
APPENDICES

APPENDIX A

RECORD OF DECISION
for NATIONWIDE ARMY TRANSFORMATION PEIS

RECORD OF DECISION

As the Army G-3, I have reviewed the *Final Programmatic Environmental Impact Statement (PEIS) for Army Transformation*. The PEIS adequately assesses the program level impacts of Army Transformation and related alternatives on the biological, physical, and cultural environment. As indicated herein, the Army will proceed with its preferred alternative, implementation of a multi-year, phased, and synchronized program of transformation.

1.0 Background

In October 1999, the Secretary of the Army and the Chief of Staff of the Army articulated a vision about people, readiness, and transformation of the Army to meet the demands of the 21st century. The requirement for change within the Army is based on the emerging security challenges of the 21st century. Chief among these challenges is the need to be able to respond more rapidly to different types of operations requiring military action. The strategic significance of land forces continues to lie not only in their ability to fight and win the Nation's wars, but also in their providing options to shape the global environment to the future benefit of the United States and its allies. The Army must change to become more strategically responsive and dominant at every point on the spectrum of operations.

The PEIS which evaluates the Army Transformation Program and this Record of Decision complies with the statutory requirements contained in the Council on Environmental Quality regulations which implements the National Environmental Policy Act (NEPA) (40 CFR Parts 1500 – 1508) and Army Regulation 200-2 (*Environmental Effects of Army Actions*).

2.0 Proposed Action

The proposal evaluated in the PEIS is for implementation of a deliberate, phased, and synchronized 30-year program to transform the Army.

The three major objectives of the transformation process are the Objective Force, Interim Force, and the Initial Force.

- **Objective Force.** The Objective Force will achieve the ultimate transformation objective: to fulfill the Army Vision which provides for an Army that has the characteristics of being more responsive, deployable, agile, versatile, lethal, survivable, and sustainable; being strategically responsive; and being able to deploy rapidly and being dominant across the full spectrum of operations.

Capitalizing on advances in science and technology, the Objective Force will be equipped with leap-ahead technologies that enable overmatching combat power.

- *Interim Force.* The Interim Force will fill the strategic near-term capability gap. It will leverage state-of-the-art technology and a modernized Legacy Force (the current force) as a bridge to the future. The Interim Force, although organized as a rapidly deployable force for providing the warfighting commanders-in-chief with increased options for responding to small-scale contingencies, will be available for employment, with augmentation, in major-theater wars. Interim Force units will be highly mobile at the strategic, operational, and tactical levels.
- *Initial Force.* The Initial Force consists of two brigades at Fort Lewis, Washington. These brigades, furnished with off-the-shelf equipment, are being used to evaluate and refine the Operations and Organization Concept for a brigade combat team (BCT) and to validate tactics, techniques, and procedures.

Transformation activities, to occur during an Initial Phase, an Interim Capability Phase, and Objective Force Phase, will affect virtually all aspects of the entire Army, to include doctrine, training, leader development, organizations, installations, materiel, and soldiers. The three phases identified for transformation are as follows:

- *Initial Phase.* In this phase, the Army is creating two Initial BCTs at Fort Lewis to validate an organizational and operational model for Interim BCTs.
- *Interim Capability Phase.* The major objective of this phase is to complete the fielding of five to eight Interim BCTs (IBCT). The Interim Capability Phase will begin with fielding of interim armored vehicles (IAVs) and will end when the last IBCT is fully manned, equipped, and trained to possess the capabilities described in the IBCT Operations and Organization Concept.
- *Objective Capability Phase.* This phase will begin when the first Objective Force operational unit is fully manned, equipped with a future combat system, and trained to achieve the capabilities described for the Objective Force. The phase would end when the Army has been fully converted to the Objective Force capability.

3.0 Alternatives

The PEIS evaluated two alternatives in detail: a preferred alternative and the no action alternative. The preferred alternative is implementation of the above-described proposed action.

Under the no action alternative, the Army would not undertake a formal, synchronized program of transformation. Needed changes affecting Army organization, weapons

systems, operations, and other matters would, over time, be addressed in an incremental, evolutionary manner.

Two other alternatives were identified but not carried forward. "Partial implementation" of transformation could necessitate that the Army retain for an indefinite period its present heavy forces built around the Abrams tank and Bradley fighting vehicle. Alternatively, the Army could attempt to achieve transformation without establishing an Interim Force. In this case, based on science and technology decisions and production and fielding of new systems, the Army would proceed directly to an Objective Force capability. Both of these alternatives were eliminated from detailed consideration because they would not meet the purpose of and need for the proposed action.

4.0 PEIS Methodology

The PEIS evaluated "activity groups" occurring in conjunction with transformation and having potential to cause environmental impacts. The activity groups are:

- *Systems Acquisition:* Development, testing, production, fielding, and disposal of the weapon systems and equipment necessary to achieve the seven force characteristics of the Objective Force.
- *Construction:* All types of construction activities, including the erection or creation of buildings, training facilities, and infrastructure, as well as renovation or demolition of buildings and facilities.
- *Land Transactions:* Three distinct types of real property activities: acquisition, asset management, and disposal.
- *Deployment:* Operational deployment of forces, as well as training that is specifically tied to deployment of forces.
- *Stationing:* Distribution of forces across Army installations in a manner that best supports achievement of the Army's mission.
- *Training:* Achieving and maintaining readiness to perform assigned missions on both an individual and collective (unit) basis.
- *Institutional Matters:* The entire range of diverse day-to-day activities not otherwise specifically accounted for in the other six activity groups.

The PEIS analyzed implementation of transformation by evaluating the effects of activity groups on environmental resources and conditions. Aspects of the human and natural environments analyzed in the PEIS are land use, real property and infrastructure, airspace, air quality, noise, water resources, geology and soils, biological resources,

cultural resources, hazardous materials and wastes, human health and safety, and the socioeconomic environment.

5.0 Environmental Consequences

Implementation of a program for transformation of the Army is expected to result in a variety of adverse and beneficial impacts to the environment. The majority of impacts will be direct impacts to affected resources. Many of the impacts will be long-term. The following provides summaries of the expected impacts determined in the PEIS for each resource for both the proposed action and no action alternatives.

5.1 Impacts to Land Use

Proposed Action Alternative. Long-term direct adverse and beneficial effects are expected. Land use is expected to change based on the requirements of the Interim Force and, ultimately, the requirements of the Objective Force. The intensity and nature of installation land use and, in some cases, adjacent land use will also be expected to change for activities such as systems acquisition, deployment, stationing, and training.

No Action Alternative. No additional or increased effects to land use are expected. Changes in weapons systems, doctrine, and training will inevitably occur. Those changes will be of such infrequency or magnitude, however, as to have no substantial impacts to land use or compatibilities with adjoining property.

5.2 Impacts to Real Property and Infrastructure

Proposed Action Alternative. Short-term and long-term direct adverse and beneficial effects are expected. Adverse effects will occur with respect to systems acquisition, land transactions, deployment, stationing, training, and institutional matters. Beneficial effects will also occur with respect to systems acquisition and land transactions.

No Action Alternative. No additional or increased effects are expected. The Army will continue to expend funds for acquisition of real property assets, for repair and maintenance of facilities, and for management of its real property and infrastructure. Additional base realignment and closure actions might reduce the inventory of real property and infrastructure. Disposal of excess properties will represent cost avoidance of the maintenance; if wholly or partially allocated to the Army, the savings could be applied to remaining assets or to other purposes, as appropriate.

5.3 Impacts to Airspace

Proposed Action Alternative. Army Transformation will result in short- and long-term direct adverse effects to airspace use. Construction or modifications of airfields and training and maneuver areas could result in changes to existing airspace use. Airspace use will be most affected by the brief, intense activities of deployment exercises and by

routine training exercises of varying intensities. Effects to airspace use will depend also upon the degree of use of modified or new systems and their associated support requirements (e.g., unmanned aerial vehicles).

No Action Alternative. No additional effects are expected. There will be little change in airspace use with respect to the Army's rotary-wing assets. Division and corps commanders presently exercise operational control over unmanned aerial vehicles. The extent of training with these limited assets would not be expected to change materially.

5.4 Impacts to Air quality

Proposed Action Alternative. Implementation of transformation in the Army will, over the long term, result in a moderate overall improvement in ambient air quality at Army installations. Net improvement in air quality over present conditions would be attributable to continuing changes in vehicles, equipment, and processes; reductions in use of mobile sources in field training due to increased reliance on simulation training; and improved adherence to compliance standards through use of better management techniques. In the short-term, the Army's retention of and predominant reliance on the Legacy Force will have little effect on air quality. Training in the use of existing systems (vehicles, weapons, and other equipment) is not expected to involve any material changes in generation of air emissions. Similarly, maintenance of existing systems will not materially change. Numbers of mobile and stationary sources across the Army's inventory of installations will remain essentially static. That is, there will be little, if any, variance in the numbers of tactical vehicles and privately-owned vehicles (commuters) or in the numbers of "process" emissions from maintenance shops and other sources (e.g., on-post dry cleaning establishments). In the short term, emissions from stationary sources could be reduced as the Army moves toward removal of WW II-era facilities and construction of new, consolidated facilities having more efficient heating and cooling systems.

No Action Alternative. No additional effects are expected. Levels of air emissions presently produced by Army activities will generally continue, subject to slight incremental increase or decrease due to changes that will occur even in the absence of a program for transformation. The Army will continue to recapitalize and modernize its equipment and vehicles inventories, regulatory requirements will continue to evolve (generally becoming more stringent), and the mobile and stationary sources associated with training and day-to-day facilities operations will continue to generate emissions of varying types and quantities. Air emissions resulting from Army operations will occur within the context of, and as authorized by, relevant air quality permits issued by appropriate authorities.

5.5 Impacts to Noise

Proposed Action Alternative. Army Transformation will result in both direct adverse and beneficial effects. Short-term minor adverse effects could occur due to activities

associated with construction, accelerated training, and deployment. Short-term adverse noise effects will likely occur during training exercises. However, in the long term, overall beneficial effects will occur with the use of new systems based on technological advances (e.g., reductions in engine noise).

No Action Alternative. No effects are expected. Noise levels of Army activities will generally continue, subject to slight incremental increase or decrease due to changes in training doctrine or employment of equipment.

5.6 Impacts to Water Resources

Proposed Action Alternative. The activities associated with transformation will cause both direct and indirect adverse effects to water resources with considerable variability among locations. Effects due to systems acquisition, construction, land transactions, training, and institutional matters will be of both short-term and long-term duration.

No Action Alternative. Long-term direct beneficial effects are expected. Army environmental stewardship efforts seek the enhanced conservation and protection of natural resources at Army installations. Consistent with this goal, the Army has begun to implement, or is now at the threshold of implementing, important programs and initiatives such as Integrated Natural Resources Management Plans, an Environmental Management System, and sustainability principles. Programs and initiatives such as these, which would commence even in the absence of the proposed action, are expected to produce positive benefits to the targeted resources.

5.7 Impacts to Geology and Soils

Proposed Action Alternative. Activities associated with transformation will cause direct adverse effects to soil resources. Differences from current practices will be related to use of wheeled vehicles instead of tracked vehicles and potential use of new, currently vegetated areas for construction, training, or deployment. Optimal use of soil resources will require that soil use be considered along with use of other resources so that it can be used sustainably for dedicated purposes and/or not damaged to the point where it could not be returned to other uses (such as natural areas or agricultural lands) when required.

No Action Alternative. No additional or increased effects are expected. Changes in landform and soil losses through sedimentation in connection with construction activities would be expected to continue at generally their present levels. Training exercises will generally be expected to continue at their present locations, frequencies, and durations. Incidental adverse effects to soils associated with training would be subject to protective and rehabilitative measures through the Land Rehabilitation and Maintenance component of the Integrated Training Area Management Program.

5.8 Impacts to Biological Resources

Proposed Action Alternative. The activities associated with transformation will cause adverse and beneficial effects to biological resources. These effects will be both short-term and long-term. Training and construction activities will create the majority of adverse effects. Army land stewardship initiatives aimed at range and maneuver area sustainability are expected to generate beneficial effects.

No Action Alternative. Long-term direct beneficial effects are expected. Army environmental stewardship efforts seek the enhanced conservation and protection of natural resources at Army installations. Consistent with this goal, the Army has begun to implement, or is now at the threshold of implementing, important programs and initiatives such as Integrated Natural Resources Management Plans, an Environmental Management System, and sustainability principles. Programs and initiatives such as these, which would commence even in the absence of the proposed action, are expected to produce positive benefits to the targeted resources.

5.9 Impacts to Cultural Resources

Proposed Action Alternative. Long-term direct adverse and beneficial effects are expected. Throughout the period of transformation, the Army will continue to exercise diligence with respect to archaeological sites, traditional cultural and historic properties, and paleontological resources presently within its control. Notwithstanding the Army's responsible management pursuant to federal law and regulations, however, actions within the construction and training activity groups pose various risks of harm to cultural resources. Installation commanders' adherence to Integrated Cultural Resources Management Plans will minimize these potential risks. Land transactions involving private land could result in beneficial effects through the provision of federal protections to cultural resources.

No Action Alternative. Long-term direct adverse and beneficial effects are expected. The potential for adverse effects on cultural resources exists without regard to implementation of the proposed action. The preceding discussion concerning the proposed action is equally applicable to the no action alternative.

5.10 Impacts to Hazardous Materials and Wastes

Proposed Action Alternative. Direct beneficial and adverse effects are expected. The beneficial effects will occur within the context of systems acquisition and land activities. Adverse effects will occur with respect to construction.

No Action Alternative. No increase in effects is expected. Existing programs for the management of hazardous materials and wastes will continue. Abatement actions to deal with threats arising from past hazardous wastes practices will also continue.

5.11 Impacts to Human Health and Safety

Proposed Action Alternative. Long-term direct adverse and beneficial effects are expected. Beneficial effects are expected with respect to systems acquisition, training, and institutional matters. Adverse effects are expected with respect to construction and deployment.

No Action Alternative. No increase in effects is expected.

5.12 Impacts to the Socioeconomic Environment

Proposed Action Alternative. At the national level of assessment addressed in the PEIS, no effects to socioeconomic resources are expected. Although workforce levels at individual installations or within communities linked strongly to some defense industries could be affected by transformation, overall troop levels and associated civilian employment will likely remain essentially unchanged. The Nation's military force levels are determined by national security policy decisions and would not be affected by the proposed action. Employment changes could, however, occur at the installation or community level and in such cases the resulting economic effects would be assessed in a site-level environmental assessment or environmental impact statement.

Implementation of the proposed action is consistent with the goals for achievement of environmental justice as articulated in Executive Order 12898. Implementation also comports with the objectives of Executive Order 13045; the Army's actions will not pose any risks of safety to children, whether resident on an installation or present as a visitor.

No Action Alternative. No change in effects is expected, as change would occur on a more evolutionary scale.

5.13 Cumulative Effects

The effects of the transformation program will extend over the next 30 years and will be nationwide. The PEIS recognizes these large scales and, based on trends analysis, identifies a limited number of potential cumulative effects associated with population growth, energy consumption, management of lands for multiple use, and airspace.

- *Population Growth.* The combined effects of activities by the Army and adjacent, larger populations may be most noticeable with respect to air quality, noise, traffic congestion, water quality, fragmentation of ecosystems, and displacement of wildlife.
- *Energy.* To the extent that the Army's transformation would act as a catalyst for development of hybrid diesel-electric vehicles or for use of fuel cells, there would be positive cumulative effects on energy resources.
- *Management of Lands for Multiple Uses.* The expected higher tempo of training and robust characteristics of forces needed for the Interim and Objective Forces

could strain the capacities of present Army land holdings and require use of additional lands for some types of training. These circumstances could potentially reduce the availability of those other lands for as many uses as they now bear. This might be most noticeable in the amount of acreage available in some locations for recreation, agriculture, and grazing.

- *Airspace.* Where there is presently insufficient special use airspace over or near Army installations, the Army would seek additional designations from the Federal Aviation Administration. The allocation of the resource to Army use could reduce the airspace available to nonmilitary aircraft and could compound the difficulties in maintaining some air corridors.

6.0 Mitigation Commitments

The PEIS occurs at the inception of a long process that requires extensive planning and step-wise execution. As the potential environmental effects of creating, training, and employing the Objective Force are presently only generally estimable, identification of specific mitigation measures is not practicable. In order to attain its underlying goal to treat its resources in a manner that best assures their long-term availability, the Army will continue to act responsibly to avoid, reduce, or compensate for effects arising throughout the transformation process. At the present juncture, the Army will take four types of actions to minimize the effects transformation can be expected to generate.

- *Mitigation in conjunction with site-specific NEPA analyses.* Prior to implementation of transformation-related projects or proposed actions at specific sites, the Army will analyze each action to evaluate potential environmental effects. Identification of site- or project-specific mitigation will occur through this process.
- *Fostering of a "sustainable environment" ethic.* The Army will continue on its present course to implement sustainability principles in both its built environment and with respect to actions taken that affect natural resources.
- *Implementation of an Environmental Management System.* An Environmental Management System will provide an overarching architecture for informed decision making with respect to environmental issues. Implementation of a comprehensive Environmental Management System is expected before 2006.
- *Use of best management practices.* Best management practices are various site- and project-specific stratagems that planners, engineers, natural resources managers, and other professionals use to avoid or minimize adverse effects while carrying out projects. Consistent use of best management practices reduces risk of creating situations that might lead to consequences that would be adverse to the environment.

7.0 Decision

On behalf of the Department of the Army, I have decided to proceed with a multi-year, phased, and synchronized process to transform the Army. I have considered the results of the analysis described in the PEIS, supporting studies, and comments provided during formal comment and review periods. Based on this review, I have determined that the preferred alternative reflects the proper balance between initiatives for protection of the environment, appropriate mitigation, and actions to achieve the Army Vision. The Army has identified and shall adopt and implement a variety of measures to avoid or minimize harm to the environment that may be caused by implementation of the proposed action.

My decision to proceed with Army Transformation, based on the consideration of the results of the PEIS, as well as other, strategic considerations, extends to ratification, approval, and confirmation of certain related matters, as follows:

- The program to transform the Army must continually accommodate changes in national security requirements.
- Project- and site-specific proposals for transformation actions and activities will be appropriately evaluated for their potential environmental effects. Future planning for and initiating actions to accomplish transformation shall be subject to appropriate evaluation pursuant to the National Environmental Policy Act and other requirements.
- The Army has undertaken the conversion of two brigades at Fort Lewis, Washington, to develop and validate organizational and operational concepts for brigade combat teams. As their conversion is completed and circumstances warrant, these two Initial BCTs shall proceed to Interim BCT status. As addressed in the PEIS, activities of and activities directly supporting the conversions at Fort Lewis shall continue to be subject to evaluation of their potential environmental effects.
- As indicated in the PEIS, transformation will affect virtually all aspects of the Army's doctrine, training, leader development, organizations, installations, materiel, and soldiers. Absent a significant change in circumstances, Interim Force units shall be constituted from existing units at their home stations.
- On July 12, 2001, the Army identified four additional brigades for conversion to Interim BCTs. These are the 172nd Infantry Brigade (Separate), Forts Wainwright and Richardson, Alaska; the 2nd Armored Cavalry Regiment (Light), Fort Polk, Louisiana; the 2nd Brigade, 25th Infantry Division (Light), Schofield Barracks, Hawaii; and the 56th Brigade of the 28th Infantry Division (Mechanized), Pennsylvania National Guard. Final designation of these brigades for conversion was conditional on the completion of the PEIS. Based on national

security requirements and strategic factors, as well as the environmental factors identified in the PEIS, I confirm the series of planned conversions previously announced. Actions at these installations to implement Army Transformation, including conversion of each of these four units to IBCT/ICR status, shall be subject to appropriate evaluation of potential environmental effects in accordance with the National Environmental Policy Act.

APPENDIX B

PUBLIC INVOLVEMENT

APPENDIX B

PUBLIC INVOLVEMENT

B.1 OVERVIEW OF THE NATIONAL ENVIRONMENTAL POLICY ACT

Under the National Environmental Policy Act (NEPA) of 1969 (Public Law 91-190) and the Council on Environmental Quality regulations, federal agencies are required to consider the environmental impacts of their proposed actions before taking action. Actions that are subject to NEPA include those involving federal funding and permits, those involving federal facilities and equipment, and those that affect federal employees. The actions proposed by the Army under the Proposed Action are subject to the requirements of NEPA. Pursuant to NEPA, the Army will prepare an environmental impact statement on the SBCT Project.

B.2 PUBLIC INVOLVEMENT

Public involvement is a vital component of NEPA for vesting the public in the decision-making process and allowing for full environmental disclosure. Guidance for implementing public involvement is codified in 40 Code of Federal Regulations 1506.6, thereby ensuring that federal agencies make a diligent effort to involve the public in preparing NEPA documents.

Public involvement efforts to date for the SBCT Project are described below.

Objectives of Scoping

- Invite agencies and public to participate
- Identify and refine alternatives to the proposed action
- Identify a preliminary list of environmental and socioeconomic issues to address in the NEPA document
- Identify and eliminate issues determined to be insignificant

Public Scoping

Prior to NEPA analysis, public scoping meetings were conducted to obtain public input on the Proposed Action and the alternatives. These meetings were conducted between April 6 and April 30, 2002.

Hawaii and Oahu scoping meeting notices were published in the *Hawaii Tribune-Herald*, *West Hawaii Today*, *The Honolulu Advertiser*, *Honolulu Star-Bulletin*, *Midweek*, and OEQC's *The Environmental Notice*. Publication dates are as follows:

- *Hawaii Tribune-Herald*—March 31, 2002; April 2 and 4, 2002
- *West Hawaii Today*—March 31, 2002; April 2, 4 and 5, 2002
- *The Honolulu Advertiser*—April 7, 9, 10 and 11, 2002
- *Honolulu Star-Bulletin*—April 7, 9, 10 and 11, 2002
- *Midweek*—April 10, 2002
- *The Environmental Notice*—April 8, 2002

Meeting locations included the following:

- April 6, 2002—Hilo Hawaiian Hotel, Hilo Hawai'i;
- April 17, 2002—Hilton Waikoloa Village, Waikoloa, Hawai'i; (Which was later changed to Outrigger Waikoloa Beach)
- April 23, 2002—Leilehua High School, Wahiawa, Hawai'i;
- April 24, 2002—Kawananakoa Middle School, Honolulu, Hawai'i;
- April 25, 2002—Haleiwa Elementary School, Haleiwa, Hawai'i;
- April 29, 2002—Kahuku High and Intermediate School, Kahuku, Hawai'i; and
- April 30, 2002—Nanakuli High and Intermediate School, Waianae, Hawai'i.

On March 4, 2002, the Army published a notice of intent in the *Federal Register*, which notified the public of the SBCT Project, announced the seven public scoping meetings, and solicited public comments. Comments were accepted through June 29, 2002.

Newspaper advertisements and media releases were issued to notify the public of the project, to request public comments, and to provide contact information. A media release was issued on May 29, 2002, announcing the extension of the public comment period to June 29, 2002. Notices announcing the extension also were placed in regional newspapers.

In conjunction with the publication of the notice of intent, an SBCT Project EIS Web site was launched to serve as a clearinghouse of project information while the EIS is being developed. The Web site (www.sbcteis.com) provides up-to-date

information on the Proposed Action. A link is also available for Web site visitors to submit comments about the project.

Public Comment on Draft EIS

The Commanding General of the US Army Hawaii 25th ID(L) approved the draft EIS for public review and it was distributed to elected officials, regulatory agencies, and members of the public. The availability of this document was announced in the *Federal Register*, and a 45-day public comment period followed to provide the public with the opportunity to comment on the findings of the EIS. After the public comments are incorporated and the draft is revised the General will weigh appropriate information and will decide which alternative to implement. A notice of availability of the Record of Decision will be published in the *Federal Register*.

Notification of publication of the Draft EIS and the opening of the public comment period was announced as both legal and display advertisements in *Hawaii Tribune-Herald*, *West Hawaii Today*, *The Honolulu Advertiser*, *Honolulu Star-Bulletin*, *Midweek*, and OEQC's *The Environmental Notice*. Publication dates are as follows:

- *Hawaii Tribune-Herald*— October 3, 5, and 8, 2003
- *West Hawaii Today*— October 3, 5, and 8, 2003
- *The Honolulu Advertiser*—October 3, 5, and 8, 2003
- *Honolulu Star-Bulletin*— October 3, 5, and 8, 2003
- *Midweek*—October 8, 2003
- *The Environmental Notice*—October 8, 2003

Meeting locations included the following:

- 28 October 2003, Honolulu Country Club, Honolulu, Hawaii
- 29 October 2003, Helemano Plantation, Wahiawa, Hawaii
- 30 October 2003, Makaha Resort Golf Club, Waianae, Hawaii
- 4 November 2003, Turtle Bay Resort Kahuku, Hawaii
- 5 November 2003, Waikoloa Beach Marriott Resort Waikoloa, Hawaii
- 6 November 2003, Hilo Hawaiian Hotel Hilo

The total number of meeting attendees was approximately 600 individuals, almost 300 of whom submitted oral or written comments. The website (www.sbcteis.com) was also available for the public to review the document and make comments. On October 31, 2003 the Commanding General of the US Army Hawaii 25th ID(L) made a decision to extend the public comment period on the Draft EIS until January 3rd, 2004. A media release was issued announcing the extension.

Comments received during the public comment period included comments from federal, state, and local agencies, non-governmental organizations, businesses, and individuals. Over 600 unique commenters participated in the public review of the Draft EIS, and their comments and the Army's responses are provided separately in Appendix P.

B.3 METHODS OF COMMENT COLLECTION AND ANALYSIS

In order to ensure that public comments are properly registered and that all public comments are addressed, a Public Comment Analysis and Tracking System (PCATS) was adopted. The Army used the PCATS to record and track all scoping comments and comments on the Draft EIS by category, which ensured that all public comments were recorded, tracked, and addressed accurately.

B.4 OTHER PUBLIC INVOLVEMENT MATERIALS

Additional materials used in the public process for the SBCT Transformation EIS are included in this appendix. The following public involvement materials for the scoping of the SBCT project are provided in Appendix B-1:

- Federal Register, notice of intent, dated March 4, 2002;
- Public Notices for Transformation EIS scoping meetings during April 2002;
- Synopses of public scoping meetings held on April 16, 17, 23, 24, 25, 29, and 30, 2002;
- Letter addressed to community members from Colonel William R. Puttmann, Jr., dated May 28, 2002;
- Media release for extension of Transformation EIS public scoping period, dated May 29, 2002;
- Affidavit of publication for extension of transformation EIS public scoping period to June 29, 2002, in *The Honolulu Star-Bulletin*;
- Affidavit of publication for extension of Transformation EIS public scoping period to June 29, 2002, *The Honolulu Advertiser*; and
- Affidavit of publication for extension of Transformation EIS public scoping period to June 29, 2002, *The Hawaii Tribune-Herald*.

The following public involvement materials for the public comment and review of the Draft EIS are provided in Appendix B-2:

- Letter to Environmental Protection Agency requesting Federal Register publish Notice of Availability of Draft EIS;
- Notice of Availability of Draft EIS, published in the *Federal Register* on Monday, September 29, 2003;
- Press release from Army announcing availability of Draft EIS, dated October 2, 2003;
- *Hawaii Tribune-Herald* Public Comment Period notice for Draft EIS, dated October 3, 5, 8, 2003;
- Cover memo releasing Draft EIS to the public, dated October 3, 2003;
- Synopses of public meetings held on October 28, 29, and 30, and November 4, 5, and 6, 2003; and
- Notice of extension of public comment period for Draft EIS, dated November 3, 2003.

APPENDIX B-1

SCOPING PRIOR TO EIS PREPARATION

Vehicles and probable additions of several unmanned aerial vehicles); (2) Construction, renovation, and demolition activities to include construction and upgrades to several small to large arms ranges, range complexes and urban training facilities; construction of IBCT vehicle motor pool facilities; construction of troop and equipment cargo and deployment facilities; enhancements to installation information infrastructure and corresponding facilities; upgrades to transportation infrastructure; construction/replacement of barracks and/or housing; and construction of additional administrative/control buildings and structures; (3) Land transactions (acquisition, asset management and disposal); (4) Deployment of forces and specific training for deployment; (5) Training to achieve and maintain readiness to perform assigned missions; (6) institutional matters to include the entire range of diverse day-to-day activities not otherwise accounted for in other activities.

