with expertise in identifying and recognizing the resource values of lava tubes

P306-5

Requests for access to these sites for purposes of scientific study should be directed to the Army. In general, the Army supports granting access for scientific study provided that safety consideration can be addressed. The EIS already identifies the site as having potential cultural value. If it is found to have paleontological value, then additional protection of these resources would be provided.

P306-6

Project impacts in the Kawaihoa Training Area would be limited to those associated with use of Drum Road. Therefore, no discussion of impacts in the larger area of Kawaihoa Training Area is presented in the EIS.

P306-7

Comment noted. The commenter should make arrangements with the Army to obtain access to perform scientific studies, and to request logistical support.

To: Barger, Cindy S

Subject: Re: SBCT EIS - decision on public meetings at islands other than Hawaii and Oahu

Dear Ms. Barger,

Thank you for your corrected version of the denial of my request to conduct meetings on islands other than Oahu and Hawaii to receive oral testimony on the Draft EIS for Army Transformation in Hawaii. Although I am disappointed by the refusal of the United States Army to provide this opportunity to all Hawaii residents, I have come to expect such responses from United States representatives when they expect public opposition to their plans.

P307-1

It appears that the stryker vehicles aren't doing very well, which is very unfortunate for the young men injured or killed. It is very discomforting to hear that there is now a need to now build "cages" on the vehicles that were sent to the Iraq region. The U.S. stryker vehicle design is flawed and dangerous to the young men assigned to man the vehicles. A redesign is warranted prior to any further training in these vehicles being conducted anywhere, which should not include Hawaii.

P307-2

Hawaii as you may know, is a sovereign nation under unlawful U.S. military occupation. Although our government has been destroyed by unlawful U.S. military supported activities dating back to the U.S.S. Boston landing U.S. military troops at Honolulu Harbor on January 17, 1893, this does not negate fact.

Under international law of occupation, the laws of the occupied nation shall be applied by the occupying nation. In Hawaii, those laws are known as Kanawai. The U.S. has continuously and unlawfully applied U.S. laws in Hawaii in violation of international law, which most people and governments of the world now understand the current U.S. administration disregards as a joke making statements such as "*Oh, I better call my attorney then.*"

This is simply a response to your e-mail for the record of my descendants and descendants of loyal Hawaii Nationals. I want these descendants to know that loyalists spoke up for our nation, and I hope that they will as well. The opposition to the unlawful U.S. military presence on our sovereign soil shall never cease for we continue to honor the words of our legitimate Head of State, the late honorable Queen Liliu'okalani. We shall forever abide by her wishes to Imua and Ku'e (Stand Firm and Resist) the theft of our nation.

Ms. Barger, you do not necessarily need to feel obligated to respond to this e-mail because the proper authority to respond on behalf of the United States is the United States Department of State. For your own information, you might want to learn more about Hawaii/U.S. history by reading United States Public Law 103-150 of 1993, which is the United States' admission to unlawful United States activity in Hawaii.

Thank you, Isaac D. Harp

Lahaina, HI 96761

P307-1

The Army continues to make changes to the Stryker vehicle to make it more reliable, effective, and safe. The Stryker will continue to evolve to make it as safe and reliable as possible as part of the Army Transformation process.

P307-2

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawaii was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawaii petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawaii entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawaii, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawaii in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

I also have questions about: Studying water samples, people, plants see how testing is affecting us who live here, also, the homes in Hawai'i and your plan for the people whose land you take away. How this benefits us at all? How you plan to protect endangered species and the aina which is more important for our future than training grounds? How are you selling this as a positive to the people, and why do you think it would be better for us - and why aren't you testing how weapons testing are affecting those in communities around testing bases. How are you taking continued responsibility to the land you have already destroyed?

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws and regulations.

Letter
P319

Dear Ms. Barger

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. I oppose the Stryker Brigade expansion in Hawai'i.

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws and regulations.

For more information on the Range Development Plan please contact US Army Hawaii, Range Control Office. Section 2.3, under the paragraph heading Mounted Maneuver Training, discusses the need for the additional 23,000 acre WPAA parcel as necessary for mounted maneuver training. As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID(L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

P340-2

A summary of impacts of the project can be found in Chapter 4 - Environmental and Socioeconomic Consequences Overview of the Final EIS. In accordance with NEPA regulations, the Army is conducting this EIS in order to identify the direct, indirect and cumulative environmental effects of the proposed action on the ROI. If the Army decides to implement the proposed action, the Army will mitigate all significant impacts in order to minimize the overall environmental impacts of the proposed action.

P340-3

The Army continues to make changes to the Stryker vehicle to make it more reliable, effective, and safe. The Stryker will continue to evolve to make it as safe and reliable as possible as part of the Army Transformation process.

P340-4

The Stryker vehicle is not intended for policing around Hawaii. The local police departments will continue to handle all domestic policing requirements.

P340-5

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. Letter
P348 Dear Ms. Barger

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. I oppose the Stryker Brigade expansion in Hawai'i.

P348-1

P348-2

P348-2

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

P353-2

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawaii was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawaii petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawaii entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawaii, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawaii in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

Hello—

I am writing to you regarding the proposed expansion of the Army at Pohakuloa by the Stryker Invasion.

P356-1 I am very troubled that if the Army is allowed to commence the
P356-2 Stryker expansion, there would be a very negative impact on the
P356-3 tourism industry*, the accuracy of the telescopes*, the safety of
our people*, and the healing capacities of this island*.

*Any of these would result in a huge loss in income for the people of this island.

We are sincerely hoping that those responsible for making the decisions are actually paying attention to the people who call the Big Island 'HOME' and spiritual sanctuary.

Thank you—

Diana Wolking (331-3688 voice mail)

P368-2

There is a relatively large complement of Army, Navy, Marines, and Air Force assets in Hawaii that are more than capable of protecting U.S. interests from attack. Reorganizing one Army brigade will make relatively few changes to the overall Department of Defense presence in Hawaii.

of material is enough to turn a
person off. The public want a digest
to be presented and Col McBride, this
in a very personable manner.

P369-2

Enclosed in my support of
Stryker Brigade. *At a ...*

P369-1

The scope of the proposed action, involving twenty-eight projects, acquisition of over 24,000 acres of land on two Hawaiian islands, and the comprehensive and complex evaluation of a multitude of resource impacts on the affected environment on O'ahu and Hawai'i necessitates an impact statement of this magnitude. The FEIS is divided into 5 geographical areas with the intent of making it easier for the general public to focus specifically on impacts the project might have on their community. In addition there is a guide inside the front cover describing the organization of the document, an abstract of the FEIS, and a very detailed Table of Contents. For reviewers not electing to read the entire main text, the Executive Summary provides a comprehensive impact evaluation overview, including a mitigation matrix.

P369-2
cont'd

We have the privilege to disagree. The presence of a Stryker Brigade invokes many concerns. As responsible citizens we must weigh all recognizable threats and problems objectively.

No doubt our environment and our life style may undergo a change. There will be increase traffic and noise, and air pollution during training. Also other negative issues are soil erosion and our flora and fauna in the training areas may be destroyed, even human life

Comments

maybe at risk.

An important contention by many is land condemnation and acquisition by the military - some feel - enough is enough.

There are those persons who feel that the town of Mahanui is pro military but primarily for economic reasons. There is some truth to this.

P369-4

We need ~~to~~ point out that the military has supported and has a genuine interest in the welfare of the islands. The army family has been an active participant and a doer. No doubt with the presence of Stryker Brigade Combat Team, the military - army - will play an even more important role.

The military is a member of our Island Family Group.

In order to minimize future problems we must work in conjoint with the military command from the very beginning. We wish to establish safe guards to our islands from dangerous fall outs or negative impact of the training sites.

P369-5

I support the Brigade and its purpose: Our soldiers need the best military weapon and training. And we need to recognize the realities of our nation's global mission. We must not forget: Paul Horton.

March 18.

Bush inks bill to fund Stryker unit in isles

The 25th Division's 2nd Brigade is in line to be upgraded into one of the Army's premier Stryker mobile combat teams by 2005.

President Bush signed a \$401 billion Pentagon budget yesterday that sets up funding for the Schofield Barracks and Pennsylvania Stryker units.

The National Defense Authorization Act provides \$93.3 billion for Army operations for fiscal year that began Oct. 1.

The Army's share includes \$35 million for the fifth and sixth Stryker Combat Teams.

Cindy S. Barger
SBCT EIS Project Manager
US Army Corps of Engineers, Honolulu District
Bldg 230, Room 306 ATTN: CEPOH-PP-E
Fort Shafter, HI 96858-5440

Dear Ms. Barger:

P370-1

I raise my voice with those of many others in opposition to the deployment of the Stryker Brigade in Hawai'i and particularly at Pohakuloa here on the Big Island. The inordinate enlargement of the Pohakuloa military area to accommodate training with the Stryker vehicles, the inevitable destruction of the land by the giant vehicles, and the very principle of destroying significant portions of our Island as training for destroying lands and their people and their animals and plants across the world, is a violation of all that is humane and decent.

Respectfully submitted,

Letter
P371

TO: Cindy Barger
RE: 45 day commit period

P371-1

As a resident of Hawaii, I am requesting ample time to explore the 1000 pages of proposed military expansion with in these islands.

The decisions made now will affect us for many years to come.

Please give us a 90 day commit period so that we can work together for the betterment of all.

Thanking you in advance,

Faye Kurk
Princeville, HI

Responses

P370-1

A summary of all the project impacts can be found in Chapter 4 - Environmental and Socioeconomic Consequences Overview of the Final EIS. Chapter 8 discusses the impacts of the proposed project on the resources at Pohakuloa Training Area specifically.

P371-1

In response to public comment the comment period was extended to 90 days and ended on January 3, 2004.

Comments

Letter Aloha Cindy,
P372

Thank you for taking my call the other day. I'm sorry to take so long to get back to you (swamped -- and my e-mail server has had a lot of problems).

P372-1

To briefly reiterate one of my major concerns is the impacts of sound. You mentioned that you would try to find out more specifically, some measure of actual difference between what we now have versus what you are proposing. The Pu'u may be of some help in blocking some sound from PTA itself, but additional (or rerouted) air flights would be another matter. In all cases it is important for me to know more in order to be able to respond to you more intelligently.

As I mentioned to you on the phone, we purchased this property (32 acres, and 2.75 acres with TMK's as follows: 32 Ac. TMK = 3-7-1-01-2 and 2.75 Ac. TMK = -3) for its unusual quiet (evening ambient noise level below 20) and in the daytime birds and nature.

P372-2

A few weeks ago, you may have heard, there was some very strong winds which blew a lot of dust from the PTA direction to our side, which made us more aware of potential dust problems from your proposed activities. More detailed information on that also would be very helpful.

Please do not hesitate to call me at (808) 325-2540. Thank you for your attention to this.

Jerry King

Responses

P372-1

Noise impact discussions regarding training activities at WPAA have been expanded in the Final EIS. As noted in the DEIS and the revised discussion in the Final EIS, potentially significant noise impacts from such training activities can be mitigated to a less than significant level. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels.

P372-2

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant. As discussed in Section 8.12 of the DEIS.

**Letter
P373**

Aloha Cindy,

Happy new year to you all although it seems to be starting off negatively. I have been a participant in many of you scoping meeting regarding the expansion of Pohakuloa training area.

We have been told repeatedly that there were no bones found with the exception of few (under 10). This past Saturday I had met with Ms. Hannah Reeves. As you may recall in her public testimony in Hilo, she started by specifying each site on your list. She repeatedly told you that you were killing her.. cutting off her feet, legs, head, etc. She also told you that she was aware of site containing "IWI" or ancestor bones that you folks claimed did not exist.

The Hawaiian Community is absolutely outraged as Ms. Reeves revealed to us that after the hearings, that certain military personnel of high rank pulled her on to the side to confirm that indeed there was a particular site in which hundreds of our Kupuna IWI were unearthed and stored in a place unknown to us a present.

P373-1

As a religious and cultural practitioner, I have given testimony regarding the sacredness of the entire area of PTA and the proposed expansion. This area is known as the PA'E or otherwise known as KU AHU IWI.... the sacred alters of ancestor bones..!!!! From the description of the finding described to Ms. Reeves I have to believe that you have tampered with one of the 5 sites containing the IWI of most Royal and protected. Those 5 sites are the boarder markers of the PA'E. Those site are absolute KAPU. Know that the word PA'E... means to be slapped for breaking the most sacred of all KAPU's.

I am aware that you folks have asked for our knowledge of graves, but it revealing them is also KAPU. That information is not for the uninitiated..... however you have been told that the entire area is extremely sacred and serves as a gateway to the upper heavenly sphere known as the PO.

We demand an immediate investigation on these matters, consultation under NAGPRA as well as the Hawaii Island Burial Counsel. Also be aware that under the 1st amendment there is the establishment clause which you are in violation of.

Cindy,

P374-1

Ms. Lewis called and wished to provide her comments telephonically. She did not want to submit a letter or e-mail.

P374-2

She is not in favor (of the SBCT) because of the horrible things it will do to the land. It will make it like Pearl Harbor revisited. More inviting for attacks.

Peggy Lewis, 269 Ilikaa Pl., Kailua 96734.

P374-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P374-2

There is a relatively large complement of Army, Navy, Marines, and Air Force assets in Hawaii that are more than capable of protecting U.S. interests from attack. Reorganizing one Army brigade will make relatively few changes to the overall Department of Defense presence in Hawaii.

Comments and Questions re: DEIS of the Transformation of the 2cd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawaii

I am very impressed with the great job done by the EIS Team for this Draft EIS for Pohakuloa Expansion, known as the Transformation of the 2cd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawaii.

I am impressed by this EIS Team in showing how this area is extremely rare and valuable and unique. As a resident of 45 years, my avocation now is studying the biology of this island. In Appendix I - 1 Natural History Information for special species found in SBCT ROI pertaining to the Pohokuloa Training Area, I found a list of 25 endemic native Hawaiian Plants found in the PTA and it's expansion area. This means they are found nowhere else in the world, some are found only in the Region of

P-746

P375-1 Inquiry. I checked the status of these plants with the Manual of the Flowering Plants of Hawaii Vol. 1 and 2, by Wagner, Herbst and Somer. c1990 Bishop Museum. This is the definitive manual on all plants of Hawaii, except ferns. I found that the Plants listed as Federally Listed as Endangered, and/or critically imperiled globally, were accurately reported, in the whole world some plants are only found in the Pohukuloa Area and some are down to one plant in the area. The Manual of Plants added some new information re: Native plants *Lipochaeta venosa*, and *Isodendron hasake* can be found on cinder cones in the PTA area, Holoholuku, Heihei, and Pu'upa Nohonaohae, Puu Papapa, and a third (not named) to the ENE of Nohonaohae.

P375-2 These cinder cone areas should be part of a conservation area, protected from mining of the cinder or any forces used in war games. Most of these rare plants have not been studied enough to see if they have any elements that could be substantially be of use to mankind.

P375-3 7 out of 14 birds listed as frequenting the PTA and ROI, are Federally listed as endangered. In more than one place in the DEIS, the mention of increased noise and use of explosives, live or not, could critically impact the rare bird populations. More attention must be paid to the Critical Habitat areas, more should be designated. We must tell the State Dept of Land and Natural Resources that attention must be paid to the Critical Habitat areas, and more should be designated.

P375-4 The US Army Hawaii should definitely implement "an environmental management system to further improve the identification and reduction of environmental risks inherent in mission activities. This would include ecosystem level management for all rare species, pest management, land rehabilitation and maintenance, and fire prevention and suppression ." p. 8 - 140 Vol. 2

This area is like the Galapagos Islands, different than any other place in the world. Why deploy more ecology destroying armaments, war games and heavy equipment in such a sensitive area? On such a small remote island with the potential for major natural disasters: Earthquakes, eruptions, lava flows, tsunamis, and land subsidence of whole sections of this island?

This is such a rare place of wilderness, Please don't transform it into a training ground for "urban" military training. It is a rare place for ongoing studies in biology, geology, meteorology, archaeology, astronomy and more. Please don't close it to these and future scientists, by making dust and noise. By making this place uglier, it is undesirable for any other activities, productive and recreational.

Sincerely,

Sarah Moon 121

Lokoaka St. Hilo, HI 96720

P375-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P375-2

Cinder cones at the WPAA will be avoided per section 7 ESA consultation. Please see Section 8.10. Other protection measures for current force training at PTA is covered in the Biological Opinion and is available upon request.

P375-3

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P375-4

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measure were included for public comment and based on public comments and a cost benefit analysis those likely to be implemented are described in the FEIS. Costs include not just monetary costs, but cost in manpower and training. The ROD will indicate which mitigation measures will actually be implemented.

Subject: Iraq: A Gnat on the Elephant of History

Iraq: A Gnat on the Elephant of History
 Commentary by Milo G. Clark, 1st January 2004

The United States of America, in its short history, has a long history of inviting or precipitating wars. In retrospect, given perspective, these wars have served the purposes of whatever leadership was in place at the time. History being the prerogative of victors, resultant mytho-histories tell quite another story.

Perspective is important, perhaps critical, to understanding events of the moment.

P376-1

Assume planet Earth from space dust to now is about 15 billion earth/sun cycles or years old. Assume humankind has evolved within the most recent million. Assume civilization as defined by western mytho-history is maybe 5 to 10 thousand years old. Assume history is about half that.

What is now the United States of America began in the late 1700s of Common Era. It was a response, resistance, dissent to British imperial rule. A mere 200plus earth/sun cycles. A spark of hope emergent from Europe's Age of Enlightenment.

Iraq, once Mesopotamia and before that Assyria, Acadia, Babylon, et al, is no more than the latest geo-national configuration at the confluence of Tigris and Euphrates Rivers, east of the Mediterranean Sea. Western mytho-history is defined as times since known written languages emerged in this area, said to be a bare 3,500 to 4,000 years back. Here successions of rulers conjoined with successions of religions from animisms to Zoroaster to Islam raised civilizations and in blinks of time razed them. The Old Testament records some of those catastrophic events.

P376-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

Responses

Comments

Iraq is a creation of WW I's (1914-1918 C.E.) victors, Great Britain, France and USA. Paying little, if any, attention to local peoples, they carved up this part of the decadent and defeated Ottoman Empire. In doing so, they obeyed the imperial dictum of Divide and Conquer.

The mixes of Kurds, Arabs, Persians, sects and splinters of Islam both Sunni and Shi'ia, proto and heretical Christians spiced with vestigial Hebrews guaranteed strife. Iraq's short history has been one of wars within, wars without and wars against imperial occupiers (Britain in the 1920s and now U.S.A.). The British imposed outsiders as kings who were overthrown to be replaced by Sunni-dominated one-party dictatorships, the latest recently blown out.

The United States of America took form first as a loose confederation of geo-political entities straggling along the eastern coast of North America from today's Maine to Florida. After the 1776 Declaration of Independence and during the Revolutionary War, in 1781, Articles of Confederation were agreed upon by 13 areas now called "States." The Articles gave way to a federal republic under a Constitution (1787) still nominally operative.

Nowhere in that Constitution, as amended to date, does the word, much less concept of democracy appear. The now-sainted founders feared mass rule. Initially, only propertied classes could vote. The founders included a cumbersome Electoral College as a final barrier within which those privileged to judge could hold off even the expressed will of relatively few propertied voters.

It was only in the 1920s that right to vote was finally extended to women offering a near universal suffrage . The Electoral College remains an essential barrier to popular will as was demonstrated in 2000.

An early and parallel principle dear to the founding saints was nullification. The American Revolution was about the right of colonies to nullify imperial fiat. "Taxation without Representation" and so on. Early leaders agreed that states must be able to reject central government actions. Under the Articles of Confederation, nullification was a recurrent contention. The 1787 Constitution established a clearer balance between federal and state powers. A shadow of nullification lurks within assertions of states' rights. Until the Republican Party was seized by those presently in control, states' rights was among its cardinal shibboleths.

When a group of southeastern states attempted nullification and succession in 1860, a viciously barbaric civil war ensued. Their economies depended upon plantation-organized no wage commodity growing for export markets.

President Lincoln believed in centralized Federal control of American government. He wanted an industrialized future defined by northern perspectives. In his view, folks were either for his ideas or against

Comments

them which meant against him.

Relatively late in that war undertaken to maintain and to assert federal authority, i.e. nullify nullification, the cover story of slavery was pushed forward. Mytho-history has since put slavery first and lost sight of the other great irritants motivating the Confederate States of America such as dominance by central government powers especially those related to economic processes.

Central government authority was firmly established by force of arms. The flattened and defeated Confederate States were occupied and taken over by victorious army, administered by imported bureaucrats and plagued by local outlaws and outlanders come to loot, pillage and garner reconstruction contracts. Sound familiar?

Within a few years, white southern authority was reasserted. Wage slavery plus tenant farming established then remain in place. Plantations are now called "agribusiness." Corporations supplant Simon Legree.

History shows that wars for peace utterly fail. The fact of continuing wars establishes that generalization. Throughout world history, empires have come and gone, gone and come. As in Mesopotamia, their enduring legacies are death and destruction, death and destruction punctuated only by intervals of tyranny and despotism. Despots are often "popular", though.

Historian John Lukacs prophesied that the decadence of the United States of America and a return to barbarity would characterize late 20th and early 21st centuries C. E. The spark of hope from Age of Enlightenment was to dim and die.

After the American Civil War ended in 1865, events driven by "economic progress" took center stages. As land was consumed, resources and peoples exploited, northern-focused industrialization and cash- then debt-driven actualities pushed waves of expansions west, north and south. Then across the oceans.

Genocides drove off and decimated indigenous peoples, borders moved north and south through wars and diplomacies of force, spatial vacuums filled.

"Manifest Destiny" was invented to give name to mytho-historical justifications. Yet, firming borders and Pacific Ocean barrier did little to quell drives for progress. Nothing less than control and more, ever more, would do.

The emergent baronies of capitalism given legal form as "persons" evolved in partnership with ambitions of "Manifest Destiny," America's "White Man's Burden." Markets beckoned. Corporations soon supplanted republic as actuality of governance. Great and small conflagrations were

Responses

Comments

entered with compelling slogans to enlist masses and to feed graves. Destructions engendered reconstructions. Reconstructions are stuff of history and good for business. Wars, illusions of empire and good business times are popular. 1930s Germany serves as illustration. There seems no downside until it falls.

The empires of mytho-history come and go, go and come. Their most enduring legacies are death and destruction, tyranny and despotism. Relative timing is about the only variable. It took Rome between 400 and 600 years to collapse. The Soviet Empire fell in a few years. Hope for better times is now about gone. There were no peace dividends, only more military demands.

In parallel with imperial manifestations from assertion of federal dominance through "Manifest Destiny," Great White Fleet, regional wars of conquest, world wars, police actions, Cold War, regime changes, security state—all becoming too numerous to count; the once republic of the United States of America has evolved more toward imperial power than beacon of hope.

The latest confections of imperial form and security state garner force from and through reactions to pinpricks. Masses are captured and mesmerized by "wars" against chimeras whether drugs or terror. Those "enemies" now command more response, more treasure, than the Soviet Union at its peak. Central authority seeks expansion and uncontested control. Politicians need enemies like junkies need their fixes. The difficulties occasioned by drugs and/or terror are little reduced while imperium grows apace. Resources are diverted and squandered recklessly. Domestic responsibilities are shunned and pushed aside.