Alternatives include: (1) No Action (existing unit structure and training, no specifically planned activities for transformation); (2) Transformation of the 172nd Infantry Brigade (Separate) to an IBCT using existing ranges facilities and infrastructure as they are now configured; (3) Transformation of the 172nd Infantry Brigade (Separate) to an IBCT and mission sustainment activities including new, additional, or modified ranges, facilities and infrastructure; (4) Total transformation of U.S. Army Alaska (USARAK) mission activities and capabilities, to include the near-term transformation of the 172nd Infantry Brigade (Separate) to an IBCT, in order to meet Objective Force requirements fulfilling the Army Vision of an Army that has the characteristics of being more responsive, deployable, agile, versatile, lethal, survivable, and sustainable; being strategically responsive; and being able to deploy rapidly and being dominant across the full spectrum of operations.

Other alternatives that may be raised during the scoping process will be considered.

Publication of this Notice of Intent does not foreclose consideration of any courses of actions or possible decisions addressed by the U.S. Department of the Army in its Draft Programmatic Environmental Impact Statement (PEIS) for Army Transformation, dated June 2001. No final decisions will be made regarding Transformation in Alaska prior to completion and signature of the Record of Decision for the PEIS for Army Transformation.

Federal, state, and local agencies, organizations, and the public are invited to participate in the scoping process for the completion of this EIS by participating in scoping meetings or submitting written comments. The scoping process will assist the Army in identifying potential impacts to the quality of the human environment. Scoping meetings will be held in Anchorage, Delta Junction, and Fairbanks, Alaska. Notification of the times and locations for the scoping meetings will be published in local newspapers. Written comments will be accepted within 30 days of the scoping meetings. Written comments may be forwarded to Mr. Kevin Gardner at the above address.

Dated: February 25, 2002.

Raymond J. Fatz,

Deputy Assistant Secretary of the Army (Environment, Safety and Occupational Health, OASA/IE&E).

Department of the Army

Preparation of an Environmental Impact Statement (EIS) for Force Transformation of the 2nd Brigade, 25th Infantry Division (Light) Hawaii

AGENCY: Department of the Army, DoD.

ACTION: Notice of intent.

SUMMARY: The Army proposes to implement a range of activities related to force transformation in Hawaii. The primary proposed activities are associated with conversion of the 2nd Brigade, 25th Infantry Division (Light) to an Interim Brigade Combat Team (IBCT), a rapidly deployable, early entry, medium weight force with a decreased logistical footprint. Impacts to the human environment, to include surrounding communities, from restructuring and from enhancing associated ranges, facilities, and infrastructure to meet Army Transformation objectives will be analyzed.

FOR FURTHER INFORMATION CONTACT:

Transformation Information: Mr. Ronald Borne, (808) 656-2878, extension 1122; by fax (808) 656-8200; by mail at Commander, U.S. Army Garrison, Hawaii, ATTN: APVG-GCT (Borne), Stop 518, Schofield Barracks, Hawaii 96797; or by e-mail: ronald.borne@schofield.army.mil.

EIS Information: Mr. Earl Nagasawa, (808) 438-0772; by fax (808) 438-7801; by mail at U.S. Army Corps of

Engineers, Honolulu Engineer District, Program and Project Management Division, Attn: CEPOH-PP-E (Nagasawa), Building 252, Fort Shafter, Hawaii 96858-5440; or by e-mail at earl.nagasawa@usace.army.mil.

SUPPLEMENTARY INFORMATION: The proposed action would result in changes to various military lands in Hawaii. Categories of proposed activities include: (1) Fielding of new or modified weapon systems, armored vehicles and equipment; (2) Construction activities including erection of buildings, training facilities and infrastructure, and renovation or demolition of buildings and facilities at military installations located on the islands of Oahu and Hawaii; (3) Land transactions (acquisition, asset management and disposal); (4) Deployment of forces and specific training for deployment; (5) Training to achieve and maintain readiness to perform assigned missions; (6) Other actions necessary to support a net increase in troops and vehicles to be assigned to the 2nd Brigade, 25th Infantry Division.

Proposed Action: The Proposed Action specifically entails transformation of the 2nd Brigade, 25th Infantry Division (Light) to an IBCT with proposed changes to ranges, facilities, and infrastructure at military installations in Hawaii to support the IBCT operation and training. Proposed activities include land transactions and construction and use of vehicle wash facilities, training and qualification ranges, installation information infrastructure and facilities enhancements, virtual and live training facilities upgrades, motor pool and range control/maintenance facilities, Army airfield upgrades, an anti-armor course, and an ammunition storage area. The remaining non-IBCT units will also use these new facilities as well as existing infrastructure.

Alternatives: (1) Transformation of the 2nd Brigade, 25th Infantry Division (Light) to an IBCT with a range of supporting activities including new, additional, or modified ranges, facilities and infrastructure; (2) Transformation of the 2nd Brigade, 25th Infantry Division (Light) to an IBCT using existing facilities and infrastructure in Hawaii as they are now configured; (3) No Action (No. transformation to an IBCT in the near term).

Other alternatives that may be raised during the scoping process will be considered.

Publication of this NOI does not foreclose consideration of any courses of actions or possible decisions addressed by the Department of Army in its Draft Programmatic Environmental Impact Statement (PEIS) for Army Transformation, dated June 2001. No final decisions will be made regarding transformation in Alaska prior to completion and signature of the Record of Decision for the PEIS for Army Transformation.

Scoping Process: Federal, state, and local agencies and the public are invited to participate in the scoping process for the completion of this EIS. The scoping process will help the Army in identifying potential impacts to the quality of the human environment. Scoping meetings will be held at various locations on the islands of Oahu and Hawaii. Notification of the times and locations for the scoping meetings will be published in local newspapers. Written comments identifying potential impacts to be analyzed in the EIS will be accepted within 30 days of the scoping meetings. Written comments may be forwarded to Mr. Earl Nagasawa at the above address.

Dated: February 25, 2002.

Raymond J. Fatz,

*Deputy Assistant Secretary of the Army
(Environment, Safety and Occupation
Health), OASA (I&E).*

[FR Doc. 02-5084 Filed 3-1-02; 8:45 am]

BILLING CODE 3710-08-M

DEPARTMENT OF DEFENSE

Department of the Army

Privacy Act of 1974; System of Records

AGENCY: Department of the Army.

ACTION: Notice to alter a system of records.

SUMMARY: The Department of the Army is altering a system of records notice in its existing inventory of record systems subject to the Privacy Act of 1974, (5 U.S.C. 552a), as amended.

DATES: This proposed action will be effective without further notice on April 3, 2002, unless comments are received which result in a contrary determination.

ADDRESSES: Records Management Division, U.S. Army Records Management and Declassification Agency, Attn: TAPC-PDD-RP, Stop 5603, 6000 6th Street, Ft. Belvoir, VA 22060-5603.

FOR FURTHER INFORMATION CONTACT: Ms. Janice Thornton at (703) 806-4390 or

DSN 656-4390 or Ms. Christie King at (703) 806-3711 or DSN 656-3711.

SUPPLEMENTARY INFORMATION: The Department of the Army systems of records notices subject to the Privacy Act of 1974, (5 U.S.C. 552a), as amended, have been published in the **Federal Register** and are available from the address above.

The proposed system report, as required by 5 U.S.C. 552a(r) of the Privacy Act of 1974, as amended, was submitted on February 22, 2002, to the House Committee on Government Reform, the Senate Committee on Governmental Affairs, and the Office of Management and Budget (OMB) pursuant to paragraph 4c of Appendix I to OMB Circular No. A-130, 'Federal Agency Responsibilities for Maintaining Records About Individuals,' dated February 8, 1996 (February 20, 1996, 61 FR 6427).

Dated: February 25, 2002.

L.M. Bynum,

*Alternate OSD Federal Register Liaison
Officer, Department of Defense.*

A0190-9 DAMO

SYSTEM NAME:

Absentee Case Files (February 22, 1993, 58 FR 10002).

CHANGES:

* * * * *

SYSTEM LOCATION:

Delete entry and replace with 'U.S. Army Personnel Control Facility, U.S. Army Desert Information Point, Building 1481, Fort Knox, KY 40121-5000.'

CATEGORIES OF INDIVIDUALS COVERED BY THE SYSTEM:

Delete entry and replace with 'Active duty Army, U.S. Army Reserve on active duty or in active duty training status, and Army National Guard personnel on active duty, absent without authority from their place of duty, listed as absentee, and/or who have been designated as a deserter.'

CATEGORIES OF RECORDS IN THE SYSTEM:

Add to entry 'individual's name, Social Security Number, grade'.

* * * * *

ROUTINE USES OF RECORDS MAINTAINED IN THE SYSTEM, INCLUDING CATEGORIES OF USERS AND THE PURPOSES OF SUCH USES:

Delete entry and replace with 'In addition to those disclosures generally permitted under 5 U.S.C. 552a(b) of the Privacy Act, these records or information contained therein may specifically be disclosed outside the

DoD as a routine use pursuant to 5 U.S.C. 552a(b)(3) as follows:

Information may be disclosed to the Department of Veterans Affairs for assistance in determining whereabouts of Army deserters through the Veterans and Beneficiaries Identification and Records Locator Subsystem.

The DoD 'Blanket Routine Uses' set forth at the beginning of the Army's compilation of systems of records notices also apply to this system.'

* * * * *

A0190-9 DAMO

SYSTEM NAME:

Absentee Case Files.

SYSTEM LOCATION:

U.S. Army Personnel Control Facility, U.S. Army Desert Information Point, Building 1481, Fort Knox, KY 40121-5000.

CATEGORIES OF INDIVIDUALS COVERED BY THE SYSTEM:

Active duty Army, U.S. Army Reserve on active duty or in active duty training status, and Army National Guard personnel on active duty, absent without authority from their place of duty, listed as absentee, and/or who have been designated as a deserter.

CATEGORIES OF RECORDS IN THE SYSTEM:

Individual's name, Social Security Number, grade, reports and records which document the individual's absence; notice of unauthorized absence from U.S. Army which constitutes the warrant for arrest; notice of return to military control or continued absence in hands of civil authorities.

AUTHORITY FOR MAINTENANCE OF THE SYSTEM:

10 U.S.C. 3013, Secretary of the Army, Army Regulation 190-9, Absentee Deserter Apprehension Program and Surrender of Military Personnel to Civilian Law Enforcement Agencies; Army Regulation 630-10, Absence Without Leave, Desertion, and Administration of Personnel Involved in Civilian Court Proceedings; and E.O. 9397 (SSN).

PURPOSE(S):

To enter data in the FBI National Crime Information Center 'wanted person' file; to ensure apprehension actions are initiated/terminated promptly and accurately; and to serve management purposes through examining causes of absenteeism and developing programs to deter unauthorized absences.

PUBLIC NOTICE

Scoping Meetings to Prepare an Environmental Impact Statement for Transformation of the 2nd Brigade, 25th Infantry Division (Light) to an Interim Brigade Combat Team

The U.S. Army Corps of Engineers announces scoping meetings to engage public participation in the environmental impact statement process that will address converting the 2nd Brigade, 25th Infantry Division (Light) stationed in Hawaii to an Interim Brigade Combat Team (IBCT). An IBCT is a rapidly deployable, early-entry, medium-weight force with a decreased logistical footprint. IBCT fielding is an integral part of the process of developing a new fighting infrastructure that is partly based on self-sufficient, brigade-sized units.

Converting the 2nd Brigade, 25th Infantry Division (Light) would result in the following force structure and facility changes that may have the potential to impact various Army installations and training lands in Hawaii.

- Fielding of new or modified weapon systems, armored vehicles, and equipment.
- Construction activities including erection of buildings, training facilities and infrastructure, and renovation or demolition of training facilities at military installations located on the islands of Oahu and Hawaii.
- Land transactions (acquisition, asset management, and disposal).
- Deployment of forces and specific training for deployment.
- Training to achieve and maintain readiness to perform missions.
- Other actions necessary to support a net increase in troops and vehicles to be assigned to the 2nd Brigade, 25th Infantry Division (Light).

Public scoping meetings will be held at and on the dates and times listed below. During each meeting, attendees will be introduced to the Army's vision of its future toward American leadership and security, the IBCT transformation process, and the range of proposed transformation activities. The public will also have the opportunity to provide input on what they would like the EIS to address as it pertains to the Army's proposal to convert the 2nd Brigade, 25th Infantry Division (Light) to an IBCT. Public comments will be accepted for a period of 15 days following the meeting dates and can be submitted in writing to the individual named below.

Hilo Hawaiian Hotel

PUBLIC NOTICE

Scoping Meetings to Prepare an Environmental Impact Statement for Transformation of the 2nd Brigade, 25th Infantry Division (Light) to an Interim Brigade Combat Team

The U.S. Army Corps of Engineers announces scoping meetings to engage public participation in the environmental impact statement process that will address converting the 2nd Brigade, 25th Infantry Division (Light) stationed in Hawaii to an Interim Brigade Combat Team (IBCT). An IBCT is a rapidly deployable, early-entry, medium-weight force with a decreased logistical footprint. IBCT fielding is an integral part of the process of developing a new fighting infrastructure that is partly based on self-sufficient, brigade-sized units.

Converting the 2nd Brigade, 25th Infantry Division (Light) would result in the following force structure and facility changes that may have the potential to impact various Army installations and training lands in Hawaii.

- Fielding of new or modified weapon systems, armored vehicles, and equipment.
- Construction activities including erection of buildings, training facilities and infrastructure, and renovation or demolition of training facilities at military installations located on the islands of Oahu and Hawaii.
- Land transactions (acquisition, asset management, and disposal).
- Deployment of forces and specific training for deployment.
- Training to achieve and maintain readiness to perform missions.
- Other actions necessary to support a net increase in troops to be assigned to the 2nd Brigade, 25th Infantry Division (Light).

Public scoping meetings on the Big Island will be held at and on the dates and times listed below. During each meeting, attendees will be introduced to the Army's vision of its future toward American leadership and security, the IBCT transformation process, and the range of proposed transformation activities. The public will also have the opportunity to provide input on what they would like the EIS to address as it pertains to the Army's proposal to convert the 2nd Brigade, 25th Infantry Division (Light) to an IBCT. Public comments will be accepted for a period of 15 days following the meeting dates and can be submitted in writing to the individual named below.

**Preparation of Phase I Environmental Impact Statement
Army Transformation of the 25th Infantry Division (Light) to an Interim Brigade Combat Team
Various Sites, Hawai'i**

SCOPING MEETING SYNOPSIS

16 April 2002

1730-2030

Hilo Hawaiian Hotel

Moku'ola Banquet Ballroom

STAFFING

Presiding Officer: COL William Puttmann
Panelists: Ron Borne, MAJ Thomas Hong, Gina Noel, COL William Puttmann, LTC Jerry Schmitz
Facilitators: Karen Aka, Annelie Amaral, Miki Lee

ATTENDANCE

Individuals Signed In: 58
Individuals Speaking: 18
Written Comments Received: 7

SCHEDULE

Meeting Convened: 1735
Meeting Adjourned: 2030

QUESTIONS

- Are cultural impacts are being assessed?
- Has the Army initiated Section 106 consultation?
- Will there be a cultural monitor?
- Will a cultural impact assessment be performed?
- Will proposed communication towers at PTA be visible?
- What land adjacent to PTA is the Army interested in procuring?
- Are C-17 aircraft landing on Hawai'i Island?
- Will military units of other governments train at PTA?
- Is depleted uranium being fired at PTA?

COMMENTS

General Issues

- Objection to expansion of the U.S. military in Hawai'i.
- There is no need for Army money, protection, pollution, arrogance, and desecration of Hawaiian sacred land.
- Fear is being used by the Army to increase its on-island presence.

- Hold additional public hearings outside Hilo and Waikoloa.
- Extend the public scoping comment period for several months.
- Army public relations are lacking.

Occupation Issues

- The Army is illegally occupying Kingdom of Hawai'i sovereign land. Illegal annexation of Hawaii is a constitutional violation and is akin to terrorism.
- The Army should shut down, clean up, and leave PTA.
- Objection to Army acquisition of land to increase PTA acreage.
- Objection to military use of non-Army lands by its troops as observation posts and sundry other training-related activities.
- Objection to expansion of the Army's fuel storage facility at Kawaihae Harbor.

Cultural Issues

- Pohakula is sacred.
- Continued use of PTA is supported but with environmental and cultural protection controls.
- Objection to military use of Mauna Kea, a sacred mountain.

Biological/Ecological Issues

- The Army's current biological protection measures are inadequate. Implement more effective ungulate controls to prevent damage to critical habitats and threatened/endangered species.
- Improve fire prevention methods, e.g., eradicate fountain grass and facilitate the establishment of fire-resistant grasses such as *Eragrostis* sp.
- Fire damage affects plant root systems which in turn negatively impacts cave biota.
- Develop and implement procedures to control/prevent the introduction/establishment of invasive weed species on Hawai'i Island transported by Army equipment.

Solid Waste / Wastewater Issues

- Concern that the Army will contribute to Hawai'i Island's solid waste problem by utilizing county landfills. The Army should manage its own solid waste so as not to tax County landfills.

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- Clean up UXO and explosive residues
- The Army should not leave the land it occupies in a condition more harmful to the public (from chemical and explosives contamination) than the foes it protects the U.S. from.
- There are concerns of nuclear storage and attendant pollution on Hawai'i Island.

Air Issues

- Airborne contaminants generated by Army training activities affect water catchment systems that many on-island residents depend on for potable consumption.

Water Issues

- Airborne contaminants generated by Army training activities affect water catchment systems that many on-island residents depend on for potable consumption.

Socioeconomic Issues

- Hawai'i must develop the ability to diversify its economy to place less reliance on the military to infuse its capital.
- There is concern with the cost of transformation that the County of Hawai'i would have to bear.
- There is no economic benefit by the Army being on Hawai'i Island.
- An Army presence on-island infuses funds into the local economy.

- The Army should purchase its goods and services from local farmers, suppliers, and vendors.

Visual Issues

- No comments expressed.

Noise Issues

- Military flights impact the community because of aircraft noise.

Traffic Issues

- No comments expressed.

EIS INPUT

General Issues

- Address environmental justice.
- Identify cumulative impacts of the proposed action.
- Identify the capacity to which Army transformation would violate international law.
- Make EIS-related information available to the public on a timely basis.

Occupation Issues

- Address Army occupation of ceded and Hawaiian Home lands.
- Identify the amount of Hawaiian Home Lands within PTA.

Cultural Issues

- Identify, evaluate, and assess archaeological resources both aboveground and underground.
- Prepare a cultural impact assessment.
- Map and identify all cultural sites to be affected by Army transformation. Identify cultural practitioners to determine the significance of these sites.

Biological/Ecological Issues

- Identify, evaluate, and assess cave resources. Formulate mitigative measures for impacts to said resources.
- Perform an ecosystem analysis.
- Utilize and reference *Rare Plants of Pohakuloa (Training Area, Hawai'i)* by (Robert B.) Shaw

Solid Waste / Wastewater Issues

- No input received.

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- Factor in the cost to clean up PTA upon Army departure of the installation.
- Characterize on-site and off-site contamination (i.e., chemical, OE, radioactive) caused by the Army to define baseline conditions. Define the synergistic effects of identified contaminants to human health and the environment.
- Identify cumulative impacts of previous live-fire training at PTA.

Air Issues

- Address soil erosion and dust generation during vehicle and troop maneuvers.

Water Issues

- Evaluate and assess water supplies, use, and disposal.

Socioeconomic Issues

- Address socioeconomic impacts.
- Identify and assess the relocation of Army forces and/or facilities from Schofield Barracks to Hawai`i Island.

Visual Issues

- No input received.

Noise Issues

- No input received.

Traffic Issues

- Address public access of military roads.

Individuals Signed In: 40
Individuals Speaking: 12
Written Comments Received: 4

SCHEDULE

Meeting Convened: 1735
Meeting Adjourned: 1940

QUESTIONS

- Will the Bradshaw Army Airfield runway be extended?
- What does “realistic training” entail why is there a need for such training?
- How much noise does blank ammunition generate?
- Is the expansion of Army activities on Hawai'i Island proposed because the Army is ceasing its use of Makua Military Reservation?
- Where are the additional lands the Army is interested in acquiring?
- Will game hunting be permitted within the additional lands the Army acquires?
- What types of aircraft are being proposed for use within the additional lands the Army acquires? How close will these aircraft fly over residential dwellings?
- How will the VFR affect the training schedule given the fog conditions at PTA?
- Who will be conducting the EIS? Is the EIS contract fixed fee or cost plus?
- Why is there so little information about PTA and its surroundings? How can the public comment prior to the draft EIS because information is lacking?

COMMENTS

General Issues

- An EIS is critical to the outcome of a project (proposed action).

- It is vital that the U.S. maintain military superiority over its adversaries through the best realistic training possible.
- Typically the Army is not honored in peace time, but is valued in times of conflict.
- The public must support national defense. It should cooperate and not attack the military.
- The 25th ID (L) is welcome.
- Waikīʻi Homeowners Association is interested in working with the Army and would like its concerns addressed, e.g., dust, noise, family safety.
- Paniolo Preservation Society offers its assistance to work with the Army on its Hawaiʻi Island proposed actions.
- Encourages continuation of the Army's community support.
- The military presence at PTA has had very little negative impact in the Waimea area.
- It is more cost effective to remodel than abandon and re-build a training facility elsewhere.
- Expeditionary forces can practice deployment to PTA.
- Add a public rifle/pistol range.
- Government-sponsored projects often affects a community's quality of life.

Occupation Issues

- Supportive of Army and its proposed expansion of training lands on Hawaiʻi Island. It is an investment by the Army to protect U.S. citizens.
- Military advocate but concerned about the proposed acquisition of Keamuku lands by the Army. Impacts of the proposed use of the land is irrevocable.
- Objection to Army acquisition of land to increase PTA acreage.
- Because the majority of funding is from the federal government, without PTA there would be no Saddle Road improvements.
- PTA is furthest removed from population centers than any other major Hawaiian island.

Cultural Issues

- Nature and culture are one and the same.
- Pohakula is culturally significant.
- There are former sheep stations at Keamuku.
- Preserve paniolo, sheep herding, and associated features of Keamuku lands being considered for Army procurement.
- Continued use of PTA is supported but with environmental and cultural protection controls.

Biological/Ecological Issues

- Grasses, e.g., kikuyu, binds the soil matrix. Wildfires that denude vegetation facilitate topsoil erosion and dust generation.
- Concern that game management areas proximal to PTA, e.g., Kaohe, Puʻu Anahulu, will be affected by the expansion of and increased disturbance at the installation.

Solid Waste / Wastewater Issues

- Set aside space within lands the Army is to acquire for a county-owned solid waste disposal site. Construct a waste-to-energy plant at the site to reduce reliance on HELCO-supplied electricity.

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- No comments expressed.

Air Issues

- Applying gravel to tank trails would reduce dust generation.
- Grasses, e.g., kikuyu, binds the soil matrix. Wildfires that denude vegetation facilitate topsoil erosion and dust generation.

Water Issues

- No comments expressed.

Socioeconomic Issues

- Waimea infrastructure and schools may be negatively impacted if there is an increase in Army personnel residing on Hawai'i Island.
- The proposed Army expansion of PTA and attendant land purchase may affect ongoing and future Waiki'i Ranch property transactions.
- The military has always had a positive economic impact on the State of Hawai'i and PTA has contributed significantly.

Visual Issues

- No comments expressed.

Noise Issues

- Recent Army training at PTA has been very noisy.

Traffic Issues

- Expansion of PTA would increase traffic and compromise safety on Saddle Road. It may, for example, increase the number of water tankers to/from PTA.
- Slow-moving military convoys traveling to/from Kawaihae present an inconvenience to other drivers sharing public roads. Expansion of PTA, however, will divert those convoys to non-public roads thereby reducing Army reliance of public thoroughfares for transportation.

EIS INPUT

General Issues

- Address reasonable and unreasonable alternatives, and provide the rationale for and against each.
- Describe how the Army will deal with its identified impacts.
- Establish a fund to address mitigative measures.
- Address historical paniolo and sheep herding activities of the Keamuku parcel.

Occupation Issues

- Address alternative uses of lands the Army is proposing to acquire.

Cultural Issues

- Delve deeper into the cultural significance, history, and traditions of PTA and its surroundings.
- Define how cultural traditions are associated with present day.

Biological/Ecological Issues

- Thoroughly evaluate topsoil erosion and dust generation caused by off-road movement of equipment and troop training.

Solid Waste / Wastewater Issues

- No input received.

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- No input received.

Air Issues

- Address soil erosion and dust generation during vehicle and troop maneuvers.

Water Issues

- No input received.

Socioeconomic Issues

- Address how Army use of Kawaihae Harbor may conflict with commercial and recreational boating there.

Visual Issues

- No input received.

Noise Issues

- Address noise impacts associated with troop training, ordnance firing, helicopter overflights, etc.

Traffic Issues

- No input received.

**Preparation of Phase I Environmental Impact Statement
Army Transformation of the 25th Infantry Division (Light) to an Interim Brigade Combat Team
Various Sites, Hawai'i**

SCOPING MEETING SYNOPSIS

23 April 2002

1800-2100

Leilehua High School

Cafeteria

STAFFING

Presiding Officer: COL Roy Waggoner
Panelists: Ron Borne, Gina Noel, Jeanne Prussman Ockerman, George Redpath, COL Roy Waggoner
Facilitators: Karen Aka, Annelie Amaral, Miki Lee

ATTENDANCE

Individuals Signed In: 22
Individuals Speaking: 4
Written Comments Received: 1

SCHEDULE

Meeting Convened: 1810
Meeting Adjourned: 1910

QUESTIONS

- Is a map of the Army's proposed land acquisitions available?
- Will R. Borne's briefing be publicly available?
- Are there any proposed runway improvements to WAAF? Will any aircraft be stationed there as a result of said improvements?
- Must written comments be submitted on an official Army form or can it be prepared on one's own letterhead?

COMMENTS

General Issues

- Restore the air safety program.
- Make maps available of the Army's proposed land acquisitions as the lack thereof is not conducive to public input during the scoping period.
- There is no environmental baseline of Schofield Barracks.

Occupation Issues

- Concerned with the size of the Army's proposed acquisition of Honouliuli Preserve, type of training on the acquired land, and public access.

Cultural Issues

- Identify traditional practices.
- Protect, preserve, and repair cultural sites.
- Document archaeological sites.

Biological/Ecological Issues

- Concerned with the Army's proposed acquisition of the northern portion of Honouliuli Preserve because of the abundance of native/threatened/endangered species there, and threats of survival from wildfires, feral ungulates, weed species proliferation, and anthropogenic disturbance.
- Honouliuli Preserve is a recognized elepai`o critical habitat.

Solid Waste / Wastewater Issues

- No comments expressed.

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- Clean live-fire training areas.

Air Issues

- No comments expressed.

Water Issues

- No comments expressed.

Socioeconomic Issues

- The Army presence near Wahiawa is contributory to the high rate of prostitution in that community.

Visual Issues

- No comments expressed.

Noise Issues

- Concerned with flight safety and noise from Army aircraft alighting and landing at WAAF, and overflight of residential communities.

Traffic Issues

- No comments expressed.

EIS INPUT

General Issues

- Address environmental justice.
- Establish an environmental baseline of Schofield Barracks.
- Thoroughly identify and assess all cumulative impacts to human health and the environment.
- Address all alternatives adequately including comparable sites within the continental U.S. that the 25th ID (L) can transform at.

Occupation Issues

- Define the location and amount of acreage the Army proposes to acquire.

Cultural Issues

- Identify cultural resources that may be impacted by the proposed action.
- Identify the availability of traditional practices.
- Describe how the Army will protect, preserve, and repair cultural sites on its property.
- Document all archaeological sites on extant Army property and property proposed for acquisition.

Biological/Ecological Issues

- Identify natural resources that may be impacted by the proposed action.

Solid Waste / Wastewater Issues

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- Describe how the Army will clean up its live-fire training areas.
- Describe how the Army will clean up chemical contamination on lands it occupies and uses.

Air Issues

- No input received.

Water Issues

- No input received.

Socioeconomic Issues

- Address negative socioeconomic impacts, e.g., the proliferation of prostitution, of Army installations in the vicinity of Wahiawa.

Visual Issues

- No input received.

Noise Issues

- No input received.

Traffic Issues

- No input received.