An authoritarian-minded clique seized U.S. government in 2000 through one vote of those privileged to judge and resulting machinations of Electoral College to deny popular will. They early staggered in search of enemy against whom to organize their programs, impose their will. Given an enemy in September 2001, the wraps came off. Looting treasury, favoring friends, burgeoning bureaucracies, smashing rights, gutting restraints, privatizing public assets, forcing a state religion, arrogating authority, denying compassion. . . the list grows weekly. Patterns of imperial arrogances spread and merge, merge and spread.

Wars for peace, failed occupations, plethora of deaths and destructions mark and define mytho-histories of recent millennia and these times.

Momentary flickers of hope die again and again. Russia, for one, in its thousand years of time goes through recurrent orgies of horrors. Vlad, the Impaler; Ivan, the Terrible; Peter, the Great; Lenin, the Emancipator; Stalin, the Merciless. And, now, a new Tsar, a new Caesar, emerges. George Bush's great friend and compatriot, perhaps role model, Vladimir Putin, takes imperial control. The more it changes, the more it is the same.

Responses

Comments

The Tree of Life said to grow near the confluence of Tigris and Euphrates died.

Is America's flicker of hope, now dimming, to die in the emergent imperium?

Lukacs and others prophesy new eras of barbarities, a decadent American empire.

In perspective then—Iraq: A Gnat on the Elephant of History

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawaii was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawaii petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawaii entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawaii, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawaii in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closer (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program. All of the referenced documents are public documents which can be obtained online or from the publishing agency.

Ms. Cindy Barger
U.S. Army Corps of Engineers, Honolulu District
Bldg. 230, CEPOH-PP-E
Ft. Shafter, HI 96858-5440

December 30, 2003

Dear Ms. Barger,

I am writing in opposition to the draft environmental impact statement of the Hawaii Stryker Brigade Combat Team. As an environmental professional, I am awed by the failure of so many pages to address the environmental concerns of Hawaii residents.

While I am opposed to the Stryker Brigade being based here at all, I realize that the decision to select Hawaii as one of six states has already been made by the Pentagon. However, until the U.S. Army prepares a legitimate environmental impact analysis, this project should not move forward.

Unfortunately for you and anyone working on this project, the military has yet to prove to island residents that they can be a good neighbor. While the timely "return" of Kahoolawe to the State after years of destruction and environmental and cultural damage was scheduled to sway public opinion about the history of U.S. military operations on this island, it did not fool me, nor anyone.

Here are the facts. You have left hazardous waste all over the Big Island, and you have no funding or plans in place to clean it up. You have no funding or plans in place to clean up the messes underway at Pohakuloa. You are crossing your fingers that the current federal administrations' efforts at exempting the military from environmental regulations and review will absolve you of cleaning up your past training areas.

Your EIS was poorly written, full of errors, purposely confusing, and did nothing to address the valid concerns of island residents. What was the point? Throw it out and start over. Listen to what people are worried about – soil compaction, dust, hazardous artillery, endangered species, cultural sites, noise, fire, and on and on and on. This document should be for the people, not something to fill the coffers of government contractors, a bothersome thing to check off your list.

You say you want to be a good neighbor. Then start over and be one.

Sincerely,

Linda Scheffler

Cindy Berger:

Thank you for shipping copies of the Stryker EIS.

Questions:

P380-1

1) How much does a basic Stryker vehicle cost? (Which may be a factor more of the contract amount. divided by number ordered.)

2) I understand from Ron that a Stryker tire is approximately 4 feet high. How wide is one? How much does one weigh? What would be the approximate cost of such a tire?

3) I understand that the weight of a basic Stryker vehicle is approximately 38,000 lbs. Is this approximation accurate?

4) Are there evaluations or reports comparing the Stryker with the Bradley? As, I assume, this data is not sensitive or classified, can they be accessed?

P380-2

5) Will Stryker vehicles be transported to projected duty areas by air, carrier vehicles (trucks), trains or by sea?

**Letter
P381**

Cindy,

I mailed my cursory editorial markup to you today from the Big Island.

P381-1

I believe that the way the Army has handled the public in recent public meetings on Oahu is just an extension of my comment about the arrogance of the language in the last page of the Executive Summary, which I highlighted in the copy I returned to you. Setting up the public meetings on private property to give more leverage for ousting protestors is very worrying to me. What's up with that? The tactic isn't even subtle. I was and am in favor of the Stryker and all that it entails, but the way these meetings are being handled is pretty heavy handed. Since I've spearheaded these kinds of meetings, I know the heavy handedness isn't necessary. The meetings I was involved in were about water in the arid west and, believe me, that's just as politically charged as the Stryker project. People have the right to be heard and their placards and banners seen. Last time I looked, freedom of speech hadn't been revoked.

A hui hou,
Connie

P380-1

For additional information on the Stryker Vehicle please see the following web sites, <http://www.army-technology.com/projects/stryker/> and http://www.global-defence.com/2003/stryker_03.htm. The Stryker vehicle is undergoing modification as a result of ongoing training and action overseas. However, these sites provide a good overview of the vehicle.

P380-2

Deployment to the Island of Hawaii will be by barge, deployment to areas out of the State of Hawaii will be by aircraft.

P381-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

Subject: 45 day extension for written comment to the Final EIS-Transformation

Importance: High

Dear Sir/Madam,

The Mililani Mauka/Launani Valley Neighborhood Board No. 35 would like to respectfully request a 45 day extension to properly comment on the Final EIS-Transformation.

This extension will allow us to be briefed on the Transformation EIS by Mike Egami at our upcoming Neighborhood Board

meeting on November 18, 2003.

Please confirm in writing the approval of the extension via email at angiffarg@wwdb.org or by mail at P.O. Box 894204, Mililani HI 96789.

Thank you for your time and consideration.

Sincerely,

Melissa E. Graffigna, Chair

Mililani Mauka/Launani Valley Neighborhood Board

P383 Dear Ms. Barger

AP 105 a

P383-1

I am writing to comment on the Army Draft EIS for a Stryker Brigade in Hawai'i. This would mean an expansion of 24,400 acres, increased unexploded ordnance and toxic chemical hazards, harm to endangered species and cultural sites, and the unacceptable degradation of our quality of life. I oppose the Stryker Brigade expansion in Hawai'i.

P383-2

I also have questions about: the dust pollution,
the 40+ endangered species in the valley,
the additional 19 million rounds of
ammo a year, the 300% increase in land
these land vehicles will drive through?

P386-2

The Army minimizes impacts to watersheds through institutional programs such as ITAM as well as abiding by all applicable laws and regulations. As summarized in Section 4.10, the Army has determined that some impacts to sensitive species will be significant. The Army proposed mitigation measures to substantially reduce the severity of the impacts. These mitigation measures are listed in detail in the Biological Opinions issued by USFWS for the current force and Proposed Action on the islands of O'ahu and Hawai'i. These BOs are available upon request.

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

P387-2

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws and regulations.

P387-3

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

Speaker Cory Harden - Sierra Club, Moku Loa Group

M4 11/6/2003 Public Meeting

M4-1

A third flaw is there are pieces of the EIS that aren't even there; and, so, there's no way the public can comment on them. For example, a big part of the 23,000 acres is considered agricultural land of importance; therefore, they need a farmland determination. That's not completed, so we can't comment on it.

M4-2

The EIS refers the reader to four sections that talk about air space and noise impacts; and I looked; I can't find any of these sections.

M4-3

Several times in the EIS it refers to a programmatic agreement with the State Historical Preservation Office, and this has to do with cultural sites and archaeological sites and historical sites. The EIS says this agreement may have been revised. It doesn't say whether it actually was revised and what version is being used. And, again, the public cannot comment.

Speaker Dr. David Heaukulani

M4 11/6/2003 Public Meeting

M5-1

I want to talk about the issue of compatibility with ancient Hawaiian warrior traditions, that is not cited or included in the cultural section of the EIS. It is recommended that some mention of this ancient use of the Hawaiian Island lands be included, at least as a footnote. It needs to be pointed out that warriors of ancient Hawai'i trained and battled on the very grounds that is being used by the modern warriors today on this aina, on this island. The culture experts on the environmental staff of U.S. Army Hawai'i recovered several iwi, ancient Hawaiian warrior spears, and approximately 20 feet long in caves in the Pōhakuloa area. This is confirmation that relative to Hawaiian culture and tradition, the training of the areas is a compatible use of the lands at Pōhakuloa. To ignore this fact is to ignore a heritage as descendants of Hawaiian warriors.

M4-1

The farmland conversion rating forms are included in Appendix E of the Final EIS.

M4-2

For analysis of Airspace please see sections 3.4, 4.4, 5.4, 6.4, 7.4, 8.4, and Chapter 9. For analysis of Noise please see section 3.6, 4.6, 5.6, 6.6, 7.6, 8.6, and Chapter 9.

M4-3

The PA was submitted for public comment in April 2003 via a notice of availability published in the newspapers (same ones as the DEIS) and in OEQC. In addition, the PA was made available during the DEIS review and comments solicited through the DEIS comment period. The Final PA as signed by the Army, SHPO, ACHP and concurring parties is included in Appendix J of the Final EIS.

M5-1

Text was added to section 5.11, Cultural Resources, regarding stories of Hawaiian warriors training in the ancient art of Lua on lands in SBMR. In addition, the cultural resources sections have been expanded to include a more detailed discussion of Areas of Traditional Importance.

Speaker **Jan Moon**

M6 11/6/2003 Public Meeting

- M6-1** | No mention is made on the impact on the astronomers on Mauna Kea.
- M6-2** | The land for your proposed expansion around Waiki'i is zoned for agriculture and conservation. It has never been used by heavy vehicles, training, or munitions, which would destroy the land, compact the soil -- quote in the EIS -- causing more dust and air pollution and noise so that it would become another waste land like the PTA is now.
- M6-3** | The 1,005 heavy-duty vehicles going up this trail would have a drastic effect on the nearby communities with the noise and air pollution from emissions and dust. Plus, the shaking of the earth would affect Pu'ukohola heiau, a national historic site which is sacred and must be respected and protected.

M6-1

While this was previously assessed and it was determined that there would be no impact on the observatories on Mauna Kea, a discussion has been added to Chapter 8.3 – PTA Visual Resources regarding this issue.

M6-2

There was and currently are maneuver training exercises taking place on WPAA by the Army and Marines by short term lease. No live-fire training or munitions are currently used on WPAA nor is any planned to be used as part of the proposed Transformation project. However, there will be a considerable amount of dust generated from maneuver training as described in the EIS. This has been determined to be significant but mitigable to less than significant. Noise, while increasing at WPAA, has been determined to be less than significant. These determinations for PTA and WPAA can be found in Sections 8.5 – Air Quality and 8.6 – Noise.

M6-3

The size of vehicle convoys on the PTA Trail would depend on the size of units deployed to PTA for training, but would never include the entire complement of vehicles assigned to the 2nd Brigade. Moreover, about half of the vehicles used by the 2nd Brigade would be Humvees and light trucks, not heavy vehicles. As noted in the traffic discussion (Section 8.7), convoys between Kawaihae Harbor and PTA would be limited to no more than 96 vehicles per hour. Convoys would travel as groups of no more than 24 vehicles spaced 15 to 30 minutes apart. Total traffic on the PTA Trail is unlikely to exceed 500 vehicles per day. The discussion of dust from vehicle traffic on the PTA trail has been expanded in the Final EIS. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/ or the use of washed gravel for surfacing military vehicle trails. Section 8.9 notes that the Island of Hawai'i has experienced earthquakes as large as a magnitude 7.2 quake in 1975 and a magnitude 6.9 quake in 1951. The 1951 earthquake damaged buildings along the Kona coast and caused a 12-foot tidal wave. Given that the Pu'ukohola heiau has withstood the ground shaking from these earthquakes, there is no risk to the heiau from ground vibrations generated by traffic on the PTA Trail.

M7 11/6/2003 Public Meeting

M7-1

Quoting the DEIS, Page 8-140, Volume 2, seven out of the fourteen native birds listed as frequenting the PTA and the regions of inquiry are federally listed as endangered. In more than one place in the DEIS, the mention of increased noise, use -- and use of explosives, live or not, could critically impact the rare bird populations. More attention must be paid to the critical habitat areas and more should be designated. And we must tell the State Department of Land and Natural Resources, that because they allowed that to be, they gave permission to the Army to ignore the critical habitats.

M7-2

Quoting the DEIS, I feel the U.S. Army -- they said they should consider an environmental management system which includes ecosystem level management for all rare species and pest management, fire prevention, and land rehabilitation. This area is like the Galapagos Islands, different from any other place in the world. Why deploy more ecology-destroying war games and heavy equipment in such a sensitive area, on such a remote island, with the potential for major natural disasters, earthquakes, eruptions, lava flows, tsunamis, and land subsidence of the whole section of an island?

M7-1

As summarized in Section 4.10, the Army considered the potential impact on sensitive species including birds. The biological resources section has been expanded and in some cases the determination of effect has been changed.

M7-2

The Army funds and implements a number of environmental management programs as discussed in chapter 2. The decision to transform in Hawai'i was analyzed in the Final Programmatic EIS completed on March 8, 2002. The Record of Decision for this EIS was signed on April 11, 2002. All the factors considered for transforming in Hawai'i are included in that Final Programmatic EIS. The discussion regarding why transformation is to take place in Hawai'i can be found in Chapter 1 – Purpose, Need, and Scope of this EIS. However, options of transforming in Hawai'i and training elsewhere are discussed in the EIS. Please see Section 2.6 in the EIS. Impacts of the proposed project described in Chapters 5-8.

Speaker **Mikahala Roy**

M8 11/6/2003 Public Meeting

- M8-1** | In the land acquisition planned -- Number 1, in the land acquisition planned by this Draft EIS, how will the Army compensate for the loss of education of Hawaiian history and lore of the heritage that comes from Hawaiians being upon the land?
- M8-2** | Number 2, what will the Army give toward the perpetuation of heritage and identity of the indigenous Hawaiian people that these lands will no longer be available for in the event this takes place?
- M8-3** | How will the Army educate Hawaiian families as to their genealogies associated with the lands the Army seeks to occupy and destroy?
- M8-4** | Four, how do existing conditions of danger and more dangerous conditions generated by expansion of the Stryker Brigade meet, for example, Linda Lingle's plan for the promotion of a safe Hawai'i for visitors?
- M8-5** | Five, how does the Army address its destruction of religious sites and religious landscapes it seeks to occupy? How will it make restitution?
- M8-6** | Six, how will the Army compensate for the destruction of the living spirituality of the Hawaiian people and those who travel to Hawai'i for such purpose?
- M8-7** | Seven, what will the military do to assure the keeping of the original trails and paths, those protected by Queen Liliuokalani?

M8-1

As discussed in Section 4.11, the Army proposes to continue work with Native Hawaiian communities on access to areas of traditional importance. In addition, an installation wide access protocol is being developed for all Army training lands in Hawai'i.

M8-2

As discussed in Section 4.11, the Army proposes to continue work with Native Hawaiian communities on access to areas of traditional importance. In addition, an installation wide access protocol is being developed for all Army training lands in Hawai'i.

M8-3

There is no program in place to educate Hawaiian families.

M8-4

The proposed project will follow all federal regulations and will make a good faith effort to participate in the State of Hawai'i's plan.

M8-5

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. The cultural resources sections of the document have been expanded. Sections 4.11, 5.11, 6.11, 7.11 and 8.11 address cultural resources impacts from the proposed action.

M8-6

We have expanded the cultural resources sections of the document. Sections 4.11, 5.11, 6.11, 7.11, and 8.11 address impacts to cultural resources.

M8-7

When original trails are identified through survey or consultation efforts, they are avoided or mitigated according to the PA.

Speaker Keonipa'a

M9 11/6/2003 Public Meeting

M9-1

You dig up a 20-year-old water study for Pōhakuloa. That's 20 years ago. You know, you guys, you not putting nothing, no effort into this.

M9-2

I'm very disappointed on the protection of the cultural.

M9-3

Even the environmental, you guys have no solution. You talk about the lead contamination in there and how the workers might have to wear masks and stuff, and you worried about further contamination by that stuff spreading. You need to control that and take it someplace to mill out or whatever, refine your lead and get that contamination out of there. You guys need to clean up your mess before you can get anything else. So I think -- I think -- I just need to tell you guys that you guys better be careful, that this is all under international laws. You need to respect international laws, laws of nations, laws of occupation, laws of war, the law of the sea. All of these are being broken by the United States.

M9-1

The EIS compiles information from multiple sources, it relies on available information, and the references included in the EIS may provide additional information of interest to readers who want to do further research on their own. The basic hydrology at PTA is not likely to have changed in 20 years. There is no reason to believe that a 20-year old study is not relevant.

M9-2

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

M9-3

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. Section 4.12 summarizes the potential impacts to human health and safety and discusses ongoing measures that will be done for UXO clearance. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. The Army is committed to cleanup existing sites in accordance with applicable laws and regulations.

Comments**Speaker Lynn Nakkim****M10 11/6/2003 Public Meeting****M10-1**

But I mention it to show you how far noise carries now from their operations and the suggestion that a thousand feet is a good buffer zone. That's what it says in the Environmental Impact Statement. And I'm kind of astonished. It's a good buffer zone if you're deaf already. But -- no kidding. And the Army admits that this is a huge problem. And in the entire six-pound EIS, they have no suggestions for mitigating the noise of the training sessions that will sometimes be, according to the officer who I heard speak six months ago, will be twenty-four hours a day, seven days a week. Not all the time, but when they're doing exercises. And you can check on Table 4-5, on Page 431, where it mentions that the noise from ordnance used is labeled as significant and -- anyway.

M10-2

Our preference would be for the buffer zone to be at least ten miles. And, as a matter of fact, I'd like to see it be three thousand miles. I'm absolutely serious.

M10-3

Environmental Impact Statement, check out ES-37, Table ES-11, Lines 5 and 6, fugitive dust from military vehicle use and wind erosion from areas (inaudible) where military vehicle use will be significant.

Responses**M10-1**

As summarized in Section 4.6, the noise discussions have been expanded with additional mitigation measures proposed. Impacts at PTA are anticipated to be mitigable to less than significant. Impacts at SBMR will remain significant but mitigation will reduce the severity of the impact.

M10-2

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

M10-3

The DEIS conclusions regarding the significance of air quality impacts were based on the magnitude of emission estimates. The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

Comments

- M10-4** | The Armed Services determined in about 1998, I think, that they had enough property; and, in fact, they were shutting down bases right and left, and they established a policy of not purchasing more land. This goes directly against the Army's own policy. Let's help them stick to their policy.
- M10-5** | According to our local zoning laws, military use is not allowed in agricultural zones.

Responses

- M10-4**
The Range Development Plan prepared in 2002 identified the acreage required for individual maneuvers necessary to meet the training requirements. On the Islands of Hawai'i there is an overall shortfall of training lands in excess of 51,000 acres.
- M10-5**
As discussed in Section 4.2, the Army has considered conflicts with local zoning laws and policies as factors for significance. Although the local zoning laws do not apply to federal government lands, the Army incorporates these policies where practicable.

Speaker **Mililani Trask - Gibson Foundation**

M11 11/6/2003 Public Meeting

M11-1 | Please extend comment period.

M11-2 | I am opposed to locating the SBCT in our state. The military has extensive holdings in HI. This has created significant problems, which the military has not addressed, including toxicity, environmental degradation, threats due to UXO and the ongoing issue of compensation for land use. 57 known sites have or are being used for bombing, artillery, and live fire exercises. At present the US has no strategic plan to address the threat posed by unexploded ordnance.

M11-3 | Number 1: What is the current plan of the United States to address and clean up the live ordnance we have on Hawai'i Island? And how much money will have to be appropriated for this purpose?

M11-1

The public comment period was extended to 90 days and closed on January 3, 2004.

M11-2

As a mitigation measure for safety, prior to initiation of any construction activities, USARHAW will employ qualified professionals to perform UXO clearance of the proposed construction area, remove all UXO encountered to ensure the safety of the site, and document UXO surveys and removal actions in full accordance with applicable laws, regulations, and guidance. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closer (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

M11-3

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closer (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

Comments

Responses

M11-4 | Number 2: What is the current plan to identify and clean up additional live ordnance that would be the result of the deployment of the Stryker Brigade on Hawai'i Island? And, secondly, how much funding has been appropriated for this purpose? And where is the funding now?

M11-4

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. Speaker Bunny Smith

M12 11/6/2003 Public Meeting

M12-1 | What will be the real cost here for our land being taken and used for this purpose and furthermore?

M12-2 | It seems to me that the Stryker is very definitely, as some others have said, an offensive weapon. It is aiming at other populations. It is a flattening, leveling instrument, if you will. What is it going to flatten?

M12-1

The impacts on economics are described in sections 4.13, 5.13, 6.13, 7.13, and 8.13 – Socioeconomics and Environmental Justice.

M12-2

The Stryker may be used in a variety of ways described in Chapter 1 – Purpose and Need, Section 1.1.

Comments**Speaker Dwight Vicente****M13 11/6/2003 Public Meeting**

M13-1 | Constitutional violations. The Article in Section VIII, Clause XVII, the military bases should be in the United States.

Responses**M13-1**

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

Comments

Speaker **David Bigelow - Waikiki Ranch Home Owners Association**

M14 11/5/2003 Public Meeting

M14-1 land is presently owned by Parker Ranch and is designated as agricultural by the State Land Use Board. The draft EIS, Section 827 states and this is a quote, The proposed training land, uses of agricultural grazing land, yet the WPAA is not consistent with the land use set forth in the County of Hawai'i general plan. I'd like to add to that in light of Judge Ronald Ibarra's recent decision regarding non-conforming use of agricultural land, we believe that the proposed action under the subject of inversion of agricultural land to training land should be changed to significant.

M14-2 Going to geology and soils, the discussion in Chapter 8.9 is a thorough treatment of the soils and geology of the PAA, and we agree with the conclusion under the subject soil loss that the impact is significant, so we take no issue with that.

M14-3 The WPAA, area surrounding our borders presently has almost no human travel. The risk of fire is very low. However, the addition of heavy vehicles and warfare stimulation with explosive devices raises the risk of fire exponentially. The potential for severe damage to our community is very high, and for these reasons, we believe under the subject of soil erosion and loss and wild/land fires, the impact should be changed to significant.

M14-4 Air quality. The use of the WPAA land for off-road exercises and the high increased risk of wildfires and resulting dust storms will cause a significant degradation of air quality. Flying dust will be a hazard to the health of our Waik'i Ranch residents and will also cause property damage. We agree with the conclusion that the proposed action under the subjects, future dust from the military vehicle use and wind erosion from areas disturbed by military vehicle use is significant.

Responses

M14-1

During the EIS review process, the Army has coordinated with Natural Resource Conservation Service and is compiling with all requirements of the Farmland Policy and Protection Act (FPPA). Farmland conversion forms are included in Appendix E of the FEIS. If the Army decides to implement the proposed action, the management and use of the West PTA acquisition area would be conducted per federal regulations and guidelines. State regulations and guidelines do not apply to federal actions. However, the Army has considered State policies in its overall assessment of impacts in the EIS. In following FPPA requirements, CEQ guidance and Army policy, the Army has determined that the proposed conversion of West PTA acquisition area is consistent with these regulations and guidance and the impact would be less than significant

M14-2

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

M14-3

In the Final EIS the discussion of impacts from wildland fires has been expanded. Please see sections 8.9, 8.10, and 8.12. For some of the resource areas the Army has changed the impact determination to significant.

M14-4

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

Comments

- M14-5** In addition, we believe another impact issue should be added, and that being wind erosion from areas burned by wildfires. The impact of this would also be significant.
- M14-6** The next subject. I'm running out of time here, I'm sorry. I'll go fast. The human health and safety hazards. We believe there are real human health and safety hazards to the residents of Waiki'i Ranch if the WPAA plan is implemented. The chapters on air quality that are in the EIS agree with this, and they state that the dust generated by vehicles and the subsequent wind erosion has the potential to create significant health effects. The same chapters conclude that dust generation has a significant impact and is not mitigable. This should be included in the human health and safety chapters, and it's not. It's lacking. So what I'm saying is in one chapter it says it's a health hazard, and in the health hazard section it doesn't mention it. The increased threat of wildfires is a direct threat to human health and safety. The fire itself and length of a dust storm after the fire is addressed in the EIS as amicable to less than significant. We believe that an impact issue titled dust particle inhalation should be added and that the impact should be significant. In addition, too, the wildfires impact should be upgraded to significant. Okay
- M14-7** The next one would be noise. And the increase of noise levels due to small arms fire and heavy weapon simulators is discussed in Chapters 4.6 and 8.6 in the Draft EIS. One of those chapters draws the conclusion that it's a significant problem and the other draws a conclusion that it's not significant, so there is a conflict there and the final -- in the table it says it's not significant, so there is a problem with this as far as being inconsistent. As far as these Waiki'i Ranch specifically, those discussions maintain that the noise levels from small arms fire and weapon simulators can be mitigated to a reasonable level by maintaining a distance of 500 feet to be 1,000 feet at night from the borders of Waiki'i Ranch. We do not agree with this conclusion. We believe that the amount of noise that will be generated by training exercises will be significant and the impact on Waiki'i Ranch will be negative. For this reason we believe that the subject of noise from ordnance use should be changed to significant in all tables.

Responses

M14-5

The FEIS recognizes the wind erosion hazard associated with soils at WPAA. Any significant reduction in vegetation cover on this area would increase the amount of dust generated by wind erosion. The FEIS also recognizes that wildfire risks are inherent in military training activities. Please see the discussion in section 8.5 for additional detailed information.

M14-6

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant. As discussed in Section 8.12 of the DEIS, most of the wildfire damage at PTA has been caused by fires that started in off-post areas from non-military causes and spread into PTA. The 1999 wildfire that burned the WPAA and significantly impacted Waiki'i Ranch was one such fire. While wildfires are a recognized hazard associated with military training activities, the most damaging wildfires in recent years have not been started by military training activities.

M14-7

The Final EIS has been revised to make Section 4.6 consistent with Section 8.6. Noise impact discussions regarding training activities at WPAA have been expanded in the Final EIS. The Army proposes to mitigate the impacts from noise at WPAA by implementing a 1,000 foot daytime noise buffer zone and a 2,000 foot nighttime noise buffer zone for training activities. The implementation of these buffer zones would reduce the impact to the Mauna Kea State Park, Waiki'i Ranch, and the Kilohana Girl Scout Camp to less than significant levels.

Responses**M14-8**

The Final EIS has been revised to make Section 4.6 consistent with Section 8.6. Noise impact discussions regarding training activities at WPAA have been expanded in the Final EIS. The Army proposes to mitigate the impacts from noise at WPAA by implementing a 1,000 foot daytime noise buffer zone and a 2,000 foot nighttime noise buffer zone for training activities. The implementation of these buffer zones would reduce the impact to the Mauna Kea State Park, Waiki'i Ranch, and the Kilohana Girl Scout Camp to less than significant levels.

Comments**M14-8**

The next one would be noise. And the increase of noise levels due to small arms fire and heavy weapon simulators is discussed in Chapters 4.6 and 8.6 in the Draft EIS. One of those chapters draws the conclusion that it's a significant problem and the other draws a conclusion that it's not significant, so there is a conflict there and the final -- in the table it says it's not significant, so there is a problem with this as far as being inconsistent. Speaker **Constance Fay**

M15 11/5/2003 Public Meeting

M15-1

I have some questions about the EIS. I'm concerned about the health impacts of the activities on the expanded base. When the wind blows from Kona, which it has for the last three weeks, what will be in the particulate matter from the fires and dust that will blow around to our side of the mountain? Will there be chemicals? Will there be nuclear contaminants? Who will test the air? How often? How quickly will we be notified that there are contaminants in the air? This expansion should not take place until all these questions are satisfactorily answered.

M15-2

I have asthma, as do many people in my area. I can tell when it's boggy, even before I open my eyes in the morning because I wake up wheezing. Will there be an independent EPA control unit monitoring contaminants with the authority to control environmental substance abuse?

Responses

M15-1

The air quality implications of activities at PTA would be generally the same regardless of wind direction. Section 8.12 of the DEIS discusses wildfires at PTA. Most wildfires caused by military training activities are relatively small, and generate correspondingly small quantities of smoke with little potential for health impacts to off-post locations. Most large wildfires in the PTA area originate off-post, and are caused by activities other than military training. As noted in Section 3.12.3 of the DEIS, no depleted uranium munitions are or have ever been used at any USARHAW installation. Ambient air quality monitoring responsibilities rest primarily with the Hawai'i Department of Health. However, the Final EIS notes that the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

M15-2

Ambient air quality monitoring responsibilities rest primarily with the Hawai'i Department of Health. EPA has oversight responsibility to approve the state ambient monitoring program, but does not directly operate ambient monitoring systems. The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

Comments**M15-3**

I have a similar concern about our food. Many people in my community eat local. We get produce from our friends and neighbors and from our local farmers markets. We talk about how we grow our food. How will we know that it's getting into our food from airborne contaminants from the base?

M15-4

The report states that there will be increase in the amount of ammunition fired. Will there be depleted uranium in the shell casings? What about larger artillery? Isn't the Stryker basically a small-like tank? What ammunition will it be firing?

M15-5

It would be good if there were some day-to-day language, because I feel like the language that the report is written in, because it's so formal and because it's addressing really specific, very detailed and technical issues, it seems to me it's very easy to hide the kind of day-to-day impacts that the base will have in this really technical presentation and language. So I'd like to have the report or parts of the report that impact people translated into real English and also into Hawaiian. I think that's respectful for those of us who don't have the kind of specialized knowledge that seems to be required when you're talking about these things, but I'm talking about how this impacts me on a day-to-day basis; my health, my children, my grandchildren.

Responses**M15-3**

Most of the compounds released by munitions use on military training ranges would be present as metal fragments, metal particles, or solid residues of various energetic materials. Small quantities of these materials would be released into the air during munitions firing and detonations. Some of the airborne releases would be carried by the wind beyond military installation boundaries, but the concentrations of these compounds would be too low to have any significant health effects. Weathering, corrosion, and leaching of munitions residues present on military training ranges would result in the slow migration of small quantities of various compounds from surface layers of soil into deeper soil layers, with soluble compounds slowly leaching into groundwater bodies. However, there are no indications that the weathering and leaching process is causing any significant contamination of groundwater resources. Please see the expanded resource discussions in sections 4.5 and 4.12.

M15-4

There will be no depleted uranium munitions used as part of SBCT training. Table 2-9 lists the types and rounds of ammunition to be used. The Stryker will carry various weapons depending on the type of Stryker. There are 10 variations of the Stryker and a description of each can be found in Appendix C, Section B.

M15-5

Thank you for your comment. To the extent possible, the Army has edited the document to make it more readable to the general public. If there were specific areas that the commenter needs clarification on the Army would be happy to discuss the findings with the commenter and provide a response.

Comments

Speaker **C. Kapono****M16 11/5/2003 Public Meeting****M16-1**

The woman who came up and said that she wanted the EIS translated in more simple language, I would encourage you that you need to exhaust every detail that's inadequate and to make sure, to make certain, without question, that everything is understood. And to short change yourself in some simple type of language would be an opportunity to bury and to hide the most important conditions.

M16-2

I'd like to address two issues of the EIS if I might. First is a socioeconomic and environmental issue. DOD currently spends \$1.3 billion in the State of Hawai'i. \$4 million -- \$4 million are spent here on the Big Island. 4 million. Of that 4 million, the United States Army contributes about 95 percent of that. So it's only the Army that's making an economic contribution to the Big Island. The Army is part of the executive division of the United States. It's not an institution to itself. I'm not here to defend the Army. They can do that for themselves, but as a citizen, I'm aware that every federal agency that supports the contents of this EIS is available to us as citizens, which includes the EPA, the CDC, to answer any questions that we might have to the integrity of our natural resources.

M16-3

Secondly, I'd like to address the mitigation schedule of those conditions that are set forth in the executive summary and ask the management team to consider including a native Hawai'ian group to help resolve some of the conditions that are being addressed in the mitigation schedule. Oftentimes the state and county has been asked to address certain issues that the United States Army and Hawai'i will not, and, you know, that's a toss up whether the County of Hawai'i is the best partner to be actively engaged in some of these issues, but I think that those of us who are concerned, who are stewards of the land, would like to make a proactive contribution to that possible outcome.

Responses

M16-1

Thank you for your comment. To the extent possible, the Army has edited the document to make it more readable to the general public. If there were specific areas that the commenter needs clarification on the Army would be happy to discuss the findings with the commenter and provide a response.

M16-2

There will be no depleted uranium munitions used as part of SBCT training. Table 2-9 lists the types and rounds of ammunition to be used. The Stryker will carry various weapons depending on the type of Stryker. There are 10 variations of the Stryker and a description of each can be found in Appendix C, Section B.

M16-3

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce the impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resources, unfeasible, or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented. At this time, the Army has determined that a separate citizen's advisory board would not be feasible due to limited resources. However, the Army has several existing programs to coordinate with the Native Hawaiian community on the protect of cultural resources. For more information, please contact the US Army Hawai'i, Department of Public Works, Environmental Program.

Comments**Speaker Rollin Frost****M17 11/5/2003 Public Meeting****M17-1**

What's the Stryker like? 40,000 pounds on eight wheels. Maybe it's got bigger wheels. Maybe eight square foot of rubber on the ground. What are we talking about? 5,000 pounds per square foot. Roughly. Good enough for government work. Five times more weight crushing the soil. It just crushes, folks, down to sand and nothing ever grows there. That's what happens when you crush that nice little sponge that used to give life. It don't give life no more. You know what I got to say, I use to run EISs at the University. They all came in, and we'd send them out to professors. I know EISs. I see one that big and that thick, it's a little laughable, but that's the way they do it. I don't see much in there about the loss of that spongy ground, that life-giving ground, the permanent loss of it.

Responses**M17-1**

The Stryker is an eight-wheeled, 23-foot (7 meter) long, 9-foot (3 meter wide), 20 -ton (18-metric ton) combat vehicle. Once compacted, the soils may remain compacted for a long time. Partial mitigation for soil compaction would include avoiding sensitive areas or by operating vehicles on roads to limit the amount of surface area subject to the impacts. Mitigation measures are discussed in Section 8.9.

Comments**Responses****Speaker Hiko Hanapi****M18 11/5/2003 Public Meeting****M18-1**

I noticed that in the summary of impacts on cultural resources, the cultural resource area and all of your information categorized here is the most hard hit, and personally, as a cultural practitioner and an artist, I find that insane. Mainly because you destroy an archeological site, you destroy Hawaiian history forever, and it's just unconscionable. I can't accept that. It's not tolerated in any culture. Many of you before me have said some great things. Mr. Bigelow, I learned one way to empower you tonight and that is to say I would like this to change to significant, and these categories here that you have, cultural resources, change that to significant because it is significant.

M18-2

The other issue is biological. You have -- the next area that's impacted is the biological resources. These are the living resources. These are animals. These are plants. You destroy that ecosystem up there, it begins a precedent, and you can checker your way through this island as our lands are divided up between ceded lands and private lands. That land up there is ceded lands. It's Hawaiian lands. It belongs to us. We come from there, and we don't want to see it destroyed.

M18-1

Cultural resources have been updated in the Final EIS. The overall impact to cultural resources on a project wide basis is significant. The Programmatic Agreement and other measures will reduce the severity of the impact but not always to the less than significant level.

M18-2

Your comments have been considered and have been included in the administrative record for this process. Biological resource issues are detailed in chapters 5.10, 6.10, 7.10 and 8.10. Cultural resource issues are detailed in chapters 5.11, 6.11, 7.11 and 8.11.

M19 11/5/2003 Public Meeting

My desire is to let the military know that there are the thousands of heiaus there and iwi in old trail in the pu'u, the caves, and also the -- and old trails, the caves of the trail that goes around islands, and there were the Pōhakuloa is practicing, and my main goal is to save the heiaus, and I have the numbers. I going to go look for the numbers and the map, but I have the map. And I -- this is five, I say, thousand, and my concern is I have to protect old Hawai'i and I want to make sure that they're not running over or destroy all the bones. And if there is anything that's in the way of the highway, they move the highway. They cannot run over. So what I wanted to let them know that, don't do that because I really want to stop, and I want to stop these. There's something that -- you know what I mean -- right on the road. They going to be along the way of Kawaihae and Ho'olulu, Kaumana, and also Pōhakuloa and also Mauna Kea and Mauna Loa.

M19-1

Speaker Josephine Keliipo

M20 11/5/2003 Public Meeting

shameful that the military goes around bombing different pieces of the islands and doesn't clean up their mess. Mr. Albertini has provided all of us in the back of the room with a list of all of these military sites, and what it looks like is -- I'm not sure if you guys have listed these sites in your EIS, but if these were sites that you used for your exercises, perhaps you guys need to go back to these sites and make sure they're safe for us, clean it up before you even attempt to desecrate another piece of our island.

M20-1

M20-2

Another thing is I wanted to know if you guys would be willing to show the public a live demonstration of what you guys are going to do with these large vehicles?

Responses

M19-1

Surveys are ongoing. The Army is working with the Native Hawaiian groups or individuals to identify any burials. If there are burials identified, they will be protected, and NAGPRA procedures will be followed.

M20-1

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closer (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

M20-2

Currently there are no planned public demonstrations of the Stryker vehicle in Hawai'i. However, over time the Army would be more than willing to provide the community with a capability demonstration.

M21-2

During the scoping meetings, the public facilities would not allow the meetings to extend beyond 10:00pm. This time restriction required that members of the public keep their oral comments short. After many public comments about the length of the meetings, and in an attempt to allow for full participation of all people present, the Army decided to hold the Draft EIS public meetings at private facilities where the facility was open as long as the Army needed. The majority of the Draft EIS public meetings did not conclude until after 12:00am.

At the first two meetings Honolulu Police Department arrested a total of seven people for trespass when they attempted to enter the facilities with signs. All individuals were advised that they were welcome to enter the facilities without the signs.

It was not the intent of the Army to restrict the public through the format and location of the public meetings. We corrected the situation by working with the other facility locations to allow signs in the meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's

M22-1

There is no construction or rebuilding of an air strip currently going on at Pōhakuloa. The upgrade of Bradshaw Army Airfield as part of this project will allow for C-130s or C-17s. The impacts of this are discussed throughout the EIS.

Comments

Speaker **Kahili Norman**

M23 11/5/2003 Public Meeting

M23-1

I would like to know why they're not taking the Stryker Brigade into their own backyard, where they come from; for instance, the Chief of the Defense -- Secretary of Defense, where is home land is. Where's his state? Why not taking the Stryker Brigade and put it in their backyard? Or President Bush's backyard? Or their coalition people that's backing their posture there in Iraq? For instance, the Philippines. They have a bigger place for them to go play army with. They have terrains that are similar to Iraq, to go take the Stryker Brigade and go and train their Army personnel there on the Philippines. Why are they doing it here? Or in Australia, another alliance of the United States. Why not go there?

Responses

M23-1

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

Comments**Speaker Samone Michaels****M24 11/5/2003 Public Meeting****M24-1**

most of my career was spent helping the military, as an analyst, and I worked on highly classified programs; and, so, one of the things I was privy to was all of the base closures, especially in California, Nevada, and some other states on the West Coast, that -- there's also some active bases that have bombing ranges, and some of the similar things that they're offering in this program could be done at these bases. One of the serious problems with creating a new space for this kind of activity is the damage to the environment. One of the things that we discovered in trying to have a re-use program for the closed bases, particularly in California, was that the contamination to the land was such that no, you know, public school system could be put there, no buildings would be approved by the Food and Health Department. So one of the things that I think that should be done is not to create a new space but, rather, to take advantage of some of the spaces that we have, particularly with the Army.

M24-2

The other problem that I see here is that I also worked on what was called the Chem Demil project, which is Chemical Demilitarization Project. It's a 20 billion-dollar program, where we're cleaning up old Army installations from the contaminants; and it includes Johnston Atoll, which is part of the Northwest Hawaiian Island chain. So at the same time we're having this cleanup, 20 billion dollars' worth, we're just going and dumping someplace else, literally. So I have some real issues with that.

Responses**M24-1**

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closer (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

M24-2

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

Comments

Speaker John Ray - Waimea Community Association
M25 11/5/2003 Public Meeting

M25-1 | The major area of concern I've heard is impacts to the proposed lands for purchase in the Keamuku area and mostly concerns over dust and fire and that those be mitigated. So I just wanted to pass along those comments tonight.

Speaker Ron Fujiyoshi
M26 11/5/2003 Public Meeting

M26-1 | I feel that the criteria that they are using is so narrow that it doesn't include the criteria of justice; and I think the criteria of justice should be fundamental in making the decisions about what happens here.

Responses**M25-1**

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

M26-1

Chapter 10 – Environmental Justice and Other Required NEPA Analysis evaluates the potential for this project to cause disproportionate impacts on minority or low-income populations. These impacts are described in Section 10.2.2.

Comments

Speaker **Cindy Lance**

M27 11/5/2003 Public Meeting

M27-1

And let me preface my remarks and questions by saying that I want written answers to my questions provided directly to me by the Army and to be included in the final draft of the EIS. At the scoping session, I raised dozens of questions. Most of them were not addressed at all in the -- in this Draft EIS.

M27-2

Dan Inouye has said he's been assured of the Stryker Brigade. He's already pushed through Congress over 80 billion dollars in support of the Hawai'i Stryker, when the Draft Environmental Impact Statement hasn't even been completed. To me, that's the cart before the horse.

M27-3

So here's my question: Why is it that the military gets all the money and land at once and Hawaiians die on a waiting list to get what is rightfully their own homeland, much of which -- much of that land which is being occupied and bombed by the U.S. military?

Responses

M27-1

Responses to all public comments are included in Appendix P of the Final EIS.

M27-2

Although Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2d Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2d Brigade, 25th ID (L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law.

M27-3

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

Comments

Speaker Chris Gaughen

M28 11/5/2003 Public Meeting

M28-1 | I would like the military, too, to consider how to mitigate, in using Waikoloa as an example.

M28-2 | And I'm wondering what's going to happen in 50 years when another new need comes up, Stryker's old, they have a new weapon, they have new needs. Will they just leave PTA area, abandon it, and leave it unusable?

M28-3 | The other thing that I would like to bring into focus as far as mitigating is the tank trail that's going to be from Kawaihae to PTA. I read over what I could of the plans; and from I understand, it's going to go around the border of Waikoloa -- and correct me if I'm wrong on that -- in one area. And from what I can read, there's going to be -- when that tank trail is used, there's going to be approximately 100 vehicles per hour using that tank rail. And I'm wondering about the dust problem. Waikoloa is very windy

However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

M28-2

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. If the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closer (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

M28-3

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/ or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

Comments

- M28-4** | As you know, there are dusty days. So I would like you to consider a path to mitigate that.
- M28-5** | The third thing that I would like you to consider, and I couldn't find in the plans, although it might be there, is the aircraft noise. Currently when they're training up at PTA, I'm assuming that they shouldn't be doing it, but we often have low-flying aircraft over our homes in Waikoloa, and sometimes the planes will fly directly over

Responses**M28-4**

As noted in the Final EIS, the Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

M28-5

Noise levels from aircraft and helicopter overflights was summarized in Figure 5-23 in the SBMR chapter of the DEIS. The final EIS has included a comparable figure in Section 8.6.

Comments**Speaker Jon Evans****M29 11/5/2003 Public Meeting****M29-1**

But just for reference purposes, Chapter 8 in the EIS has an awful lot about soil destruction regarding to what the other biologist guy said, engineer. Okay. There's a lot of soil destruction, and the mitigation that they propose in the EIS is reseed; although, if you look in the Executive Summary of the EIS, they admit that so far none of that has worked. But because that doesn't work, they have another strategy, and that is to mitigate the problems of destroying the soil by concentrating in one area only for a short while until it's completely destroyed, and then they'll move on to the next place, and then they'll reseed; but reseed doesn't work yet. But, then, they're going to destroy the next place before they move on to the next place. So it seems like you need a little work on mitigation there for soil destruction. Nothing personal.

Responses**M29-1**

The EIS identifies impacts on soils as a significant impact that may not be mitigated by the measures available. Similarly, impacts on biological resources, water resources, and air resources are expected to be significant. However, the mitigation measures available to land managers under the ITAM program include more than just reseed. They include, but are not limited to: engineering controls to redirect or control runoff and run-on, standard sediment and soil erosion control measures used at construction sites, avoidance of particularly sensitive areas, and use of chemical treatments that have low impact to environmental receptors to control dust.

Speaker **Bobby Camara**

M30 11/5/2003 Public Meeting

M30-1

think one of the best things you could do at this point is hire an editor. Seriously. This is not meant to be facetious. It's really bothersome to read a document and to continually find contradictions; and there are many, many, many of them.

M30-2

One of the huge problems that I see as a natural and cultural resources manager, and it puzzles me -- and I admit I don't understand endangered species law very well -- but in my reading of the document and looking at the tables, the mitigation tables, it appears as though it doesn't matter that there are at least ten endangered plant species, federally listed endangered plant species, growing on the property. All impacts of those species seem to be mitigable to less than significant. And that part I don't understand, and I'm hoping that will get addressed in the Final EIS. I understand the practice of growing plants in nurseries and then out-planting. I also realize that Pōhakuloa is extremely dry, conditions are very, very harsh up there, and trying to replant, especially endangered species, would present pretty large problems. Anyway, that was -- that's one example.

M30-3

I would fully expect that an inventory of cave arthropods, which should be conducted according to the information in the biology section, will undoubtedly reveal new species of cave invertebrates. They are there; they just haven't been found yet. The problem is going to be, those cave invertebrates also need to be described so they can also become legal species. And even if they are legal, because they're not listed on the endangered species list, they have no formal protection other than the good will of people.