Preparation of Phase I Environmental Impact Statement
Army Transformation of the 25th Infantry Division (Light) to an Interim Brigade Combat Team
Various Sites, Hawai'i

SCOPING MEETING SYNOPSIS

24 April 2002

1800-2100

Kawananakoa Middle School

Cafeteria

STAFFING

Presiding Officer: COL William Ryan III
Panelists: Ron Borne, Gina Noel, Jeanne Prussman Ockerman, George Redpath, COL William Ryan III
Facilitators: Karen Aka, Annelle Amaral, Miki Lee

ATTENDANCE

Individuals Signed In: 40
Individuals Speaking: 18
Written Comments Received: 1

SCHEDULE

Meeting Convened: 1815
Meeting Adjourned: 2120

QUESTIONS

- How much land does the Army possess on O`ahu and Hawai'i Islands?
- Who is contracted to prepare the subject EIS?
- How much money is being spent to prepare the EIS?
- What are the specifics of Army transformation?
- What are the range of alternatives to the proposed action?
- Did the Army recently purchase Kahuku acreage?
- Did the Army prepare an EIS in 1994 as it relates to PTA?
- Who is performing the cultural assessment for the EIS?
- When will the Section 106 process commence?
- Will the Army prepare an EIA (environmental impact action [sic])?
- What is meant by the development of proposed areas previously developed?
- If a bill currently in Congress to exempt the military from compliance with environmental regulations passes, will it affect the subject EIS and will the Army consequently cease to prepare the document?
- Is a map available that demarcates which portion(s) of Honouliuli Preserve the Army is proposing to acquire?
- Is the Army trying to obtain more land on O`ahu Island?

- If the Army establishes alternate areas for live fire, will it terminate its use of Makua Valley for that purpose and leave the valley?
- Is a trail or road to be constructed by the Army from Schofield Barracks to Dillingham Military Reservation?
- Can the Army use extant USMC rifle ranges instead of proposing to acquire additional property to build one of its own?
- Must Makua Military Reservation be kept open for just one Legacy force?
- Why train in Hawai'i if it is so expensive to station troops here?
- Who is the Army accountable to?

COMMENTS

General Issues

- The Army's proposed timetable to prepare the subject EIS is insufficient to undertake complex studies requisite to the document.
- The Army has not expended any effort to correct the damage it has done.
- The U.S. military is a good steward of the land.
- Work closely with The Nature Conservancy.
- The earth is sacred and is our mother.
- Make maps available of the Army's proposed land acquisitions as the lack thereof is not conducive to public input during the scoping period.
- There is no environmental baseline of Schofield Barracks.
- Army training is destroying the uniqueness of the Hawaiian Islands.
- The Army has no long-term thinking.
- There is no effort by the Army to utilize modern technology that is protective of the land.
- No further expansion of the military in Hawai'i.
- Cease all live fire training in Hawai'i and take it elsewhere.
- The Army presence is a magnet for trouble.
- This is not a scoping meeting per Army and federal regulations. There is scanty information and vague generalities that do not enable the public to adequately provide input during the scoping period.
- The Army should be providing potential environmental effects associated with the proposed action as well as impacts associated with past Army actions.
- There is no description of the range of proposed alternatives or other related EAs and EISs.
- Stationing Army troops in Hawai'i is illogical.
- The Makua Military Reservation and Army transformation EISs are inter-related.
- Establish a restoration advisory board for lands the Army is no longer using and include individuals of Hawaiian descent on the board.
- Use funds for the cleanup of Army-impacted lands instead of transformation.
- Support of a military presence in Hawai'i is for money instead of its mission to protect the nation and its people.
- The people and not the Army should be able to manage its own resources.

Occupation Issues

- The Army owns no ceded lands in Hawai'i.
- The illegal occupation in Hawai'i by the Army is meant to eliminate the Hawaiian people from its land, and to destroy the culture.
- The U.S. military is not wanted here.
- The Army does not belong here and should leave.
- The Army has no legal or spiritual right to be in Hawai'i.
- Army-owned or occupied lands are inaccessible to the public for cultural and recreational purposes.

- The U.S. military has little or no consideration of land ownership by the Hawaiian people.
- Find the document(s) that evidence Army ownership of its lands in Hawai'i.
- O`ahu land is scarce and is to be exacerbated if the Army acquires more property.
- Concerned with the size of the Army's proposed acquisition of Honouliuli Preserve, type of training on the acquired land, and public access.

Cultural Issues

- It is important that the Army understand the perspectives of the Hawaiian people.
- The military needs to obtain the support of the Hawaiian people.
- Cultural and traditional practices are not adequately translated into English.
- Pohakuloa is one of many areas sacred to Hawaiians.
- Speak and consult directly with the Hawaiian community.

Biological/Ecological Issues

- There is insufficient time for Section 7 consultation given the EIS preparation schedule.
- Proposed access roads would contribute to the proliferation of weed species.
- The threat of fire resulting from Army training is a concern.
- The military is not concerned with the preservation of native plants and animals, e.g., Makua Valley.
- Honouliuli Preserve is an unfortunate choice for acquisition by the Army as it contains the greatest concentration of rare, native Hawaiian tree snails. Of them, six are endangered.
- Army occupation of the preserve could destroy the snail population.
- Rare, endangered plants and animals inhabit areas along the proposed road corridor between Schofield Barracks and Dillingham Military Reservation.

Solid Waste / Wastewater Issues

- No comments expressed.

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- The Army does not clean up the environment it impacts.
- Clean up UXO.
- Contaminating a site with UXO and not cleaning the site up is typical of the U.S. military.

Air Issues

- No comments expressed.

Water Issues

- No comments expressed.

Socioeconomic Issues

- No comments expressed.

Visual Issues

- No comments expressed.

Noise Issues

- No comments expressed.

Traffic Issues

- No comments expressed.

EIS INPUT

General Issues

- Address positive aspects of the military land stewardship.

Occupation Issues

- Address traditional, cultural, and historic properties.

Cultural Issues

- Expand Section 106 consultation beyond SHPO and OH to civic clubs, past and present residents of the affected areas, cultural practitioners, and burial councils.
- Prepare a detailed plan of surface and subsurface cultural sites at extant and to-be-acquired lands, and develop procedures to protect these sites and provide cultural access thereto.
- Study the cultural and environmental impacts of the proposed road between Schofield Barracks and Dillingham Military Reservation.

Biological/Ecological Issues

- Identify the threat of fire.
- Describe how Army will protect threatened and endangered species on and proximal to its installations.

Solid Waste / Wastewater Issues

- No input received.

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- Address the cleanup of contaminated sites.

Air Issues

- Address airborne contamination generated by the Army.

Water Issues

- Address the cumulative impacts to water resources.

Socioeconomic Issues

- Assess the economic loss caused by deployment of the 2nd Brigade.
- Perform an economic analysis of the 2nd Brigade relocating to Fort Lewis.

Visual Issues

- No input received.

Noise Issues

- No input received.

Traffic Issues

- No input received.

Preparation of Phase I Environmental Impact Statement
Army Transformation of the 25th Infantry Division (Light) to an Interim Brigade Combat Team (IBCT)
Various Sites, Hawaii

SCOPING MEETING SYNOPSIS

25 April 2002

1800-2100

Haleiwa Elementary School

Ruth Rankin Hall (Cafeteria)

STAFFING

Presiding Officer: COL James Schisser
Panelists: Ron Borne, Gina Noel, Jeanne Prussman Ockerman, George Redpath
Facilitators: Karen Aka, Annelie Amaral, Miki Lee

ATTENDANCE

Individuals Signed In: 29
Individuals Speaking: 9
Written Comments Received: 3

SCHEDULE

Meeting Convened: 1815
Meeting Adjourned: 2015

QUESTIONS

- What is the total square footage of structures proposed for construction by the Army as a result of the 2nd Brigade, 25th ID (L) transformation?
- Has there been a shift in Army philosophy or policy to purchase rather than lease land?
- Will the proposed roads be made available to the public in emergencies?
- Will there be an increase in military aircraft utilizing Dillingham Military Reservation and, if so, what are the attendant noise levels anticipated?
- How much additional noise will be generated by ammunition fired during training once transformation commences?
- Will the interim brigade combat team result in an increase in military personnel?
- What are the visual impacts and attendant mitigative measures to the Army's proposed towers?
- Will underground or aboveground tanks be installed at the proposed fuel stations?
- Is Army expansion necessary?
- Will the public have access to scoping process comments from all the communities at which Army transformation scoping meetings are held?
- What is meant by "realignment of ranges"?
- Has or is the Army firing depleted uranium munitions in Hawaii?
- Has the Army transformed elsewhere? If so, where?

COMMENTS

General Issues

- Who will perform the construction work as transformation of the 2nd Brigade ensues? Though less expensive if conducted by the Army, private industry contractors would provide a better quality of work.
- Consider a means of continuity through the Army chain of command and with changes in command.
- Listen to and deal with disagreements with the affected communities. The Army should avoid resorting to a “my way or not at all” position.
- Observed revisions to the Army transformation this evening are not being conveyed to all the affected communities, particularly those where scoping meetings have already occurred.
- Transformation is inevitable as the Army must adapt to changing times.
- Lack of interest in Army transformation is evident based on this evening’s attendance and is disconcerting. There is no legislative or city council representation.

Occupation Issues

- Developed land as defined by the Army in its transformation briefing is actually agricultural land.
- Work with the community to preserve agricultural land use.
- Oahu land is scarce and is to be exacerbated if the Army acquires more property.
- There is no necessity on the Army’s part to occupy additional on-island property.

Cultural Issues

- Be sincere and responsive to the Oahu Island Burial Council and the community.

Biological/Ecological Issues

- Honouliuli Preserve contains the greatest concentration of rare, native, and endangered Hawaiian tree snails.
- Army occupation of the preserve could destroy the snail population, and would contribute to the proliferation of weed species, ungulates, and rodents, and increase the fire threat.
- Provide public access rights to Honouliuli Preserve.
- The Army has done much to protect threatened and endangered species on lands under its purview.

Solid Waste / Wastewater Issues

- Solid waste and wastewater management at the Army’s training areas is a concern.

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- Clean up Army ranges.

Air Issues

- No comments expressed.

Water Issues

- No comments expressed.

Socioeconomic Issues

- The Army has yet to provide information on the funding proposed for its land acquisitions as well as the total acreage under consideration.
- Community-specific health issues are associated with military presence.

Visual Issues

- No comments expressed.

Noise Issues

- Noise generated by helicopter over flight along the North Shore is a concern.

Traffic Issues

- Get the military off public roads.
- Determine how Army access roads (e.g., Drum Road, Schofield-Dillingham trail) can be made available to North Shore communities for emergency access.

EIS INPUT:

General Issues

- The EIS is critical and must be thorough. Interface with the affected communities to that end and engage the public to become part of the process.
- Make relevant information available and on a timely basis.
- Describe the Army's environmental program and how it will be implemented.
- Explore the no action alternative and consequences thereof.
- Describe the various training exercises, e.g., where, by whom, duration, and impacts to the environment following each exercise.
- Provide detailed maps with sufficient information.

Occupation Issues

- Examine the continued use of agricultural lands.
- Address access to or through Army lands by native Hawaiians, hunters, and hikers.
- Describe current and future land uses, ownership, and environmental baseline conditions.
- Describe the Army's flooding mitigation plan and preventive measures.

Cultural Issues

- Comply with NAGPRA and Section 106 during the EIS process.
- Conduct surface and subsurface archaeological surveys at extant and to-be-acquired lands, and develop procedures to protect these sites and provide cultural access thereto.
- Conduct a cultural impact assessment to include the past and present. Communicate with cultural practitioners within areas the Army will be training at.

Biological/Ecological Issues

- Address rare/threatened/endangered species impacts and mitigative measures.
- Address bird-helicopter interaction.
- Assess fire issues, e.g., prevention, areas and periods of susceptibility, community notification, contingencies.

Solid Waste / Wastewater Issues

- Address solid waste and wastewater management at the Army's training areas.

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- Describe weapons and weapons systems to be utilized by the Army as a result of transformation. Identify nuclear and chemical weaponry, and conduct a risk analysis thereof.
- Describe how the Army will prepare and remediate its ranges.

Air Issues

- No input received.

Water Issues

- Communicate with the Water Commission as it relates to proposed bridges that may be constructed as a consequence of the proposed transformation.
- Characterize the groundwater underlying Army lands.
- Describe the groundwater protection protocols, mitigative measures, and long-term monitoring program.

Socioeconomic Issues

- The Army has yet to provide information on the funding proposed for its land acquisitions as well as the total acreage under consideration.
- Community-specific health issues are associated with military presence.

Visual Issues

- No input received.

Noise Issues

- Address noise generation by Army training and operating aircraft near residential areas and business communities.

Traffic Issues

- Address traffic impacts to public roads.
- Describe weapons transport, safety protocols, and accident contingencies.

Preparation of Phase I Environmental Impact Statement
Army Transformation of the 25th Infantry Division (Light) to an Interim Brigade Combat Team (IBCT)
Various Sites, Hawaii

SCOPING MEETING SYNOPSIS

29 April 2002

1800-2100

Kahuku High & Intermediate School
Cafetorium

STAFFING

Presiding Officer: COL Andrew Twomey
Panelists: Ron Borne, Gina Noel, Jeanne Prussman Ockerman, George Redpath
Facilitators: Annelle Amaral, Ken Fukunaga, Miki Lee

ATTENDANCE

Individuals Signed In: 33
Individuals Speaking: 12
Written Comments Received: 5

SCHEDULE

Meeting Convened: 1820
Meeting Adjourned: 2040

QUESTIONS

- How do the revised Army regulations affect the NEPA requirements?
- What guidelines will the Army follow as it relates to the proposed construction of roads and infrastructure?
- Who is to perform the cultural assessment to be included in the EIS?
- How much money has been allocated by the federal government for Army transformation?
- When are the proposed transformation projects to commence?
- How long will it take for the transformation projects to be completed?
- Will local contractors be involved in the transformation projects?
- Is the decision to limit live fire at South Range permanent and has there been any public input to that end?
- What changes are there to the unified Army chain of command and will it bear on transformation?
- Will a congressional proposal to exempt the Department of Defense from environmental regulations affect Army transformation and attendant NEPA requirements?
- Is the Army in discussion with the State of Hawaii to exempt the former from state environmental regulations as is occurring in Alaska.
- How will Army transformation affect military training at Kahuku, will it increase noise generation by aircraft (e.g., helicopters), and will there be an increase in aircraft flight time over Kahuku?
- Will proposed structures to be constructed at Kahuku Training Area be visible from public and residential areas of Kahuku?
- Can the EIS findings halt Army transformation?

- How will the Army's proposed transformation projects contribute to flooding in Kahuku.

COMMENTS

General Issues

- Flooding is a big issue in Kahuku consequently the Army should partner with the community to address flood mitigation.
- The Army is taking advantage of the 11 September 2001 terrorist attack to expand its control and presence in Hawaii, and is a form of political and military opportunism.
- Communicate with the U.S. Marine Corps and Navy regarding their plans for transformation to avoid conflicts that could negatively affect areal communities.
- The Army has enough lands and facilities, and should make more efficient use of what is has.
- Army expansion is ridiculous.
- The scoping process is flawed as there is insufficient information available to the public.
- Proposed alternatives fail to consider sites outside of Hawaii.

Occupation Issues

- The Army has control of a significant amount of land on Oahu with acquisitions being conducted covertly (e.g., 9,000 acres of Kahuku Training Area property acquired from James Campbell Estate).
- Preserve recreational areas in and around Army lands as well as access thereto.
- Hawaii was illegally annexed by the U.S. government.
- The Army owns no ceded lands in Hawaii.
- The illegal occupation in Hawaii by the Army is cultural genocide and de-colonization of those of Hawaiian descent.
- The U.S. military is not wanted here.
- The Army does not belong here and should leave.
- Ceded lands may be a violation of international law.
- Hawaiians are violated by the Army's proposed transformation as it represents yet another invasion of Hawaii lands.
- Provide more land for public recreational activities.

Cultural Issues

- Do not compromise cultural access rights.

Biological/Ecological Issues

- Honouliuli Preserve contains the greatest concentration of rare, native, and endangered Hawaiian tree snails.
- Army occupation of the preserve could destroy the snail population, and would contribute to the proliferation of weed species, ungulates, and rodents, and increase the fire threat.
- Provide public access rights to Honouliuli Preserve.
- The Army has done much to protect threatened and endangered species on lands under its purview.
- The Army is incapable of long-term protection of threatened and endangered species on lands under its purview.
- The needs of critical habitats and perpetuation of rare, threatened, and endangered species is timeless.

Solid Waste / Wastewater Issues

- There is much Army litter (e.g., discarded MREs, concertina wire, small arms) observed by moto-cross riders at Kahuku Training Area which presents a safety hazard, is unsightly, and is disrespectful of the land.

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- Near shore waters are affected by chemical contaminants and UXO that drain to island coastlines.
- Clean up and restore all the land the Army occupies.

Air Issues

- No comments expressed.

Water Issues

- Preserve public and community water rights.

Socioeconomic Issues

- Augment rather than impede economic development of rural areas by activities associated with the proposed Army transformation.
- Involve younger Army personnel in the transformation process rather than the older, established Army regime.
- Economic gain should not be used to justify militarization.

Visual Issues

- No comments expressed.

Noise Issues

- Noise generated by helicopter over flight along the North Shore is a concern.

Traffic Issues

- It is unnecessary for the Army to build new roads.
- The Army improves but does not maintain its roads.

EIS INPUT:

General Issues

- Address environmental justice.
- Establish environmental baselines of all extant and proposed Army lands, and account for cumulative impacts that form current baseline conditions.

Occupation Issues

- Address Hawaii's treaty of annexation and ceded lands.
- Explain how the Army acquired its lands and the authority by which possession was granted.
- Identify and evaluate alternative installations and training facilities outside Hawaii.

Cultural Issues

- Address cumulative impacts to those of Hawaiian descent.
- Have significant sites be identified and interpreted by cultural practitioners.

Biological/Ecological Issues

- Address ecosystem impacts.

Solid Waste / Wastewater Issues

- No input received.

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- Address costs to clean up Army lands of chemical and UXO contamination.
- Evaluate contaminated or potentially contaminated sites using the precautionary principle approach rather than by risk assessment as the former is more conservative than the latter.

Air Issues

- No input received.

Water Issues

- Preserve public and community water rights.
- Address the proposed construction of new facilities in Kahuku and if it will affect flood-prone areas of the community.

Socioeconomic Issues

- Address the environmental costs of militarization in Hawaii.
- Address opportunity costs of alternative uses to military lands in Hawaii.
- Address the leakage of Army funds that are not infused into the local economy to support, for example, public education support and housing.
- Address areal illicit or immoral business activities, e.g., prostitution, that flourish because of Army personnel.

Visual Issues

- No input received.

Noise Issues

- Address noise generation by Army training and operating aircraft near residential areas and business communities.

Traffic Issues

- Identify and evaluate alternatives to Drum Road improvements.

Preparation of Phase I Environmental Impact Statement
Army Transformation of the 25th Infantry Division (Light) to an Interim Brigade Combat Team (IBCT)
Various Sites, Hawaii

SCOPING MEETING SYNOPSIS
30 April 2002
1800-2100
Nanakuli High & Intermediate School
Cafetorium

STAFFING

Presiding Officer: COL Rodney Anderson
Panelists: Ron Borne, Gina Noel, Jeanne Prussman Ockerman, George Redpath
Facilitators: Karen Aka, Annelie Amaral, Ken Fukunaga

ATTENDANCE

Individuals Signed In: 61
Individuals Speaking: 27
Written Comments Received: 5

SCHEDULE

Meeting Convened: 1805
Meeting Adjourned: 2130

QUESTIONS

- Where would the Army propose to conduct live-fire (urban assault) training if not at Kahuku?
- If Army personnel can training at Schofield Barracks, why is there a need for PTA?

COMMENTS

General Issues

- The lack of specific information regarding the Army's proposed actions makes it difficult for the public to address how the Army will conduct its troop training.
- The Army is to be commended for conducting its scoping meetings, however, another round of scoping meetings is requested after maps and more specific information is made available by the Army.
- This is not a scoping meeting in accordance with NEPA and Army regulations. It is instead an informational meeting.
- The military presence in Hawaii renders it as a target of aggression.
- The U.S. military has a track record of environmental abuse; it is the greatest violator of environmental destruction.
- The Army's values are questionable by coming to Hawaii, destroying its environment, then leaving without attending to the destruction.
- The Army is unable to care for the lands it already occupies.
- Fires are a threat.

- Include the cost of environmental cleanup in the Army transformation budget.
- Use transformation funds instead for environmental protection.
- The Army does not know what transformation is.
- The U.S. military is one of the greediest entities in the state.
- Access to military lands is increasingly being denied to the public.
- Relocate all Army training to the continental U.S.
- Hawaii is expendable as an Army outpost.
- The U.S. Army is not my army.
- The Army should leave Hawaii as it is not wanted here.
- The Army should take its time during the EIS process to ensure that the document is prepared correctly.
- Work on foreign policy rather than military expansion.

Occupation Issues

- The Army should use lands it already controls rather than acquiring additional property.
- The Army controls too much land.
- Any expansion by the Army into the lands of Lihue is opposed.
- Army acquisition of additional lands is opposed.
- There is no deed that grants the U.S. military legal right to occupy land in Hawaii.
- The U.S. Senate never ratified a treaty of annexation consequently Hawaii was illegally annexed by the U.S. government, and military occupation is also illegal.
- Ceded lands comprise the majority of what the U.S. military occupies in Hawaii.
- The Hawaiian Islands are a U.S. colony.
- Preserve undeveloped areas as such.
- The Army should clean up Makua Valley then leave the valley.
- Return Makua to the community and train troops at the Schofield Barracks multi-purpose range.
- A road between Schofield Barracks and Kawaihapai is unnecessary.

Cultural Issues

- Preserve, protect, and restore existing, damaged, and destroyed complexes Hawaiian in origin.
- The Army must exercise cultural sensitivity to the significance of lands it occupies and trains on.
- Live-fire training is inappropriate and irresponsible as it will impact cultural sites.
- Guarantee cultural sites and access rights will be protected.

Biological/Ecological Issues

- Honouliuli Preserve contains the greatest concentration of rare, native, and endangered Hawaiian tree snails.
- Army occupation of the preserve could destroy the snail population, and would contribute to the proliferation of weed species, ungulates, and rodents, and increase the fire threat.
- Provide public access rights to Honouliuli Preserve.
- The Army has done much to protect threatened and endangered species on lands under its purview.
- The Army should not acquire any portion of Honouliuli Preserve.
- Army training at or near Honouliuli Preserve is unacceptable.

Solid Waste / Wastewater Issues

- No comments expressed.

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- Blank ammunition is the largest source of fire.
- The pollution of Army training areas still exists, and the contaminants are toxic to human health.

Air Issues

- No comments expressed.

Water Issues

- Concerned with water contamination from the Army's use of Makua Valley.
- Groundwater beneath Schofield Barracks is a concern.

Socioeconomic Issues

- An increase in Army personnel will contribute to more prostitution in Wahiawa.
- Evicted families of Makua Valley should be given back their land and the Army should pay restitution to said families for military use of the land.

Visual Issues

- No comments expressed.

Noise Issues

- No comment expressed.

Traffic Issues

- No comments expressed.

EIS INPUT:

General Issues

- Have long-time residents of Hawaii involved in the EIS preparation.
- Have the EIS prepared by learned people beyond reproach.
- Address environmental justice.
- Provide details of properties subject to Army transformation, e.g., maps, drawings, etc.
- Address the cumulative impacts of all proposed projects as it relates to Army transformation to include impacts associated with past and present activities.
- Address the relocation of the 2nd Brigade outside of Hawaii as an alternative.
- Address both Army transformation and continued live-fire exercises at Makua Military Reservation together.
- Assess as an alternative the use of extant instead of new housing for additional personnel required by Army transformation.
- Include Waianae Public Library as an additional records repository during the EIS process.

Occupation Issues

- Define the total acreage currently occupied by the Army and the additional acreage proposed for acquisition.

Cultural Issues

- Perform a surface and subsurface cultural survey.
- Communicate with Hawaiian civic clubs for site information and oral histories.
- Assess cultural, historic, and traditional resources impacts.
- Identify traditional cultural practices and its significance to the proposed action.
- Document archaeological sites within and around the Army's proposed project areas.
- Prepare a cultural sites protection plan.
- Address cultural sites access.

- Define how site identification and access will be communicated to the affected communities for its input.

Biological/Ecological Issues

- Address natural resources and ecosystem impacts.

Solid Waste / Wastewater Issues

- No input received.

Hazardous, Toxic, and Radioactive Waste / Ordnance and Explosives Issues

- Describe existing programs to clean up Army lands of chemical and UXO contamination.
- Assess the effects of Army training area contamination to human health and the environment.
- Research the disease rate and health of individuals residing or working in communities proximal to Army installations.
- Identify contaminants of concern being introduced to the environment by the Army, and how the COCs affect human health and the environment.
- Identify and evaluate the synergistic effects of COCs in the environment.
- Assess extant ammunition storage facilities at PTA and Lualualei as an alternative to proposed new storage storage facilities.

Air Issues

- Describe the Army's air safety program including emergency response procedures.

Water Issues

- Investigate surface and subsurface water contamination at Makua Valley.
- Investigate the aquifer residing beneath Schofield Barracks for contamination.
- Precautions must be taken to protect the Pearl Harbor aquifer.

Socioeconomic Issues

- Assess the Army's presence in Hawaii and its attendant costs.
- Assess the economic loss caused by deployment of the 2nd Brigade.

Visual Issues

- No input received.

Noise Issues

- No input received.

Traffic Issues

- Describe the Army's road and traffic safety program.

DEPARTMENT OF THE ARMY
HEADQUARTERS, UNITED STATES ARMY GARRISON, HAWAII
SCHOFIELD BARRACKS, HAWAII 96857-5000

REPLY TO
ATTENTION OF

May 28, 2002

Office of the Garrison Commander

Dear Community Member:

I would like to thank you for participating in our public scoping process for our proposal to transform the Second Brigade of the 25th Infantry Division (Light) into an Interim Brigade Combat Team (IBCT). This letter contains additional information about our proposal to help you in your further participation. We take our stewardship of the environment very seriously and use the public scoping part of the Environmental Impact Statement development process to help us involve the community and determine the concerns and significant issues of our proposed action.

We began this scoping process by publishing a Notice of Intent (NOI) in the Federal Register on March 4, 2002. I have included a copy of the NOI with this letter. We also held seven public scoping meetings to exchange information. Additionally, we have a web site (<http://www.ttsfo.com/ibcteis>) that contains up-to-date information on the proposed Transformation here in Hawaii.

I would like to thank those of you who attended the scoping meetings and made comments. To help you evaluate this additional information and provide further comments, I have extended the comment period until June 29, 2002.

In our NOI, we listed three proposed alternatives: 1) Transform the Second Brigade to an IBCT with a wide range of supporting projects, including new, additional, or modified ranges, facilities and infrastructure (we have provided a list of these projects with this letter); 2) transform the Second Brigade, using existing facilities and infrastructure and lands; and 3) take no action (the so-called No Action Alternative), in which the Army in Hawaii would not be transformed to an IBCT but would continue operating as it does now until future organizational changes are made. While we believe that transformation is critical to the future of the Army and our nation's security, we are committed to making sure that we understand the environmental consequences and impacts of transformation so that we can make informed decisions on whether or how it should proceed.

As we discussed at the scoping meetings, transforming the Second Brigade to an IBCT includes changing to a more rapidly deployable force with advanced computer capabilities. This would involve multiple projects, including constructing infrastructure and training ranges, improving and constructing military access roads, and acquiring land. These projects would be necessary to support the additional 480 soldiers and 400 vehicles required for the IBCT.

With your help we will be able to identify those potential adverse impacts that should be analyzed in our Environmental Impact Statement. We already know that we have to evaluate the impacts that construction might have on cultural and historical resources or on natural resources, such as plants and animals, including any temporary increase in noise and dust levels. If training ranges are constructed,

impacts could also include those to air, water and soil, natural and cultural resources, and socio-economics.

We also want to provide you with as much information as is possible at this time about our proposed acquisition of additional lands. I have enclosed the available maps depicting the general area where the Army proposes to acquire property. We are in initial discussions with landowners but formal negotiations cannot be initiated until we receive permission from the Department of Defense to proceed. For this reason more detailed maps and information on the proposed land acquisitions are not available at this time, but we will provide more detailed information as we progress.