M30-4

I noted that the mitigation for cultural and biological remains all note that we will try to avoid. Trying to avoid is not quite enough. There needs to be a mechanism where things that are rare and endangered can be protected forever.

Responses

M30-1

Thank you for your comment, we will take this comment into consideration.

M30-2

The results of Section 7 consultation include development of an Pōhakuloa Implementation Plan funded by the Army which addresses some of your concerns about the endangered species at PTA. The individual measures determined in Section 7 to mitigate from Army actions are outlined in the biological resource section of chapter 8.10.

M30-3

As discussed in Section 8.10, the Army has conducted initial surveys of lava tubes for the presence of habitat suitable to support unique arthropods. If the Army decides to implement the proposed action, the Army would conduct more detailed surveys of these lava tubes to determine if the arthropods are present. If so, the Army would orient the construction to avoid impacting these lava tubes to the full extent practicable.

M30-4

There is specific guidance included in the Biological Opinion prepared as part of the Section 7 ESA by the Fish and Wildlife Service regarding protection of rare and endangered species and the Programmatic Agreement prepared as part of the NHPA regarding protection of cultural resources. These are available upon request.

Comments

- M30-5** | I think that our island would be better off with a larger road coming from the east to the west. It certainly would be safer. I think if we can participate in some trade-offs, that we will all be able to get something out of this that really helps us individually, collectively, and as part of the family
- M30-6** | And I would encourage that we have some more one-on-one in consults to be able to take the dust issue -- I mean, we all know it exists now. We all know it's going to exist in a bigger fashion.
- M30-7** | I think we need to discuss the noise factor, not only from the aircraft but also from the ordnance.
- M30-8** | And I think we have a tremendous opportunity to say, you know, if you guys are going to be here and you have the manpower, then maybe you need to step up the process of cleaning up the stuff that was left by the last round of military people that came through.

Responses**M30-5**

Comment noted. Potential traffic impacts are analyzed in Sections 5.7, 6.7, 7.7 and 8.7. Description of the Proposed Action and Alternatives is detailed in Chapter 2.

M30-6

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

M30-7

Noise from large caliber weapons firing and from use of explosive materials was discussed in the DEIS for SBMR (Section 5.6) and PTA (Section 8.6). Noise from small arms firing (live and/or blank ammunition) was discussed in the DEIS for SBMR, DMR, KTA, and PTA. The discussion of noise from small arms firing has been expanded in the Final EIS.

M30-8

The Defense Reutilization And Marketing Offices has established procedures for disposal of items no longer needed by the Army. It is not the policy of the Army to abandon any items.

Responses**M30-9**

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

Comments**M30-9**

And I also think that if we want to go to a broader scale, we have an opportunity right now to recognize the Hawaiian Nation; and I think that that's the federal government level. Why not take that opportunity and see if there's some way to be able to mitigate that at the same time. I think if you're going to be here, you also have to realize that there is an issue that needs to be settled.

Comments

Speaker Marisa Plemmer - Protect Our Native Ohana
M31 10/28/2003 Public Meeting

M31-1

I say no to the transformation. I'm most concerned about the harmful chemicals that the Army leaves behind wherever it goes. Army personnel leave the islands. There's no accountability, records are lost, the years go by and no one knows what was left behind in the land and the water as we have seen in Makua Valley for 70 years. No more land, no more expansion until everything harmful has been cleaned up.

Speaker Lawrence Ebel
M32 10/28/2003 Public Meeting

M32-1

But anyway, let's get back to the change in the military. This apparently is required. They think it is, and I support their thinking. I don't know if it is, but if the infantry needs something between heavy armor and his face, then the Stryker Brigade is it. It's going to save lives. It's going to help us win. This requires some training facilities. Hawai'i is part of those -- this program. The whole country is. I just want you to know I support it.

Speaker **Dan Sailer - The Nature Conservancy**
M33 10/28/2003 Public Meeting

M33-1

We're pleased that the Army did listen to our concerns regarding the proposed acquisition of the northern portion of our Honouliuli Preserve for use as a small arms qualifications range. The original plan faced the range directly into one of our highest priority management areas, effectively blocking us out from doing our own work. The Army did realign the firing range so that it would no longer face our main work area, and because the acquisition area borders our reserve and includes the access roads, in our negotiations with the Army, it was agreed that we should be allowed continuous and unlimited access into the reserve. In our opinion, realigning the range is of no benefit to our conservation efforts if we cannot get in. We do believe that the Army intends to follow through on this agreement, however, we are disappointed that the draft Environmental Impact Statement states that our access would only be allowed when the range is not in use. With the estimated 180 to 240 days per year and 8 to 12 hours of range use per day, that could mean that we would only be allowed access on weekends, holidays, and a few days in between. That clearly does not coincide with our work schedule and as a result, one of our main work areas would effectively be left unmanaged. The draft EIS recognizes that this mitigation would not reduce the environmental impact to less than significant. In other words, by effectively blocking us out from our management areas, that impact would be significant. An additional mitigation that the Army considers in the draft EIS is obtaining a permit to allow The Nature Conservancy access. We propose that this statement be rewritten to give us perpetual access that is necessary to carry out our work. Conservation is a long term and continuous process which requires a multi-decade commitment.

M33-2

Another concern is for the prevention and suppression of wildfires. According to the draft EIS, ammunition, weapon systems, and pyrotechnics will be used during training at Schofield's main post, and as we have witnessed, even with a good fire plan and the system of fire break roads, fires can and do escape and burn unfortunately for many, many days. We are concerned that the forest habitat and

Responses

M33-1

As discussed in detail in Section 5.2 - Land Use, the Army has realigned the ranges proposed for the SRAA so that they will no longer affect any lands within the Honouliuli Preserve. Additionally, the Army will grant TNC and TNC-sponsored personnel daily, controlled access to the TNC-managed lands.

M33-2

In response to comments received early in the EIS process, USARHAW reoriented QTR2 such that the SDZ would no longer impact any lands within the Honouliuli Preserve. Army will grant TNC personnel and TNC-sponsored personnel daily, controlled access to the TNC-managed lands along a route to be determined by the Army in consultation with TNC for as long as they have legal right to use of the affected property for conservation/stewardship purposes. Access controls will be developed and implemented to ensure the safety of all personnel and will consist of notification by TNC to the Army prior to entering Army lands and notification by the Army to TNC of any unusual activities that may present, or appear to present a danger to TNC personnel in the area. The boundary will be signed to prevent unauthorized use/trespass. Sections 5.11.2 and 8.11.2 discuss access for cultural practitioners.

Comments

**M33-2
cont'd**

species that are damaged by these fires above Schofield would also threaten Honouliuli Preserve. So, we strongly urge the Army to include a series of fire break roads and other presuppression measures in its wildfire plan, and the Army should also train all applicable personnel to implement the wildfire plan and to communicate efficiently with each other so that valuable hours, if not minutes, are not wasted just because of a lack of coordination.

M33-3

Lastly, over the past four years, The Nature Conservancy has been engaged in ongoing discussions with the Army regarding the use of lands in Honouliuli Preserves as part of the Makua Implementation Plan. Sections of the preserve, including the areas that we have specifically mentioned above, are planned to be used for stabilization for more than a dozen plant and animal species mention in the Makua Implementation Plan. The Army must understand that their mitigation and conservation goals can only be achieved if we have daily access and that these areas are protected from wildfire and endangered species. We are confident that the Army will continue to listen to our concerns and make the changes that we find are necessary. These changes are not major. It's not a lot of land, and these kind of access agreements are not -- not impossible to overcome. The Nature Conservancy recognizes the Army as an important value and conservation partner in Hawai'i, and we will continue to seek ways to work together to accommodate the Army's own training needs without damaging the irreplaceable resources of Honouliuli.

Responses

M33-3

In response to comments received early in the EIS process, USARHAW reoriented QTR2 such that the SDZ would no longer impact any lands with the Honouliuli Preserve. Army will grant TNC personnel and TNC-sponsored personnel daily, controlled access to the TNC-managed lands along a route to be determined by the Army in consultation with TNC for as long as they have legal right to use of the affected property for conservation/stewardship purposes. Speaker Wally Inglis - Mala Aina Center for Non-Violent Education and
Act
M34 10/28/2003 Public Meeting

M34-1 The intent of my statement is to oppose this project and to signify that the Stryker threat is not island specific. It is neither a Big Island nor an O'ahu issue. The implications are statewide and nationwide. If truth be told, we are global. To quote our Center's director from an article published recently in the Hawai'i Island Journal, "A Stryker Brigade will deepen Hawai'i's involvement in raging wars of aggression and occupation of other nations around the world. There is nothing defensive about a Stryker. A Stryker is meant to strike."

M34-2 And what are the other impacts, the economic, the cultural, and the spiritual impacts? Who's working on those impact statements?

Speaker Maunakea Trask
M35 10/28/2003 Public Meeting

M35-1 Agricultural land and conservation land is the biggest one, and the Army would be taking conservation and agricultural land, and my concern is that after -- we're going to win the war on terrorism. I trust you guys. You know, no one can beat us. Solid. But when the war is over, we're going to be stuck with like two more Kaho'olawes and we'll be forced to clean it up.

M34-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process

M34-2

The impacts to socioeconomics and cultural resources, including impacts on spiritually important sites, are discussed in the EIS in chapters 5.11, 6.11, 7.11 and 8.11 for cultural resources and 5.13, 6.13, 7.13, and 8.13 for socioeconomics.

M35-1

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closer (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

Speaker Maunakea Trask
M36 10/28/2003 Public Meeting

M36-1 | As I was going through the EIS on various military training sites that we have here in the islands, you come to a realization that it's only native Hawaiians that are affected. It's any basic human who has to live off the land, and a lot of the wording in the EIS has a lot to do with -- environmental pollution is not like toxins entering our freshwater aquifers. What I'd like to have in the EIS is what the plan is if something like that happens because every single person, whether you are a native or not to Hawai'i, will be affected by that.

Speaker Wendy Renne
M37 10/28/2003 Public Meeting

M37-1 | and I brought the Earth Charter here, and I gave it to one of your representatives to please review and perhaps incorporate the Earth Charter principles into your plans on using Hawai'i or any part of our world for practicing. In particular, I wanted to share from this Earth Charter, prevent harm as the best method of environmental protection, and when knowledge is limited, apply a precautionary approach. There's two parts of this I wanted to share. One is, "Prevent pollution on any part of the environment and allow no build-up of radioactive toxic or other hazardous substances." And also, "Avoid military activities damaging to the environment."

Speaker Marion Kelly
M38 10/28/2003 Public Meeting

M38-1 | my position is that the United States military must not settle their Strykers in Hawai'i.

M36-1

The EIS evaluates impacts on not only the natural resources but the effects of any changes on the human population as well. In particular see Sections 3.12, 4.12, 5.12, 6.12, 7.12, and 8.12 - Human Health and Safety Hazards, and Sections 3.13, 4.13, 5.13, 6.13, 7.13, and 8.13 - Socioeconomics and Environmental Justice.

M37-1

We thank you for your comment. We have considered your comment and it has been added to the public record. NEPA and other federal environmental regulations address issues of ecological integrity. The Army is abiding by all applicable laws and regulations. In accordance with the NEPA Process, the Army has taken every step to minimize impacts of the proposed project as describe in the EIS while meeting the goals of training. Many mitigation measures have been incorporated into the project to reduce identified impacts where possible. The Executive Summary and Chapter 4 summarize the potential impacts and mitigation measures.

M38-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

Speaker Suzanne Marinele

M39 10/28/2003 Public Meeting

M39-1 | And so I would like to ask for a baseline discussion of the realities of the development and refinements of the systems that you are proposing to enhance our lives with here. That would be really important to me.

M39-2 | you say you want to transport soldiers more quickly to areas of conflict, I would like to point out that Hawai'i is the most remote land mass on the planet. And it seems to me that using that as a resource to get to other places quickly is very peculiar.

M39-3 | And to put a project that might be manini, small, in California or Texas -- Texas would be my choice, (Laughter), but to put a project like that in a place this small it is not tiny. It is absolutely gargantuan. It is behemoth. And I have some concerns about that.

Responses

M39-1

Thank you for your comment. Chapter 2 – Project Description describes in some detail the elements of the proposed project. If you have particular questions about the project we would be happy to answer them. An additional source of project information is the SBCT website located at <http://sbcteis.com/>.

M39-2

Hawai'i's central location in the Pacific gives it locational importance to America's national defense policy, particularly in Asia. As discussed in section 1.6 of the FEIS the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID(L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue to carry out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

M39-3

Comments**M39-4**

And, of course, the final EIS has responses to people's questions and people's comments as they have generated them in the production of that document. So, of course, we all turn to our own comments first, whether we admit it or not. But I turned to find the comments that had been generated by the input that I made. And I found, not to my great surprise but to my disappointment, that my comments were outside the scope of the document and therefore would not be answered.

Responses**M39-4**

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. The Army considered all public comments submitted during scoping and when related to the proposed action, the Draft EIS addressed those comments to the extent feasible. A summary of the comments received during the scoping process is included in Appendix B of the draft EIS, organized by location, meeting date, and subject. In addition, comments submitted during the public comment period on the Draft EIS that were related to the proposed action have been addressed within the Final EIS and are included as an Appendix to the Final EIS. If comments were submitted regarding current force activities and unrelated to the proposed action, we recommend that the commenter contact the US Army Hawai'i 25th ID Public Affairs Office for further assistance.

M40 10/28/2003 Public Meeting

M40-1 | First of all, I do want to say that this process is flawed.

M40-2 | I will guarantee you that all these training brigades and Stryker, they will not be used to defend the United States. They're going to be there in third world countries subjugating them just like we've done ever since World War II.

Speaker June Shimokawa

M41 10/28/2003 Public Meeting

M41-1 | Actually I find it impossible to address the particulars of the EIS because I totally reject the plan of Stryker Brigades and reject, therefore, stationing a brigade here in Hawai'i.

Speaker Rags Scanlan

M42 10/28/2003 Public Meeting

M42-1 | I would speak in support of the Stryker Brigade, or the military. I'm a strong believer in military. It's what allows us to have our freedom, and anything we can do to enhance their ability to protect us is there.

M42-2 | I know there's questions about environment and everything else, but the areas that they're going into are, basically, unused areas. So, just briefly, I think for the environmentalists there's not that much concern.

M42-3 | Plus, economically, it's a great economic thing for the state of Hawai'i.

M40-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

M40-2

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

M41-1

M42-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

M42-2

The Department of Army has taken every step to minimize impacts of the proposed project as describe in the EIS while meeting the goals of training. Many mitigation measures have been incorporated into the project to reduce identified impacts where possible. Chapter 4 summarized the potential impacts and mitigation measures.

M42-3

Section 4.13 summarizes the potential socioeconomic impacts of the Proposed Action including both negative and beneficial impacts.

Comments

Speaker John Stewart
M43 10/28/2003 Public Meeting

M43-1

there's one little section in there where they talk about actually doing mitigation that benefits, which is, they said, buffer zone acquisition, working with non-profits to actually acquire lands for the non-profits, and it's the only mitigation in the entire EIS that doesn't just make things less worse; it makes -- it's actually something that gives the people something. It's a net plus as opposed to just a bad thing made a little less bad. So I wanted to just give my support for the one thing in there that seems like it's actually giving us something as opposed to giving us less of a bad thing. It's Number 35.

Responses

M43-1

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

Comments

Speaker Evelyn Lane

M44 10/29/2003 Public Meeting

M44-1 My first concern is the air traffic that is air traffic going over those areas. First of all, since the EIS that was done at the time of the Kahuku Training Area since the condemnation was done back in -- I think '98, when the military took over the actual -- you know what I'm talking about -- there's been a gradual but persistent increase of military air traffic over that area, even more than just when there's major training activities; and I know that for a fact since I've been there for ten years. And I don't understand why there hasn't been any more additional EISs that have happened since then, because it's really become bothersome. And, so, I'm concerned about significant more air traffic that's going to be going on as a result of this EIS. And I didn't really pick that up in the overall EIS at this time.

M44-2 And I also -- whenever -- there seems to be, also, a lot of blatant disregard for elevation of air traffic. And that corridor, since there's -- the military seems to want to take the air space for exclusive use for the military now, so that -- I believe -- that's what I read in the EIS -- that would be no more private use over that corridor, if I was reading that correctly in the EIS. Could you -- maybe you could answer that question for me. I'm not -- is that part of the EIS? There's a reservation put on the air space there by the military?

M44-3 And I also think that we should have a longer comment period, because 45 days for -- the EIS is a pretty big document to get through for a lot of people. I think that's a little bit too cumbersome.

M44-4 I'm concerned about the safety record of the Army, especially after the controlled burn that was out at Makua, the live fire -- the controlled burn that happened recently and that it went out of control.

Responses

M44-1

During aviation training, the number and types of aircraft used are expected to stay the same as under the Legacy Force training, with the exception of UAVs. The use of UAVs is addressed under Aviation Safety in Chapters 4-8.

M44-2

Its unclear what section of the DEIS this comment is referring to. There is no proposal for additional or modified restricted areas that would limit civilian and general aviation aircraft flights. A controlled firing area (CFR) would be established over QTR2, but the nature of CFRs means that there would be no affect on aircraft approaching a CFR since all hazardous activities would be halted.

M44-3

The public comment period was extended to 90 days and ended on January 3, 2004.

M44-4

Thank you for your comment. The Army has updated and improved the Integrated Wildland Fire Management Plan to consider the circumstances surrounding the wildland fire in July 2003 at Makua. This plan was updated in October 2003 and is being fully implemented at all Army installations. In addition, it will be implemented to any new lands that the Army may acquire. The plan is available upon request.

Comments

- M44-5** | And I am really concerned because the helicopters fly directly over my house, and my neighbors and I have become, you know -- it's really scary, you know, to hear this type of activity, day-in, day-out, and more persistently.
- M44-6** | make sure that you're not going to have helicopters crash on top of my house.
- M44-7** | make sure that next month, if you have what you say you want, a road up across Waimea Valley, that you're not going to destroy endangered species or any other species that are endangered in any other protected areas.

Responses**M44-5**

As discussed in Section 4.4 and Section 4.6, there is no increase in aviation from the Proposed Action. There will be an increase of aircraft activity over WPAA with a redistribution from the current activity at PTA. The Army has determined that the impacts associated with noise aircraft will be less than significant. The Army acknowledges that individuals may be annoyed by the noise levels although the level is within acceptable zoning noise standards.

M44-6

Complaints regarding current force activity may be submitted to the US Army Hawai'i 25th ID Public Affairs Office - Community Relations Program.

M44-7

Complaints regarding current force activity may be submitted to the US Army Hawai'i 25th ID Public Affairs Office - Community Relations Program.

Speaker **Blake McElheny**
M45 10/29/2003 Public Meeting

M45-1 It's a potential mitigation measure called, Investigating a new regulatory authority to work with non-profit organizations to purchase what's called "buffer lands" as potential mitigation purposes. As I understand it, this mitigation, as conceived in the current draft, was meant to talk about how to mitigate effects on natural resources; but I think that there's other mitigation that could be considered under this purview, particularly ones related to dust, air quality, noise, potential fire hazards, as well as runoff and effects on water resources. So I think it's pretty interesting. I was hoping that this process could be utilized to examine the opportunity to see if there's some interest, potentially in exploring acquisition of a parcel that's called the Pupukea Paumalu Homestead. So I was thinking that maybe this could be used to protect the training capability and also protect the natural and other resources in the area, if possible. And I think that this particular opportunity meets the criteria for selecting ACUBs, including potential severe encroachment impacts of (inaudible), effects on endangered species, air space, noise, air quality, water resources, and it's possible to reverse this encroachment by taking the step of the ACUB. There's available land; the land is currently for sale. It seems to be a time-sensitive issue. There's a lot of different growth and activities happening out here. And so far there's been a high degree of support, both from the community and other interested local governmental officials that we've talked to about this opportunity.

M45-1

The Army is considering ACUB as mitigation for other proposed actions and has met with the commenter. For this action ACUBs were also considered but more feasible mitigation measures were proposed.

Comments

Speaker Jackie Carlisle
M46 10/29/2003 Public Meeting

M46-1

The three factors stated in Executive Statement 3, Need for the Proposed Action, states, one, its location within the Pacific Rim is a critical area of interest for the United States; two, Hawai'i provides the terrain and conditions most likely to be encountered in the Pacific Rim; and three, the ease of deploying the Stryker Combat Team because of the proximity, to multiply the air bases are suitable. You know, to me, this is absurd, and I'm pretty sure you can come up with better reasons. With more military expansion in the Hawaiian Islands, the islands will be a perfect target for today's new terrorists that still have not been caught.

M46-2

According to Section 3.2.1, Introduction to Regional Influences, the definition of ceded lands, I would have to object to this definition. There is no such thing as ceded lands. I recommend you change the "ceded lands" to "stolen lands".

Responses

M46-1

As discussed in section 1.6 of the FEIS the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue to carry out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.) There is a relatively large complement of Army, Navy, Marines, and Air Force assets in Hawai'i that are more than capable of protecting U.S. interests from attack. Reorganizing one Army brigade will make relatively few changes to the overall Department of Defense presence in Hawai'i.

M46-2

We thank you for your comment and your comment has been included into the administrative record for this process. For the purposes of this document, "ceded lands" refers to lands that were "ceded" to the federal government by the State of Hawai'i. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

Responses

M46-3

M47 10/29/2003 Public Meeting

M47-1

That's why we, the residents of North Shore, are sincerely concerned about the Wildfire Management Plan or lack thereof. What I'm saying, Colonel, is that we need to be more specific as to the kinds of fire protection that your people will be doing for the North Shore. There are 12,000 acres of vacant land on the North Shore, and you will be traversing on land that -- you know, a field that's readily combustible, as evidenced by the fire last month.

M47-2

If you have a plan to procure, for example, a water pumper, a sophisticated water pumper that can hold like 100,000 gallons or 50,000 gallons of water -- Colonel, out in the wild you don't have fire hydrants; so if a fire were to occur, where's the water going to come from?

M47-3

The area that your equipment will be traveling will be when you cross Kaukonahua Road, right below Hukilau Loop, the major highway that goes to Haleiwa. Can you imagine 100 vehicles crossing this highway? I believe you have discussed this with the Dole Plantation folks, and they have made recommendations to you. So my suggestion is to heed their suggestion and to alter that portion of the Helemano Trail that bisects Kaukonahua Road and deals an outlet site, because the residents of Hukilau Loop, for the last, maybe, 25 years, have experienced either rumbling, the noise, the dust from the cane haul road for a long, long time.

M47-1

The Integrated Wildland Fire Management Plan has been completed for the Army facilities on O'ahu. It will be revised to include the Military Trails and land acquisitions proposed as part of this project. Specific measures will be included, as appropriate, to minimize the chanced of wildfire and to quickly extinguish any fire that does break out.

M47-2

The Integrated Wildland Fire Management Plan will be revised to include the WPAA and Military Trail. Specific measures will be included, as appropriate, to minimize the chanced of wildfire and to quickly extinguish any fire that does break out. The WFMP includes information on proposed equipment and water sources.

M47-3

As discussed in Section 4.7, standard operating procedures for convoys is to have the vehicles grouped in numbers of 24 or less and spaced apart so as to minimize impact with other traffic. The Army has designed the trails to limit interference with local traffic. Based on trail designs and standing operating procedures for convoy travel, the Army has determined that the impact on traffic would not be significant.

Speaker **Oliver Lunasco**

M48 10/29/2003 Public Meeting

M48-1

So it's very critical that you have a fire prevention system up there. The landowners are not maintaining the land, so it's all overgrown. The Bishop Estate has cut fire breaks; but if you already know how fire travels during a windy day, it will travel through that fire breaks.

M48-2

while the Army always want to be partners, once they implement a project and it's completed, unfortunately the general public gets shut off. As an avid outdoor person, I utilize the Drum Road, which cuts from Helemano Military Reservation all the way to the Kahuku Training Area. In that area we have two public recreational areas. Presently, one is closed by Dole; we have no access. We trying to get access through the military reservation, to use Mumuhua Trail. The second one is at Pupukea. It's a public recreational area. So I want you or any ASA in the Environmental Impact Statement to include when the road is not in use that public can use it. And I hope with this Stryker Division -- because you're going to cut a road from Schofield all the way to Dillingham and improve the road from -- from Helemano radio station all the way to Kahuku. So you -- you know, you talking a sizeable area that you're going to have control over. If you deny access, you know, a lot of us won't be able to enjoy the outdoors.

M48-1

The Integrated Wildland Management Plan will be revised to include the WPAA and Military Trail. Specific measures will be included, as appropriate, to minimize the chanced of wildfire and to quickly extinguish any fire that does break out.

M48-2

For security and public health and safety reasons, and in order to protect the property of adjacent homeowners, the public will not be allowed access to the PTA Trail or Dillingham Trail after construction is completed, except in instances of public emergency.

Comments**Responses**

Speaker Keli'iwai (Chris) Camarillo
M49 10/29/2003 Public Meeting

M49-1 | There's a huge difference. Not to mention you guys are going to bring soldiers here to man those vehicles. They're going to live in communities that you guys are going to build for them. You say you guys are going to bring money to the state. Well, you don't pay taxes when you guys buy gas on base. You don't pay taxes when you guys buy cigarettes, alcohol, food on base. So how's that money going to get back into our community?

M49-2 | You use our roads. You guys might have paid for the federal ones. What about the county ones? What about the increased traffic from the members of your brigade? They're coming here.

Speaker Lawrence Ebel
M50 10/29/2003 Public Meeting

M50-1 | Extra effort must be placed on fire prevention and fire suppression and the word I'm trying to find is putting out the fires. Try prevent them. Be prepared if something goes wrong, does happen. Have very adequate facilities, please. That's terribly important to me and I think everybody.

M49-1

The impact analysis does not assume a huge influx of cash into the local economy as a result of the project, but the analysis does include the federal impact funds made available to communities in this situation, to make up for the lost income from taxes not paid by military staff.

M49-2

Funding issues for roadways are discussed in Section 3.7.3. Potential traffic impacts are analyzed in Sections 5.7, 6.7, 7.7 and 8.7.

M50-1

Wildfire Management Plans have been completed for the Army facilities on O'ahu and Hawai'i. They will be revised to include the Military Trails and land acquisitions proposed as part of this project. Specific measures will be included, as appropriate, to minimize the chances of wildfire and to quickly extinguish any fire that does break out.

M51 10/29/2003 Public Meeting

M51-1

They were required to do traffic impact. That's not in there, you know. And I live in Wahiawa. It's already, like, you have to wait forever to get into the city area around 4:30, 5. You want more cars, more families, more people in this area.

M51-2

And you're saying: "It's okay. This critical habitat. We need to sacrifice it for national security." You know, when is enough, enough?

Speaker **Julia Estrella**

M52 10/29/2003 Public Meeting

M52-1

All I can say is there are already 5 3,000, according to your study -- that already 3,438 soldiers stationed at Schofield Barracks and another 7 810 new soldiers and their families will be coming to Schofield Barracks under the Stryker plan. More street violence, more domestic violence, more dust, more armored vehicles, more accidents. And, unfortunately, I would -- because of all of this I want to say we need to stop. We need to stop this madness, stop this worship of war machines. Stop the violence that will come with more soldiers in our communities. This land of ours is very sacred. We don't want heavy armored vehicles to come and trample all over us and all over our sacred land.

M51-1

Potential traffic impacts are analyzed in Sections 5.7, 6.7, 7.7 and 8.7. As noted in Section 4.7.1 and 4.7.2, the number of peak hour trips that each project will generate is estimated using standard trip generation procedures as per guidelines described in the Trip Generation Handbook (ITE 1998). If generation analysis determined an insignificant increase, then a traffic impact analysis is not required. There is also no local criterion for determining whether a traffic impact study is needed; this determination is performed on a case-by-case basis.

M51-2

As discussed in Section 8.10, the Army is committed to protecting endangered species in compliance with the ESA. Since the publication of the Draft EIS, USFWS issued a Biological Opinion of "no jeopardy" for the Proposed Action and current force activities. As part of this BO, the Army is committed to mitigation measures to reduce the impact on federally listed species. The BO is available upon request.

M52-1

For any increase in personnel, the Army considers the impacts on Military Police and staffing. The Army is committed to working with the community, including educating and disciplining Army personnel in the event of inappropriate behavior. The Army offers many services to Army personnel and their dependents including drug and alcohol abuse counseling and family counseling services to assist with problems in domestic abuse.

Comments

Speaker Keli'I

M53 10/29/2003 Public Meeting

M53-1

In particular with reference to O'ahu you call it the South Range Acquisition Area. SRAA, which I stand in opposition to in becoming another part of the Schofield Barracks Military Reservation, SBMR. Quoting the Army's Environmental Impact Statement, "Under the proposed action that acquisition area would consist of approximately 1400 acres. The SRAA is currently used for pineapple agriculture." But more vital to this land theft is the reality that quote "the proposed action configuration also encompasses forest land, part of the Honouliuli Preserve."

M53-2

Now, how does live fire training in conjunction with an estimated 138,240 to 278,784 heavy polluting vehicles per training year, Strykers, uphold the previously stated objectives that pertain to the Conservation District Resource Sub zones? Let me answer that question for you. They do not uphold. "Training and operation of the proposed QTR2 Multi-purpose Qualifying Training Range on SRA could affect land use with a portion of the Honouliuli Preserve. "I would suggest change the word "could" to "will". "Furthermore," quote, "during training and operation of QTR2 natural resources management and recreational activities would be restricted within certain portions of the SRAA. This would result in a significant impact on natural resources management and recreation within SRAA," end quote. Again, change "would" to "will". What is inferred in this section of the EIS is the compound destruction of the few places left on O'ahu that is vacant from adverse human interaction. Due to your proposed training schedule, massive moving steel and bombs compiled with less environmental restoration and preservation work, leads to the creation of a quote, unquote "biological ghetto." Let me remind you of a specific conservation sub zone objective. "To limit uses where natural conditions suggest constraints on human activities."

Responses

M53-1

In response to comments received early in the EIS process, USARHAW reoriented QTR2 such that the SDZ would no longer impact any lands with the Honouliuli Preserve. Army will grant TNC personnel and TNC-sponsored personnel daily, controlled access to the TNC-managed lands along a route to be determined by the Army in consultation with TNC for as long as they have legal right to use of the affected property for conservation/stewardship purposes. Access controls will be developed and implemented to ensure the safety of all personnel and will consist of notification by TNC to the Army prior to entering Army lands and notification by the Army to TNC of any unusual activities that may present, or appear to present a danger to TNC personnel in the area. The boundary will be signed to prevent unauthorized use/trespass. Sections 5.11.2 and 8.11.2 discuss access for cultural practitioners.

M55 10/29/2003 Public Meeting

M55-1

This Draft EIS is too long, and it's too complicated, and it's too spread out all over the place. I tried to do it. You got to read this page and then you got to get this acronym and then you got to go back to this page and then that volume. It's insane. I mean, there must be an easier way to put this information in it, in a form that we can understand.

M55-2

The Draft EIS does not represent my testimony at the various scoping sessions that were held a year and a half, almost two years ago. It didn't include the very first thing I asked -- and Ralna said this over and over and over again -- what about taking the 2nd Brigade and moving them to Fort Lewis.

M55-3

The EIS does not -- did not include an investigation of -- and I asked this many times -- constructing a CCAAC range within one of the multipurpose use ranges for the replacement of Makua. I asked this. I also asked this purposely several times to make sure that the two EISs cross-matched, that one said if we move to a multi-use range at Schofield, maybe we can get rid of Makua, and vice versa when we deal with the Makua EIS.

Responses

M55-1

The DEIS was divided into 5 geographical areas with the intent of making it easier for the general public to focus specifically on impacts the project might have on their community. In addition there is a guide inside the front cover describing the organization of the document, an abstract of the DEIS, and a very detailed Table of Contents. In addition the Executive Summary highlights the important aspects of the proposed project including a project description, a summary of impacts, and proposed mitigation

M55-2

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

M55-3

SBCT training requirements are not dependent on the use of the Makua Military Reservation (MMR). While MMR is an integral part of USARHAW training capabilities and historically used by other services, SBCT units could perform dismounted CALFEX training at other ranges. This is discussed in Chapter 1. SBCT may use MMR if the range were available only after completion of the Makua EIS and ROD. The Makua EIS will analyze the potential environmental impacts associated with dismounted CALFEXs for both Current Force and SBCT; therefore, this SBCT EIS does not analyze training impacts of SBCT at MMR.

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-813

M55-4

It also didn't include to quantify the economic loss. Because I hear Senator Inouye talking about economic loss. I hear -- or economic gain. And I hear -- and surely there's somebody in this crowd tonight from the Chamber of Commerce, okay. What a wonderful economic benefit this is going to bring. But what happens when these guys get deployed? And certainly they will be, because they're the front-running battalions of this new world order of how we fight wars -- how you fight wars. I have to be careful. They're going to be gone. They're going to be gone a long time. So what happens to all of you merchants in Wahiawa? In Mililani?

M55-5

The Draft EIS does not do a good job of discussing pollution and social justice issues. I live right across Kokole Pass, downwind. Every time you train, I see the smoke. I breathe the smoke; my grandkids breathe the smoke.

M55-6

Every time Dole and Del Monte burns their fields, we breathe the smoke. The past week, we had five days of southwest winds. Everybody in Waianae breathed the smoke of the Kahe Power plant. The Campbell Industrial Park, industrial giants that are there, the two refineries, the coal fire. I don't see anything in this plan that talks about cumulative impacts, including those things in a cumulative fashion, on what it's causing my grandkids. I don't see it. I don't see anything. I see these guys saying, Oh, this is our part. You know what? But when you talk about cumulative impacts, when we talk about cumulative impacts, the community is talking about everything: Campbell Industrial park, Kahe Park, what you put into the air at Schofield, what Del Monte and Dole puts into the air. You know why? Because we breathe it every day. I have to watch my grandkids breathe it every day. And you know what, you guys in uniform? You don't have to do that. You guys that are visiting from Tetra Tech, you guys don't have to do that. You guys can go home. You guys move out in two years. But us guys on that side of the mountain, we breathe it every day. Is it any wonder that we have the highest asthma rates?

M55-4

These deployments, while lengthy in some cases, are temporary and are part of Army activities at all bases. The Army is engaged in a wide range of missions around the world requiring all types of forces. There is no information to suggest that Stryker forces would be deployed more often or for longer durations than current forces.

M55-5

Social justice is specifically discussed in sections 4.13, 5.13, 6.13, 7.13, 8.13, and Chapter 10. Military training activities at SBMR do not produce large quantities of smoke. Brief puffs of smoke are generated at artillery firing points or at locations where smoke devices are used. While such smoke may be visible from Kolekole Pass, it is very unlikely that this smoke would remain visible as it is dispersed during transport toward Kolekole Pass. The most likely sources of visible smoke reaching Kolekole Pass are smoke from wildfires, controlled burns, or agricultural burning in areas north and south of SBMR.

M55-6

As noted in the air quality discussion of Section 9.2 of the Draft EIS, available air quality monitoring data show few indications that air quality is declining despite continuing development. Peak air pollution levels measured on O'ahu and Hawai'i Island are presented in Table 2 of Appendix G1. The only episodes of peak air pollution levels approaching the federal air quality standards have been the high 24-hour average PM₁₀ levels measured during the New Year period at Pearl City and Kapolei. These events have been attributed to fireworks use, not industrial or agricultural emission sources. Ambient air quality monitoring responsibilities rest primarily with the Hawai'i Department of Health. The Hawai'i Department of Health has concluded that the major sources of air pollutant emissions are concentrated in urbanized areas, and consequently has located air monitoring stations in urban areas and near major industrial facilities. The State of Hawai'i does not have any air quality monitoring stations in the immediate Waianae vicinity. The closest monitoring stations are in the Barber's Point area at West Beach, Makaiwa, and Kapolei. USEPA has oversight responsibility, and has approved the state ambient monitoring program as meeting the requirements of the Clean Air Act.

Comments

- M55-7** | Cultural impacts, the Draft EIS fails to understand and recognize that it's not just a pile of rocks. And I look to Laurie over there because she knows it's not just a pile of rocks. But in your analysis -- and I'll read it to you, first sentence -- Some impacts on cultural resources, significant but mitigable. Mitigable according whose standards?
- M55-8** | I don't see anything in the EIS talking about the cultural significance of springs or how to mitigate the damage to those springs. The cultural impact portion of this EIS fails to address those things.
- M55-9** | It also fails to address how we fix things when you burn them, as you certainly will. Because I have to tell you, I quite frankly don't believe you when you say you're going to have a controlled burn.
- M55-10** | Mitigating effects on those sites that are important, but the EIS doesn't describe how to restore. How do you restore mana after you burn it? How do you restore the sanctity of a site after you inadvertently or intentionally run it over and destroy it?
- M55-11** | Please do not include the Programmatic Agreement as part of the EIS. It has no place in this EIS. It satisfies another law. So please remove -- and for the Makua EIS -- where's Peter? -- please do not include the Programmatic Agreement in the Makua EIS. I'm telling you right now, it has no place in there. That is a different law than NEPA.

Responses

- M55-7**
Cultural resources have been updated in the Final EIS. The overall impact to cultural resources on a project wide basis is significant. The Programmatic Agreement and other measures will reduce the severity of the impact but not always to the less than significant level.
- M55-8**
Our surveys have not identified any springs. If springs are identified in the future, the Army will engage in consultation with Native Hawaiian groups or individuals to determine if they are significant.
- M55-9**
Thank you for your comment. As discussed in Table ES-21 and in Section 4.10 - biological resources, the Army will evaluate areas damaged by wildfires and determine the feasibility of restoring them. Restoration will be dependent on safety, practicality and funding. As a measure to reduce the risk of wildland fires, the Army has updated and improved the Integrated Wildland Fire Management Plan. This plan was updated in October 2003 and is being fully implemented at all Army installations. The plan will be implemented to any new lands that the Army may acquire. The plan is available upon request.
- M55-10**
The Army makes every attempt to avoid known sites and known areas of sensitivity. Cultural resource sections have been revised to reflect concerns raised during the public comment period including expanded discussions of the potential impacts to Areas of Traditional Importance. Additionally the Programmatic Agreement has been finalized and is included in Appendix J.
- M55-11**
While the Programmatic Agreement is in response to another law, the National Historic Preservation Act, it does address protection of archeological, historical, and cultural site that are eligible for listing on the National list of Historic sites. As such it documents the protection measures for sites found in the project area and is considered in the evaluation of project impacts. For that reason it is included in the EIS.

Responses**M55-12**

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closer (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

Comments**M55-12**

And, finally, the biggest failure of all of this Draft EIS: It not only fails to consider, but it fails to address a clean-up plan. What are we going to do with these areas when they're pau?

Responses

Speaker **Martin Ortogero**

M56 10/29/2003 Public Meeting

M56-1 | Will there be another public forum? Or what is your plan? Because I made comments at the scoping meeting and my comments were not in this final draft. I made verbal and written comments.

M56-2 | I voiced concern focused on aircraft flight safety -- and by the way I will include a copy of that statement in my written report.

M56-3 | Additionally, I faxed written concerns about the increased training noise from East Range which will impact upon the Launani Valley and Mililani Mauka residential area. That fax was not documented in the Draft EIS.

M56-4 | Air space management. Reference Page 4-16, 15 Paragraph 4.4 Airspace. This section lacks a discussion on physical hazards. Specifically there should be detailed discussions on aircraft operations, a brief description on the existing conditions. Operative word "existing conditions". At a minimum a map should be provided that clearly shows the aircraft flight tracks for local helicopter departures, IFR 06 departures and standard VFR departures, all of which overfly the Launani Valley and Mililani Mauka residential areas.

M56-1

Seven EIS scoping meetings were held in the project areas for the purpose of determining the major concerns and issues to be addressed in the Draft EIS. The Army considered all public comments submitted during scoping and when related to the proposed action, the Draft EIS addressed those comments to the extent feasible. A summary of the comments received during the scoping process is included in Appendix B of the draft EIS, organized by location, meeting date, and subject. In addition, six community meetings and a 90-day comment period were provided to receive public comments on the draft EIS. These comments, and responses to them, are contained in the final EIS.

M56-2

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

M56-3

All comments from the public scoping process were reviewed during preparation of the Draft EIS. The DEIS does not, however, include copies of written comments received during the scoping process or transcripts of the public meetings held during the scoping process. Appendix B of the DEIS includes a synopsis of issues raised at the various scoping meetings.

M56-4

NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that affect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. As stated in Section 3.4.2, in the Aviation Safety subsection, all military aircraft fly in accordance with Federal Aviation Regulations (FAR) Part 91, Subchapter F (Air Traffic and General Operating Rules) and Army Regulation 95-1 (Aviation Flight Regulations).

Comments

- M56-5** Probable impact. A brief description of the Wheeler Army Airfield Accident Potential Zone. Operative word "Accident Potential Zone". There should be some discussion on event of aircraft accident mishap and dump fuel and munitions from helicopters, C-130, C-17, 5 UAVs, etc.
- M56-6** Mitigating measures. A description of how U.S. Army and other services can work closely with state, county officials to ensure there is safe and compatible air operations.
- M56-7** Recommend Final EIS have discussion on physical hazards associated with possible aircraft mishap such as crashes into residential areas of Launani Valley, Mililani Mauka or Wahiawa.
- M56-8** It is remotely possible that an emergency situation would result in a release of ordnance or fuel into the residential community area during a training fly-by.
- M56-9** Assumption must also be made that a C-130 or C-17 could be fully loaded, quotes, "fully loaded" with equipment and personnel to include munitions during a biannual full training deployment or actual deployment when an aircraft mishap occurs.

Responses

M56-5

NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that affect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. As stated in Section 3.4.2, in the Aviation Safety subsection, all military aircraft fly in accordance with Federal Aviation Regulations (FAR) Part 91, Subchapter F (Air Traffic and General Operating Rules) and Army Regulation 95-1 (Aviation Flight Regulations).

M56-6

As stated in Section 3.4.2, in the Aviation Safety subsection, all military aircraft fly in accordance with Federal Aviation Regulations (FAR) Part 91, Subchapter F (Air Traffic and General Operating Rules) which govern such things as operating near other aircraft, right-of-way rules, aircraft speed, and minimum safe altitudes when flying outside special use airspace. Army Regulation 95-1 (Aviation Flight Regulations) covers army aircraft operations, crew requirements, and flight rules. These regulations have precise requirements for the use of airports, heliports, and other landing areas, local flight rules, and special use airspace.

M56-7

Army has an excellent safety record, as described in Section 3.4. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that affect would be caused by an accident.

M56-8

NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that affect would be caused by an accident.

M56-9

Neither the C-130 or C-17 will carry munitions needed during training. All ammunition will continue to be transported by current approved carriers. For actual missions deployment would take place from Hickam AFB and the aircraft may or may not carry munitions.

Comments

- M56-10** | Would state, county and Wheeler Army Airfield resources be sufficient to respond and take necessary actions to save life and property in the event of a major aircraft accident in the Launani Valley, Mililani Mauka or Wahiawa areas? The Final EIS must discuss this probability and any plans to adequately address the resolution.
- M56-11** | Reference Page 4-16 Paragraph 4.4 Air Space. The EIS demonstrates that fixed-wing aircraft, increased number of helicopters and overflight UAV flight activity will not increase at Wheeler Army Airfield and Schofield Barracks Military Ranges. However, it's obvious this new activity, transformation, will increase aircraft activity threefold. If transformation will increase training, then correspondingly aircraft activity will increase. So without a doubt aircraft noise, movement and flying will impact the adjacent residential areas to Wheeler Army Airfield, Schofield Barracks East Ranges and all other Hawai'i training areas touched by transformation.
- M56-12** | Recommend that the Final EIS for transformation be coordinated, operative word "coordinated" with the FAA, not just to provide them a copy of the EIS. Formal coordination on the Final EIS report is essential to flight safety in the Central O'ahu Airspace Region. The new introduction of large fixed-wing aircraft, i.e. C-130, and C-17 plus the UAVs flying above and increased number of helicopters in the Central O'ahu airspace demands major safety concerns for airspace management and control.
- M56-13** | It would be prudent to have the FAA review its existing regulations and directives governing air space management and control of the Central O'ahu region to ensure accuracy, currency, and applicability so flight of safety is maintained. Outdated airspace management regulations, procedures can then be changed accordingly or new processes regulated. With an increase of military helicopters flying training missions over all Mililani, Wahiawa residential areas, you know, helicopters have no flight restrictions except to stay a minimum of 100 feet away from any ground object.

Responses

M56-10

NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that affect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record.

M56-11

Section 2.3.4 of the EIS states that during the deployment training SBCT units would be deployed at least twice a year to PTA from Hickam AFB or Wheeler AAF using one or two C-17 or C-130 aircraft. During aviation training, the number and types of aircraft used are expected to stay the same as under the Legacy Force training, with the exception of UAVs. The use of UAVs is addressed under Aviation Safety in Chapters 4-8.

M56-12

Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated. The FAA has well-defined procedures for remotely operated aircraft such as UAVs. As stated in Section 5.4.2 in the Aviation Safety subsection, a certificate of authorization would be required at least 60 days prior to the proposed commencement of UAV operations. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. The precise flight paths of the UAVs have not been determined at this time. They will be identified when the Army submits its plans to the FAA when it applies for the FAA Certificate of Authorization for UAV flights.

M56-13

Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated.

Comments

- M56-14** | New UAVs flying training patterns high above these helicopters; and now large fixed-winged C-130 and C-17s aircraft flying training patterns in and around Wheeler Army Airfield, coupled with civilian helicopters, small aircraft, state/military aircraft and large civilian airliners, obviously the Central O'ahu airspace has changed and will fill up quickly and dramatically.
- M56-15** | A relook, operative word, "relook" of FAA's governing directives, regulations of airspace environment in the Central O'ahu region and the proposed action of transformation would ensure the safety and quality of life of all Hawai'i citizens living in the Mililani Town, Wahiawa Town, Launani Valley and Mililani Mauka areas.
- M56-16** | Another concern about airspace I had is the concept of use of these aircraft, which the Draft EIS has still left unclear.
- M56-17** | Will these fixed-wing aircraft be permanently based at Wheeler Army Airfield? If not, what's the plan in their use?
- M56-18** | Will they (fixed winged aircraft) be flown in to pick up troops and equipment for biannual, monthly, quarterly deployments?