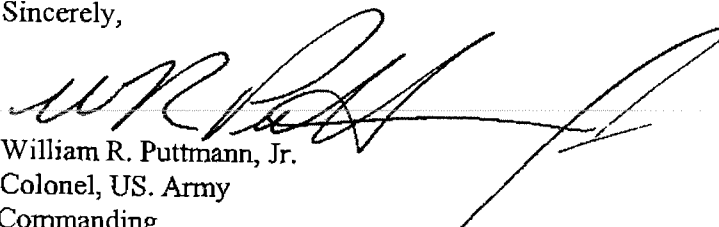

In addition to this IBCT EIS, we are preparing other Environmental Assessments for several projects that are essential to the Army's current mission. These projects include an upgrade Drum Road, acquisition of land south of Schofield Barracks for constructing two buildings, and improving the Installation Infrastructure Information Architecture. These projects are not specific to Army Transformation, however, to the extent that they may also be used for IBCT support and training, we plan to address these impacts in the IBCT EIS as well. As you may know, we are also preparing a separate EIS on live-fire training at Makua Military Reservation by our current units. The Makua EIS is specifically required by a settlement agreement we reached to resolve issues on an earlier Supplemental Environmental Assessment for Makua.

More information about the proposed action and the EIS process is posted on our website at <http://www.ttsfo.com/ibcteis> and at the following locations: on Oahu at Hawaii State University Library, Kahuku Public & School libraries, Mililani Public Library, Wahiawa Public Library, Waialua Public Library and Waianae Public Library and the University of Hawaii Environmental Center; and on the Big Island at the Hilo, Kailua-Kona and Thelma Parker Public libraries. We encourage you to check these resources regularly for the latest updated information. Additionally, we have included with this letter the briefing presented at the final scoping meeting.

We would like to continue two-way communications throughout the EIS process. I hope that extending the comment period will ensure that you have ample opportunity to communicate with us. We will accept written comments, whether mailed, e-mailed or faxed, until June 29, 2002. Mailed comments should be postmarked by June 29, 2002. Comments may be posted on the IBCT website or sent to Mr. Earl Nagasawa, U.S. Army Corps of Engineers, Honolulu Engineer District, Program and Project Management Division, Attn: CEPOH-PP-E (Nagasawa), Building 252, Fort Shafter, Hawaii 96858-5440; e-mail: earl.nagasawa@usace.army.mil; or fax (808) 438-7801. A blank comment sheet is included with this letter. We also will be available to participate in public workshops and discussion groups on Transformation until the end of the scoping period. These sessions can be arranged by contacting Mr. Nagasawa at (808) 438-0772.

Thank you for your valuable participation in the scoping process for the IBCT EIS. We appreciate your assistance in helping us prepare a comprehensive document.

Sincerely,

William R. Puttmann, Jr.
Colonel, US. Army
Commanding

Army Extends Transformation EIS Public Comment Period

SCHOFIELD BARRACKS --The Army is extending the public comment period for the Transformation Environmental Impact Statement (EIS) by 30 days to June 29.

"The Army will continue its ongoing dialogue with the individuals and organizations in the community as it prepares an EIS for transformation of the 2nd Brigade, 25th Infantry Division (Light)," said Col. William Puttmann, Commander, U.S. Army Garrison, Hawaii.

In response to public comments, the Army will provide, by mail, additional informational materials that briefly describe the projects encompassed in Transformation to everyone who attended the public scoping meetings conducted in April on the Big Island and Oahu. Others interested in receiving these materials should contact the address or number listed below.

The information packet will include presentations, proposed descriptions of projects, handouts, and available maps.

This information will also be available on the Transformation EIS website www.ibcteis.com, at the University of Hawaii Environmental Center in Manoa, and the following libraries: Main, Kahuku Public and School, Mililani, Wahiawa, Waialua, Waianae, on Oahu and the Hilo, Kailua-Kona, and Thelma Parker, Kamuela, libraries on Hawaii.

"The Army will also continue to offer discussions or workshops to organizations interested in learning about Transformation," Puttmann said.

The Army continues the scoping process, it will respond to requests for workshops and discussions until the end of the comment period and accept written comments post marked, faxed, or e-mailed by **June 29**. Requests and comments, or if an organization is interested in receiving a workshop of discussion, please contact: Mr. Earl Nagasawa, U.S. Army Corps of Engineers, Honolulu Engineer District, Programs and Project Management Division, Attn: CEPOH-PP-E (Nagasawa), Building 252, Fort Shafter, Hawaii 96858-5440; email earl.nagasawa@usace.army.mil; phone 438-0772 or fax (808) 438-7801.

For additional information, contact Troy Griffin at 655-4221.

APPENDIX B-2

PUBLIC INVOLVEMENT ON DRAFT EIS

**DEPARTMENT OF THE ARMY
OFFICE OF THE ASSISTANT SECRETARY
INSTALLATIONS AND ENVIRONMENT
110 ARMY PENTAGON,
WASHINGTON DC 20310-0110**

**Director
Office of the Federal Register
National Archives and Records
Administration
Washington, D.C. 20408**

Dear Sir:

The enclosed notice of availability (NOA) for the Draft Environmental Impact Statement (EIS) for the Transformation of the 2nd Brigade, 25th Infantry Division (Light) to a Stryker Brigade Combat Team in Hawaii is submitted for publication in the Notice section of the Federal Register.

Please publish this NOA in the earliest edition of the Federal Register. This notice is required for the Department of the Army to perform its military mission and to comply with the National Environmental Policy Act and the President's Council on Environmental Quality Regulations.

To confirm publication date of this notice or for further information, please contact Mr. John Cook at (703) 695-4487.

Sincerely,

**Raymond J. Fatz
Deputy Assistant Secretary of the Army
(Environment, Safety and Occupational Health)
OASA (I&E)**

Enclosure

Department of Defense
Department of the Army

Release of the Notice of Availability (NOA) for the Draft Environmental Impact Statement (EIS) for the Transformation of the 2nd Brigade, 25th Infantry Division (Light) to a Stryker Brigade Combat Team in Hawaii

AGENCY: Department of the Army, DoD

ACTION: Notice of Availability

SUMMARY: The Proposed Action includes training to be conducted at Schofield Barracks Military Reservation, Dillingham Military Reservation, Kahuku Training Area and Kaiwaloa Training Area on O'ahu and at Pōhakuloa Training Area on the island of Hawaii. Twenty-eight projects are proposed that would improve on the existing support structure and facilities to provide the necessary field training required for an SBCT. These projects include construction of ranges, airfield upgrades, land acquisition, and new equipment such as new and modernized vehicles (namely the Stryker, an eight-wheeled, 20-ton combat vehicle) and weapons systems (105mm cannon and 120mm mortar). The number of soldiers and vehicles stationed at SBMR also would increase. The Army would acquire land on O'ahu (approximately 1,400 acres) and on the island of Hawaii (approximately 23,000 acres) for training areas and road construction.

DATES: The review period for the Stryker Brigade Combat Team Draft EIS will end 45 days after publication of the Notice of Availability in the Federal Register by the US Environmental Protection Agency.

ADDRESSES: Direct questions and/or written comments regarding the Stryker Brigade Combat Team Draft EIS to, or a request for a copy of the document from: Ms. Cindy Barger, U.S. Army Corps of Engineers, Honolulu Engineer District, Program and Project Management, Attn: CEPOH-PP-E (Barger) Building 230, Fort Shafter, Hawaii 96858-5440.

FOR FURTHER INFORMATION CONTACT: Ms. Cindy Barger at (808) 438-4812; by facsimile at (808) 438-7801; or by e-mail at SBCT_EIS@usace.army.mil

SUPPLEMENTARY INFORMATION: The Stryker Brigade Combat Team Draft EIS analyzes three alternative courses of action with respect to the Transformation of the 2nd Brigade, 25th Infantry Division in Hawaii: 1) the transformation of the 2nd Brigade, 25th Infantry Division (Light) to an SBCT with a range of supporting activities including new, additional, or modified ranges, facilities and infrastructure and acquisition of approximately 1,400 acres of additional training lands on Oahu and 23,000 acres on the island of Hawaii (preferred alternative); 2) the transformation of the 2nd Brigade, 25th Infantry Division (Light) to an SBCT with a range of supporting activities including new, additional, or modified ranges, facilities and infrastructure, and acquisition of approximately 100 acres of additional training lands on Oahu and 23,000 acres on the island of Hawaii; and 3) the no action

alternative, under which no transformation would occur in the near term and training would continue as currently exists.

Comments on the Draft EIS, received during the 45-day public comment period, will be considered in preparing the Final EIS. Public meetings to comment on the Stryker Brigade Combat Team Draft EIS will be held at various locations on the islands of Oahu and Hawaii. Notification of the times and locations for the public meetings will be published in local newspapers and in the Hawaii Office of Environmental Quality Control bulletin.

Copies of the Stryker Brigade Combat Team Draft EIS are available for review at the following libraries:

- Hilo Public Library, 300 Waianuenue Avenue, Hilo, Hawaii 96720-2477;
- Kailua-Kona Public Library, 75-138 Hualalai Road, Kailua-Kona, Hawaii 96740-1704;
- Thelma Parker Memorial Public and School Library, 96767-1209 Mamalahoa Hwy. Kamuela, Hawaii 96743-8429;
- Kahuku Public and School Library, 56-490 Kamehameha Hwy., Kahuku, Hawaii 96731-2200;
- Mililani Public Library, 95-450 Makaimoimo Street, Mililani, Hawaii 96789-3018;
- Hawaii State Library, 478 South King St., Honolulu, Hawaii 96813-2901;
- Wahiawa Public Library, 820 California Avenue, Wahiawa, Hawaii 96786-2034;
- Waianae Public Library, 85-625 Farrington Hwy., Waianae, Hawaii 96792-2406;
- Waialua Public Library, 67-068 Kealohanui Street, Waialua, Hawaii 96791;
- UH Environmental Center, 317 Crawford Hall, 2550 Campus Rd., Honolulu, Hawaii 96822-2217.

The Draft EIS may also be reviewed at the SBCT website <http://www.SBCTEIS.com>.

ARMY ANNOUNCES AVAILABILITY OF DRAFT ENVIRONMENTAL IMPACT STATEMENT ON STRYKER BRIGADE IN HAWAII

October 2, 2003

The Department of the Army announces the availability of the Draft Environmental Impact Statement (DEIS) for the Transformation of the 2nd Brigade, 25th Infantry Division (Light) to a Stryker Brigade Combat Team (SBCT) in Hawaii.

The Army has proposed to undertake a multi-year, phased and synchronized program of transformation over a 30-year period. The proposed transformation will take place in three phases, an Initial Phase, an Interim Capability Phase, and an Objective Force Phase. Transformation would affect most aspects of the Army's doctrine and is needed to address the changing circumstances of the 21st century. The Army is proposing to implement a range of activities related to force transformation in Hawaii as part of the Interim Capability Phase. The proposed activities are associated with conversion of the 2nd Brigade, 25th Infantry Division (Light) to an SBCT, a rapidly deployable, early entry, medium-weight force with a decreased logistical footprint.

The SBCT DEIS analyzes three alternative courses of action with respect to the conversion of the 2nd Brigade, 25th Infantry Division (Light) to a Stryker Brigade Combat Team: 1) Transformation of the 2nd Brigade, 25th Infantry Division (Light) to an SBCT with a range of supporting activities including new, additional, or modified ranges, facilities and infrastructure, and acquisition of approximately 1,400 acres of additional training lands on Oahu and 23,000 acres on the island of Hawaii (preferred alternative); 2) Transformation of the 2nd Brigade, 25th Infantry Division (Light) to an SBCT with a range of supporting activities including new, additional, or modified ranges, facilities and infrastructure, and acquisition of approximately 100 acres of additional training lands on Oahu and 23,000 acres on the island of Hawaii; and 3) No Action (no transformation to an SBCT in the near term).

Copies of the Stryker Brigade Combat Team Draft EIS will be available for review at the following locations: Hilo Public Library, 300 Waiānū Avenue, Hilo, Hawaii 96720-

1704; Thelma Parker Memorial Public and School Library, 96767-1209 Mamalahoa Hwy. Kamuela, Hawaii 96743-8429; Kahuku Public and School Library, 56-490 Kamehameha Hwy., Kahuku, Hawaii 96731-2200; Mililani Public Library, 95-450 Makaimoimo Street, Mililani, Hawaii 96789-3018; Hawaii State Library, 478 South King St., Honolulu, Hawaii 96813-2901; Wahiawa Public Library, 820 California Avenue, Wahiawa, Hawaii 96786-2034; Waianae Public Library, 85-625 Farrington Hwy., Waianae, Hawaii 96792-2406; Waialua Public Library, 67-068 Kealohanui Street, Waialua, Hawaii 96791; and UH Environmental Center, 317 Crawford Hall, 2550 Campus Rd., Honolulu, Hawaii 96822-2217.

The Draft EIS may also be reviewed at the SBCT website <http://www.SBCTEIS.com>.

The review period for the Stryker Brigade Combat Team Draft EIS will end 45 days after publication of the Notice of Availability in the Federal Register by the U.S. Environmental Protection Agency. Comments on the Draft EIS will be used in preparing the Final EIS.

To obtain a paper copy of the Draft EIS, ask questions, or provide written comments, contact Ms. Cindy Barger, U.S. Army Corps of Engineers, Honolulu Engineer District, Program and Project Management, Attn: CEPOH-PP-E (Barger) Building 230, Fort Shafter, Hawaii 96858-5440; e-mail at SBCT_EIS@usace.army.mil.

Media interested in more information may also contact MAJ Gary Tallman, Army Public Affairs, at 703-697-4314, or gary.tallman@hqda.army.mil

-END-

Public Notice

Release of Army Transformation Draft EIS, Opening of Public Comment Period, and Public Meetings to be Held

The US Army, Hawaii, announces the release of the Draft Environmental Impact Statement (EIS) detailing the impacts of Army Transformation in Hawaii. The Draft EIS is available for review on the web at www.sbcteis.com or at the following libraries:

UH Hilo, Edwin H. Mookini Library, 200 W. Kawili St., Hilo, 808-974-7346
Hilo Public Library, 300 Waianuenue Avenue, Hilo (808) 933-8888
Kailua-Kona Public Library, 75-138 Hualalai Road, Kailua-Kona (808) 327-4327
Thelma Parker Memorial Public and School Library, 67-1209 Mamalahoa Highway, Kamuela (808) 887-6067

Date: October 3, 2003

Release of Army Transformation Draft EIS and Public Meetings to be Held

The US Army, Hawaii, announces the release of the Draft Environmental Impact Statement (EIS) detailing the impacts of Army Transformation in Hawaii. Army Transformation in Hawaii includes the proposed construction of 28 projects and proposed land acquisition on the islands of O'ahu and Hawai'i.

The Draft EIS is available for review on the Web at www.sbcteis.com or at the following libraries:

- **Hilo Public Library, 300 Waianuenue Avenue, Hilo, (808) 933-8888**
- **Kailua-Kona Public Library, 75-138 Hualalai Road, Kailua-Kona, (808) 327-4327**
- **Thelma Parker Memorial Public and School Library, 96767-1209 Mamalahoa Hwy., Kamuela, (808) 887-6067**
- **Kahuku Public and School Library, 56-490 Kamehameha Hwy., Kahuku, (808) 293-8935**
- **Mililani Public Library, 95-450 Makaimoimo Street, Mililani, (808) 627-7470**
- **Hawaii State Library, 478 South King St., Honolulu, (808) 586-3500**
- **Wahiawa Public Library, 820 California Avenue, Wahiawa, (808) 622-6345**
- **Waianae Public Library, 85-625 Farrington Hwy., Waianae, (808) 697-7868**
- **Waialua Public Library, 67-068 Kealohanui Street, Waialua, (808) 637-8286**
- **UH Environmental Center, 317 Crawford Hall, 2550 Campus Rd., Honolulu, (808) 956-7361**

To request copies of the Executive Summary, CDs or hard copies of the DEIS, please contact:

Cindy S. Barger

SBCT EIS Project Manager

U.S. Army Corps of Engineers

Honolulu District

Bldg 230, Rm. 306 ATTN: CEPOH-PP-E

Ft. Shafter, HI 96858-5440

Telephone: (808) 438-4812

Facsimile: (808) 438-7801

e-mail: SBCT_EIS@poh01.usace.army.mil

Written comments will be accepted until **19 November 2003**.

Additionally, the Army will host community meetings to provide an opportunity for the people of Hawaii to comment on the Draft EIS. The meeting dates are as follows:

- **28 October 2003, Honolulu Country Club, 1690 Ala Puumalu Street Honolulu, Hawaii 96818-1599, (808) 441-9400**
- **29 October 2003, Helemano Plantation, 64-1510 Kamehameha Highway Wahiawa, Hawaii 96786, (808) 935-9361**
- **30 October 2003, Makaha Resort Golf Club, 84-626 Makaha Valley Road Waianae, Hawaii 96792, (808) 695-9544**
- **4 November 2003, Turtle Bay Resort 57-091 Kamehameha Highway Kahuku, Hawaii 96731, (808) 293-8811**
- **5 November 2003, Waikoloa Beach Marriott Resort 69-275 Waikoloa Beach Drive Waikoloa, Hawaii 96738, (808) 886-8125**
- **6 November 2003, Hilo Hawaiian Hotel, 71 Banyan Drive Hilo, Hawaii 96720 (808) 935-9361**

All meetings begin with an informal open house from 5:30-6:45 pm. The formal meeting will begin at 7:00 pm and continue until 10:00 pm.

If you need special communications or seating accommodations (American sign or accessible seating, and documents in alternative formats), please contact Ms. Cindy Barger, telephone (808) 438-4812 at least 3 days before the meeting.

Please note that a Native Hawaiian language interpreter will be present at the meetings.

SCHEDULE

Meeting Convened: 1900
Meeting Adjourned: 2040

COMMENTS

General Issues

- Maintain better records regarding the types and amounts of weaponry used in training areas.
- Individuals voiced support of the project.
- Individuals voiced opposition to the project.
- Dissemination of information about the specific projects was requested.
- Proposed alternatives fail to consider sites outside of Hawaii.
- The public comment process was flawed because the information in the Draft differed from the information presented in the scoping meetings.
- The training brigades and Stryker will not be used to defend the United States but will be used in third world countries against innocent people.

Land Use/Recreation

- Provide The Nature Conservancy with perpetual access to their conservation lands.
- The Army would be taking conservation and agricultural land.
- Work with non-profit organizations to acquire buffer lands adjacent to Army training areas

Cultural Issues

- Do not compromise cultural rights.

Human Health and Safety Hazards

- The Army leaves behind harmful chemicals wherever it goes.
- Forest habitat and species that are damaged by fires that spread outside of Schofield would also threaten Honouliuli Preserve. Include proper training for personnel in the wild fire management plan.

Socioeconomics and Environmental Justice

- What are the economic impacts?
- The state of Hawaii will benefit economically from Transformation.

Meeting Adjourned: 2146

COMMENTS

General Issues

- The comment period should be extended.
- With more military expansion in the Hawaiian Islands, the islands will be a perfect target for terrorists.
- Proposed alternatives fail to consider sites outside of Hawaii.
- The Stryker Brigade Combat Team will help the United States of America.
- United States is using this means to intimidate, to continue to intimidate the Hawaiian people. These are small islands.
- Outrageous.
- This Draft EIS is too long and complicated.
- The Draft EIS does not address comments raised during the scoping period.
- The EIS does not include an investigation of constructing a CCAAC range within one of the multipurpose use ranges.

- The Programmatic Agreement should not be included as part of the EIS.
- The Draft EIS fails to consider and address a clean-up plan for military lands.
- There is very little recognition of the Launani Valley and Mililani Mauka communities when discussing the impact or potential impact of transformation from Wheeler Army Airfield and East Range.

Land Use/Recreation

- Explore acquisition of the Pupukea Paumalu Homestead to protect the training capability and also protect the natural and other resources in the area.
- Lands that area called "ceded lands" in the DEIS should be called "stolen lands".
- Denying access to areas in the vicinity of Drum Road and between Schofield and Helemano will reduce the ability of residents to enjoy the outdoors.
- The SRAA is valuable agriculture land.
- Training and operation of the proposed QTR2 Multi-purpose Qualifying Training Range on SRA will affect land use with a portion of the Honouliuli Preserve.
- During training and operation of QTR2 natural resources management and recreational activities will be restricted within certain portions of the SRAA.

Visual Resources

- No comments expressed.

Airspace

- There's been a gradual but persistent increase of military air traffic over KTA and further increases cause concern.
- The military seems to want to take the air space for exclusive use.
- An increase in helicopter flights will increase the annoyance to the community.
- Make sure that helicopters do not crash into homes.
- Airspace section of the DEIS lacks a discussion on physical hazards.
- Provide a map that clearly shows the aircraft flight tracks for local helicopter departures, IFR 06 departures and standard VFR departures.
- The U.S. Army should work closely with state and county officials to ensure there is safe and compatible use of airspace.
- It is remotely possible that an emergency situation would result in a release of ordnance or fuel into the residential community area during a training fly-by.
- There is concern over safety, number, type and location of all proposed aircraft and activity associated with the project.

Air Quality

- No comments expressed.

Noise

- Training noise from East Range will impact the Launani Valley and Mililani Mauka residential areas.

Traffic

- Alter the portion of the Helemano Trail that bisects Kaukonahua Road.
- There is already a lot of traffic.

Water Resources

- No comments expressed.

Geology, Soils, and Seismicity

- No comments expressed.

Biological/Ecological Issues

- Do not destroy endangered species.
- Do not destroy critical habitat.
- More Army training combined with fewer restoration projects creates a biological ghetto.

Cultural Issues

- Impacts on cultural resources are considered significant and mitigable according to whose standards?
- The cultural impact portion of this EIS fails to address springs as cultural resources.
- Describe how to restore sanctity to a cultural site that is destroyed.

Human Health and Safety Hazards

- The prescribed burn that occurred at Makua Military Reservation and escaped the boundaries set for the fire has many people concerned about future prescribed burns and the safety and reliability of the fire management plan.
- Fire protection and safety plans need to be available for the North Shore.
- The EIS doesn't describe how to restore areas burned by wildfire.

Socioeconomics and Environmental Justice

- Soldiers living on base do not pay taxes on the goods and services they acquire on base so that money does not go back to the community.
- When the troops get deployed the community will suffer an economic loss.
- Smoke is created on military lands and drifts into the nearby communities, affecting health of the residents.
- An increase in the number of soldiers will increase street violence, domestic violence, dust, armored vehicles, and accidents.

Public Services and Utilities

- Hawaii schools are crowded and in need of help with resources to accommodate an increase in student population.

Cumulative

- Agricultural companies and the Kahe Power plant create smoke that affects the Waianae coastline.

SCHEDULE

Meeting Convened: 1900

Meeting Adjourned: 2400

COMMENTS

General Issues

- This Draft EIS is too long and complicated.
- Extend the public comment period to 120 days.
- Proposed alternatives fail to consider sites outside of Hawaii.
- The Draft EIS does not address comments raised during the scoping period.
- Show the treaty of annexation that exists between the United States and the Kingdom of Hawaii which allows the Army to claim the land.
- The Draft EIS fails to consider and address a clean-up plan for military lands.
- Start all over again.
- Discuss the market value of the land used by the military since the time of annexation.

- There are conflicting reports about whether or not the Stryker Brigade is transportable within 96 hours in the C-130 aircraft.
- With the Stryker Brigade in the Hawaiian Islands, the islands will be a more of a target .
- The Department of Defense issued a memorandum in 1990 that set a moratorium on new land acquisitions for training.
- The Army must not show preference for or commit funds towards an alternative.
- The EIS needs to spell out the mitigation measures, otherwise the public will not be a true part of the decision-making process as mandated by Congress because the public may not be commenting upon actual plans.
- From a Hawaiian perspective, you cannot separate land from people, people from land.
- The likely environmental impacts need to be written in simple, non-technical language for the lay reader.
- In order to respond to the concerns and some of the issues raised, the document needs to be longer.

Land Use/Recreation

- The Army contradicts itself by stating in 1997 that there is a shortfall of 70,000 acres of land for training. So does that mean that the proposed 25,000 acres is an installment of 70,000 acres that's going to be acquired in the future?
- Since 1978 agricultural land rate of loss in Hawaii was 1 percent. The Stryker Brigade will bring that up to 2.7 percent, which will reduce productive capacity, revenue and land value.

Visual Resources

- No comments expressed.

Airspace

- No comments expressed.

Air Quality

- Additional dust resulting from an increase in military training might affect coral reefs and people with respiratory ailments.

Traffic

- Young military people drive recklessly when they are off base and add to the traffic problem.

Water Resources

- The Army needs to protect the springs and the wells from the contamination of munitions constituents that are sure to enter the water tables.

Geology, Soils, and Seismicity

- Hawaiians spend more time in the dirt, more time planting, and their exposure to high levels of toxic metals in the soil will have a different effect on them than it would on those levels of exposure for somebody in Kansas.
- The soil needs to be protected from harmful constituents.

Biological/Ecological Issues

- The project would take away critical habitat for endangered species.
- Is the idea to make Hawaii into a desert?

Cultural Issues

- The draft EIS fails to recognize that cultural sites are not just piles of rocks.
- There's nothing in the DEIS that talks about the potential destruction of mana by a Stryker vehicle running over a cultural site.
- Have cultural values briefing for the soldiers before they enter society.

Human Health and Safety Hazards

- The prescribed burn that occurred at Makua Military Reservation and escaped the boundaries set for the fire has many people concerned about future prescribed burns and the safety and reliability of the fire management plan.
- The soil sampling was flawed.
- What are the rates of environmentally induced diseases in these affected areas? If there are contaminants, let's go the next step and figure out how it's affecting people. Have there any toxicology studies been done in the community? Are there any plans to treat folks if there are illnesses?
- There's no sampling off-range.
- There are a lot of diabetes and thyroid-related diseases in the area.

Socioeconomics and Environmental Justice

- Determine the actual costs of developments and what leaks out of the economy.
- Drug trafficking could increase.
- An increase in the number of soldiers will increase violence.

Public Services and Utilities

- There will be additional demands on Hawaiian Electric, the Board of Water Supply, and the refineries.
- The water supply will be taxed by bringing additional troops and their families into the state.

Cumulative

- Agricultural companies, Kahe Power plant, Campbell Industrial Park, and the industrial landfill in Nanakuli create smoke that affects the Waianae coastline.

Meeting Adjourned: 2450

COMMENTS

General Issues

- The Army will bring 2,000 people in to the state and everyone will suffer.
- Look at the environmental issues in the surrounding communities.
- Do not build up the military or bring the Stryker Brigade here.
- 200 Strykers will put a strain on the available land resources around the island.
- The Stryker Brigade should be focused on peacekeeping and humanitarian issues.
- Locate and train in a larger uninhabited area
- The process is invalid.
- Strykers are about invasion, not defense.
- The principle that you should put forward is aloha 'aina [Love the land].
- Set new, higher standards of environmental sensitivity and responsibility.

- The mitigation measures are non-committal.
- Release Hawaii from military occupation.
- Save our natural wonders.
- Land and resources in Hawaii are too precious for the military to use.

Land Use/Recreation

- Activities at Honouliuli Preserve, hiking, and use of the motorcycle park might be impacted by the project.
- Hawaii will be losing valuable agricultural land, which will reduce the ability to live sustainably.
- The military has plenty of land in Hawaii already.

Visual Resources

- Visible fences and telecommunication antennas would reduce the visual quality of the Dillingham area.
- What does 365 tons of fugitive dust look like?

Airspace

- Air traffic was not addressed in the EIS.
- UAV may fly in close proximity to homes.

Air Quality

- The modeling shows that dust generated from the project will exceed the federal acceptable levels in a 24-hour period.
- The Army is asking that we trade health for safety.
- 365 tons of fugitive dust is a lot respiratory-wise.
- What kind of chemicals would be used to spray to mitigate fugitive dust?

Traffic

- Army vehicle use of public roadways is a concern.
- Army activities affect traffic flow on Foot Avenue at Lyman Gate.
- The tank trails are currently proposed as gravel roads but they should be hardened.
- Clean up when these 20-ton vehicles bring mud across the civilian highways.

Water Resources

- Analyze impacts of hazardous materials on groundwater.
- Soil erosion could affect nearshore waters and coral reefs and freshwater streams.
- Address deaths caused by vehicles caught in floods in the Kahuku area.

Geology, Soils, and Seismicity

- Certain activities will create a high probability of soil erosion.

Biological/Ecological Issues

- Land take a long time to recover from vehicles like the Stryker.
- Hawai'i has the most endangered species in the nation.
- There can be no assurances of the safety of biological species.

Cultural Issues

- Consult with ohana and individuals.
- The Environmental Impact Study does not address identified cultural resources.
- Consider the overall impact on social relations in the community.
- Blocking access to lands is not consistent with Hawaiian culture.

- Safeguard the land for our future generations.

Human Health and Safety Hazards

- The EIS acknowledges this past contamination but then does almost nothing on describing possible new contamination.
- Analyze impacts of hazardous materials on groundwater.
- Regarding the Kahuku area and the Dillingham area, would the antennas produce electromagnetic radiation?
- In the Kahuku Training Area the EIS states that when using short-range training ammunition there's a high risk of wild fires.

Socioeconomics and Environmental Justice

- Hawaii already has a problem financing the educational facilities that exist.

Public Services and Utilities

- Address the additional burned that will be on the utilities.
- The services provided by the state will be impacted by the integration of additional personnel and their families.

Cumulative

- Violence is cumulative.
- Address the other parcels of land that will be acquisitioned by the military services.

COMMENTS

General Issues

- Translate the report into English and into Hawaiian.
- Consider including a native Hawaiian group to help resolve some of the conditions that are being addressed in the mitigation schedule.
- Clean up previous Army sites on the islands before desecrating more land.
- Show the public a live demonstration of what you will do with these large vehicles.
- Considering the quantity of lead and munitions left on the ground in places like Pohakuloa, how can you say you are good stewards of the land?
- Hotel management should let people chant.
- put in your EIS how much money you're going to put down now in bonding for cleanup, what you plan to do

- Take the Stryker Brigade into the backyard of, for instance, the Secretary of Defense.
- Take advantage of some of the area already controlled by the Army.
- Clean up.
- The criteria for determining the alternatives is too narrow.
- The military gets all the money and land and Hawaiians die on a waiting list to get what is rightfully their own homeland.
- The document is full of contradictions.

Land Use/Recreation

- There needs to be consistency with the land use designation of WPAA.

Airspace

- There is concern about the air strip the Army is building at Pohakuloa.

Air Quality

- Flying dust will be a hazard to the health of Waiki'i Ranch residents and will also cause property damage.
- Wind erosion from areas burned by wildfires should be added as an impact issue.
- Dust and inhalation of dust is a great concern for the surrounding communities.
- Airborne particulate matter is a danger to the residents that needs to be monitored and analyzed for toxic chemicals.

Noise

- These chapters are inconsistent.
- Noise levels from small arms fire and weapon simulators can not be mitigated to a reasonable level by maintaining a distance of 500 feet to 1,000 feet at night from the borders of Waiki'i Ranch.

Traffic

- The island would be better off with a larger road from the east to the west.

Geology, Soils, and Seismicity

- Soil loss is significant for PAA.
- At WPAA, the addition of heavy vehicles and warfare stimulation with explosive devices raises the risk of fire exponentially.
- There will be permanent damage to the land from the Strykers.

Biological/Ecological Issues

- To destroy the ecosystem at Pohakuloa sets a precedent.
- Some species are not yet described and may be destroyed before they can be studied.
- There needs to be a mechanism where things that are rare and endangered can be protected forever.

Cultural Issues

- Move project sites to protect cultural resources
- There needs to be a mechanism where things that are rare and endangered can be protected forever.

Human Health and Safety Hazards

- At WPAA, the addition of heavy vehicles and warfare stimulation with explosive devices raises the risk of fire exponentially.
- The wildfires impact should be upgraded to significant
- The toxic contents of the munitions and shell casings should be discussed.

Socioeconomics and Environmental Justice

- Flying dust will be a hazard to the health of Waiki'i Ranch residents and will also cause property damage.
- Religious rights have been violated by this paper.

Meeting Adjourned: 2447

COMMENTS

General Issues

- There are no maps of the new Saddle Road extension in your document
- The organization of the document is confusing.
- Why Hawaii?
- The Stryker Brigade conflicts with Linda Lingle's plan for the promotion of a safe Hawaii for visitors.
- The Armed Services established a policy of not purchasing more land.
- Please extend the comment period.
- No Stryker Brigade.
- What is the real cost of the land being taken?
- The Stryker is very definitely an offensive weapon.

Land Use/Recreation

- Army plans for Kawaiahae Harbor as it is now delineated will close the entire harbor to all recreational use along with the recreational harbor and sailing facility that also occupies that point of land.
- A portion of the 23,000 acres is considered agricultural land of importance.
- According to local zoning laws, military use is not allowed in agricultural zones.
- The military has extensive holdings in HI.
- An important ongoing issue is compensation for land use.

Visual Resources

- Will an expansion and importation of 19-ton vehicles enhance the beauty and serenity of the islands?
- No mention is made of the impact on the astronomers on Mauna Kea.

Air Quality

- The land for your proposed expansion around Waiki'i is zoned for agriculture and conservation and has never been used by heavy vehicles, training, or munitions.
- The 1,005 heavy-duty vehicles going up the PTA trail would have a drastic effect on the nearby communities from the air pollution from emissions and dust.

Noise

- The noise associated with training could have psychological effects because it is the sound of war; the sound of people training to kill other people.
- Noise from vehicle use of the trail is a concern in the surrounding communities.
- There are no mitigations for the impacts from noise.
- More attention must be paid to the effects of noise on critical habitat areas.
- The buffer zone around the communities should be 10 miles.

Traffic

- The impacts from the proposed expansion on the new Saddle Road alignment have not been discussed.

Water Resources

- The studies cited are not current.

Geology, Soils, and Seismicity

- There is no way to restore the kind of soils that will be destroyed.

Biological/Ecological Issues

- Rare birds and critical habitat could be affected by many of the proposed training activities.

Cultural Issues

- The public has not been given the opportunity to comment on the revised Programmatic Agreement mentioned in the EIS and it is not clear which version is cited in the EIS.
- There is evidence that shows the ancient Hawaiians used the lands around Pohakuloa as a place to train their warriors and using the area to train other warriors is compatible with that tradition.
- The shaking of the earth from vehicles along the trail would affect Pu'ukohola heiau, a national historic site.
- Restricting access to native Hawaiians will remove this area from the identity of Hawaiians who are spiritually connected to the land through physical contact. How will the Native Hawaiians be compensated for this removal of their cultural heritage?

- The Army needs to make restitution for the religious and cultural sites it destroys

Human Health and Safety Hazards

- Keep the lands free from unexploded ordnance and toxic waste for generations to come.
- Clean up the areas already contaminated.
- The use of the extensive military land holdings in HI has contributed to toxicity, environmental degradation, and threats due to UXO.

Media Release

25th Infantry Division (Light) & U.S. Army, Hawaii
Public Affairs Office

For Immediate Release
Release number: 2003-11-01
Nov. 3, 2003

Public Comment Period Extended for Stryker Brigade Environmental Impact Statement

SCHOFIELD BARRACKS – The 25th Infantry Division (Light) and U.S. Army, Hawaii, have extended the public comment period for the Stryker Brigade Draft Environmental Impact Statement (DEIS) by 45 days.

The final day to receive comments is now Jan.3, 2004. The comment period is being extended to accommodate those who have expressed public concern during public meetings and written comments.

“The decision to extend the comment period is a good faith effort and it allows the public to review the document and provide feedback,” said Col. David L. Anderson, commander, U.S. Army Garrison, Hawaii.

The Army has held three public meetings with the remaining meetings taking place this week on Oahu and the Island of Hawaii. The meetings will be held on Tuesday, Nov. 4 at the Turtle Bay Resort. On the Island of Hawaii public meetings are scheduled for Wednesday, Nov. 5 at the Waikoloa Beach Marriott Resort and Thursday, Nov 6 at the Hilo Hawaiian Hotel.

All meetings will begin with an Informal Open House from 5:30 p.m. to 6:45 p.m. The Formal meetings to listen to public comments will be held from 7 p.m. to 10 p.m., or later if required.

The Draft EIS can be reviewed at the SBCT website <http://www.SBCTEIS.com>.

For further information please contact Major Stacy Bathrick, Public Affairs Officer, 25th Infantry Division (Light) & u.s. Army, Hawaii, (808) 655-2918 or Captain Kathleen Turner, Media Relations Officer, 25th Infantry Division (Light) & U.S. Army, Hawaii, (808) 655-8729.

APPENDIX C

SBCT ARMY TRANSFORMATION

A. Major Elements and Features of an SBCT Brigade

- *Infantry Battalions.* Supported by combined arms integration across the Brigade that extends into the rifle companies, the motorized infantry battalions are the primary maneuver elements within the SBCT. The three-battalion formation within the SBCT provides force robustness, provides reserves for enhanced operational flexibility, and permits a larger area of operations (AO). Internal to the infantry battalions, the incorporation of snipers, mobile gun systems, mortars, and Striker-equipped fire support teams provides the appropriate systems required for combined arms integration vital to support dismounted operations by squads, platoons and companies, including dispersed actions.
- *Reconnaissance, Surveillance, and Target Acquisition (RSTA) Squadron.* The RSTA squadron is a unique organization developed specifically to satisfy a set of unique operational requirements. As the SBCT's primary source of combat information, the squadron supports the development of situational understanding, empowering the SBCT to anticipate, forestall, and dominate threats, ensuring mission accomplishment through decisive action and freedom of maneuver. The squadron seeks to see, know, and understand the operational environment in detail, instead of applying traditional reconnaissance, focused primarily on enemy forces, with the objective of creating an umbrella of understanding across the Area of Operations. The squadron consists of three reconnaissance troops, each of which includes Javelin anti-armor and 120 mm mortar support. The RSTA surveillance troop incorporates a UAV platoon, a ground sensor platoon, and an Nuclear, Biological, and Chemical (NBC) reconnaissance platoon. The UAVs enable the unit to expand its vision without helicopters. The NBC element provides the SBCT's core capability for detection and early warning of chemical and radiological contaminants, plus some forms of biological agents.
- *Anti-tank (AT) Company.* The AT company comprises the SBCT's primary tank-killing capability by providing stand-off fires against enemy armor. The company increases SBCT flexibility and improves its survivability, particularly in open terrain. The company consists of three platoons, each with four long-range, Tube-launched, Optically-tracked, Wire-guided missile, BGM-71 (TOW IIB) systems mounted on IAVs.
- *Field Artillery Battalion.* The artillery organization organic to the SBCT, while required to provide supporting fires, is focused sharply on the requirement to conduct responsive, proactive counter-battery fires. The SBCT will be organized with a field artillery battalion equipped with the M777, light weight, 155mm towed Howitzer until the Army develops an IAV-based system.
- *Engineer Company.* Given the significance of tactical mobility to successful operations, the engineer company is optimized for mobility support.
- *Signal Company.* The SBCT signal company provides the communications backbone required to support distributed operations within urban and complex terrain across potentially significant distances, as well as the organic linkages required for effective communications. Beyond-line of sight communications connectivity is essential to force effectiveness. Networking through satellite communications enables access to the global information grid and facilitates reachback for information. The signal company is optimized to meet the SBCT's small-scale contingency optimized requirements.
- *Military Intelligence (MI) Company.* The MI Company essentially operates as an extension of the brigade S-2 staff for the internal and external management of intelligence, surveillance and reconnaissance (ISR) collection assets. It provides analysis to support the development of the SBCT common

operational picture, targeting/effects, and intelligence preparation of the battlefield. The company has the organic systems necessary to interface with ISR systems resident at the division, Army Forces, Joint, theater, and national levels and supports the tactical human intelligence activities required in the small-scale contingency environment.

- *Brigade Support Battalion (BSB).* The Brigade Support Battalion is designed to perform distribution-based, centralized logistics functions in accordance with current combat service support (CSS) concepts. Its effectiveness stems from the employment of the latest advances in CSS command and control measures, enhanced CSS situational understanding, and the exploitation of regionally available resources through joint, multinational, host nation, or contract sources. The small size of the battalion significantly minimizes the logistical footprint in the SBCT Area of Operations.
- *Brigade Headquarters and Headquarters Company.* The SBCT headquarters, comprising command and staff personnel, executes command, control, information management, fires/effects coordination, maneuver support, sustainment, and communications functions to enable the command to plan, prepare, and execute its assigned mission. The headquarters company provides administrative support to the headquarters.

B. Stryker Vehicle Variants

The Interim Armored Vehicle Family of Vehicles	
ICV – Infantry Carrier Vehicle	
	The ICV provides protected transport for an infantry squad and direct fire support during dismounted assault. Its remote weapon station may be equipped with either an M2 .50 caliber machine gun or MK 19 40mm grenade launcher. The ICV may also be equipped with Javelin missiles. It has a top speed of 60 mph on improved roads.
MGS – Mobile Gun System	
	The MGS provides rapid and lethal direct fire to support assaulting infantry and to destroy enemy vehicles, equipment, and hardened positions. It has a low-profile turret and is equipped with the M68A1 105 mm cannon with autoloader, as well as a coaxially-operated 7.62 mm machine gun.
ATGM – Anti-Tank Guided Missile	
	The ATGM variant fires the unit's heavy anti-tank missiles to destroy high-value threat targets at extended ranges in order to defeat enemy armor before the enemy can return effective fire. The ATGM fires the TOW IIB missile (BGM-71).
MC – Mortar Carrier	
	The MC provides accurate and lethal high-angle fire to support operations in complex terrain and urban environments. The MC accommodates a 120 mm mortar system that fire a full family of mortar ammunition while mounted.
CV – Commander's Vehicle	
	The CV provides an operational platform for elements of command within the unit. The CV integrates the Command, Control, Computers, and Communications, and Intelligence, Surveillance, and Reconnaissance (C4ISR) equipment for the unit commanders. It has the ability to access aircraft power and antenna systems to plan missions aboard transport aircraft while enroute to operational theaters.
MEV – Medical Evacuation Vehicle	
	The MEV is the primary ambulance platform. The MEV provides the mounted capability to transport four patients in standard NATO litters or six ambulatory patients in addition to an ambulance team of three soldiers. The MEV provides protection for the patient and medical team and enhances the medical care in a protected environment with adequate lighting and accessible medical equipment.
FSV – Fire Support Vehicle	
	The FSV provides enhanced surveillance, target acquisition, target identification, target designation, and communications supporting the combat unit with "first round" fire-for-effect capability. It integrates the current M707 Striker Mission Equipment Package. The FSV provides the Fire Support Team (FIST) with the capability to automate command and control functions, to perform fire support planning, directing, controlling, and cross-functional area coordination, and execution.
RV – Reconnaissance Vehicle	
	The RV provides an effective platform for Reconnaissance, Surveillance, and Target Acquisition (RSTA) squadrons and battalion scouts to perform reconnaissance and surveillance operations. The RV is the key enabler for both sensor and human intelligence operations. The RV accommodates a squad of six and one augmentee.

The Interim Armored Vehicle Family of Vehicles	
NBC RV – <i>Nuclear, Biological, and Chemical (NBC) Reconnaissance Vehicle</i>	
	The NBC RV provides NBC situational awareness to increase the combat power of the combat organization. The core of the NBC RV is its onboard-integrated NBC sensor suite and integrated meteorological system. An NBC position overpressure system that minimizes cross-contamination of samples and detection instruments provides crew protection and allows extended operations while soldiers are wearing protective clothing.
ESV – <i>Engineer Support Vehicle</i>	
	The ESV provides the engineer squad with highly mobile, protected transport to decisive locations on the battlefield. Integrated into the ESV are current obstacle neutralization and lane marking systems and mine detection devices.

C. SBCT Operational Concepts and Tactical Operations

SBCT Operational Concepts

- *Multi-dimensional.* The SBCT will execute future operations in a battlespace that is much more multi-dimensional than before. In addition to the classical parameters of depth, width, height (to include space) and time, the SBCT must dominate the electromagnetic spectrum to assure uninterrupted information flow and to degrade/deny that same data flow to its adversaries. Political, economic, legal, social, and cultural aspects of the battlespace environment must be accounted for more completely and at lower levels than in previous eras, particularly when confronting a nontraditional, asymmetric enemy.
- *Linear and Non-Linear Framework.* While retaining the ability to operate linearly, the SBCT will use advances in information and mobility capabilities to operate routinely in a non-linear manner. Depending on the nature and evolution of the contingency, conditions may require the SBCT to operate in a continuum of linear, contiguous operations, or, to conduct nonlinear operations, with tactical actions separated spatially, but focused with respect to timing and purpose against key enemy capabilities and assets.
- *Precision.* Organic and reach-back ISR capabilities must enable the SBCT to identify and focus on enemy centers of gravity, decisive points, and key capabilities. Given that orientation, the SBCT applies its capabilities to locate/attack targets precisely, to execute precision maneuver (timing, objective, routes), to achieve precise effects (lethal and non-lethal) against key enemy capabilities and resources in order to rapidly break down the enemy's will and his defensive/offensive schemes. Against an asymmetric adversary, precision includes the capability to rapidly identify the best means of influencing enemy behavior and synchronizing military and nonmilitary elements of power to achieve the precise effects desired by the commander to compel the enemy to change his behavior and respond predictably to SBCT actions.
- *Simultaneity.* Evolving doctrinal concepts call for simultaneous attack of critical targets throughout the battlespace, synchronizing all source fires with exploitative maneuver. Enhanced situational understanding, outstanding tactical mobility, internetted combined arms, and organizational agility provide the means for the SBCT to conduct synchronized, simultaneous, combined arms attacks throughout its Area of Operations. The Brigade can also execute the less demanding requirements of a deliberately sequenced campaign. Against a non-traditional enemy, simultaneity includes the concurrent application of military force with other non-military elements of power to achieve desired effects. The nature of small-scale contingencies will often demand that the SBCT conduct combat operations simultaneously with the execution of stability and support tasks, to include population and area control, support to humanitarian operations and peace enforcement.
- *Distributed Operations.* Distributed operations consist of those activities and functions executed simultaneously throughout the depth, width, and height of the area of operations. They are conducted concurrently against multiple decisive points, rather than one decisive point, or a series of decisive points in sequence. Distributed operations are further divided into shaping, decisive, and sustainment operations, which are also conducted simultaneously across the battlespace. The SBCT is equipped, manned, and trained to operate within this battlefield framework.

The discussions below regarding SBCT shaping and decisive operations apply most directly to small-scale contingency operations. The main points are also relevant to its participation in major theater war, but the SBCT's overall responsibilities for shaping and decision are considerably reduced given the larger scale and longer duration of a major campaign.

- *Shaping Operations.* Shaping operations are those military activities that set the conditions for decisive operations. Responding to a small-scale contingency, the SBCT may conduct shaping operations prior to combat operations by means of early deployment, movement to within employment range (i.e., poised for entry), information operations, and other activities intended to influence the enemy's will and his assessment of his chances for success, with the goal of deterrence. Once combat is joined, shaping operations occur concurrently with decisive operations. Together, shaping and decisive operations overwhelm the enemy's centers of gravity and deprive the enemy of the ability and/or will to fight. With a traditional, symmetric enemy, SBCT capabilities for early entry and exploitation of joint effects coordinated through the division considerably enhance its ability to contribute to shaping the battlespace at operational and tactical levels. The SBCT can conduct feints, demonstrations, other offensive information operations, extended reconnaissance, and integrated maneuver and shaping fires to place the enemy at a disadvantage. It can isolate, neutralize, or destroy critical combat, command and control, intelligence, and logistical elements of the enemy force, deny the enemy's use of key terrain or resources, and prevent the enemy from achieving initial objectives or setting conditions favorable to his plans. SBCT shaping operations degrade or destroy key enemy capabilities, posture him for failure, set conditions for success, and shorten the timeline to decision. When dealing with a non-conforming, asymmetric adversary, SBCT shaping operations assume a broader nature. Centers of gravity and decisive points for asymmetric adversaries are more difficult to determine. How best to affect the perspectives and will of the enemy is not always clear at the outset. In many situations, military capabilities will not constitute the primary vulnerabilities or best means of influencing the asymmetric adversary. As a result, the traditional approach of employing lethal and non-lethal effects to degrade/destroy specific enemy capabilities is not sufficient in itself to shape the battlespace and affect the enemy's will. A more holistic approach is required. Other measures and activities encompassing all elements of national power—diplomatic, economic, and information (media, public affairs)—must be fully synchronized with military operations from tactical to strategic level.
- *Decisive Operations.* Military operations that compel the enemy to submit to one's will are decisive operations. Achieving decision against symmetric adversaries in the foreseeable future will still require Army forces to seize, secure, and control terrain and to repel, eject, kill, or capture enemy forces. Decisive operations depend primarily upon the simultaneous, synchronized delivery of precision fires and effects, coupled with exploitative maneuver, that leave the enemy incapable of physical or moral resistance. When employed within its optimal small-scale contingency operational environment, it is possible that SBCT shaping operations can transition quickly to decisive operations without reinforcement by follow-on forces, although reinforcing by additional decisive forces will be the norm. The SBCT is best suited to be applied against decisive points in urban and complex terrain where it will exploit its core capabilities for close combat and dismounted assault, empowered by situational understanding. Asymmetric warfare focuses whatever comparative advantages one side has against the other side's relative vulnerabilities or weaknesses. A defining and distinguishing aim of asymmetric warfare is to create conditions where an enemy's relative advantage cannot be applied, is degraded or is neutralized. For the asymmetric adversary, decisive operations are those operations that compel the enemy to cease resistance and agree to seek conflict resolution through a negotiated settlement. In this context, decisive operations extend further in time (beyond a cease-fire, for example) to include the post-conflict stability operations required to insure that negotiations and implemented political solutions take place in a controlled environment and lead to long-term stability. For the SBCT, decisive operations against an asymmetric adversary are characterized by integrated, multi-dimensional activities of similar scope and quality to shaping operations.

SBCT Tactical Operations

The SBCT is capable of executing any doctrinal tactical mission in complex and urban terrain. However, as a strategically deployable, full spectrum combat force available as a “first responder” to burgeoning crises, the SBCT has a pronounced offensive orientation. Its key operational capabilities in the areas of mobility, dismounted assault, and enhanced situational understanding/information superiority, although highly applicable to defensive situations, are deliberately designed to enhance its offensive power, with the clear benefits attendant thereto for deterrence, conflict prevention, containment, or conflict resolution. When employed in the circumstances for which it is optimized, the SBCT can achieve decision as an integral component with the joint contingency force. Centuries of military history instruct that decision most often follows the offense, rarely the defense. Accordingly, the SBCT’s offensive orientation is necessary, particularly given the projected nature of the international security environment and the expected conditions of the SBCT’s employment.

Nevertheless, the SBCT may be required to assume the defense temporarily in a small-scale contingency environment. In addition, some elements of the SBCT may assume a defensive posture while the Brigade as a whole conducts offensive operations. In those situations, the SBCT and its subordinate elements will execute existing doctrinal principles for an effective defense. Overall, the SBCT will purposefully exploit its dismount strength, highly mobile and lethal infantry carriers and support systems, and reach-back capabilities for joint fires/effects, to conduct a mobile defense. Enabled by RSTA operations that unveil and anticipate the enemy’s plan, a mobile defense best permits the SBCT to counter the enemy’s moves, deprives the enemy of initiative, and enables rapid and seamless transition to the offense at the earliest opportunity. The organization is not suited to conduct a long-term static defense; however, it is capable of doing so with augmentation, primarily additional lethal, CSS, and survivability capabilities.

As a motorized force, the SBCT is designed for fast-paced, distributed operations. Typically (non-augmented), it operates within an Area of Operations of approximately 50 kilometers by 50 kilometers. Distributed operations within the umbrella of situational awareness created by the RSTA squadron, and other sources permit the SBCT to dominate its entire Area of Operations and to dispose forces in the most effective manner. The RSTA squadron disperses throughout the entire Area of Operations to develop situational understanding. Normally, the infantry battalions will operate within smaller areas, non-contiguous to each other; constituent rifle companies and platoons may also be dispersed within the battalion areas (as may RSTA units), consistent with mission and situational factors.

Effects-based fires represent an emerging operational, organizational, and doctrinal evolution within the Army regarding the planning and employment of fires and effects. In the past, Army fires were platform and system oriented. Fires were planned based largely on the availability of indirect weapon systems organic to or assigned to support the organization. As such, fire planning tended to focus more on positioning and allocating weapons systems, munitions, and servicing targets, rather than achieving specified effects in time and space. The development of precision munitions and better non-lethal capabilities, coupled with advances in range, communications, and improved capabilities for routine employment of non-organic and joint service assets, are collectively leading to an orientation on effects rather than the systems that deliver fires.

The organizational and operational concept for the SBCT focuses on the employment of the brigade in small-scale contingency operations, the environment for which it is optimized. However, the SBCT is capable of operating throughout the entire range of Army operations, from less intensive stability and support operations to major theater war.

Full spectrum utility requires the SBCT to acquire additional capabilities through the process of augmentation, defined as the addition of units or elements that execute tasks or functions not resident within the SBCT (e.g., adding armor, air defense, military police, or aviation elements).

Augmentation is normally achieved by task organization from assets within the division, based on analysis of the division's mission. Type and extent of augmentation is determined by several factors. As with normal task organizations, the period of the augmentation is dependent upon the phase of operation and upon the tasks, missions, and objectives assigned to the SBCT within the overall division mission.

- When deployed as part of a light division, the SBCT extends the tactical mobility available to the division commander and increases the organic firepower available to support dismounted infantry assaults. As the most mobile, lethal, and survivable element within a light division, the SBCT is likely to be employed as the main effort within the division. It may therefore receive the large share of divisional resources elements such as combat engineers to assist mobility in offensive operations, an aviation task to expand combined arms capabilities and extend the range of its reconnaissance, surveillance and security, and air defense to insure its protection against enemy air threats.
- When deployed as part of a heavy division, the SBCT is the first to deploy, facilitating the arrival of the remainder of the division by consolidating and extending the security of entry points, accelerating the closure of the entire division in theater. The SBCT, with its increased tactical and operational mobility, when not in contact, adds dimension to the capabilities of the heavy division. However, given the differences between the IAV-based SBCT and the M1/M2-based heavy ground maneuver formations, the SBCT does require force tailoring. With augmentation, the SBCT is a full participant in heavy division combat operations. It can form part of the division's main effort, execute the supporting attack, act as the division reserve, conduct economy of force operations, or conduct operations in complex/urban terrain while other division elements operate within open and mixed terrain. Additional artillery is likely to be required to compensate for limitations of direct fire to conduct offensive operations against mechanized and armored threats. Division artillery must provide higher priority for proactive counterfires to enhance the SBCT's survivability versus the threat arrayed against the division. In short, the Brigade provides additional capabilities but also consumes capabilities of divisional resources elements.

Regardless of environment, certain principles and consequences govern the nature of augmentation and its effect on the SBCT. Augmenting units do not require extensive training to operate with the SBCT. They will operate as they are organized, trained and equipped, executing tasks in accordance with their own Mission Essential Task List. Augmentation will be mission and situation dependent. Although augmentation elements may be pre-packaged (in task forces) from the point of view of planning, every contingency is characterized by unique requirements. Any augmentation packages task organized to the SBCT must include additional CSS structure and capability. The SBCT's CSS structure is not sufficient to accept increased sustainment requirements without itself being augmented. Similarly, augmentation packages may need to be accompanied by tailored staff support in order to expand the ability of the SBCT headquarters to execute effective command and control.

Augmentation would be required for many major theater war and stability and support operations situations.

- Major theater war presumes the presence of large enemy forces with some measure of symmetry to US forces with respect to air and ground capabilities, including, in particular, high performance aircraft, attack aviation, mechanized formations, cruise/theater ballistic missiles, extensive precision rocket and cannon artillery, and chemical/biological munitions. The terrain in which the SBCT would operate may vary from open and rolling to mixed complex/urban. When employed in this environment, it must acquire additional capabilities for lethality, survivability, and sustainability. Augmentation packages required for major theater war may include the following kinds of forces and capabilities: armor/anti-armor, reconnaissance, fires and effects, aviation, air and missile defense, maneuver support (through additional engineer and military police resources), chemical, and CSS.