Responses

M56-14

Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated. The FAA has well-defined procedures for remotely operated aircraft such as UAVs. As stated in Section 5.4.2 in the Aviation Safety subsection, a certificate of authorization would be required at least 60 days prior to the proposed commencement of UAV operations. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. The precise flight paths of the UAVs have not been determined at this time. They will be identified when the Army submits its plans to the FAA when it applies for the FAA Certificate of Authorization for UAV flights.

M56-15

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

M56-16

If this comment refers to UAVs, the FAA has well-defined procedures for remotely operated aircraft such as UAVs. As stated in Section 5.4.2 in the Aviation Safety subsection, a certificate of authorization would be required at least 60 days prior to the proposed commencement of UAV operations.

M56-17

The US Air Force C-17 and C-130s would be based at Hickam AFB or other Air Force bases.

M56-18

As stated in Section 2.3.4, for Deployment Training, SBCT units would be deployed at least twice a year to PTA from Hickam AFB or Wheeler AAF using one or two C-130 aircraft. Individual training scenarios would dictate the requirements. The actual number of aircraft would not affect the conclusions of the airspace use analysis. All aircraft would be subject to air traffic control clearances and instructions, and would follow Army flight regulations and FAR regulations.

Comments

- M56-19** | Will they (fix winged aircraft) be parked on alert?
- M56-20** | Will how long they (fixed-winged aircraft) be parked on alert?
- M56-21** | Will both C-130 and C-17s be flying out of Wheeler Army Airfield?
- M56-22** | How many C-130 and C-17s be flying out of Wheeler Army Airfield?
- M56-23** | Will only equipment be flown out?
- M56-24** | Second concern: Noise. This item covers my concern in the written comments I faxed to you at the scoping meeting. One obvious shortcoming in the Draft EIS was how poorly it addresses the interests of the Launani Valley and Mililani Mauka communities. And this is done in a very subtle way.

Responses

M56-19

No, there will be no fixed wing aircraft on alert at either Wheeler AAF or BAAF.

M56-20

There will be no fixed wing aircraft on alert at either Wheeler AAF or BAAF. However, when parked at either location for training purposes they could be parked for as long as 8 hours.

M56-21

As discussed in Section 2.3.4, C130s and C-17 will be flying out of WAAF.

M56-22

As stated in Section 2.3.4, for Deployment Training, SBCT units would be deployed at least twice a year to PTA from Hickam AFB or Wheeler AAF using one or two C-17 or C-130 aircraft. Individual training scenarios would dictate the requirements. The actual number of aircraft would not affect the conclusions of the airspace use analysis. All aircraft would be subject to air traffic control clearances and instructions, and would follow Army flight regulations and FAR regulations.

M56-23

The aircraft would also be used to fly troops such as for training at PTA.

M56-24

The base maps used in many of the maps in the DEIS come from available topographic maps. None of the impact analyses presented in the DEIS used these base maps as the major guide for determining land use conditions near the different installations. The noise impact analyses determined proximity of schools and residential areas around SBMR, SBER, DMR, and KTA from the 2003 edition of The O'ahu Map book. Schools in Mililani-Mauka are significantly further from the Zone II noise contour, facility construction sites, and off-road vehicle maneuver areas than are on-post schools or schools in Wahiawa.

Comments

M56-25

In the Draft EIS when any residential communities around Schofield Barracks are mentioned only Mililani Town and Wahiawa are mentioned. There is very little recognition of the Launani Valley and Mililani Mauka communities when discussing the impact or potential impact of transformation from Wheeler Army Airfield and East Range. So by omission, it has overlooked a significant sector of people that are right in the middle of the transformation project. Examples: Figures 2-3 which describes the geographical lay of the East Range is outdated. By that I mean, the Launani Valley and Mililani Mauka residential areas are represented in its very early stages of development and not in its present day size or footprint. Both communities have grown in footprint size and population and they now border past the main training areas in East Range.

M56-26

Also there are three new public schools in the Mililani Mauka areas not represented on the map. By having these communities truly represented on your map, the appropriate approval authorities of the Final EIS can readily see how noise and aircraft over flights does impact on these communities and schools.

M56-27

Another reference. All references in the Draft EIS to noise from Wheeler Army Airfield and East Range as a result of transformation always describes its impact to Mililani Town, which is way south of the East Range and across H2 Highway. No mention is made of noise impact to Launani Valley or Mililani Mauka. The Final EIS needs to address the noise impacts on Launani Valley and Mililani Mauka areas. So I agree with the Draft EIS wherever it states, "the training noises from the East Range have negligible impact on Mililani Town."

Responses

M56-25

The reference to Mililani Town and Wahiawa were to give a scope of the area covered, not intended to name all residential areas/communities. Figure 2-3 is intended a map to show the location of Schofield Barracks East Range on the Island of O'ahu and it's project feature, not to delineate each community. All impacts of the project, whether noise, air quality, traffic, etc. considered the impacts of all surrounding communities

M56-26

Noise contours for live fire training at SBMR which might affect Mililani Mauka/Lunani are shown on Figure 5-15 in the EIS. While likely noticeable at Mililani. Mauka/Luanai these communities are well outside the areas that exceed Hawai'i's community noise standard. There will be no change to the number of flights and numbers or type of aircraft operating out of Wheeler Army Airfield over current conditions. Therefore this project would not increase noise from aircraft in this area.

M56-27

Transformation of the 2nd Brigade would have little impact on the overall level of flight activity conducted by the Aviation Brigade. Consequently, the Army does not anticipate any significant changes in flight activity at Wheeler Army Airfield or at East Range. The EIS notes that about half of the noise complaints received by the Army are related to helicopter and aircraft flight activity.

Comments

- 20 Another subtle example of how Launani
- 21 Valley and Mililani areas are left out of the report is
- 22 there is no noise abatement program mentioned in the
- 23 report for these communities. However, apparently there is one mentioned for the Wahiawa community. In Chapter 4, Page 4-34, paragraph 1, line 10-11, the EIS makes reference to establishment of a 1,000 foot, 305 meter, noise buffer along those portions of East Range that border residential areas of Wahiawa. However, no such noise abatement program is mentioned for the Launani Valley or Mililani Mauka communities. The Final EIS needs to address this shortfall. Because of the growth and now close proximity of Launani Valley and Mililani Mauka, why isn't there a noise abatement program for these communities?
- M56-28
- Lastly, the Draft EIS does not addresses whether a noise measurement study was done in the Mililani Mauka and Launani Valley communities to determine what real impact transformation will have, especially since there will be an increase in training.
- M56-29
- To my knowledge no measurement was ever done of the training noise that comes from East Range. This requirement needs to be addressed in the Final EIS so that a federal, state noise baseline can be established for these residential areas. This noise baseline can be used to compare noise infractions from the East Range to these residential communities.
- M56-30

Responses

M56-28

There is no formal noise abatement program for Wahiawa. There is, however a noise buffer zone along the north boundary of SBER because development in Wahiawa encroaches against the SBER boundary. Maneuver training areas in the western portion of SBER are confined to areas north of Wahiawa Reservoir. Thus, the area south of Wahiawa Reservoir provides an extensive buffer for the western half of Mililani-Mauka, and there is no need for a separate noise buffer policy in that portion of SBER.

M56-29

No state or federal agencies have any programs for routine ambient noise monitoring in Hawai'i. No special noise measurements were undertaken for the DEIS at SBMR or in surrounding communities. The Army currently has no plans to conduct ambient noise monitoring studies at SBMR or in communities bordering SBER. The DEIS relied on previous noise monitoring data and various noise modeling analyses to evaluate the noise impacts of transformation. In addition to annual average noise contours from large caliber weapons firing and explosive materials use, the DEIS presents information on noise levels associated with aircraft flyover events, vehicle pass by events, vehicle convoy traffic, and small arms firing with live and blank ammunition.

M56-30

No special noise measurements were undertaken for the DEIS at SBMR or in surrounding communities. The Army currently has no plans to conduct ambient noise monitoring studies at SBMR or in communities bordering SBER. Aside from occupational noise exposure regulations, there are no state or federal regulatory programs governing noise generated by Army training activities.

Responses

M56-31

The last item, state, county infrastructure. Transformation will bring an increase in student population to our schools. However, the Draft EIS doesn't address how the U.S. Army will plan to help state/county with resources in this area. Our schools are crowded and we need help with resources to accommodate an increase in student population. Not only in buildings and space but in teachers and support staff, and resources to operate a quality school system. The Final EIS needs to address what the U.S. Army intends to bring, operative word "bring" in this area before and when transformation is implemented.

M56-31

As discussed in Section 5.13.2, burdens on local school districts will be mitigated by early Army coordination with school districts. Additional funding is provided through the Federal Impact Money program, but it was determined that it does not fully cover education or other costs. It helps to lessen the impacts on the schooled but does not provide a substantial beneficial impact.

M56-32

Secondly, the Draft EIS states that there will be an increase in vehicles using our highways. However, the Draft EIS does not address how the U.S. Army plans to help maintain our highways or widen them to accommodate their vehicles. Our highways and country roads are inadequate for future population growth. Scarce resources make it difficult to maintain. The Final EIS in transformation needs to address what the Army intends to bring to resolve in this area or help in this area. Conclusion. That's all I have now. Again, I have more in my written comments. I want to again thank you for the opportunity to address this forum on the Draft EIS for transformation.

M56-32

Hawai'i Department of Transportation is responsible for maintaining the highways and major roads. Minor streets are maintained by the counties. The Transportation for O'ahu Plan 2025 (TOP 2025) and Hawai'i Long Range Land Transportation Plan guide transportation planning to accommodate future growth. Potential traffic impacts are analyzed in Sections 5.7, 6.7, 7.7, and 8.7. Potential impacts resulting from the proposed action would not cause the need to widen highways and local roadways.

M57 11/4/2003 Public Meeting

M57-1 | But what is the recovery rate for land that has been traversed by vehicles such as the Stryker, a 20-ton, 21-ton vehicle once it's finished and it's completed as a vehicle? What is the recovery rate of land, you know?

M57-2 | How are we going to -- and I want this to be addressed, also, in the final version of the EIS. What is going to be the cost in very human terms of bringing in 2,000 more people, and whatever other people have to come, to an island which can barely sustain its current population?

M57-3 | However, as -- one point that Hawai'i Aloha Aina feels very strongly about is looking beyond those boundaries and trying to assess what is the environmental impact on surrounding communities.
The water that accrues at the water lens under Wahiawa, the water, any -- any of the mutagens or cancer-causing agents which are released into the environment, they float down to Waipahu, which is a working-class community.

M57-4 | And I'd like the final version of the EIS to make a sustained and serious effort to address the environmental impact on the surrounding communities. 15 around Wahiawa.

M57-1

All land recovers at different rates, depending on the environmental conditions and stresses it faces. The Army programs that deal with land recovery are the LCTA program and ITAM both of which use the latest modeling and technology to safely utilize training lands.

M57-2

A summary of all the impacts of the project can be found in Chapter 4 – Environmental and Socioeconomic Consequences and Overview.

M57-3

We strongly agree that the impacts of the project on down gradient and downstream water users is both relevant and critical to assess in the EIS. The types of impacts described in the comment have been addressed in several places in the EIS. In addition to the water resources section, they are addressed in the environmental justice section, and in the cumulative impacts section. The project is not expected to result in significant offsite impacts on water quality.

M57-4

Chapter 5- Schofield Barracks Military Reservation and Wheeler Army Airfield in the EIS analyzes all the potential environmental impacts of the project on Wahiawa and surrounding communities such as Mililani Town, Mililani/ Luanani, and Kunia Village among others.

Speaker **DaVianna McGregor**
M58 11/4/2003 Public Meeting

M58-1

Moreover, the element which I'm most interested in and which is my area of expertise, the Cultural Impact Report, is not in the report; it hasn't been completed. And I request a copy of the Cultural Impact Study when it is completed, because my concern is the living practice of our culture, not the archaeological sites as much as the ongoing living practice of our culture. And the Environmental Impact Study, in the Cultural Section, only looks at archaeological sites and impacts to archaeological sites. And it promises that there will be a survey -- a summary of survey of cultural practitioners and, also, a report on informant interviews, and I'm interested in reading that.

M58-2

24 Page 3-73 cites a report that I worked on, called "Kanu o Ka 'Aina", as a source for identifying categories of culturally significant natural resources; and it includes areas of naturally occurring or cultivated resources used for food, shelter, or medicine; areas that contain resources used for expression and perpetuation of Hawaiian culture, religion, and language; places where known historical and contemporary religious beliefs or customs are practiced; areas where natural and cultivated endangered terrestrial marine flora and fauna used in Hawaiians' native ceremonies are located or materials for ceremonial arts and crafts are found; and areas that provide natural and cultural community resources for the perpetuation of language and culture, including place names, and natural, cultural, and community resources for arts, crafts, music, and dance. While those -- those categories are listed there on Page 3-73, the Cultural Impact Statement does not address -- or the Environmental Impact Study does not address those cultural resources. There's no evidence that subsistence hunters and gatherers or cultural practitioners have been consulted regarding the uses of cultural and natural resources. And, as I said, the Cultural Impact Study is promised to be produced; and hopefully it can be produced before the deadline, whereby we can comment, so that we'll have adequate time to review it and comment by January 3rd, 2004.

M58-1

The cultural resource sections have been expanded to better address the importance of and potential impacts to Areas of Traditional Importance. Based on this expanded discussion, the Army has changed the determination to significant. The Army has identified mitigation to reduce the severity of the impact but not to less than significant levels. A list of all the reports used for this analysis is listed in Chapter 11 and Appendix J. These reports are available upon request.

M58-2

Traditional Religious and Culturally Important places or areas can include areas such as natural resources as described in Section 3-73. The Army will identify through consultation with Native Hawaiian Groups and Individuals. We do not believe there was a promise to do a Cultural Resource Impact study, and as stated above, there is no federal requirement.

Comments

Responses

M58-3

The living cultural practices of Native Hawaiians are important to assess and to protect. And in other studies, Cultural Impact and Environmental Impact Studies, such as with the Geothermal Study and the Proposed Space Board Study, where these cultural impacts were vital, we assessed impacts to not just resources but to ohana and impacts to the ability of ohana to gather, and also to continue the relationship to ancestral lands, the ability of the community to gather and to -- and what would be the overall impact on social relations in the community. Will the new forces, for example, stationed here change the delicate ethnic balance in the community? Those issues are also factors to assess.

M58-4

And in regard to the natural cultural resources, the report needs to address what will be the impact in terms of changing conditions; that is, changes in quality and quantity of resources, size of resources, the usability of the resources, the boundaries that define these resource areas, the integrity of the resources, and the quality of the cultural experience.

M58-5

Moreover, there needs to be a cumulative impact study, not in the matter that you have. I know you have a little section on cumulative impacts, and it's looking at related development, like a new bridge on the old road going from Wahiawa to Waialua or improvements that will be made to this hotel as part of the process of cumulative impact. But what it doesn't address is the real cumulative impact that we are concerned with, which is, that overall, once these lands begin to be used as training ground, access will be cut off to them for Native Hawaiian rights and Native Hawaiian practitioners; and the long-term impact is, that once these lands are allowed to be impacted by ordinance, we're never going to have these lands returned to us again.

M58-3

In the event that isolation of a property or restricted access occurred, the impacts were discussed in the cultural resources section. Please refer to section 11 in Chapters 5-8.

M58-4

The definition of ATI has been broadened to specifically include these resources.

M58-5

Cumulative impacts to cultural resources are discussed in Section 9, and this section has been revised to address more clearly issues regarding impacts to areas of traditional importance and access for practitioners. Chapters 8 and 10 have also been revised.

Speaker Mohala Aiu

M59 11/4/2003 Public Meeting

M59-1

In consulting with Native Hawaiian groups, I don't believe that only consultation with Native Hawaiian groups gets the whole picture. They should also consult with ohana and individuals. I want them to look at the current cultural uses of land as well as the historical uses; and I want them to see that how can current use continue if they keep on blocking access to lands.

M59-2

I also am concerned about the use of land and the continued use of new lands and what this will do to the culture, landmarks, things that Hawaiians are -- hold dear and are used to seeing through historical eyes. And if they change, what does that do to our culture? What does it do to our livelihood? And what does it do to us as people who live in a strong relation to the land?

M59-3

I want to see what they're doing to safeguard the land for our future generations and how military use could stand side by side with Hawaiian values and say that -- in one sentence say that they -- they want to use the land and use it well and still maintain Hawaiian values. I can't see that -- those two points coming together.

M59-5

Hawai'i -- the Hawaiian Islands have already suffered heavily under military use. O'ahu and Hawai'i Island have had a huge impact. And I don't want to see any more buildup. I don't want to see the Stryker Brigade here.

M59-5

I think the U.S. military sees us, Hawai'i and Hawaiians, as expendable and as a strategic location and nothing more. How does this stand in relation, in solidarity to Hawaiian values?

M59-1

As summarized in Section 4.11, the Army has been consulting with Native Hawaiian Organizations and interested parties and will continue to consult with them through the implementation of this project. A list of the individuals included in this consultation is provided in Appendix J. If you would like to be included as an interested party, please contact the U.S. Army Hawai'i Department of Public Works, Cultural Resource Manager.

M59-2

Plans and construction of projects are designed to avoid identified traditional places. In the event that avoidance is not possible, consultation will take place with the SHPO and the Native Hawaiian community. The Army would follow notification and consultation procedures in accordance with NAGPRA.

M59-3

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations and surrounding communities. The Department of Army has taken every step to minimize impacts of the proposed project as describe in the EIS while meeting the goals of training. Many mitigation measures have been incorporated into the project to reduce identified impacts where possible. Chapter 4 summarized the potential impacts and mitigation measures.

M59-4

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

Speaker Henry Curtis and Kat Brady - Life of the Land
M60 11/4/2003 Public Meeting

M60-1

So the EIS acknowledges this past contamination but then does almost nothing on describing possible new contamination. They give a few sections, and it's buried in three different sections of the report, which makes it hard to put together; but they say, for example, they analyzed 39 composite samples. Now, "composite" means you take a little dirt from here, a little dirt from here, a little dirt from here, and you mix them together, and you hope that if any one of those samples is contaminated that the blend will pass your approval rating. And then they go on to say that these sites, very limited in number, are representative of the contamination sites and, in fact, are probably higher contaminated than the sites they didn't test; and, therefore, the sites they didn't test are absolutely safe.

M60-2

The military has found that there's high levels of valium, arsenic, iron, aluminum, magnesium, nitroglycerin, and RDX. RDX has multiple names, like C4, T4; it's a plastic explosive. These granules exist above levels that are safe for residential use. They know that it can get down into the groundwater; and, therefore, the EIS does not evaluate it at all. We find this shocking.

M60-3

So I will say in the next one minute that the groundwater contamination, which is pitiful, is better than their section, a lot of their other sections, which are even smaller in size.

Responses

M60-1

These results and their potential affect on surface soil and water pollution are further discussed in Sections 4.8 (Water Resources) and 4.9 (Geology, Soils, and Seismology). The investigation report is included in Appendix M1. The sampling protocols were adopted from methods tested at other installations and are well-documented in scientific literature available to the public. Some of this literature is cited in the EIS. The geological resources section of the EIS summarizes the results of the soil sampling. Appendix M1 of the EIS includes a table with the full set of results, and maps showing sampling locations at PTA and SBMR. The sampling locations were selected to test areas expected to have higher than average concentrations of contaminants.. Composite sampling is a standard procedure to determine average concentrations over a select area. This minimizes the chance that the analysis will show too low OR too high concentrations. Composite samples were made up of sub samples from within a relatively small area in which field evidence suggested that higher than average concentrations would likely be present. Under these circumstances, composite sampling is a superior method for identifying soil concentrations that might be significant to human health or the environment.

M60-2

The EIS explains that several metals are naturally present at high concentrations in Hawaiian soils. By valium, the commenter may be referring to vanadium. Of the metals and metalloids, only arsenic was found to exceed a relevant EPA standard (the cancer-based industrial soil PRG). RDX is a constituent in many high explosives used on ranges, including C4. However, these explosives are designed to burn very quickly and efficiently, releasing the energy in an explosive reaction, which is what causes them to be effective explosives. Studies have shown that only minute quantities of RDX remain after detonation of high explosives. These concentrations are not likely to significantly impact groundwater or surface water, and to date we are not aware of any sampling data that suggest that groundwater or surface water have been impacted. Although additional studies may be required in order to further confirm this hypothesis, the low concentrations detected in soils strongly support the hypothesis.

M60-3

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

M61-1

you want to build a fake village in Kahuku. We are concerned about our coastal waters; we are concerned about topsoil eroding and getting into the streams and blocking them up.

Speaker Marisa Plemer - Protect Our Native Ohana

M62 11/4/2003 Public Meeting

M62-1

Recovery Plan for the Koolau Mountain Plant Cluster. And I borrowed this book, and I ended up doing my botany project on this book. Because even though I'm born and raised here, I've gone to school here, I had no idea about these endemic, endangered, Native Hawaiian plants and animals. Beautiful things, many of them already gone, disappeared from the earth forever, forever, for many reasons, not just because of the military. But you're asking us to allow you to kill and destroy more of these rare plants and animals found nowhere else in the world. Do you realize that? Here is a list of some of these names. Long lists; long names. Have you seen this publication? Is it in your EIS? Your EIS is so incomplete.

Speaker Danny Li

M63 11/4/2003 Public Meeting

M63-1

Today all we have to do is look as far as possible environmental impact and the stewardship of the land, look at what's happening. I have two words for that depleted uranium. Okay. (Applause).

Speaker Keli'iwai (Chris) Camarillo

M64 11/4/2003 Public Meeting

M64-1

Air traffic was not addressed in your EIS because you guys are not specifically dealing with air stuff. However, I know your colonels and generals like to fly in on helicopters and that you guys will be doing joint training with other agencies within the military.

M61-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. Please see Sections 7.10 for a discussion of impacts on marine resources and Section 7.9 for a discussion of impacts due to erosion.

M62-1

This document was used in the writing of the EIS. It is listed in Appendix I in association with species having Recovery Plans.

M63-1

No depleted uranium has been used or is currently being used on the island. No depleted uranium is planned to be used in the future.

M64-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process. Impacts to Airspace are discussed in Sections 4.4.

Speaker **Patrick O'Brien**

M65 11/4/2003 Public Meeting

M65-1

need to look closely at the number of vehicles that you're saying the Strykers operate in East Range and Kahuku. 200 Stryker vehicles. I first got here and we still had quarter tons using. Now, that was a quarter ton vehicle Jeep. Then we went to the Humvees, about 1 ton. Now we're going to the Stryker 20-tons. You can see the progression. We had 200 Jeeps up in the Kahukus. I think 200 Strykers may be severely straining the terrain in the area of the Kahukus and around the island.

M65-2

Certainly, in any intelligent preparation of battlefield you would have a lot of no-go areas to maneuver a vehicle of such size. So, again, you need to consider that.

M65-3

You need to look at a worst case. It rains. It rains a lot. We've had several severe storms, flash flooding in this area, to include the vehicle deaths, been here long enough to know Humvee deaths in the Kahuku areas with soldiers involved. Those with Humvees, I'm not sure what a 20-ton vehicles would do when you look at the stream crossings and such with that.

M65-4

If it rains hard enough in the Kahuku area you're going to increase the erosion significantly. You can go up to the motor cross area and look at the moonscape that's been created by motorcycles driving over that terrain. Imagine the impact of a 20-ton vehicle going over that same terrain in the rain month after month, year after year.

M65-1

The impacts of operating the Strykers in East Range and Kahuku are described in Chapter 5 for East Range and Chapter 7 for Kahuku.

M65-2

All no go areas are defined and are shown on figures 2-2, 2-3, 2-4, 2-5, and 2-6 and were considered in all analysis.

M65-3

The EIS identifies the impacts on water quality as potentially significant. Flooding is likely to occur under No Action, but the project will include improvements to stream crossings that will likely reduce some of the potential impacts from flooding of roads within the installation that occur under existing conditions. The project is not likely to increase flooding potential downstream of the installation.

M65-4

The motocross area is outside the Army's control. For lands in the Kahuku area under Army ownership or management, the Army implements the ITAM program to provide a long-term management process for soil erosion. The ITAM program assesses the areas damaged, implements actions to repair damage, and monitors the effectiveness of those actions. The impacts from the motocross are considered in Chapter 9 in terms of cumulative impacts from past, present and reasonably foreseeable future actions in relation to the Proposed Action and impacts on soil erosion.

Comments

- M65-5** On your chart "road improvements" I think you need to look at the impact of violent traffic on that. My experience, is the staging area. Where would be your assembly area for the DRF-1, the quick reaction forces, 20-ton vehicles, how that's going to convoy to Hickam, fly out? That would be the plan why we would want to be here. I didn't see that talked about in the plan. If it is in the EIS I didn't see that addressed.
- M65-6** Along those lines, the road from Schofield Barracks to East Range, how are the vehicles going to get to East Range from Schofield?
- M65-7** Again, 20-ton vehicles, they come out of Foot Avenue of Lyman Gate, are they going to cross Kunia Road, cross Wheeler, cross Kam Highway East Range? I don't know how that's going to be done. I don't see a tank trail designed for that. That's going to be an impact.
- M65-8** Similarly, the tank trails, the construction of those, the chart says it's going to be gravel. I think you may want to consider biting the bullet and actually hardening those roads. Otherwise you're going to be in constant state of repair on the gravel roads with the rain, especially the roads such as Drum Road. So I think you need to go back and look at changing from making it a gravel road to actually making it a hard road. I didn't see a specific map of where you're going to plan to put the road to go from Schofield to Dillingham, but I know that terrain if you're not on the Snake Road itself it's fairly steep drop-off.
- M65-9** I think that would be a fairly significant impact on the environment. That needs to be addressed. In all those cases, I haven't had a vehicle yet that doesn't break down. And I don't know what that haul capability is on a 20-ton vehicle. If you're going to pick it up, move it it's got to be something larger than 20 tons to carry that thing back, haul it back.

Responses

M65-5

Highways H-1 and H-2 were designed to carry heavy military vehicles between SBMR and HAFB. This discussion has been added to Section 5.7 - Traffic.

M65-6

The Army will use public roads to access East Range. The Stryker Vehicle is designed to travel on public roads and the roads to East Range are designed to carry a vehicle of the Stryker's weight.

M65-7

As discussed in Section 5.7.2, the Lyman Gate of SBMR would be used and traffic between SBMR and the Multiple Deployment Facility would cross Kunia Road. The SBMR DPW implemented a project during the summer of 2003 to reroute the road to WAAF Kunia Gate so it is directly across from Lyman Gate.

M65-8

The improvements to Drum Road consist of realignment, a hardened surface, and shoulders. As stated in Section 6.7, Dillingham Trail is proposed to be a one-lane gravel road, 15 feet (5 meters) wide and approximately 11 miles (18 kilometers) long. The proposed Dillingham Trail would not be open to the public. The Stryker can maneuver across a slope that is less than 30 percent, up a slope that is less than 60 percent. For all trails the decision to pave segments of the trails will depend on steepness, erodibility, and traffic. It is expected that some portions will be paved. In the case of Drum Road an economic analysis my show that paving the entire road would be best. However, Drum Road is not being constructed as part of the Proposed Action.

M65-9

The Stryker vehicle can be towed by another Stryker to a location where it can be loaded onto a heavy equipment truck and returned to SBMR for repair. If the Stryker cannot be towed or easily be loaded onto a equipment truck it can be airlifted to a location for pickup.

Comments

- M65-10** | civilians roads, Snake Road, Kam Highway, knowing when the sugar cane haul vehicles or if Dole uses it they go back and clean it. I know myself, my own experience, I clean the road after ourselves. That needs to be addressed how that's going to be cleaned up when these 20-ton vehicles bring mud across the civilian highways.
- M65-11** | Also the vehicle wash area. You may want to consider one for readiness through Hickam. I know trying to get the vehicles on the aircraft they need to be spotless.
- M65-12** | Also I saw one (Wash Rack) in Kahuku. The location wasn't specified. But there's going to be a lot of runoff in that area. The soil appears clay, doesn't percolate very well. So where that's going to run off to?
- M65-13** | My concern about the unmanned aerial vehicles what proximity are going to be the homes. And if one of those -- we had a helicopter crash not too long ago in X strip. Once those go out of control, if there's an emergency, has a crash, there's no pilot to steer it to somewhere safe, that's going to go, perhaps, into a home. It's not that area where they're actually flying just looked at the impact

Responses

- M65-10**
The roads will be cleaned as necessary after convoy traffic crosses all public highways.
- M65-11**
Vehicles leaving Schofield Barracks will be washed prior to leaving for Hickam. They will be traveling by public highways and will arrive clean enough for deployment. Any vehicle not clean enough will undergo further cleaning at the rigger facility at Hickam as they are now.
- M65-12**
There is no wastewater associated with the Tactical Vehicle Washes. The water is recycled and separated within the vehicle wash. The separated particulates (such as dirt and oils) are removed on a regular basis and disposed of in accordance with appropriate material disposal laws and regulations. The treatment system is described generally in Section 8.14
- M65-13**
The potential impacts to aviation safety from the use of UAVs is addressed in Chapter 4.

Speaker **Jess Snow**

M66 11/4/2003 Public Meeting

- M66-1** | My question is what kind of impact it will have on the existing Waiale'e Motorcycle Park. Will there be any changes?
- M66-2** | Will they continue to -- as it is now, there's certain weekends where they will come in and train, and the motorcycle riders won't be able to -- they'll close the park for the weekend. And my concern is: Are they going to centralize it in their new area that they're building or will it impact us differently at the motorcycle park?
- M66-3** | Are they going to have military police, like they did in the old days, guarding it (Waiale'e Motorcycle Park)?
- M66-4** | And what about hikers? I live in the area. So when I come up and hike in the area with my family, kids, and dogs, are we going to be trespassing?
- M66-5** | Is somebody asking about the water sources, all the natural Artesian springs that are up there? I'm concerned about the water sources that would be impacted, Artesian springs that come down into the coastal areas, of course.

M66-1

There are no planned changes to access or use of the Waiale'e Motorcycle Park.

M66-2

There are no planned changes to access or use of the Waiale'e Motorcycle Park.

M66-3

The Army is not proposing any Military Police at the Waiale'e Motorcycle Park.

M66-4

As discussed in Section 7.2.1, authorized recreation uses of KTA would not change. Unauthorized recreation access would be subject to additional limitations as a result of fencing and the introduction of live-fire training. SDZs would be clearly identified and no public access would be permitted during live-fire activities.

M66-5

We agree that the types of impacts identified in the comment should be assessed in the EIS, and we think that they have been. The project is not expected to significantly impact water supply (especially not the amount of water flowing in springs high in the watershed), and it is not expected to impact water quality high in the watershed.

Speaker **Diane Anderson**

M67 11/4/2003 Public Meeting

M67-1

I wanted to know about the antennas in the Kahuku area and the Dillingham area, how tall they were going to be and whether or not that they would be significantly producing electromagnetic radiation.

M67-2

I was concerned about the road, how these vehicles were going to go from Schofield Barracks to Helemano, how many times would they have to cross the highways, and were they going to be using the same existing roads that we're all using now.

M67-1

The total height would range from 25 to 102 feet including whatever they are attached to. A more detailed description of the FTI antenna can be found in Appendix D pages D-15 and D-50. An Electromagnetic Compatibility (EMC) study for the SBCT-5 training sites on O'ahu and PTA was conducted. Over 65,500 frequency records were considered in this study from the civil sector and other federal government agencies. Result indicates no significant interference problems should be encountered on O'ahu and PTA during the operation of the Enhanced Position Locating and Ranging System (EPLRS), backbone of the training systems on the FTI Sites. There would be no significant electromagnetic radiation produced by these small whip antennas.

M67-2

Helemano trail crosses three public roadways. All military traffic will yield to civilian traffic at these crossings. Potential traffic impacts are analyzed in Sections 5.7, 6.7, 7.7, and 8.7 - Traffic.. The Army would acquire approximately 17 acres of land in a perpetual easement and construct a 15-foot-wide gravel road with 3-foot-wide gravel shoulders on both sides that would provide military vehicle access between SBMR and HMR. In conjunction with Drum Road, this project would provide a road network from SBMR to KTA. The road would run approximately 7 miles from SBMR to HMR. It would be north of Wahiawa and would use as much of the agriculture roadways as possible. Work includes grading, paving, and drainage improvements. Road grades steeper than 10 percent will be paved with asphalt or concrete. As discussed in Section 5.7, the maximum number of vehicles per convoy would be 24. Convoys would be sequenced at 15- to 30-minute intervals, so the maximum hourly volume would be 96 vehicles per hour. Convoys would be scheduled during non-peak traffic hours, thus reducing potential impacts on peak-hour traffic conditions. The identified impact would be less than significant, and no mitigation would be necessary.

Comments

- M67-3** | There is a road being proposed to be built from Schofield Barracks to Dillingham. I wanted to know if the road was visible from Kaukonahua Road, whether they were going to be fencing the area.
- M67-4** | And the proposed telecommunication lines, I wanted to know if they were above ground, would they be visible.
- M67-5** | I want to make sure that the Department of Defense understands that Hawai'i already has a problem with financing the educational facilities that are -- already exist.
- M67-6** | But if this is an Interim Force and the goal is towards an Objective Force, how much more in the way of cumulative impacts and in the acquisition of land or expansion of training areas can Hawai'i expect in the future?

Responses

M67-3

Section 6.3 discusses impacts to visual resources at DMR. The Dillingham trail is not visible from Kaukonahua road but when the Stryker and other vehicles are traveling along the trail, the vehicles can be seen from Kaukonahua Road along a few points for short distances. In addition, the trail crossed under Kaukonahua Rod, the vehicles may be seen as they cross under the road. The Army will design the trails to mimic or conserve the natural features to the extent practicable. With this mitigation, the impacts to visual resources from Dillingham Trail will be reduced to less than significant.

M67-4

As described in Appendix D, the telecommunications lines to be added to PTA will be underground inside the cantonment area, and strung on poles from the cantonment area to the ranges.

M67-5

As discussed in Section 5.13.2, burdens on local school districts will be mitigated by early Army coordination with school districts and additional funding provided to compensate for each military dependent attending local public schools.

M67-6

The scope of this EIS as discussed in Chapter 1 is to evaluate the proposal of transforming the 2nd Brigade, 25th ID(L) to an SBCT. The next Army evolution to a future force is not proposed until 2011 or later. At this time, there is no proposed project description or timeline developed in adequate detail to conduct a NEPA analysis. The cumulative impact section does include a trends analysis of all reasonably foreseeable, current and future projects in the ROI, tracking land use in Hawai'i but there is currently no specific Army plan or program for additional land acquisition.

Comments

- M67-7** | The air quality issues of dust being a significant impact, the Executive Summary states that already the -- it will exceed the federal level of -- 24-hour federal level. So in -- My question is: Are we trading off our health for safety?
- M67-8** | And I'm not really sure how to understand 365 tons of fugitive dust and what that actually means visibly and respiratory-wise.
- M67-9** | I don't really know what "sediment loading" is. But one of the concerns that I had was about the wildfires and how they would mitigate the fugitive dust. What kind of chemicals would they use to spray to mitigate fugitive dust?

Responses**M67-7**

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

M67-8

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant. A separate analysis was added to Chapters 4.3, 5.3, 6.3, 7.3, and 8.3 - Visual, concerning the impacts of dust on the visual resources.

M67-9

As part of the mitigation effort the Army will prepare a Dust and Soil Management Plan to identify appropriate measures to minimize soil loss and fugitive dust and mitigation measures to control losses.

Comments**M67-10**

The Army is -- says it is also considering -- in the -- one of the tables, it said they're considering putting and implementing an environmental management system. I would hope that that would be a mandatory management system, not "considering".

M67-11

I'd also like to be able to say that the first paragraph of the Executive Summary stated that the reasons for this Stryker Brigade is to have an Army that's ready for intense combat, for peacekeeping, and for humanitarian issues; however, I don't see any discussion about humanitarian issues or peacekeeping issues being raised; and that's really sad, because I think that's where we really need to go.

Responses**M67-10**

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

M67-11

Often times peacekeeping duties require that a strong presence be made to deter hostile activities by others. Many humanitarian efforts require protection of those undertaking those efforts. In both cases the presence of a highly mobile and potentially lethal forces are beneficial. While the Army trains it's soldiers in the art of restraint they must also be trained in the art of combat in case it is needed even in peacekeeping and humanitarian situations.

Comments

Speaker **Karla Kral**

M68 11/4/2003 Public Meeting

M68-1 | Also there was reference made to the Honouliuli preserve and the various encroachments that would be taking place there. Basically there would be a citizens advisory board, which I think many of us know in regard to those situations are too little too late when they once come together.

M68-2 | There is a reference to the loss of agricultural land. At this time when Hawai'i is trying to develop itself to regain its sustainability, to removing land from agriculture use, it's bad enough it's gone into all sorts of housing developments we have seen everywhere, but to have it go into military use from agriculture use is like a knife to the heart of people who love the land no matter what persuasion they might be, haole, Hawaiian or whatever.

M68-3 | Why not locate and train in a larger uninhabited area such as Utah, New Mexico, Nevada where the climate and the terrain and conditions are more comparable to potential locations to where this Stryker Brigade is to be deployed?

Responses

M68-1

In response to comments received early in the EIS process, USARHAW reoriented QTR2 such that the SDZ would no longer impact any lands with the Honouliuli Preserve. Army will grant TNC personnel and TNC-sponsored personnel daily, controlled access to the TNC-managed lands along a route to be determined by the Army in consultation with TNC for as long as they have legal right to use of the affected property for conservation/stewardship purposes. Access controls will be developed and implemented to ensure the safety of all personnel and will consist of notification by TNC to the Army prior to entering Army lands and notification by the Army to TNC of any unusual activities that may present, or appear to present a danger to TNC personnel in the area. The boundary will be signed to prevent unauthorized use/trespass. Sections 5.11.2 and 8.11.2 discuss access for cultural practitioners.

M68-2

Chapter 9 has been expanded to better discuss the cumulative impacts on land use from the conversion of agricultural land. Although the Proposed Action would result in a less than significant project wide impact on land use from the conversion of agricultural land, the cumulative impact is significant in light of past, present and reasonably foreseeable future actions.

M68-3

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

Speaker Kyle Kajihiro - American Friends Service Committee
M69 11/4/2003 Public Meeting

Senator Inouye's press release June 26, 2003 quote, "Senator Inouye has been assured that one of the six Stryker Brigades will be based in Hawai'i and Schofield Barracks will be building new facilities, adding personnel and increasing its land area to accommodate this unit."

That sounds like a done deal to me. I don't know how you can justify this process with this kind of thing on the record. So put that in your comments to take it back. This process is invalid. So you got to go, for a rational person why are they pushing this thing? You got to follow the money to figure that out. What happens here the Senate Defense Appropriation Subcommittee, the two ranking members, Senator Inouye representing Hawai'i and Senator Stevens representing Alaska are the ones that appropriate the money. Then Senator Inouye's buddy, General Shinseki from Kauai, another local boy, is head of the Army at the time. He's the one who creates this plan and pushes it forward despite a lot of criticism from his own troops, his own officers. His subordinate, General Hibner, retires from the Army after setting up the deal with General Dynamics and then takes a lucrative job with General Dynamics who is the manufacturer of the Stryker. Then you have the Strykers being assigned nicely to Alaska and Hawai'i, among the other six. So the question, you know, arises is what is the relationship between General Hibner and General Shinseki and how did that relationship affect the decision to station the Stryker Brigade here. Because if the military guys don't want it, if the people here don't want it, then why is it being pushed to vehemently and imposed upon us? And I also want to know if it's not true that the commander of one of the Stryker battle games that took place -- I heard this story that he quit in frustration because the exercise was rigged in favor of the Stryker team winning. So can you address that, please. I don't see any analysis about these criticisms of the system itself in your EIS.

M69-1

M69-1

Although the Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2nd Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2nd Brigade, 25th ID(L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law.

Comments

M69-2

Like somebody come into your house with one gun and ordering you around. How would that feel? Can you right the cumulative impacts of a hundred years of that kind of violence? Please put that in your EIS. That's what we're dealing with here. We're dealing with cumulative violence.

M69-3

Lualualei, Nohile. I read in the e-mail that there's going to be another taking of land over there, 6,000 acres. That should be in the cumulative impacts.

M69-4

That should be in there, Kalama Island, nuclear dump site. Plutonium, one of the most dangerous chemicals in the world is buried in an unlined landfill that's going to wash away in about 50 years into moananui, Pacific Ocean. These are all cumulative impacts that you ignore in these 1400 pages. I don't know that you can even have the language to describe what's going on. But if you want to do a really correct EIS, Environmental Impact, you need to look at all of that.

M69-5

These Strykers are meant to attack. They're not defensive things. They're about invasion. They're going to be used as -- they should mention that impact in the EIS. (Applause)

Responses

M69-2

We thank you for your comment and your comment has been considered and included into the administrative record. Chapter 9 of the Final EIS discussed the cumulative impacts on socioeconomic and environmental justice issues of the proposed action in light of past, present, and reasonably foreseeable actions.

M69-3

At this time there are no plans by the Army to acquire additional lands in these areas. We are also unaware of any plans to acquire lands in these areas by other parties.

M69-4

There are no activities proposed as part of this action at Kalama Island. Also, NEPA requires that a region of influence be established to determine the potential extent of impacts. Kalama Island, being thousands of miles from Hawai'i was not considered in the project's region of influence. Normally, for hazardous materials, those projects that somehow relate to each other in regard to health impacts on a certain population are considered in Chapter 9, the cumulative impacts section. Kalama's distance puts it out of range of impacts to residents of Hawai'i.

M69-5

Chapter 1 – Purpose and Need and Scope describes how the Stryker vehicles will be used.

Comments

M69-6

Aloha 'aina. That should be the driving concern in your EIS. That should be the principle that you put forward. The question is, "How safe can we make it? Now clean can we get it? How much life can we put into this place?" That a questions you ought to be asking.

Speaker Carol Philips
M70 11/4/2003 Public Meeting

M70-1

One is that you set new standards of environmental sensitivity and responsibility. And I'm not talking about the standards that exist already, but higher standards. That's been done. Because Hawai'i is the most precious place in the world.

Responses

M69-6

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

M70-1

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. The Department of Army has taken every step to minimize impacts of the proposed project as describe in the EIS while meeting the goals of training. Many mitigation measures have been incorporated into the project to reduce identified impacts where possible. Chapter 4 summarized the potential impacts and mitigation measures.

Comments

Speaker Cathleen Mattoon - Ko'oloalua Hawaiian Civic Club

M71 11/4/2003 Public Meeting

M71-1 | Throughout the EIS document it becomes apparent that without exception every statement of mitigation is prefaced by such words as "wherever, within feasible, reasonable, practical or prudent," which tells me that the U.S. Army will decide without input from state or federal laws what constitutes feasible, reasonable, practically and prudent.

M71-2 | I have some questions I hope will be answered later. And one of them is: What percent of the lands in Hawai'i is currently used by military, Army, Navy, Marine, Air Force? And I think someone already said 35 percent. What percent if you add more lands, and how does this compare with the rest of the nation?

M71-3 | Given that Hawai'i has the most endangered species in the nation, why would the U.S. Army demand the use of special lands that they historically destroyed?

M71-4 | Is the cost of training somewhere else too great a price to save our natural wonders? Will America be in greater danger if the Stryker Brigade is not trained here?

M71-5 | Also, how can you plan to integrate your personnel and families without impacting the many services provided by the state?

Responses

M71-1

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

M71-2

As discussed in Section 9.5.2, the current percentage of land owned or leased by the military in the state is 10.8 percent. Implementation of the proposed action would bring that total to 11.4 percent.

M71-3

As discussed in Section 8.10, the Army is committed to protecting endangered species in compliance with the ESA. Since the publication of the Draft EIS, USFWS issued a Biological Opinion of "no jeopardy" for the Proposed Action and current force activities. As part of this BO, the Army is committed to mitigation measures to reduce the impact on federally listed species. The BO is available upon request.

M71-4

The decision to transform in Hawai'i was analyzed in the Final Programmatic EIS completed on March 8, 2002. The Record of Decision for this EIS was signed on April 11, 2002. All the factors considered for transforming in Hawai'i are included in that Final Programmatic EIS. The discussion regarding why transformation is to take place in Hawai'i can be found in Chapter 1 – Purpose, Need, and Scope of this EIS. However, options of transforming in Hawai'i and training elsewhere are discussed in the EIS. Please see Section 2.6 in the EIS.

M71-5

Impacts on state-supplied public services such as police and fire protection, as well as other public utilities such as water, wastewater, solid waste management, telephone, electricity, and natural gas, as a result of project operations and population growth resulting from the project, are discussed in Sections 4.14, 5.14, 6.14, 7.14, and 8.14.

Comments

- M71-6** | I'd like you to comment on the effect on water and electrical power because you barely touched it in your EIS. I'd like to have it expanded.
- M71-7** | I'd like to know how you're going to handle the impact of these families on schools, trash, parks, environment, social services, health, courts, fire, hospitals. Every additional person has an effect on our limited lands.
- M71-8** | Also, will you ever release Hawai'i from military occupancy? Are we to accept imposition of military influence forever? Whenever you discover a better way to make the war better, will we always be your choice of training and experimentation?

Responses**M71-6**

Based on our analysis, impacts on water and electrical power are expected to be less than significant and therefore no more detailed discussion was required.

M71-7

Impacts on public services and utilities from the increase in population (as a result of personnel increases at SBMR) are described in Sections 5.13, Socioeconomics and Environmental Justice, and 5.14, Public Services and Utilities.