- Stability and support operations (SASO) (“the use of military capabilities for any purpose other than war”) cover a broad range of military activities, including combating terrorism, support to counter-drug operations, nation assistance, noncombatant evacuation, peace operations, show of force, support to insurgencies or counterinsurgencies, humanitarian assistance, foreign humanitarian assistance, and domestic support operations. SASO normally entail a combination of actions and operations within a single Area of Operations. SASO can be long or short in duration, unilateral or multilateral, domestic or foreign, developmental or coercive. They will often be joint and multinational. As a rule, these operations are governed by restrictive rules of engagement and are more sensitive to political considerations than higher-end military operations. SASO can be initiated under very short timelines or they may involve extended warning and preparation. In some stability and support operations, the Army will be in a support role to another US agency or international organization. Finally, these operations can be carried out in a permissive, relatively benign environment, or they can involve the threat or actual conduct of tactical combat operations. When committed to SASO, the SBCT is expected to take the role of a "combat guarantor force" that provides security and protection to forces and agencies charged with the core SASO mission. The SBCT must preserve its basic combat power in order to fulfill its expected mission, but, as in every contingency operation, situational factors will determine precisely how the SBCT will be scaled, augmented, or otherwise mission-tailored. Substantial elements in the SBCT are already well suited to a SASO environment, particularly the infantry battalions, the RSTA squadron, and the command's communications structure (including signal and MI companies). However, some SBCT augmentation is likely required in the following areas: aviation, air defense, effects coordination, maneuver support (through engineers and military police assets), chemical, and CSS.

D. Training Exercises and Scenarios Occurring in Hawai‘i

Training Exercises

- *Map exercise (MAPEX)*. The MAPEX portrays military situations on maps and overlays. It requires a minimum number of support personnel and may be conducted in garrison or in the field. Communications equipment may be used. A MAPEX helps the commander train his staff and leaders in planning, coordinating, and executing operations tasks on map boards, chalkboards, training mock-ups, and sand tables. A MAPEX trains soldiers and leaders to function as an effective team, exchanges information, prepare and give appraisals, make recommendations and decisions, prepare plans and issue orders, and coordinate execution of orders.
- *Tactical Exercise Without Troops (TEWT)*. The TEWT is conducted on actual terrain with unit leaders and staffs, without soldiers. A TEWT allows a battalion task force or company commander to train his staff and subordinate leaders. It also allows him to analyze, plan, and present how he would conduct an operation on the actual terrain. Because only the battle staff and selected support personnel are involved, the TEWT is an inexpensive way to familiarize leaders with an area of operations. A TEWT can be used to train personnel to analyze terrain, employ units according to terrain analysis, emplace weapons systems to best support the unit's mission, prepare and validate plans, and to plan combat support and combat service support operations.
- *Fire Coordination Exercise (FCX)*. The FCX is used to train the combined arms team chain of command and related fire control elements to rapidly synchronize fires on the battlefield. The exercise can use reduced-scale targets and training facilities to depict combat situations. The chain of command must respond in the form of maneuver and fire coordination techniques and procedures. Each subunit is represented by a single weapon system, which can be equipped with a subcaliber device and commanded by a platoon or section leader. Commanders use FCXs to develop the chain of command into a team, synchronize fires within the combined arms team, train the chain of command prior to a live fire exercise, exercise the communications net, assist in integrating new weapons system, and portray a rapidly changing situation for the chain of command to react to. FCXs are normally used to train from platoon through-battalion level.
- *Command Post Exercise (CPX)*. The CPX may be conducted in garrison or in the field. It requires the establishment of the command post. When compared with the MAPEX or TEWT, it represents a greater commitment of soldiers' time and resources. A CPX is an expanded MAPEX for staff and all commanders to lead and control tactical operations by using tactical communications systems. Normal battlefield distances between command posts may be reduced. A CPX trains commanders and staff to build teamwork and cohesion, exchange information by proper reporting in accordance with tactical standing operating procedures (SOPs), prepare plans and orders, establish and employ tactical communications, displace headquarters and command posts, and integrate synchronized battlefield operating systems. While battalions and companies may participate in a CPX as part of a larger force, they also may conduct internal CPXs.
- *Situation Training Exercise (STX)*. STXs are mission-related, limited exercises designed to train one collective task, or a group of related tasks and drills, through practice. STXs teach the standard, preferred method for carrying out the task. They are more flexible than drills and usually include drills, leader tasks, and soldier tasks. STXs may be modified, based on the unit Mission Essential Task List, or expanded to meet special mission requirements. The company commander trains STXs and other similar exercises while platoons execute combat and crew drills. The battalion commander does the same for company exercises. The battalion commander assigns his staff to evaluate and assist with the STX. The STX's final objective is to prepare units for larger scale exercises.

Prerequisite training for the STX is progressive with heavy emphasis on drills. “Close-in” or local training follows with drills executed in a tactical setting using multiple integrated laser engagement systems (MILES).

- *Command Field Exercise (CFX)*. The CFX lies on a scale between the CPX and Field Training Exercises (FTX) (see below). The CFX can be a backup for the FTX if maneuver damage, weather, or other factors prohibit a planned FTX. The CFX is an FTX with reduced unit and vehicle density, but with full combat arms, combat support, and combat service support elements. For example, a platoon leader in his vehicle represents the entire platoon. CFXs provide vehicles for training leaders and staff with full command, control, communications, and logistical systems. They sharpen unit skills in such areas as intelligence, fire support, rear area operations, and command, control, and communications. A CFX can train as much, or as little, of the unit as necessary, depending on the commander's assessment and training objectives.
- *Logistical Coordination Exercise (LCX)*. LCXs allow leaders to become proficient at conducting unit sustainment operations such as supply, transportation, medical, personnel replacement, maintenance, and graves registration. LCXs provide hands-on opportunities to deal with combat-related challenges of these activities. Through LCXs, leaders develop SOPs essential to effective task accomplishment. An LCX clarifies key elements of a battalion, squadron, or task force logistics apparatus, exercises the flow of logistical information, incorporates a tactical war game that produces a wide variety of logistical requirements, and exercises the communications network.
- *Field Training Exercise (FTX)*. FTXs are conducted under simulated combat conditions in the field. FTXs fully integrate the total force in a realistic combat environment. They involve combat arms, combat support, and combat service support units. FTXs encompass such training as battle drills, crew drills, and STXs to reinforce soldier and collective training integration. They are used to train the commander, staff, subordinate units, and attached elements to move and maneuver units realistically, employ organic weapons systems effectively, build teamwork and cohesion, plan and coordinate supporting fires, and plan and coordinate logistical activities to support tactical operations.
- *Live Fire Exercise (LFX)*. LFXs are resource-intensive events in which units maneuver and employ organic and supporting weapons systems using full-service ammunition. LFXs may integrate all combat arms, combat support, and combat service support elements. Since extensive range and resource requirements usually limit LFXs to platoon and company team levels, their principal focus is on unit and weapons integration at company team level. LFXs provide realistic training on collective and soldier skills in such areas as, fire control and distribution, command and control in a noisy, confusing environment, individual movement techniques, integration of all fire support assets, small-unit tactics, weapons, demolitions, and other pyrotechnics not used in other exercises, and safety awareness.
- *Reconnaissance Training In Kawaihoa Training Area*. Dismounted training in Kawaihoa Training Area is conducted by Legacy units at present and will also be conducted by elements of the SBCT. Typical operations involve small groups, from squad to platoon strength (3 to 50 soldiers). No live fire is involved, and vehicles are not typically used. The training is conducted between 20 and 40 times per year, in daytime and at night. Unit movement during dismounted training activities may consist of soldiers in tactical (when contact with an enemy is likely) and non-tactical (when contact with an enemy is not likely) formations moving in a predetermined direction to accomplish a mission. Maneuver also entails the set-up of temporary defensive positions to repel an enemy attack. Defensive positions may consist of soldiers lying in concealed positions and designating fire zones.

During extended maneuver training, soldiers may sleep in the field. To avoid detection and allow for quick displacement, tents are not set up during light infantry maneuvers.

- *Company combined arms live fire exercises (CALFEXs).* All infantry companies are required to conduct at least one CALFEX annually. The following subsections describe, in general terms, a company-level CALFEX.

Movement to the CALFEX Site—Moving an infantry company to the CALFEX site typically involves approximately 150 persons and supporting elements via 10 to 15 military vehicles. Movements are scheduled to avoid peak commuter and school transit hours. Travel may be in convoys or individual vehicles dispersed throughout the traffic flow. Aviation units fly out to the CALFEX site at scheduled times prescribed in the training scenario.

The unit ammunition section from the battalion support platoon draws ammunition to be used for the exercise at the ammunition storage point at WAAF, at the naval magazines at Lualualei, or at West Loch, where ammunition types for military units in Hawai'i are stored in specially designed facilities. Any unused ammunition must be returned at the end of the exercise.

Vehicles used to transport ammunition must pass a rigorous safety inspection before they are allowed to enter any ammunition storage facility. All personnel involved in transporting ammunition are trained in accordance with Army, federal, and state standards and are certified to transport hazardous materials. Artillery and mortar ammunition are packed separately from ignition fuses to preclude accidental detonations. In addition, all ammunition is stored in specialized packing materials designed to withstand an impact 15 times greater than the force of gravity, which further reduces the risk of accidental explosion. All vehicles used in moving ammunition are powered by diesel fuel or JP-8, fuels that are much less volatile than gasoline. These factors contribute to substantially reducing the risk of explosion in a vehicle accident.

Preparation and Dry Fire—Exercise units arrive at the training site and bivouac in designated areas near roadways. Their ammunition is stored at ammunition supply points in the vicinity of the exercise and are guarded throughout the exercise period. Soldiers subsist on prepackaged meals, ready-to-eat or on delivered hot foods, and they use portable toilets. Pop-up targets and blast simulators are sometimes placed in the training area to replicate contact with the enemy.

Unit leaders receive briefings from range division staff on the locations of threatened and endangered species and habitat, locations of known cultural resource sites, fire hazards, and fire prevention measures and procedures. Where necessary, the scenario is modified to reduce the risk of fire or other damage to the environment.

Various measures and procedures may be used to deal with the threat of fires. Soldiers from the unit may be designated as firefighters and in the event of a fire can be immediately withdrawn from training and dedicated to assisting professionally trained firefighters. A helicopter dedicated to firefighting may be on call. Smoking may be permitted only in the administrative bivouac site or other designated areas. In the event of fire at any location, the unit takes all appropriate actions to put out the fire.

Live fire exercise—The company generally moves with three platoons of approximately 30 to 40 men (or nine squads of five to ten men each, plus personnel operating machine guns and support personnel) toward the objectives. The soldiers in the first squad in the lead platoon fire their rifles and machine guns at the objective or target. The mortar section fires its 60mm mortars at the target while the lead platoon moves toward it. When the lead platoon makes contact with the target, the

platoon leader moves the squads to a position of advantage and, by spreading out the soldiers to ensure that they can hit every target, gains fire superiority over the “enemy.”

Most exercises present advancing platoons with the problem of trench lines, mine fields (simulated), and concertina wire obstacles. Confronted with these situations, platoons must practice the skills required to enter and clear a trench line, to conduct a company deliberate attack, to conduct a platoon and squad attack, to knock out a bunker, and to conduct an initial breach of a mine field/obstacle. Some simulated minefields will be cleared with the aid of engineers attached to the company. Bangalore torpedoes (10-foot (3-meter)) tubes filled with explosives) may be used to blast routes through such locations.

Upon seizing their objectives, units must prepare for any counterattack. A company commander may direct the emplacement of Claymore mines (small, command-detonated antipersonnel mines) in front of the unit. If artillery is employed in the scenario, the company commander may distribute its fire preparatory to the attack or direct its fire toward a target to suppress counterattack. The commander may also direct the company’s anti-armor section to position their missile launchers to prevent any enemy tanks from overrunning the just taken objective.

Company-level scenarios can be modified to include additional training opportunities and combat elements. Helicopters may be used for air assault. Troops in observation and attack helicopters may fire their guns into designated impact areas in support of ground troop movement. Helicopters may also be sling-loaded with vehicles and equipment for the company’s use. Artillery support is an integral part of combined arms training. The size of the howitzer (155mm or 105mm), a cannon that combines certain characteristics of guns and mortars, depends on the range being used. A typical exercise involves at least two gun sections.

Scenarios are typically conducted both day and night in order to complete a training evaluation to Army standard.

Conclusion of training—After the CALFEX is complete, units remove any target equipment they may have provided, gather brass casings from spent rounds, remove litter, and otherwise make every effort to restore the range to its condition prior to their use. Explosive ordnance disposal (EOD) specialists destroy all unexploded ordnance. Ordnance normally is destroyed where it is found, whether from the training being conducted or from earlier exercises. No known dud rounds are left in place at the conclusion of a training exercise.

Training Scenarios

- *Force-on-Force (FOF) Operations.* These operations involve armed clashes between two organized forces, up to brigade-level. Activities include dismounted ground maneuvers during day and night, helicopter operations day and night, operation of wheeled and tracked vehicles, establishment of field command centers, establishment of operating sites for logistics and aviation units, and preparation of field fortifications. There is a continuous movement of aircraft, vehicles, and troops within the training area during FOF operations. The multiple integrated laser engagement systems (MILES), blank ammunition and artillery, flares, and other pyrotechnic devices may be used extensively to simulate live fire during FOF operations.
- *Military Operations on Urbanized Terrain (MOUT).* These operations provide realistic training in third world urban warfare scenarios. MOUT facilities typically represent several kinds of properties that might be encountered by soldiers and leaders, such as a city complex, an airfield, and a military

compound. FOF training for light infantry and Special Forces can be conducted throughout MOUT facilities using MILES. Depending of training complex capabilities, precision engagement live-fire training may be conducted in buildings in a MOUT complex.

- *Special Forces*. Special Forces training concentrates on clandestine, cover, and low-visibility techniques used to gather intelligence data on a target or to conduct limited offensive strikes.
- *Military Operations Other Than War (MOOTW)*. Training exercises for MOOTW include activities that occur during peace time and war time and consist of a variety of tasks such as Special Forces Operations, peace-keeping, and peace-enforcement actions. These training activities emphasize military interactions with civilians-on-the-battlefield and MOUT, with limited FOF training. Exercises are often conducted at specially-constructed villages that replicate population centers in third world countries.

E. Army Transformation Overview

Army Transformation

The following information provides an overview of the foundation for and processes underlying Army Transformation.

Concept. Army Transformation is a multi-year, phased, synchronized effort approach throughout the operational force and the institutional Army to translate the Army Vision from concept to reality in the most efficient and effective manner.

During transformation, the Army will retain its Legacy Forces (the present operational force assets) until their scheduled transformation. The Army will modernize and sustain selected legacy formations to maintain essential capabilities in support of the National Command Authority. While maintaining readiness, the Army will simultaneously design and field new Interim and Objective Forces, both of which will respond to the near-term capabilities gap and, ultimately, provide for a more strategically responsive Army.

Deliberate, synchronized transformation entails three simultaneous efforts: (1) maintenance of a trained and ready force capable of fighting and winning the Nation's wars, (2) transformation of the operational force, and (3) transformation of the institutional Army. These three efforts will proceed based on a strategy involving a series of decisions. Each decision will be based on stated objectives and the achievement of associated conditions that will have to be met before implementing subsequent decisions.

Characteristics of Transformed Forces. Transformation seeks to fulfill the Army Vision which provides for an Objective Force that has the characteristics of being more responsive, deployable, agile, versatile, lethal, survivable, and sustainable. All transformation efforts will proceed in a controlled and coordinated fashion to implement changes necessary to achieve these characteristics. The following are the seven force characteristics described in the Army Vision that will drive the transformation process.

- *Responsiveness.* Responsiveness requires the ability, within hours of a decision, to put forces where needed on the ground, supported by air and naval forces, to directly affect the outcome of a situation or crisis. The force must be prepared to accomplish its mission regardless of the environment, nature, or scope of the proposed operation, or other commitments. It should have a demonstrated capability to deter a prudent adversary. Also required is a capability for preemptive, not just reactive, employment to influence and shape the outcome of the crisis. If required, the force should have the ability to respond through use of force from low to high intensity. Responsiveness pertains not only to the operational force. For instance, the mobilization process must be responsive to ensure access to the entire force in a timely manner.
- *Deployability.* Strategic deployability is critical: The Army must have the speed to confront enemies before they can attain their goals. The Army needs to be able to put forces in place that will change an adversary's decision calculus. Doing so can create the opportunity to avert conflict through deterrence. The Army has established a requirement to have a combat brigade on the ground with 96 hours (4 days), a division within 120 hours (5 days), and five divisions within 30 days. Operationally, the Army must have the capability to position forces to create advantages in the theater and on the dispersed battlegrounds of the future. Information superiority can help create that advantage. Forces must be rapidly deployable across the theater, providing the adversary a more complex targeting challenge. This factor affects the size and number of systems to be developed and employed and the intra-theater lift requirements.
- *Agility.* To meet the demands of highly volatile situations, all forces must inherently be able to shift intensity of operations immediately without augmentation, break in contact, or additional training.

Today's forces have the agility to shift from offensive to defensive to offensive operations. That kind of agility must be developed in a much broader, full-spectrum operational context. With little or no time to change mindset or organization design, forces will be called on to transition within or between operations ranging from noncombat disaster relief to low-intensity contingencies to high-intensity warfighting. Although forces must prepare for the unexpected, agility will reduce the risks associated with uncertainty and surprise.

- *Versatility.* Future forces must be more adaptive to both different and changing situations. Rarely is there time to organize and prepare forces to respond specifically at various points across the spectrum of operations. Organizational flexibility to respond must be built in. With the downsizing that followed the post-Cold War era, there are currently too few forces to specialize greatly. The operational tempo and personnel tempo of the broad range of crisis response contingency operations and sustained commitments cannot be supported by only a portion of the Army's resources. The Army must have the ability to commit all of the force in its turn, regardless of component, to meet operational demands.
- *Lethality.* An overwhelming ability to win through application of lethal force can frequently preclude conflict by making the adversary's potential losses disproportionate to his objectives. Lethality must be embedded in every force and unit, including support forces. Even in seemingly benign environments, forces cannot ignore the possibility of a chance encounter with hostile elements. The consequences of the inability to apply appropriate lethal effects extend beyond unnecessary loss of life and could include potentially significant political and operational changes in the environment. Increased lethality also means that fewer forces might be required in each operation to achieve similar effects. Increased lethality enables a force to be more responsive and deployable, as well as less dependent on heavy support forces that have large logistical footprints.
- *Survivability.* All possible measures to protect a force and to ensure its survival are crucial to its confidence and ability to carry out assigned missions. Survivability also affects adversaries' perceptions about their ability to fight and win against U.S. forces. The Army must improve its force survivability capabilities through the integration of new technologies into systems and equipment, address emerging threat capabilities, and eliminate the risks of fratricide.
- *Sustainability.* Forces must have the capability to continue operations longer than any adversary confronted. Sustainability is directly linked to responsiveness and deployability. Assigning too many forces or the wrong forces to the mission strains the support system. Use of reach back and split basing reduces some of the sustainment requirements. Support from a host nation or other ally to sustain the force depends on arrangements documented in written agreements and periodic rehearsals to ensure operational execution. Even so, forces need the ability to operate unilaterally, despite the costs of that mode of operation. The Army must find ways to exploit advanced technologies in order to lower the logistics footprint and the related costs of support structure.

Transformation Objectives and Phases. Objectives are desired outcomes. They are essential to achieving unity of effort and focusing on realization of the Army Vision. Objectives are defined by associated sets of conditions. The three major objectives of transformation, described below, are the Objective Force, the Interim Force, and the Initial Force.

- *Objective Force.* The Objective Force is a future force that will achieve the seven force characteristics described in the Army Vision, be strategically responsive, and be able to deploy rapidly and dominate across the full spectrum of operations. Capitalizing on advances in science and technology, the Objective Force will be equipped with leap-ahead technologies that enable overmatching combat power. Elements of the institutional Army will also undergo change. Installations will be power

projection platforms to enhance deployment and to support deployed formations. Training regimes will address abilities to handle complex and varying situations, enabling soldiers and leaders to gain a greater degree of agility.

- *Interim Force.* The Interim Force will fill the strategic near-term capability gap. It will leverage current state-of-the-art technology and a modernized Legacy Force as a bridge to the future. The Interim Force, although organized as a rapidly deployable force for providing the warfighting Combatant Commanders with increased options for responding to small-scale contingencies, will be available for employment, with augmentation, in major-theater wars. Interim Force units will be highly mobile at the strategic, operational, and tactical levels. They will be transportable in the Air Force's principal tactical cargo plane, the C-130, or comparable aircraft. They will be equipped with a family of interim armored vehicles (IAVs), lightweight artillery, and other available technology designed to ensure maximum lethality and survivability while increasing tactical, operational, and strategic maneuverability. Stryker Force brigade bases will be self-contained, fully mobile, and completely deployable by air. Deploying units will be projected as combat-ready units, organized and equipped for immediate operational employment.
- *Initial Force.* The Initial Force consists of two brigades located at Fort Lewis, Washington. These brigades, furnished with off-the-shelf equipment, are being used to evaluate and refine the Operations and Organization concept for a brigade combat team and to develop tactics, techniques, and procedures. Achievement of these measures will establish the critical conditions necessary for the Interim Force. Lessons learned and insights derived from the Initial Force will help achievement of the Interim Force capability. Upon fielding of the first UAVs, these units will be designated Stryker Brigades.

Transformation of the Army is planned to occur in three major phases:

- *Initial Phase.* In this phase, the Army is creating two Initial BCTs at Fort Lewis, to validate an organizational and operational model for Stryker BCTs. In the Initial Phase, warfighting units would be fully manned and the major focus would be on developing the strategic, operational, and tactical doctrine for subsequent phases of transformation.
- *Interim Capability Phase.* The major objective of the Interim Capability Phase is to field five to eight Stryker BCTs. At least one Stryker BCT will be drawn from the Army National Guard. The Interim Capability Phase will begin with the fielding of the IAVs. The Initial BCTs at Fort Lewis will become part of the Interim Force at that time. The Interim Capability Phase will end when the last Stryker BCT is fully manned, equipped, and trained to possess the capabilities described in the Stryker BCT Operations and Organization. During this phase, the Army will consist of both Legacy Forces and transformed forces. The transformed forces will be capable of conducting joint, multinational, and interagency missions. Insights gained from these operations will help refine and define the operational requirements and capabilities of the Objective Force. The Army expects to transition from the Interim Force to the Objective Force in the 2008—2010 time frame. This transition will depend highly on progress in science and technology developments.
- *Objective Capability Phase.* The major goal of the Objective Capability Phase is the Objective Force itself. This phase of the transformation will begin when the first Objective Force operational unit is fully manned, equipped with a "Future Combat System" and trained to achieve the capabilities described for the Objective Force. It will end when the Army has been fully converted to the Objective Force capability.

Synchronization of Efforts. Integration and synchronization of the Army's transformation efforts will be guided by the Transformation Campaign Plan (TC Plan). The TC PLAN is a "living" and continuously evolving internal "working" plan for synchronizing transformation activities. The TC PLAN contains the level of detail required to synchronize efforts and to maximize the effectiveness and efficiency of those efforts. At the same time, the TC PLAN is designed to allow maximum flexibility for innovation and initiative throughout the Army as the Army moves toward achieving the transformation objective.

For instance, the TC PLAN could be revised upon determination by senior leadership that specific tasks or responsibilities need to be reassigned from one major Army command to another. Alternatively, future events might lead to revised perspectives on the world situation that the Army confronts, resulting in identification of amended or new strategic requirements to be addressed. The basic feature of the TC PLAN, which is its establishment of a framework for synchronization of planning for and execution of transformation to reach the goals expressed in the Army Vision, is not expected to change substantially.

Early Actions. The Army has initiated certain actions to validate Initial and Interim Force concepts. The Army began the Initial Phase by identifying two Initial BCTs at Fort Lewis, Washington. These Initial BCTs serve as the validation force for development of operational concepts relevant to transformation. In many instances, the two Initial BCTs use "off-the-shelf" equipment and vehicles in lieu of the equipment and vehicles expected to be acquired for the Interim Force. The Army has taken this initial action to validate basic concepts on which subsequent transformation planning and implementation activities can logically build.

The Army is also conducting an acquisition program for an UAV to be used by the Interim Force. Compared to present heavy forces, which consist primarily of units employing the M1A1 Abrams Tank and the M2/M3 Bradley Fighting Vehicle, the IAV is intended to provide improved force deployability and sustainment.

Transformation to the Interim Capability Phase involves converting a number of existing brigades to Stryker BCTs and, eventually, to units that have the characteristics of the Objective Force. Because of equipment fielding, personnel staffing, and training requirements, the conversion process for brigades and possibly higher echelons would occur over a period of several years. In July 2001, the Army identified which organizations, in addition to the two brigades at Fort Lewis, will be converted to Stryker BCTs. They are the 172nd Infantry Brigade, a separate brigade located at Fort Wainwright and Fort Richardson in Alaska; the 2nd Armored Cavalry Regiment (Light), stationed at Fort Polk, Louisiana; the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks in Hawai'i; and the 56th Brigade of the 28th Infantry Division (Mechanized) of the Pennsylvania Army National Guard.

Transformation as a Work in Progress. Army Transformation will have many direct and indirect consequences to manning, equipping, and training of operational forces. As transformation is of only relatively recent origin and continues to unfold, it is a work in progress.

The Active Component of the Army has 10 divisions, and the Reserve Component has 8 divisions. Each division has three brigades. The Army also has a limited number of armored cavalry regiments and separate (non-divisional) brigades, bringing the total number of brigade-sized units to 70. Brigades usually have 3,000 or more personnel. "Heavy" brigades of armored and mechanized forces (such as the 2nd Armored Cavalry Regiment) generally have more personnel than "light" brigades, which consist mainly of dismounted infantry. The Army's heavy brigades have no peer in the world, but they are challenged to deploy rapidly. The Army's light brigades are the world's finest, but lack adequate lethality, survivability, and mobility once in theater in some scenarios. Transformation will affect all the Army's brigades by bringing about changes that will render them more responsive, deployable, agile, versatile, lethal, survivable, and sustainable. Reaching these objectives will require changing the organization and operational concepts of the Army's brigades, and then providing manning, equipping, and training to the brigades in accordance with the revised concepts.

In the near- and mid-term, SBCTs will use wheeled vehicles. The interim armored vehicle (IAV), now in production, will weigh less than 20 tons to enable its in-theater air deployment by tactical transport aircraft such as the C-130. An MGS will be similarly air transportable. In what were formerly light brigades, the IAVs and MGS will bring greater tactical mobility and firepower to the infantry. In what were formerly heavy brigades, these systems enable strategic mobility by replacing heavy tracked vehicles such as the M2A1 Bradley Infantry Fighting Vehicle, M3A1 Bradley Cavalry Fighting Vehicle, and M1A2 Abrams Main Battle Tank. Ultimately, the Army will develop and acquire its Future Combat System. The Future Combat System will be an integrated system of systems that exploits leap-ahead advances in scientific technologies.

SBCT PROJECT DETAILS

USARHAW

SBCT Project List—Table of Contents

Project Location	Project Title	Graphics Code	Page Number
<u>Projects for Proposed Action</u>			
SBMR	Urban Assault Course and Training Facilities	S1	D-2
SBMR	Virtual Fighting Training Facility	S2	D-4
SBMR	Range Control Facility	S3	D-6
SBMR	Battle Area Complex (BAX)	S4	D-8
SBMR	Motor Pool	S5	D-10
SBMR	Tactical Vehicle Wash Facility	S6	D-12
Antenna locations throughout army training ranges on O‘ahu	Fixed Tactical Internet (FTI)	S7	D-14
SBMR South Range	South Range Land Acquisition	S8	D-22
SBMR	Qualification Training Range 1 (QTR1)	S9	D-24
SBMR - South Range	Qualification Training Range 2 (QTR2)	S10	D-26
Wheeler Army Airfield (adjacent to SBMR)	Multiple Deployment Facility	S11	D-28
Wheeler Army Airfield (adjacent to SBMR)	Upgrade Airfield for C-130 Aircraft Operations	S12	D-30
SBMR route to DMR	Land Easement/Road Construction between SBMR and DMR	D1	D-32
KTA	Tactical Vehicle Wash Facility	K1	D-34
KTA	Combined Arms Collective Training Facility (CACTF)	K2	D-36
Road from SBMR to HMR on the route to KTA	Easement/Road Construction between SBMR and Helemanō Military Reservation (HMR)	K3/K4	D-38
PTA	Battle Area Complex (BAX)	P1	D-40
PTA	Anti-Armor Live Fire and Tracking Range (AALFTR)	P2	D-44
PTA	Easement/Construct Tank Trail between Kawaihae Harbor and PTA	P3/P4	D-48
PTA	Ammunition Storage Area	P5	D-50
PTA	Tactical Vehicle Wash Facility	P6	D-52
PTA	West PTA Maneuver Training Area Acquisition	P7	D-54
PTA	Range Maintenance Facility	P8	D-56
PTA	Upgrade and Reorient Bradshaw Army Airfield (BAAF) Runway	P9	D-60
Antenna locations throughout Island of Hawai‘i	Fixed Tactical Internet (FTI)	P10	D-62
PTA	Installation Information Infrastructure Architecture (I3A)	P11	D-66
<u>Projects for Reduced Land Acquisition Alternative</u>			
SBMR	Reduced Land Acquisition Area for South Range	None	D-68
PTA	Qualification Training Range (QTR2)	None	D-70

Figure D-1

Urban Assault Course and Training Facility

Graphics Code: S1

Project #: 58143

Project Title: Urban Assault Course and Training Facilities

Project Location: SBMR

Project Size: 1,742 square feet of structures and 14 acres of training area

Construction Timeframe: December 2005 to December 2006

Background: The Military Operations on Urbanized Terrain Assault Course at SBMR is not designed to support the Army's urban operations training strategy. Training facilities in Hawai'i are inadequate to satisfy the training requirements for the Mobile Gun System, Light Armored Vehicle, and Reconnaissance Armored Vehicle. Hawai'i-based units are unable to train to standards because they do not have an urban assault course, breach facility, and live-fire shoothouse.

Project Description: Construct a state-of-the-art Urban Assault Course, including a breach facility, an urban assault training facility, and a live-fire shoothouse. The breach facility would be used to train soldiers in the proper techniques to enter buildings through doors, windows, and walls. The urban assault training facility would train soldiers in other techniques associated with urban combat, including underground training. The live-fire shoothouse would be used to train individuals, squads, and platoons on the proper techniques to enter and clear a building. The shoothouse is the culmination of the training at the breach facility and the urban assault training facility and is required to support the combined arms urban operations training strategy for conducting full spectrum operations (offense, defense, stability, and support). Range operations facilities will include a small After Action Review (AAR) building, a latrine, and an operations/storage building. Simulated overhead power lines would be run from building to building throughout the "city" training objective but would not be connected or energized. Range operational supporting facilities include a new access road and temporary parking area for privately owned and tactical vehicles, primary and secondary power, and data distribution systems. Storm drainage, site improvements, and berms will be provided as necessary. This facility would replace the military assault course on the Kolekole Ranges at SBMR and would be sited 100 yards north of Trimble Road, approximately one-and-a-quarter miles west of the intersection of Beaver and Trimble roads. The project would be oriented to the north using the current range impact area.

Estimated Utility Requirements: This project would require connection to the primary power distribution system. Electrical lines (12.47-kilovolt, three-phase) are available 1,640 feet away. A 120/240-volt secondary power line would be run underground from the small AAR Building power panel to the outlying structures (the shoothouse and other appropriate facilities). Air conditioning requirements are estimated at 20 tons. Heating is not required. All sewage on the site would be collected in the aerated vault latrine and removed by pumper truck, so no sewage lines or septic field would be required. Water would be trucked to the site, so no waterline, distribution systems, or well would be required. Telephone and LAN service can be had approximately 10,000 feet from the project site at the Information Systems Facility (ISF). Approximately 1500 feet of aerial cable will be run from the AAR building to the Information Installation Infrastructure (I3A) to provide connectivity for this project. The cable would be attached to a new power pole line. The remaining buildings within the project requiring telecom services would be connected via an underground duct system to the AAR building. The availability of these utilities is expected to continue.

Figure D-2
Virtual Fighting Training Facility

Graphics Code: S2

Project #: 57404

Project Title: Virtual Fighting Training Facility

Project Location: SBMR

Project Size: 11,496 square feet

Construction Timeframe: After March 2009

Background: The Army has identified a new requirement for a consolidated and virtual training facility. Facilities considered for renovation are too small, lack infrastructure, and have inadequate fire protecting provisions to house the type of sophisticated simulator equipment necessary to train 2nd Brigade units to cover their strategic, operational, and tactical missions.

Project Description: Construct an 11,496-square-foot, single-story, state-of-the-art virtual fighting training facility to house war-fighting simulation operations to support small arms marksmanship and dismounted weapons system training. The facility would include 50 engagement skills trainer lanes (video game-like weapons simulators), an AAR room, a conference area, a break area, administrative office space, storage, restrooms, a telecommunications room, a mechanical room, a classroom, and an electrical room. Support facilities would include water, sanitary sewer, storm drainage, electric service, fire protection and alarm systems, telephone, paving, walks, curbs, gutters, parking, information systems, state-of-the-art intra-communications and intercommunications systems, and site improvements. The building would be constructed on the south side of Trimble Road, approximately half a mile west of the intersection of Beaver Road and Trimble Road.

Estimated Utility Requirements: Electrical power is estimated to be 148 KVA. Energy consumption is estimated at 370,000-kilowatt hours per year. Air conditioning requirements are estimated at 40 tons. Heating is not required. Water supply is estimated at 4,000 gallons per year. The sanitary sewer will connect to the existing installation sewer system by gravity flow. Telephone and LAN service can be had approximately 3,000 feet from the project site at the ISF. Approximately 100 feet of underground duct would be installed from the Virtual Fighting Training Facility building to the I3A to provide connectivity for this project.

Figure D-3
Range Control Facility

Graphics Code: S3

Project #: 56923

Project Title: Range Control Facility

Project Location: SBMR

Project Size: 22,133 square feet

Construction Timeframe: After March 2009

Background: Range Division Hawai'i commands and controls operations at all Army training areas on O'ahu. Operations are dispersed among eight buildings at SBMR and Wheeler Army Airfield (WAAF). The Range Control Facility (Building 1150), the only permanent-construction facility of the eight buildings, was converted from a simulator building on this site. Customers must stand outdoors while talking with staff. The other seven buildings used for range operations and maintenance are semi-permanent or temporary construction and have long since exceeded their useful lifespan. The welding shop lacks a sprinkler system and adequate ventilation, which means all welding must be done outdoors. Locating the carpentry shop, electronics shop, supply/storage, and administrative space together means all personnel must wear earplugs because noise levels exceed 85 decibels. The Range Safety Office is at WAAF, a site that has no ranges. This dispersion of personnel and function impairs efficiency and causes extensive travel time and miscommunication.

Project Description: Construct a Consolidated Range Control Complex to support consolidated command and control and other operations, especially range maintenance operations, for range activities at all Army training areas on O'ahu. The project would add 22,133 square feet of new facilities and would involve demolishing eight facilities with a total area of 35,867 square feet. The demolished facilities would include buildings 1124, 1125, 1150, 1181, 2108, 2056, 2276, and 1192. Supporting facilities would include water, sewer, and electrical service, paving, walks, parking, security fencing, information systems, and site improvements. The facility would be constructed on an open field on the west side of Beaver Road, approximately half a mile north of the intersection of Trimble and Beaver roads. The project will include administrative space for Range Division and Range Control, a carpentry shop, a welding shop, target and raw material storage, and parking for personally operated vehicles, tactical vehicles, and equipment.

Estimated Utility Requirements: Electrical lines are available approximately 160 feet west of the project site. Power requirements to operate building systems and equipment include single phase, 250-amp service in the administrative space; three-phase/four-wire, 250-amp service in the carpentry shop; and three-phase/four-wire, 400-amp service in the welding shop. A 150-KVA transformer is also required. Air conditioning, estimated at 25 tons, would be provided for administrative space only. Mechanical ventilation would be provided in the warehouse and shop areas. Heating is not required. Water would be provided through a connection to an existing six-inch line, approximately 180 feet east of the proposed site. Sanitary sewage discharge would be collected and treated through a connection to the on-site sanitary sewer system. These resources are expected to continue to be available. Telephone and LAN service can be had approximately 2,900 feet from the project site at the ISF. Approximately 500 feet of underground duct would be installed from the Range Control Building to the I3A to provide connectivity for this project.

Figure D-4
Battle Area Complex

Graphics Code: S4

Project #: 58144

Project Title: Battle Area Complex (BAX)

Project Location: SBMR

Project Size: 8,063 square feet of support structures and 2,075 acres of training area

Construction Timeframe: September 2005 to December 2006

Background: Current range facilities on O‘ahu and the island of Hawai‘i were designed and constructed to support either the current configuration of light infantry or armored forces previously stationed in Hawai‘i. No facilities in Hawai‘i provide a realistic battle area for mounted infantry units in need of live-fire training.

Project Description: Construct a BAX designed for company-level weapon proficiency training. The range would also support dismounted infantry platoon tactical live-fire operations with or without supporting vehicles. Training objective features would include four course roads, 30 stationary armor targets, six moving armor targets, 174 stationary infantry targets, 14 moving infantry targets, 17 machine gun/observation bunkers, two grenade/breaching obstacles, three helicopter landing zones, 18 mortar simulation devices, 8 hull-down defilades, and vehicle firing positions. Range operations support facilities would include a dual sex dry-vault latrine, bleacher enclosure, covered mess area, range operations center, storage building, ammunition-loading dock, and AAR building. Supporting facilities would include site improvements, erosion control, a bivouac (temporary camp) area, electrical service, and security fencing and gates. The range would be sited on the west side of Beaver Road north of Trimble Road, on the range complex and range impact area of the SBMR range area.

Estimated Utility Requirements: This project would require connecting to the primary power distribution system. The nearest available power (12.47-kilovolt, three-phase) is 980 feet (300 meters) away. A new 12.47-kilovolt, three-phase primary line would be constructed to bring primary power to the range site. Once at the site, primary power would be run underground to feed a pad-mounted transformer near the control tower. All buildings would be supplied with underground 120/240-volt, single-phase, secondary power from the transformer. Air conditioning, estimated at 20 tons, would be provided. Heating is not required. All sewage on the site would be collected in the aerated vault latrine and removed by pumper truck, so no sewage lines or septic field would be required. Water would be trucked to the site, so no water line, distribution systems, or well would be required. Telephone and LAN service can be had approximately 4,000 feet from the project site at ISF. Approximately 1500 feet of aerial cable will be run from the AAR building to the I3A. Cable will be attached to a new power pole line. The remaining buildings within the project requiring telecom services would be connected via an underground duct system to the AAR Building.

Figure D-5
Motor Pool

Graphics Code: S5

Project #: 57421

Project Title: Motor Pool

Project Location: SBMR

Project Size: 167,775 square feet of building space and 1,293,725 square feet (34 acres) of hardened surface

Construction Timeframe: September 2005 to September 2007

Background: Vehicle maintenance facilities at SBMR are inadequate to meet the requirements of the 2nd Brigade. The facilities do not meet Army standards due to deteriorated condition, substandard size, and failure to meet standard design. The additional demands from Army transformation will worsen these inadequacies.

Project Description: Construct a 167,775-square-foot motor pool facility, including new tactical equipment maintenance shops with repair bays; separate administrative area; shop control; overhead cranes; petroleum, oil and lubricants facilities; oil-water separators; hardstand and organizational vehicle parking areas; arms rooms; communication rooms; deployment storage facilities; hazardous material storage facility; and telecom shelter. Supporting facilities would include a new water tank on Trimble Road, sanitary sewer, storm drainage, electric service, phone system, exterior lighting, fire protection and alarm systems, paving, walks, curbs and gutters, parking, roadways, information systems, and site improvements. This motor pool would be sited on agriculture fields within the proposed SRAA. The USARHAW is conducting informal discussions with the owner to identify a location that is satisfactory to both parties and that reduces potential impacts. Two deployment storage buildings would be placed approximately 8,000 feet down Lyman Road.

Estimated Utility Requirements: The present power grid distribution system would be used and could provide the required additional power. It is expected to continue to be available. Estimated energy usage is 12,480,000 kilowatt hours per year. Air conditioning, estimated at 170 tons, would be provided by a chilled water system. Heating is not required. The existing water distribution system is adequate for domestic water flow and fire demand requirements, estimated at 17,600,000 gallons per year. The gravity sewer collection system is adequate. Telephone and LAN service can be had approximately 4,400 feet from the project site at the ISF. Approximately 1,000 feet of underground duct would be installed from the TEM 7 maintenance building to the I3A to provide connectivity for this project. The remaining buildings within the project requiring telecom services would be connected via an underground duct system to the TEM 7 maintenance building.

Figure D-6

Tactical Vehicle Wash at East Range

Graphics Code: S6

Project #: 57416

Project Title: Tactical Vehicle Wash Facility

Project Location: SBER

Project Size: unavailable

Construction Timeframe: September 2005 to September 2006

Background: No wash facility on SBMR can support the Stryker Interim Armored Vehicle.

Project Description: Construct a tactical vehicle wash facility with six wash stations. The bays will be sized to support 18.3-meter (60 feet) long by 3.7-meter (12 feet) wide vehicles. The primary facility will consist of the preparation area and wash stations. The wash stations will use a high-pressure wash system and will recycle water to minimize wastewater disposal. The water will flow through a water sediment basin, an equalization basin, and oil-water separators and then be deposited into a water supply reservoir. Treatment will include oil and grease removal, grit removal, and organic control. A structure will be provided to house the mechanical secondary treatment units and the control panels necessary for the facility. The structure will be approximately 12 meters (40 feet) by 9 meters (30 feet), will require louvers, and will have a large door for equipment installation and maintenance. Supporting facilities include utilities, paving, fencing, curbing, and site improvements. The islands at the wash facility will be double-tower to ensure the ability to cover an 18.3-meter (60 feet) vehicle. Concrete curb will be provided at the wash facility to control the flow of wastewater. Trench drains will lie perpendicular, at the center of the wash station, and will cover the entire width of the facility.

Estimated Utility Requirements: This project would require connecting to the primary power distribution system, which is believed adequate to meet the project requirements. Energy consumption is estimated at 80,119 kilowatt hours per year. Heating is not required. Water supply is estimated at 600,000 gallons per year, with wash water to be recycled as described above.

Figure D-7

Fixed Tactical Internet on O‘ahu

Graphics Code: S7

Project #: None

Project Title: Fixed Tactical Internet (FTI)

Project Location: Fourteen antenna locations throughout Army training ranges on O‘ahu

Project Size: 500 square feet per antenna location

Construction Timeframe: FY05 through FY06

Background: An FTI will provide necessary tactical communications infrastructure, enabling units to train at any hour of the day or night without deploying to the field. When linked to the I3A, FTI could also provide connectivity for the command and control integration of live-fire and simulation training.

Project Description: Install a group of antennas strategically placed throughout the installation and training areas that will allow radios within military vehicles to receive and process both voice and data signals. Four antennas will be installed at each proposed site located on O‘ahu. The antennas are vertical whips (see configurations on page D-58). Two will be approximately 4 feet long and 2 inches in diameter and two will be approximately 10 feet long and 2 inches in diameter. Antennas will be mounted on masts or existing support structures (new support structures would be required, except at the locations noted in Table D-1). Because none of the proposed antennas would exceed 102 feet in height, no red warning lights would be required. Each fenced site area will be 20 feet by 25 feet, including a 15-foot by 20-foot concrete pad for the support structure and shed. Sites will be accessed via existing roads in all cases. Personnel will visit the sites prior to and after Army training sessions. No security lighting will be installed at the sites. Equipment sheds will house four radios and four batteries. Antennas at Dillingham Ridge, Kawela (Kahuku) 1, Kawela (Kahuku) 2, Kolekole, Mt. Ka‘ala East, and Mt. Ka‘ala West would be sited adjacent to existing communications facilities.

Estimated Utility Requirements: The project will use the existing power grid distribution system, which is expected to continue to be available. Estimated energy usage is 5,915 kilowatt hours per year.

Figure D-13
South Range Acquisition Area

Graphics Code: S8

Project #: 55270

Project Title: South Range Land Acquisition

Project Location: SBMR South Range Acquisition Area

Project Size: 1,400 acres

Construction Timeframe: September 2004 to June 2005

Background: According to the land use and requirements study of February 2002, there is a 32,249-acre shortfall in contiguous training and maneuver land for the 25th ID(L). The range infrastructure is old and requires significant upgrading for greater efficiency and maneuverability. A motor pool study completed in June 2000 categorized most of the motor pools as substandard because they lack the necessary building and hardstand space to perform required vehicle maintenance. To bring the motor pool facilities to Army standards, additional acreage is needed for expansion and upgrades. SBMR does not have available open acreage for these expansions.

Project Description: Acquire approximately 1,400 acres of fee simple land from Campbell Estate adjacent to the south boundary of SBMR. The land would be used for roadway easements, a motor pool, a pistol and rifle qualification training range, and roadway easements and utility infrastructure between SBMR and proposed facilities on this land. The proposal also would allow USARHAW to control the aircraft clear zone and accident prevention zone number one west of WAAF. The area would also be used for limited types of maneuver training.

Estimated Utility Requirements: None

Figure D-14
Qualification Training Range 1

Graphics Code: S9

Project #: 57461

Project Title: Qualification Training Range 1 (QTR1)

Project Location: SBMR

Project Size: 5,154 square feet of support structures and 120 acres of training range

Construction Timeframe: September 2004 to December 2005

Background: Small arms ranges at McCarthy Flats are spread across a wide area, requiring units to occupy numerous ranges to accomplish all of their weapons qualifications. The layout and separation between the ranges increases logistical requirements, and the ranges are antiquated and lack modernized facilities for training. The range configuration does not provide an opportunity for maneuver training at SBMR.

Project Description: Construct a non-standard Qualification Training Range at McCarthy Flats, consisting of 12 lanes of Combat Pistol/MP Firearms Qualification Course, 24 lanes of Modified Record Fire Range, 12 lanes of Multipurpose Machine Gun/Sniper Range, and 50 lanes of Basic 10/25 Meter Firing Range (Zero). Other primary facilities include stationary infantry target emplacements, moving infantry target emplacements, zero panel emplacements, and standing silhouette emplacements. Supporting facilities include all construction within the perimeter of the range complex, which consists of information systems requirements, demolition, earthwork electrical service, limit markers, fencing, lighting, berms, parking, service roads, site drainage, erosion control, and site improvements. Proposed range support facilities include an operations/storage building (796 square feet), two general instruction buildings (1,593 square feet), three zero control stations (192 square feet), two ammunition breakdown buildings (237 square feet), a latrine (204 square feet), an indoor mess hall (764 square feet), and a bleacher enclosure (592 square feet).

Estimated Utility Requirements: This project will require connecting to the primary power distribution system. The nearest available power (12.47-kilovolt, three-phase) is 1,220 meters away. A 100 kVA, single-phase primary line will be constructed to bring primary power to the range site. Once at the site, primary power will be run underground to feed a pad-mounted transformer located near each control tower. All buildings will be supplied with 120/240-volt, single-phase, secondary power underground from the pad-mounted transformers. Secondary power of 120/240 volts will be run from each control tower power panel underground to the target cable junction boxes. Range targets will be fed using 240-volt, single-phase secondary power. The heated/illuminated range limit markers at 300 meters on the modified record fire range require 120-volt circuits. The heated/illuminated range limit markers at 31 meters on the pistol range require a 120-volt circuit. Nineteen AWG twisted pair copper cables will be required to operate the range target systems. The controls for targets require 120/240 volts. Voltage available to each target will be no less than 95 percent of its rated operating voltage. A separate 120-volt outlet is required in each target emplacement for target thermalization. Air conditioning, estimated at 20 tons, will be provided in the instruction buildings and range control towers. Telephone service is available within approximately 2,400 meters of the site at the Information Systems Facility (ISF). Lines will be run overhead from the I3A to the site with the primary power line and then underground between buildings. Telephone service will be provided at the control towers and other applicable buildings. All sewage on the site will be collected in the aerated vault latrines and removed by pumper truck, so no sewage lines or septic field would be required. All water needed will be trucked in, so no water line, distribution systems, or wells would be required. The availability of these utilities is expected to continue.

Figure D-15
Qualification Training Range 2

Graphics Code: S10

Project #: 57462

Project Title: Qualification Training Range 2 (QTR2)

Project Location: SBMR South Range

Project Size: 4,768 square feet of support buildings and 120 acres of training range

Construction Timeframe: September 2005 to September 2006

Background: Ranges used for modified record fire and combat pistol qualification on SBMR are considered non-standard, have excessive maintenance costs, or conflict with higher priority ranges or future range projects.

Project Description: Construct a modified Qualification Training Range (QTR) designed for modified record fire and combat pistol qualification and training by the Stryker Brigade Combat Team and Legacy Force of the 25th ID(L) at SBMR. QTR2 training objective features will include 10 lanes of modified record fire targetry and 12 lanes of automated Combat Pistol Qualification Course targetry. Primary facilities include all construction within the perimeter of the range complex: electrical service, firing positions, target service roads, target maintenance trails, limit markers, lane markers, site improvements, earthwork, site drainage, erosion control, and information systems. Supporting facilities within the Range Operations Control Area (ROCA) include two control towers, an operations/storage building, two general instruction buildings, two ammunition breakdown building, dual sex dry-vault latrine, covered mess, bleacher enclosure, electric service and transformers, security fencing, range flagpole, area and security lighting, storm drainage, information systems (telephone), and site improvements.

Estimated Utility Requirements: This project will require connecting to the primary power distribution system. Electrical power (12.47 kV, 3-phase) is available 3,937 feet away. Secondary power of 120/240 volts will be run from each control tower power panel underground to the target cable junction boxes. Range targets will be fed using 240-volt, single-phase secondary power. The heated/illuminated range limit markers at 300 meters on the modified record fire range require 120-volt circuits. The heated/illuminated range limit markers at 31 meters on the pistol range require a 120-volt circuit. Air conditioning, estimated at 7 tons, will be provided for the control towers, with mechanical ventilation in other structures at the rate of 142 cubic meters (5,000 cubic feet) per minute. Heating is not required. All sewage would be collected in an aerated vault latrine and removed from the site by pumper truck, so no sewage lines or septic field would be required. Water would be trucked to the site, so no waterline, distribution system, or well would be required. These utilities are expected to continue to be available. Telephone and LAN service can be had approximately 7,800 feet from the project site at the ISF. Approximately 2,040 feet of underground duct would be installed from the Operations Building to the I3A to provide connectivity for this project. The remaining buildings within the project requiring telecom services would be connected via an underground duct system to the Operations Building.

Figure D-16

Multiple Deployment Facility at WAAF

Graphics Code: S11

Project #: 57422

Project Title: Multiple Deployment Facility

Project Location: WAAF (adjacent to SBMR)

Project Size: 90,697 square feet

Construction Timeframe: March 2005 to March 2006

Background: The facilities are temporary structures and are not efficient for deploying troops to combat from multiple airfields.

Project Description: Construct a Multiple Deployment Facility (MDF) to support deployments from multiple airfields. The facility includes a deployment marshalling area, pre-fabricated guardhouses and document control station, wash rack, de-fuel shed, scale houses, joint inspection area, vehicle maintenance shelter, vehicle holding area, alert holding area (AHA), and contingency warehouse. An additional ASP is provided to support Stryker vehicles that are processed through the MDF and then directed to the ASP site to be loaded with ammunition. These vehicles are reweighed at the ASP scale area; the information is processed at Building 1551 and transmitted to the AHA facility. The AHA facility will be accessible for the disabled. Three buildings will be demolished as part of this project. Supporting facilities include water, sanitary sewer, storm drainage, electric service, exterior lighting, fire protection alarm systems, telephone, paving, fencing, parking, information systems, and site improvements. The MDF would be on a previously disturbed site south of Airdrome Road, on an abandoned WAAF airstrip.

Estimated Utility Requirements: Electrical power is estimated at 1,012 KVA, for an estimated energy consumption of 5,795,066 kilowatt hours per year. The present systems are believed adequate to support the new facility. Telephone and LAN service can be had approximately 12,338 feet from the project site at Wheeler buildings 102/104. Approximately 8,508 feet of underground duct would be installed from the AHA facility to infrastructure on WAAF to provide connectivity for this project. The remaining buildings within the project requiring telecom services would be connected via an underground duct system to the AHA facility. Air conditioning requirements are estimated at 10 tons. Heating is not required. Water supply requirements are estimated at 770,000 gallons per year, and the use of solar hot water is being considered. The sanitary sewer will connect to the installation's sewer system by gravity flow.

Figure D-17

Airfield Upgrade for C-130 Operations at WAAF

Graphics Code: S12

Project #: 57405

Project Title: Upgrade Airfield for C-130 Aircraft Operations

Project Location: WAAF (adjacent to SBMR)

Project Size: 54,006 square meters (64,600 square yards)

Construction Timeframe: After March 2009

Background: Apron pavement at WAAF is deteriorated due to age and usage. C-130 transport aircraft use the facility in support of the SBCT, 25th ID(L) training and rapid deployment. The apron areas are structurally inadequate for loading C-130 aircraft. The present condition of the pavement restricts and raises costs of airfield operations.

Project Description: Repair the existing 212-meter by 255-meter (694-foot by 837-foot) aircraft parking apron. Repair would strengthen the apron to accommodate C-130 aircraft staging operations for the proposed life cycle of WAAF. Also included are strengthening the taxiway and parking pad. An apron is roughly an airfield equivalent to a shoulder on a roadway. The apron, like a roadway shoulder, frees the runway for continuous use during loading and unloading. This project would be sited on the apron on the west side of WAAF just north of Airdrome Road.

Estimated Utility Requirements: None

Figure D-18

Land Easement/Road Construction between SBMR and DMR

Graphics Code: D1

Project Number: 58161

Project Title: Land Easement/Road Construction between SBMR and DMR

Project Location: SBMR route to DMR

Project Size: 36 acres along 12.4 miles

Construction Timeframe: After March 2009

Background: Access to DMR from SBMR is via state and county public roads, with only a single two-lane public road connecting the two locations. Military convoys using this road slow the flow of traffic and create potentially dangerous situations when cars attempt to pass the military vehicles.

Project Description: Acquire a perpetual easement of approximately 36 acres (15 hectares) and construct a 15-foot-wide (5 meter) gravel road with 3-foot-wide (1 meter) gravel shoulders on both sides. The road would run 12.4 miles (20 kilometers) from SBMR to DMR and would provide military vehicle access to both installations. Work would include grading, paving, improving drainage, and installing culverts at stream crossings and guardrails at drop-offs. Storm drainage structures and lines would be installed to prevent excessive amounts of stormwater runoff from water flowing over the road and endangering traffic. Telecommunication lines would be provided alongside the new road during construction. Road grades steeper than 10 percent would be paved with asphalt or concrete and the sides would be supported with shotcrete, guardrails, retaining walls, drainage structures (for example, concrete and grass swales), and signs.

Estimated Utility Requirements: None

Figure D-19

Tactical Vehicle Wash at Kahuku Training Area

Graphics Code: K1

Project #: 57415

Project Title: Tactical Vehicle Wash Facility

Project Location: Kahuku Training Area (KTA)

Project Size: Unavailable

Construction Timeframe: June 2007 to June 2008

Background: The vehicle wash facility at KTA is inoperable, and the drainage system is clogged and silted. Military vehicles at KTA pick up nonnative grass seeds that may be spread to areas outside the range. The vehicles also accumulate soil that may be tracked onto state highways when the vehicles return to the SBMR garrison area.

Project Description: Construct a tactical vehicle wash facility with six wash stations and a new off-site water system. The water system will include two pump-only stations with motors and controls and a mid-point pump station with a tank and level controls for the operation of the pumps. The pumps and tank will be installed inside pump houses with natural ventilation. The pump-only pump houses will be approximately 3 meters by 3 meters (10 feet by 10 feet), while the mid-point pump house will be approximately 3 meters by 4.6 meters (10 feet by 15 feet). Each wash station will be sized to support vehicles 18.3 meters (60 feet) long by 3.7 meters (12 feet) wide. The primary facility will consist of the preparation area and wash stations. The wash stations will use a high-pressure wash system and recycle water to minimize wastewater disposal. The water will flow through a water sediment basin, an equalization basin, and oil-water separators, and then be deposited into a water supply reservoir. Treatment will include oil and grease removal, grit removal, and organic control. A mechanical equipment building will house the mechanical secondary treatment units and the control panels necessary for the facility. The structure will be approximately 12 meters (40 feet) by 9 meters (30 feet), will require louvers, and will have a large door for equipment installation and maintenance. Supporting facilities include utilities, paving, fencing, curbing, and site improvements. The islands at the wash facility will be double-tower to ensure the ability to cover an 18.3-meter (60-foot) vehicle. Concrete curb will be provided at the wash facility to control the flow of wastewater. Trench drains will lie perpendicular, at the center of the wash station, and cover the entire width of the facility.