M71-8

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

Speaker Creighton Mattoon - Ko'olauloa Neighborhood Board

M72 11/4/2003 Public Meeting

M72-1 | However I believe my comments will be applicable to other sections of the EIS. I'm concerned that, once again, the military is seeking to acquire more of our limited land area with its limited but precious resources to conduct training for war.

M72-2 | In the Kahuku Training Area the EIS states that when using short-range training ammunition there's a high risk of wild fires.

M72-3 | Another section mentions that certain activities will create a high probability of soil erosion. Yet another section it is reported that there can be no assurances on the safety of biological species. (Kahuku)

M72-4 | In each case the mitigating measures are less than convincing. Although surface water impacts are mentioned, it would seem that groundwater impacts are not addressed at all. At least I couldn't find one.

M72-5 | Finally, the EIS does address cultural impacts in the Kahuku area. It does mention 23 sites in the upgrade area of Drum Road alone. It does propose mitigation measures in dealing with recorded sites and how to deal with inadvertent discoveries.

M72-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

M72-2

Chapter 7.12 identifies a high risk of wildfire at KTA. However the high risk is associated the rugged topography of the area which constrains fire suppression efforts. Because SRTA uses plastic bullets the potential for causing wildfires, while increased, is not considered a high risk. The implementation of the Integrated Wildland Fire Management Plan would reduce the overall risk to less than significant.

M72-3

Without the specific citations it is hard to respond to this comment. However, the EIS has identified significant impacts due to potential soil erosion from training activities and significant threats to biological resources from wildfires. A summary of the impacts of the project on these resources can be found in Chapter 4 – Environmental and Socioeconomic Consequences and Overview.

M72-4

Groundwater impacts are specifically called out in each Water Resources section of the EIS.

M72-5

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

Comments

Speaker **Sparky Rodrigues - Malama Makua**

M73 10/30/2003 Public Meeting

M73-1

The cumulative impacts of militarism here on the Waianae Coast is huge. One of the words that's in this 3-book document on the EIS is fugitive dust. This is the dust created by the wheels going through the training area.

I'm a down-winder so I get to breathe all this stuff that gets to come over the Waianae Range. It comes right into my bedroom because that's the direction my room, my bedroom is facing, Schofield. There's no indication that they're going to do any air quality sampling, testing on an ongoing basis.

M73-2

The burn plan, the fire plan was inadequate as it is with the Stryker plan.

M73-3

My question is how does the benefits of this Stryker Brigade benefit our youth, our health, our education, our environment, our people?

Responses

M73-1

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/or the potential use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

M73-2

Thank you for your comment. As a measure to reduce the risk of wildland fires, the Army has updated and improved the Integrated Wildland Fire Management Plan. This plan was updated in October 2003 and is being fully implemented at all Army installations. The plan will be implemented to any new lands that the Army may acquire. The plan is available upon request.

M73-3

In addition to being able to better protect all citizens of the US including those from the State of Hawai'i the Transformation project also has some direct beneficial effects in Hawai'i on socioeconomics, traffic, water resources, and land use. Chapter 4 – Environmental and Socioeconomic Consequences Overview summarizes these beneficial impacts.

Comments

Responses

Speaker **Patricia Patterson**

M74 10/30/2003 Public Meeting

M74-1 | I see there's going to be 120 millimeter mortars versus the 80 millimeter they used at Makua. Are these mortars new? Just we have never used them here before? Where else do they use them? Do you know? Lots of places? Are they as bad and as loud as The Bangalore?

M74-2 | Page 5, 180 describes some ATIs as including a rock or two. That is insulting. You may remember, quoting William Aila, Jr., "It's not just a rock." It can be a very sacred place.

M74-3 | On page ES5 "Makua Valley will not be included in these volumes." But Makua Valley should be a part of this EIS since you admit that you, quote "may use" Makua for the Stryker Brigade combat team training.

M74-4 | In this current EIS you quote many authors' versions of ancient Hawaiian uses of Waianae Uka and the Central O'ahu plateau. It's been very good to see all this information brought from here, there, everywhere and put down in one place. I thank you for that. I ask you, again, to publish the cultural information in a hardback copy for general distribution.

M74-5 | Table ES17 on page ES43 anticipates, quote, "Less than significant impacts on undiscovered sites," end quote. How can you make that declaration when those 19-ton Stryker vehicles filled with 14 soldiers plus their equipment and some of them with the gun on top will go roaring over the land? I don't think that would probably be

M74-1

The 120 mm mortar is a new weapon and will be used at SBMR and PTA. The impacts of noise in terms of overall munitions used, of which the 120 mm mortar was included, can be found in Section 5.6 for SBMR and 8.6 for PTA.

M74-2

The cultural resource sections have been expanded to better address the importance of and potential impacts to Areas of Traditional Importance. Based on this expanded discussion, the Army has changed the determination to significant, and has identified mitigation to reduce the severity of the impact but not to less than significant levels.

M74-3

As stated in Chapter 1, SBCT training requirements are not dependent on the use of the Makua Military Reservation (MMR). While MMR is an integral part of USARHAW training capabilities and historically used by other services, SBCT units could perform dismounted CALFEX training at other ranges. SBCT may use MMR if the range were available only after completion of the Makua EIS and ROD. The Makua EIS will analyze the potential environmental impacts associated with dismounted CALFEXs for both Current Force and SBCT; therefore, this SBCT EIS does not analyze training impacts of SBCT at MMR. These issues will be discussed in the forthcoming Makua EIS.

M74-4

The Army is considering the publication of this document. If the Army publishes this document, an announcement will be made to the public.

M74-5

The cultural resource sections have been expanded to better address the impacts to cultural resources from the Proposed Action. Based on this expanded discussion, the Army has changed some of the determinations of effect to significant. The Army has identified mitigation measures for these impacts to reduce the severity of the impact but not to less than significant levels.

Comments

- M74-6** | You bring in at least how many more people, the 350 with their families to this already overdeveloped island? These people won't shop in our mom and pop stores, but in, of course, the base PXs and commissaries, especially that beautiful gigantic complex at Pearl Harbor where we're not allowed to buy.
- M74-7** | Our already crowded roads will have to accommodate more cars. You're building new roads in Kahuku and on the Big Island. But you never built us a secondary road, even though your trucks, your troop carriers have, for a long time, and continue to use our one in and out highway to Makua and Kolekole Pass which we can't use either. It would be nice if you would help us with our need for a second access road into our community (West Side).
- M74-8** | You have proved yourselves that Pōhakuloa is not an appropriate place to train soldiers to fight in the Pacific Rim if you have to bulldoze lava, rocks and hard soil to soften the substrate on which to train soldiers to fight. Where? Where is similar terrain found in this Pacific Rim that you're going to need to go to?
- M74-9** | Quoting, "Wild fire is the single largest impact made by military activities in the Hawaiian ecosystem." And yet your detailed voluminous Wild Land Fire Management Plan doesn't work.

Responses**M74-6**

The impact analysis does not assume a huge influx of cash into the local economy as a result of the increased personnel and families, but the analysis includes the federal impact funds made available to communities in this situation, to make up for the lost income from taxes not paid by military staff.

M74-7

The Army will coordinate the need for future roadway improvements with agencies such as the Hawai'i Department of Transportation and counties' public works departments.

M74-8

As discussed in Chapter 2, ground softening occurs only at the site of range projects. This is a standard range construction practice. Mounted and dismounted maneuvers do not require ground softening.

M74-9

Thank you for your comment. As a measure to reduce the risk of wildland fires, the Army has updated and improved the Integrated Wildland Fire Management Plan. This plan was updated in October 2003 and is being fully implemented at all Army installations. The plan will be implemented to any new lands that the Army may acquire. The plan is available upon request.

Comments

Speaker Kyle Kajihiro - American Friends Service Committee
M75 10/30/2003 Public Meeting

M75-1

Right now the military controls around 56 percent of your land, is what you call ceded lands. They're actually occupied national lands of the Hawaiian nation. You're not paying anything for those lands. I'd like your EIS to reflect that analysis because I think that section that covered that history was very inadequate. So tell us how you have jurisdiction over these lands? And exactly how much of those occupied national lands will be impacted by the Stryker expansion, and what will be the fair market value for the use of those lands if you had added it up from the time it was illegally taken over?

M75-2

So you got to go, for a rational person why are they pushing this thing? You got to follow the money to figure that out. What happens here the Senate Defense Appropriation Subcommittee, the two ranking members, Senator Inouye representing Hawai'i and Senator Stevens representing Alaska are the ones that appropriate the money. Then Senator Inouye's buddy, General Shinseki from Kauai, another local boy, is head of the Army at the time. He's the one who creates this plan and pushes it forward despite a lot of criticism from his own troops, his own officers. His subordinate, General Hibner, retires from the Army after setting up the deal with General Dynamics and then takes a lucrative job with General Dynamics who is the manufacturer of the Stryker. Then you have the Strykers being assigned nicely to Alaska and Hawai'i, among the other six. So the question, you know, arises is what is the relationship between General Hibner and General Shinseki and how did that relationship affect the decision to station the Stryker Brigade here. Because if the military guys don't want it, if the people here don't want it, then why is it being pushed to vehemently and imposed upon us? And I also want to know if it's not true that the commander of one of the Stryker battle games that took place -- I heard this story that he quit in frustration because the exercise was rigged in favor of the Stryker team winning. So can you address that, please. I don't see any analysis about these criticisms of the system itself in your EIS.

Responses

M75-1

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

M75-2

Although the Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2nd Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2nd Brigade, 25th ID(L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law.

Comments

- M75-3** | Also one criteria for the Stryker Brigade is that it's transportable in the C-130 aircraft. Other reports have come out says it's not, it doesn't fit, it's not doable. The GAO says it's not deployable within 96 hours.
- M75-4** | How does that raise the level of threat for Hawai'i in your strategic analysis? How does the enormous military presence increase the level of what they call target rich environment for Hawai'i? Give us some analysis about that.
- M75-5** | Another contradiction I want to point out. In 1990 there was a Department of Defense memorandum that set a moratorium on new land acquisitions for training. So no new land for training were supposed to be acquired by the military. Yet the Army is expanding here. I don't understand this. This is a big contradiction to me.
- M75-6** | The other thing that's a contradiction is that the land use requirement study that was done by the Army in 1997 states that there is a shortfall of 70,000 acres of land for training. So does that mean that this 25,000 acres is an installment of 70,000 acres that's going to be acquired in the future?
- M75-7** | You folks finally did a study of the soil and groundwater contamination. A little limited part of it but it was very revealing. Because four toxics components of explosives were discovered: DNT, RDX, HMX, nitroglycerine, plus high levels of arsenic, high levels of lead. So I don't understand how you can just do that spot sample and then say that these are acceptable risks when you haven't sampled over a period of time to understand the behavior of these substances in the environment as these weather conditions fluctuate, as our environmental conditions fluctuate.

Responses

M75-3

As a result of the GAO report and ongoing Army operations, the Stryker vehicles are being modified to fit in C-130 aircraft. Additionally, deployment practices continue to evolve. The Transformation process allows for adaptations to equipment and operations to ultimately meet the goals of current, SBCT, and future forces.

M75-4

There is a relatively large complement of Army, Navy, Marines, and Air Force assets in Hawai'i that are more than capable of protecting U.S. interests from attack. Reorganizing one Army brigade will make relatively few changes to the overall Department of Defense presence in Hawai'i.

M75-5

The Army requested a waiver to the Department of Defense moratorium from Headquarters US Army and the waiver was granted.

M75-6

The analysis for the Proposed Action is based on a 2002 land use requirement study (Nakata 2002). For more information on the plan please contact US Army Hawai'i, Range Control Office. Section 2.3, under the paragraph heading Mounted Maneuver Training, discusses the need for the additional 23,000 acre WPAA parcel as necessary for mounted maneuver training.

M75-7

The EIS relies on the data available. The behavior in the environment of the chemicals in question is fairly well understood because there is a vast literature based on chemical properties of these compounds that can be used to predict behavior under a wide range of conditions. For example, the solubilities and affinities for binding to soil particles of many chemicals has been determined and can be used to predict their mobility. If high concentrations of contaminants had been observed, further detailed studies would be warranted. However, under the circumstances, the investigation results support the conclusion that there is no immediate threat to public health or the environment. Certainly, additional studies may help to refine these conclusions, but the results suggest that future efforts should be selective and targeted at providing assurance to the public that the conclusions of the EIS are accurate over the long term.

Comments

- M75-8** | Since 1978 this Stryker Brigade expansion will increase the rate of loss of agricultural land. So from 1978 to today the rate of loss of agricultural lands was 1 percent. This Stryker Brigade will bring that up to 2.7 percent, roughly, loss of lands. Therefore, how much productive capacity will be lost? What is the value of that loss? How much revenue will be lost? How much of this land will be lost forever?
- M75-9** | What are the rates of environmentally-induced diseases in these affected areas? If there are contaminants, let's go the next step and figure out how it's affecting people. Have there any toxicology studies been done in the community? Are there any plans to treat folks if there are illnesses?
- M75-10** | There's no sampling off-range. And there's no sampling of the Pōhakuloa impact range.
- M75-11** | As Dr. Dodge mentioned there's a lot of diabetes and thyroid-related diseases. Perchlorate affects the thyroid. So why haven't there been studies of perchlorate ?

Responses

M75-8

In Chapter 9 cumulative impacts, the Army determined the cumulative effect on the loss and conversion of agricultural land from past, present, and reasonably foreseeable actions is significant. As discussed in Section 4.2, 5.2, and 8.2 the SRAA includes 535 acres of pineapple land which would be converted to military training uses. While the purchase of the WPAA would convert 23,000 acres of agricultural land to military training uses, that land is not consistently used for grazing currently and is currently leased by the military on an occasional basis for training uses. Additionally, the Army may continue to make it available for such purposes pending training schedules and negotiations with local ranchers.

M75-9

The Army found no studies that indicated that there are any environmentally induced diseases in the ROI that are tied to Army activities.

M75-10

The soil investigation was a selective survey of areas expected to contain the highest concentrations, including impact and firing areas at PTA. The investigation was not intended to determine background concentrations in off-range areas. The investigation was a survey and was not designed to be comprehensive. However, it was intended to provide a representative sample of the types of conditions that occur throughout the PTA range areas.

M75-11

Perchlorate was included in the analytical suite for all of the soil samples collected in the soil investigations at PTA and SBMR. Perchlorate was not detected. The full results of the investigation (including non-detections) are included in Appendix M1.

Comments

- M75-12** | So, you know, please explain what the rate of the release of this material in the environment is and the quantity of lead that's already released. How many tons are in the environment?
- M75-13** | But what is the estimated cost of cleaning up the mess that the Army has made over the years? This is also getting into the cumulative impacts.

Responses

M75-12

The Army's Toxic Release Inventory reports for 2001 and 2002 indicate that airborne emissions of lead compounds were 710 pounds in 2001 and 465 pounds in 2002 for the three USARHAW installations where live firing occurs. For 2001, airborne lead compound emissions were estimated to be 236.6 pounds at SBMR, 466.2 pounds at PTA, and 7.6 pounds at Makua Military Reservation. For 2002, the estimated quantities were 286.4 pounds at SBMR, 157.7 pounds at PTA, and 21.2 pounds at Makua Military Reservation. In contrast, non-air releases of lead and lead compounds were approximately 29 tons per year at SBMR, 2 to 3 tons per year at PTA, and 336 to 873 pounds per year at Makua Military Reservation. The lavas from Hawaiian volcanoes have a natural lead content that averages about lead content averages 2 to 6 ppm by weight (2,000 to 6,000 micrograms per kilogram). Thus, soils derived from lavas or volcanic ash should be expected to have a modest lead content of natural origin. The lead added to soils by military training activities would be mostly in the form of relatively large metal fragments. This lead would not be a significant contributor to lead concentrations found in soils at off-post locations.

M75-13

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closer (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

Comments

- M75-14** | But no analyses have been done of what the actual costs are of these developments and what actually leaks out of the economy. So I think those need to be part of this analysis. If you're going to argue that the economy is better off because of the money coming in, then we need to show real costs.
- M75-15** | Pōhakuloa is three times the size of Kaho'olawe. You're proposing to add almost the equivalent area of another Kaho'olawe to your land holdings. Therefore, what is it going to cost to clean this up after 60 years or more of drain?
- M75-16** | And then the issue of the dust. I think it was like 3500-tons of dust more per year will be kicked up? So, like, where does that go? How is this affecting people with respiratory ailments? How is it affecting our reef settlement downstream? I didn't see a very good analysis of that.

Responses

M75-14

Project-specific costs relating to Army expenses on construction, mitigation, and O&M are not generally discussed in NEPA documents except where such financial issues relate to feasibility. Additionally, at this point specific project costs are rather speculative, depending on funding levels and contract estimates.

M75-15

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closer (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

M75-16

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and / or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

Comments**M75-17**

You guys are supposed to study alternatives but I didn't see any of that in there. You just said Hawai'i -- the requirement was that a brigade was stationed in Hawai'i, and, therefore, you did your study around that. I don't see somewhere in the programmatic environmental statement where they analyze different alternatives and compares cost, anything in there. So something fell through the cracks there. If you're talking about Hawai'i, what else has being considered? Why was the decision made that Hawai'i had to be it? That will also bring us back to follow the money and where the political purposes override the actual need.

Phyllis Coochie Cayan
10/30/2003 Public Meeting

M76-1

Is the Stryker Brigade amphibious in the middle of the Pacific Ocean?

Responses**M75-17**

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

M76-1

The Stryker will be transported by C-130 or C-17s during deployment as described in Section 2.3.4 under the paragraph titled "Deployment Training."

Comments

Speaker **Heidi Guth**

M77 10/30/2003 Public Meeting

M77-1

It requires much more extensive research into alternative proposals, mitigating measures, and cumulative cultural and environmental impacts on O'ahu and Hawai'i. The fact that there's an inadequate range of alternatives presented.

M77-2

With all of the Army's proposed transformation activities maintained and moved to the Big Island is not an adequate representation of the possible range of alternatives according to the U.S. Supreme Court and various other federal courts. The Army must not prefer that its preferred alternative will be the chosen alternative. It cannot commit funds to that alternative until the requisite decision has been approved.

M77-3

The Army should know by now what it will be able to do. Under regulations it states that the EIS should include planned mitigation measures, not possible ones, otherwise the public will not be a true part of the decision-making process as mandated by Congress because the public may not be commenting upon actual plans. The current wording implies that the Army effects and portrays whatever mitigation measures, if any, it wishes in its record of decision. Therefore, because of the inadequacy of the draft EIS, the length and density of the draft EIS, the extent of impact of the proposed Army transformation process, the level of controversy and concern arising from this proposal, the Congressional intent of the NEPA process itself, OHA requests that the public comment period be extended to at least 120 days.

Responses

M77-1

The discussion regarding why transformation is to take place in Hawai'i can be found in Chapter 1 – Purpose, Need, and Scope of this EIS. However, options of transforming in Hawai'i and training elsewhere are discussed in the EIS. Please see Section 2.6 in the EIS.

M77-2

The decision to transform in Hawai'i was analyzed in the Final Programmatic EIS completed on March 8, 2002. The Record of Decision for this EIS was signed on April 11, 2002. All the factors considered for transforming in Hawai'i are included in that Final Programmatic EIS. The discussion regarding why transformation is to take place in Hawai'i can be found in Chapter 1 – Purpose, Need, and Scope of this EIS. However, options of transforming in Hawai'i and training elsewhere are discussed in the EIS. Please see Section 2.6 in the EIS.

M77-3

There were 58 proposed mitigation measures outlined in Table ES-21 of the Executive Summary. These proposed mitigation measure were included for public comment and based on public comments and a cost benefit analysis those likely to be implemented are described in the FEIS. Costs include not just monetary costs, but cost in manpower and training. The ROD will indicate which mitigation measures will actually be implemented. The use of the mitigation measures described by the commenter will be evaluated using the cost benefit analysis described above.

Comments**Speaker Ikaika Hussey****M78 10/30/2003 Public Meeting****M78-1**

The EIS that we have in front of us, thousands of pages of the Environmental Impact Statement, it's a big document. I want to focus on the name, it's an Environmental Impact Statement, a draft EIS, but it's not a human impact statement. It takes into consideration the water, the land, but from a Hawaiian perspective, you can't separate land from people, people from land.

M78-2

They were taken away from themselves because so much of what it means to be Hawaiian is the connection with this place, and so one question that I do have which pertains directly to the EIS is what is the quantity of money -- what is the value of all of the drug rehab that's going to have to take place? What's the value in dollars, the opportunity costs, the cost to the people of the alcoholism that will increase, more than what we already have now, because of the additional 25,000 acres that will be taken away from Hawaiian people, from people in Hawai'i, okay?

Responses**M78-1**

The EIS describes the impacts to the human environment as required by NEPA. As such the EIS describes impact to the natural resources as well as impacts to cultural resources, socioeconomics, human health and safety.

M78-2

The lands proposed for acquisition are currently under private ownership. If the Army acquires these lands, we will continue to work with Native Hawaiians on access to ATIs as discussed in the cultural resources sections.

Comments

Speaker Alana G. Haught

M79 10/30/2003 Public Meeting

M79-1

Also, the EIS -- the draft EIS is so complex and it's too long and it's too complicated to be reviewed in that short period of time, so I would recommend 90 -- I'm glad OHA was here and they requested 120.

M79-2

the 25th Infantry has it's 1st Brigade up at Fort Lewis, Washington, undergoing transformation right now, so poor little me with my common sense, trying to think about ways of saving money, because that's what government should do, my first request was why not do a survey or a study of what it would cost to move the 2nd Brigade there?

M79-3

The EIS does not include -- and I asked for this many times -- an investigation of either constructing a pack range over at Schofield or the ability to have within your new multi -- your proposed new multipurpose ranges, the ability to do an infantry pack, thus relieving the need for the Army to have Makua.

M79-4

The draft EIS also fails in its painting a rosy economic picture of how much money it's going to bring to Hawai'i. It fails to address the true cost. The cost of the poisons that's going to be added to the land.

Responses

M79-1

The public comment period was extended to 90 days and ended on January 3, 2004.

M79-2

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

M79-3

As stated in Chapter 1, SBCT training requirements are not dependent on the use of the Makua Military Reservation (MMR). While MMR is an integral part of USARHAW training capabilities and historically used by other services, SBCT units could perform dismounted CALFEX training at other ranges. SBCT may use MMR if the range were available only after completion of the Makua EIS and ROD. The Makua EIS will analyze the potential environmental impacts associated with dismounted CALFEXs for both Current Force and SBCT; therefore, this SBCT EIS does not analyze training impacts of SBCT at MMR. These issues will be discussed in the forthcoming Makua EIS.

M79-4

As summarized in Section 4.8, 4.9 and 4.12, the Army has determined that the Proposed Action will not result in significant impacts due to contamination of soil or water resources.

Comments

- M79-5** | The cost of the health problems that are going to occur from us down-winders, us guys who live in Lualualei who see the smoke come over, not only from the military, but from Del Monte, from Dole, from the Kahi Power Plant when the winds blow southwest, like they did for the last six days, and behind the smoke from the Kahi Power Plant is the smoke from Campbell Industrial Park, and the EIS doesn't include a cumulative impact of all of these things,