Estimated Utility Requirements: Electrical power is estimated at 95.4 KWN, with energy consumption estimated at 12,906 kilowatt hours per year. The present systems are believed adequate to support the new facility under this project. Air conditioning and heating are not required. Water supply is estimated at 600,000 gallons per year, with wash water to be recycled as described above. A new off-site water system will be constructed as described above.

Figure D-20

Combined Arms Collective Training Facility at KTA

Graphics Code: K2

Project #: 57305

Project Title: Combined Arms Collective Training Facility (CACTF)

Project Location: KTA

Project Size: 106,110 square feet of CACTF structures, 11,851 square feet of support structures, and 560 acres of training area

Construction Timeframe: September 2005 to December 2006

Background: Hawai'i-based units lack a large range to train soldiers, small units, and unit commanders in an urban environment under simulated conditions. The MOUT assault course at SBMR no longer supports urban operations training strategy. Basic design and targetry are inadequate to efficiently train close quarters marksmanship skills. Training will require SRTA live-fire ammunition.

Project Description: Construct a 24-building live-fire CACTF and range operation support facilities. Mock city structures would include two warehouses, a municipal building, an office building, a service station, four business buildings, one hotel, a police station/jail, a church and cemetery, a bank, a townhouse, nine residences, one school, four dual-sex dry vault latrines, an underground trainer, and a soccer field/playground. Range support facilities would include a combined command control and AAR building, a storage building, an ammunition breakdown building latrine, a covered mess hall, and an access road. The proposal includes renovating ten structures and demolishing two buildings (guard towers S150 and S151), totaling 280 square feet. The project would be sited approximately two-and-a-half miles west of Kahuku in the KTA.

Estimated Utility Requirements: This project would require connection to the existing primary power distribution system. The nearest available power is approximately 4 miles (6 kilometers) from the site. (The old Nike Command Site has power that would be replaced with new construction.) A new 12.47-kilovolt, three-phase primary line would be constructed to bring primary power to the site. Once at the site, primary power would be run underground to feed a pad-mounted transformer near the Operations Storage Building and a pad-mounted transformer at the AAR building. All buildings would be supplied with 120/240-volt, single-phase, secondary power underground from the transformers. All sewage would be collected in the aerated vault latrine and removed by pumper truck, so no sewage lines or septic field would be required. Water would be trucked to the site, so no waterline, distribution systems, or well would be required. Telephone and LAN service can be had at Building 886. Approximately 3,000 feet of underground duct would be installed from the AAR building to a maintenance hole installed on the Drum Road project. The remaining buildings within the project requiring telecom services would be connected via an underground duct system to the AAR building. Air conditioning requirements are estimated at 20 tons.

Figure D-21

Easement/Road Construction between SBMR and Helemanō Military Reservation

Graphics Code: K3/K4

Project #: 57802/57406

Project Title: Easement/Road Construction between SBMR and HMR

Project Location: Road from SBMR to HMR on the route to KTA

Project Size: 13 acres along 6 miles of road

Construction Timeframe: September 2004 T March 2005 (easement) to September 2005 to December 2006 (construction)

Background: Military convoys travel from SBMR to HMR on Wilikina Drive onto Kamananui Road, then to Kamehameha Highway to KTA and KLOA to conduct military training exercises. Wilikina Drive, Kamananui Road, and Kamehameha Highway are only two-lane public roads, used by both local residents and tourists. The elevation/grade from SBMR on Kamehameha Highway to both training areas are relatively steep, and when returning from training at KTA or KLOA the heavy military vehicles are traveling well below posted speed limit designations. Use of the existing highway is also creating traffic congestion and damage to the roads. Military convoys traversing this public road slow down the flow of all traffic and create dangerous situations when cars attempt to pass the large caravan, creating the potential for head-on crashes. Dirt, rocks, and debris from the vehicles are deposited on public roads, creating hazardous driving conditions to the general public. The Army is preparing to upgrade Drum Road, a military road from HMR to KTA and KLOA training areas. The new road in this project would tie into Drum Road and reduce heavy military vehicles from public roads.

Project Description: Acquire approximately 13 acres (5 hectares) of land in a perpetual easement and construct a 15-foot-wide gravel road with 3-foot-wide gravel shoulders on both sides that would provide military vehicle access between SBMR and HMR. In conjunction with Drum Road, this project would provide a road network from SBMR to KTA. The road would run approximately 6 miles (4 kilometers) (from SBMR to HMR. It would be north of Wahiawa and would use as much of the agriculture roadways as possible. Work includes grading, paving, drainage improvements, culverts at stream crossings, guardrails, shotcrete, retaining walls, concrete swales, grass swales, signage, and storm drainage structures and lines to preclude excessive amounts of storm runoff from water flowing over the road and endangering traffic. Work will also include provisions for telecommunication lines to run alongside the new paved road. Road grades steeper than 10 percent will be paved with asphalt or concrete. Supporting facilities includes provisions for information systems.

Estimated Utility Requirements: Approximately 6.5 miles (4 kilometers) of fiber cable will be direct buried between SBMR, McNair Gate and Pupukea Road leading to Helemanō. Additionally, a direct buried cable will be installed along Pupukea Road and a duct system will be installed to building P1 at Helemanō. Also, a duct system will be installed from McNair gate to Building 886 on SBMR.

Figure D-22

Battle Area Complex at PTA

Graphics Code: P1

Project #: 57197

Project Title: Battle Area Complex (BAX)

Project Location: Pōhakuloa Training Area

Project Size: 11,808 square feet of structures and 2,075 acres of training area

Construction Timeframe: May 2007 to May 2008

Background: No facility of this type exists in Hawai'i, and the light infantry brigades of the 2nd Brigade cannot accomplish required mounted combined arms live-fire exercises. No ranges exist for gunnery training for the MGS, Interim Armored Vehicle infantry carrier vehicle, or Interim Armored Vehicle reconnaissance vehicle. Facilities on O'ahu and the island of Hawai'i were designed and constructed to support either the current light infantry configuration or armored forces previously stationed in Hawai'i. Implementation of evolving Department of the Army and TRADOC Combat Doctrine and Training Strategies in Hawai'i will affect the ability to train the SBCT and 25th ID(L) using existing range facilities. The unique vehicle design and expected mission requirements of this medium force are not met by current range facilities. The combination of the types, densities, and distance to targets, obstacles, and landing zones are not available on standard range designs.

Project Description: Construct a BAX designed for live-fire, maneuver gunnery training and qualification requirements of the weapons systems for the proposed SBCT and the division's Legacy Force at PTA on the island of Hawai'i. This range will also support company-level mounted and dismounted combined arms live-fire exercises, dismounted infantry platoon tactical live-fire operations, with or without supporting vehicles, as well as Army aviation, close air support, artillery, and air defense artillery gunnery and live-fire maneuver gunnery training operations. The project will be sited along Lava Road, approximately five miles from the entry into the PTA and approximately half a mile south of BAAF. The range project will be oriented south toward the existing impact area and built over Range 12 on the eastern portion of PTA. The training assets at Range 12 will be demolished so the new layout can be overlaid and accommodated. The primary features of the range will include four course roads with crossover capability, 30 reconfigurable stationary armor targets (SAT), six moving armor targets (MAT), 174 reconfigurable stationary infantry targets (SIT), 14 moving infantry targets (MIT), 17 machine gun/observation bunkers, two gunnery/breaching obstacles, 18 mortar simulation devices (MSD), 16 hulldown defilades, three landing zones, vehicle firing positions, grenade/breach facades/trench complexes, military vehicle trails, and service roads. Other range operations facilities will include observation tower, range control center, AAR facility, operations/storage building, ammunition breakdown building, ammunition loading dock, latrine, bleacher enclosure, covered mess, bivouac concrete pads, and flagpole. All targets will be fully automated; the event specific target scenario is computer driven and scored from the Range Control Center. The reconfigurable stationary infantry target and reconfigurable stationary armor target will be solar powered, radio-controlled targets with target coffins. The range operating system will be fully capable of receiving, transmitting, and capturing digital traffic to/from the using participants. This captured data is compiled and available to the unit during the AAR. Storm drainage, service roads, site improvements, and berms will be provided as necessary. Range support facilities include electrical service; paving, walks, curbs and gutters; site improvements; and demolition.

Estimated Utility Requirements: Primary power would come from 12.47-kilovolt lines extended overhead from the weather tower to the downrange pad-mounted transformers in the power centers. Range targets would be fed underground using 480-volt, three-phase, or 240-volt single-phase

secondary power from the closest power center. Each downrange, lighted and heated range limit marker and each video camera would require 120-volt power fed underground from the nearest power source. Air conditioning, estimated at 20 tons, would be provided for the support buildings by self-contained units. All sewage on the site would be collected in aerated vault latrines and portable toilets and would be removed by pumper truck, so no sewage lines or septic fields would be required. Water would be trucked to the site and stored in a tank, so no waterline, distribution systems, or wells would be required. Telephone and LAN service can be had approximately 41,000 feet from the project site at the PTA cantonment area. Approximately 1,000 feet of aerial cable would be installed from the AAR building to the I3A to provide connectivity for this project. The remaining buildings within the project requiring telecom services would be connected via an underground duct system to the AAR building.

This page intentionally left blank.

Figure D-23

Anti-Armor Live-fire and Tracking Range (AALFTR)

Graphics Code: P2

Project #: 57183

Project Title: Anti-Armor Live-fire and Tracking Range (AALFTR)

Project Location: PTA

Project Size: 16,030 square feet of structures and 750 acres of training area

Construction Timeframe: September 2009 to September 2010

Background: Brigades of the 25th ID(L) have no range for anti-armor live fire and tracking. Such a facility is required for support of the light armored vehicle, mobile gun system, and reconnaissance armored vehicle, as well as anti-armor forces firing from HMMWVs. Present forces and the proposed SBCT need a range that enables individual and collective gunnery training that simulates sweeping gunfire (enfilading) during movement along the flank of an opposing force.

Project Description: Construct a modified Anti-Armor Live-Fire and Tracking Range (AALFTR) on ranges 3, 8, and 10 at PTA. The AALFTR will include 21 Stationary Armor Targets (SAT) and eight Armor Moving Targets (AMT). All targets will be fully automated; the event-specific target scenario is computer-driven and scored from the control towers. Other range features include baseline firing positions, primary and secondary power and data distribution systems, and heated and illuminated limit markers. The AALFTR will allow anti-armor forces to simulate enfilading fire as they move along the flank of an opposing force before joining the larger force at the programmed BAX, much as they would in an actual battle. Range 8 will be developed as a complete ROCA; minimal ROCA facilities will be developed at ranges 3 and 10. Facilities required at each range include three control towers, three AAR facilities, and three general instruction buildings. Range 8 facilities will also include an ammo breakdown building, an ammo loading dock, an operational/storage building, a dual sex dry-vault latrine, a covered mess, a bleacher enclosure, and a range maintenance building. Support facilities include electric service, access roads, parking, maintenance area, unit staging area, earthwork, concrete tent pads, range flagpoles, fencing and gates, and information systems (telephones). Demolition of one small observation tower at Range 8 will be required. While no downrange demolition is anticipated, other possible demolition may include existing concrete slabs and foundations, utility poles, utilities, and fencing located within ROCA. Because the land surface at the site is primarily made up of smooth lava, firing areas, maneuver lanes, service roads, target positions, and troop assembly areas within the ROCA will require surface conditioning. Grading will also be required to achieve positive drainage around all buildings and assembly areas within the ROCA.

Estimated Utility Requirements: Supply downrange of 12.47-kilovolt, 480/277-volt and 240/120-volt power distribution would be required. The project would include providing power from the overhead 12.47-kilovolt, three-phase primary line near the weather tower, approximately 29,857 feet from the project site. A 12.47-kilovolt overhead power line would be built from the weather tower to existing and new AALFTR locations. Underground 12.47-kilovolt power would be run from the new line to each AALFTR range, to a pad-mounted transformer near each control tower. These transformers would provide underground secondary (240/120-volt) to each range control tower. All facilities would be provided with 240/120-volt power from a panel in each control tower. Telephone and LAN service can be had approximately 39,500 feet from the project site at the PTA cantonment area. Approximately 500 feet of aerial cable would be installed from the AAR building to the I3A to provide connectivity for this project. The remaining buildings within the project requiring telecom services would be connected via an underground duct system to the AAR building. All sewage would be collected in aerated vault latrines and portable toilets and removed by pumper truck, so no sewage

lines or septic fields would be required. Water would be trucked to the site and stored in a tank, so no water lines, wells, or distribution system would be required.

Figure D-24

Easement/Construct Tank Trail between Kawaihae Harbor and PTA

Graphics Code: P3/P4

Project #: 58273

Project Title: Easement/Construct Vehicle Trail between Kawaihae Harbor and PTA

Project Location: PTA

Project Size: 132 acres along 27 miles of road

Construction Timeframe: September 2009 to September 2010

Background: Military convoys travel from Kawaihae Deep Draft Harbor to PTA on state and county two-lane public roads. A convoy first travels on Kawaihae-Waimea Road and then on Mamalahoa Highway and onto Saddle Road. Some of the convoys also transport ammunition to PTA for the howitzers. Both local residents and tourists use the roadways. The elevation/grade from Kawaihae Deep Draft Harbor to the training area using Kawaihae-Waimea Road and Saddle Road is relatively steep, and the heavy military vehicles travel well below posted speed limit designations. Use of the highway also creates traffic congestion and damage to the roads. Military caravans traversing public roads slow down the flow of all traffic and create dangerous situations when cars attempt to pass the large caravan, creating the potential for head-on crashes. Dirt, rocks, and debris from the vehicles are deposited on the public roads. Combined with the transportation of ammunitions, this creates hazardous driving conditions to the general public. The new road will remove all heavy military vehicles from public roads.

Project Description: Acquire a perpetual easement of approximately 132 acres to construct a 18-foot-wide gravel road with 3-foot-wide gravel shoulders and 8-foot-wide right-of-way on both sides, totaling 40 feet in width, that would run from Kawaihae Harbor to PTA. This road would run for approximately 27 miles and provide access for military vehicles transporting troops, ammunition, and equipment between Kawaihae Harbor and PTA without using public roads. The road would replace the military vehicle trail but may not follow the current route. Information systems are not required. Work includes grading, paving, drainage improvements, culverts at stream crossings, guardrails at drop offs, and storm drainage structures and lines to preclude excessive amounts of storm runoff from water flowing over the road and endangering traffic. Road grades steeper than 10 percent will be paved with asphalt or concrete. Supporting facilities includes provisions for shotcrete, guardrails, retaining walls, concrete swales, grass swales, drainage structures, and signage.

Estimated Utility Requirements: None

Figure D-25
Ammunition Storage at PTA

Graphics Code: P5

Project #: 57417

Project Title: Ammunition Storage Area

Project Location: PTA

Project Size: 6,750 square feet

Construction Timeframe: After March 2009

Background: PTA has eight ammunition storage igloos. These igloos, operated at capacity, are too small to accommodate additional training requirements that would arise upon conversion of the 2nd Brigade to an SBCT.

Project Description: Construct three earth-covered ammunition igloos totaling 6,750 square feet at the ammunition storage facility. An ammunition holding area for daily distribution of ammunition would be constructed to safely hold loaded vehicles. Work would also include installing pole-mounted security lights, floodlights above each entrance, and telephone and computer systems. Supporting facilities would include utilities, electric service, stormwater drainage, paving, and access roads.

Estimated Utility Requirements: Electrical power requirements are estimated at 4873 VA and energy consumption at 32,564 kilowatt hours per year. Telephone and LAN service can be had approximately 5,660 feet from the project site at the PTA cantonment area. An existing aerial pole will provide the pathway to the location. An underground duct system will connect the pole to a new administrative building. Three igloos within the project site would be connected via an underground duct system to the administrative building. Water supply needs are estimated at 18,000 gallons per year.

Figure D-26

Tactical Vehicle Wash at PTA

Graphics Code: P6

Project #: 57414

Project Title: Tactical Vehicle Wash Facility

Project Location: PTA

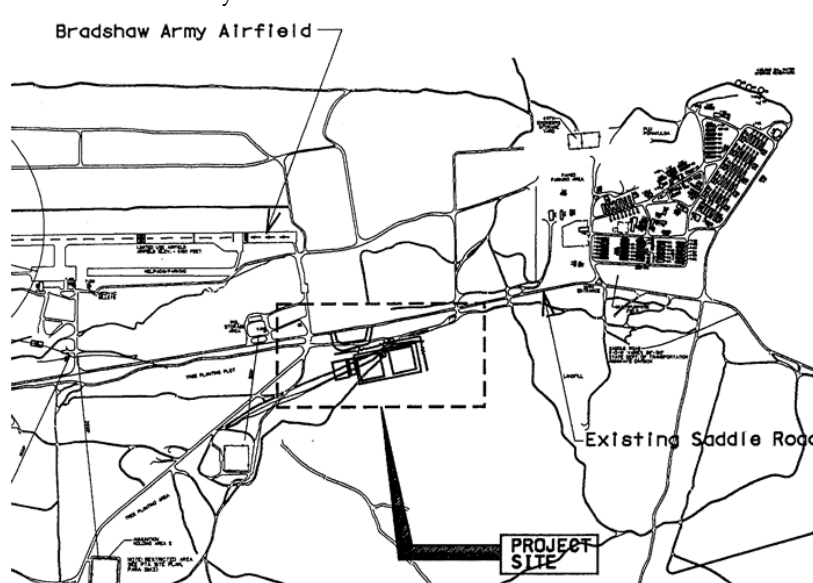

Project Size: unavailable

Construction Timeframe: March 2006 to March 2007

Background: Military vehicles at PTA accumulate soil that may be tracked onto roads and on the transport ship when they return from the island of Hawai'i to O'ahu. They may also transport nonnative vegetation between ranges. The existing vehicle wash facility is too small and is in the safety zone of Bradshaw Army Airfield.

Project Description: Construct a tactical vehicle wash facility with four wash stations sized to support vehicles 18.3 meters (60 feet) long by 3.7 meters (12 feet) wide. The primary facility will consist of the preparation area and wash stations. The wash stations will use a high-pressure wash system and will recycle water to minimize wastewater disposal. The water will flow through a water sediment basin, oil-water separators, and an equalization basin and then be deposited into a water supply reservoir. Treatment will include oil and grease removal, grit removal, and organic control. An oil-water separator will be provided to treat any residual water that does not go through the main system. A structure will be provided to house the mechanical secondary treatment units and the control panels necessary for the facility. This structure will be approximately 12 meters (40 feet) by 9 meters (30 feet), will require louvers, and will have a large door for equipment installation and maintenance. Supporting facilities include utilities, paving, curbing, and site improvements. The islands at the wash facility will be double-tower to ensure the ability to cover an 18.3-meter (60 feet) vehicle. Concrete curb will be provided at the wash facility to control the flow of wastewater. Trench drains will lie perpendicular, at the center of the wash station. The trench drain will cover the entire width of the facility.

Estimated Utility Requirements: Estimated energy consumption is 32,107 kilowatt hours per year. The present distribution system is believed adequate to meet the project requirement without enlargement. Air conditioning and heating are not required. Water use is estimated at 500,000 gallons per year, with wash water to be recycled as described above.

[Figure D-27](#)
West PTA Acquisition Area

Graphics Code: P7

Project #: 57411

Project Title: West PTA Maneuver Training Area Land Acquisition

Project Location: PTA

Project Size: 22,675 acres

Construction Timeframe: May 2005 to May 2008

Background: According to the land use and requirement study of February 2002, there is a 32,249-acre shortfall in contiguous training and maneuver land for use by 25th ID(L). PTA consists of approximately 108,792 acres, only 19,148 of which are considered to be suitable for maneuver training purposes. Additional land is needed adjacent to PTA to expand the total maneuver area. To the north of PTA is Mauna Kea, an inactive volcano, the lower slopes of which contain some endangered species. The southern boundary is Mauna Loa, which consists of mostly volcanic rock that is not conducive to maneuver training exercises. The only area available for expansion is northwest, the area proposed for acquisition. The present uses of PTA are maneuver and live-fire training, and drop zone use.

Project Description: Acquire approximately 23,000 acres of fee simple land adjacent to PTA from Richard Smart Trust (Parker Ranch), Hawai'i. The land would be used for a brigade task force maneuver training area, vehicle maneuver training, and a paratrooper drop zone. The Army has been using the property on an interim basis for maneuver training. In the late 1940s portions of the area were used as artillery firing ranges and the site is part of the Waikoloa Study Area currently being assessed for UXO cleanup (see Chapter 9 for more information). The land proposed for acquisition is contiguous to PTA and is relatively flat, open country with little forested area, making it ideal for maneuver training.

After acquisition of the parcel is complete, the Army plans to construct about 28 miles of gravel training roads on the acquired property. The location of these gravel-training roads is as yet undetermined. The Army will comply with all applicable environmental statutes including but not limited to NEPA, the ESA, and the NHPA, in determining the location and potential impacts of these roads before construction. The Army will also consult with adjacent and near by property owners and other interested parties on the location of the proposed training roads in order to address and resolve potential air quality and dust concerns.

Estimated Utility Requirements: None.

Figure D-28

PTA Range Maintenance Facility Location

Graphics Code: P8

Project #: 56994

Project Title: Range Maintenance Facility

Project Location: PTA

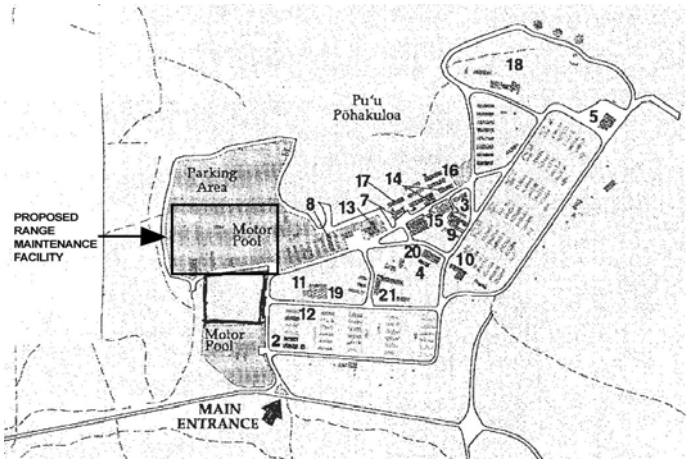

Project Size: 16,011 square feet

Construction Timeframe: After March 2009

Background: Range Division Hawai'i is responsible for command and control of operations at all Army training areas on the island of Hawai'i, primarily PTA. Range control and maintenance operations are housed in eight temporary buildings dispersed throughout the PTA cantonment area, leading to inefficiencies, excessive travel, reduced response times, and miscommunication between different range elements. Most of these facilities are Quonset huts built in 1957, with characteristic curved roofs that render much of their interior space useless. Electrical and mechanical systems are antiquated and require excessive maintenance funding. The shop facilities lack adequate ventilation and operating sprinkler systems. As a health and safety issue, all welding must be conducted outside by order of the fire department. Dispersal of maintenance activities has reduced the quality of service provided to range users due to inefficient split functions. The poor quality of the facilities also worsens the difficult task of recruiting qualified laborers at this remote location.

Project Description: Construct a Consolidated Range Maintenance Facility for PTA on a previously developed site within the installation's cantonment area. The project will include administrative space for range maintenance, a carpentry shop, a welding shop, target and raw material storage, and parking for personally operated vehicles and other vehicles and equipment. Supporting facilities include potable water system, septic system, electric service and 150-kVA, three-phase transformer, paving, walks, parking, security fencing, information systems, and site improvements. Access for the handicapped will be provided in all areas. Three buildings (T17, T19 and T20) will be demolished and replaced by the proposed complex.

Estimated Utility Requirements: Existing electrical lines are approximately 100 feet north of the project site, and these resources are expected to continue to be available. Power requirements to operate building systems and equipment would include single-phase, 250-amp service in the administrative space, three-phase/four-wire, 250-amp service in the carpentry shop, and three-phase/four-wire, 400-amp service in the welding shop. A 150-kilovolt transformer would also be required. Air conditioning, estimated at 10 tons, would be provided for administrative space only. Mechanical ventilation would be provided in the warehouse and shop areas. Water would be connected to an existing line approximately 150 feet north of the proposed site. Sewage would be collected and treated by a standard septic system, including septic tank and leach fields, to be located immediately to the west of the site. Telephone service can be had approximately 1,000 feet away at building 106. LAN service can be had approximately 1,150 feet away at building 179. A 100-foot underground duct would be installed from the Range Maintenance Building to the I3A to provide connectivity for this project.

This page intentionally left blank.

Figure D-29

Bradshaw Army Airfield Upgrade

Graphics Code: P9

Project #: 57408

Project Title: Upgrade and Reorient Bradshaw Army Airfield (BAAF) Runway

Project Location: PTA

Project Size: 451,960 square feet

Construction Timeframe: After March 2009

Background: BAAF, located at PTA, is used for deploying, redeploying, and resupplying all military units training on the island of Hawai'i. The airfield has one runway, 3,700 feet long from east to west, with a total of 1,100 feet of overruns. The airfield's relatively high elevation of 6,200 feet above mean sea level impedes aircraft performance and limits the weight of cargo aircraft can safely carry. The airfield operates under substandard conditions. The combination of runway length, mountainous terrain, man-made obstructions to the east, winds from the east that increase throughout the day, and maximum tailwind landing restrictions for the C-17 (10 knots) and C-130 (15 knots) aircraft impede mission accomplishment. Current operations are limited to visual flight rules and approaches and departures only from the west. The pavement is deteriorated in many areas and is structurally inadequate for C-17 and C-130 loading operations.

Project Description: Construct a 5,600-foot-long full strength paved runway with 300-foot-long full strength paved overruns on each end (type A traffic area). Total length of full strength pavement will be 6,200 feet long. The runway will be 100 feet wide with 25-foot-wide paved shoulders. The first 500 feet of each end of the runway and the hammerheads will be paved with rigid pavement. The remainder of the runway and shoulder pavements will be flexible pavement. This configuration will create a Class A Army airfield with the capabilities to operate as a training assault runway for C-17 and C-130 aircraft. A new runway threshold and visual approach slope indicator lighting system and edge lighting will also be required for the extension. Construction mobilization and demobilization requirements are part of the primary facility cost. PTA's remoteness from major commercial centers presents special logistic demands in transportation to and from the project site, including heavy equipment, project office trailer, telephone communication connection, restroom facilities, and other miscellaneous requirements. Supporting facilities will include site preparation (clear/grubbing, excavation, grading, and storm drainage), a mobile asphalt concrete batching plant, water supply source, and extension of the primary electrical service line from the base camp. The runway will be designed and lengthened to accommodate C-130 and C-17 aircraft under assault landing zone criteria.

Estimated Utility Requirements: Electrical power is estimated at 1.8 KW, with estimated energy consumption 15,768 kilowatt hours per year. The present distribution system is believed adequate to meet the project requirement without enlargement. Air conditioning and heating are not required. Water use is estimated at 2,600,000 gallons per year. A sanitary sewer will connect to the existing system by gravity flow. Telephone and LAN service can be had approximately 18,588 feet from the project site at the PTA cantonment area. Approximately 9,035 feet of underground duct would be installed from the Consolidated Building (operations/weather/medevac) to the I3A to provide connectivity for this project. The remaining buildings within the project requiring telecom services would be connected via an underground duct system to the Consolidated Building.

Figure D-30

Fixed Tactical Internet at PTA

Graphics Code: P10

Project #: None

Project Title: Fixed Tactical Internet (FTI)

Project Location: Eleven antenna locations throughout PTA

Project Size: 500 square feet per antenna location

Construction Timeframe: FY05 through FY06

Background: The training ranges that would be used by the SBCT are in dispersed areas that have either substandard or no telecommunications. Much of the cabling is aerial, air-core, or lead-sheathed cables that do not support minimum bandwidth necessary to sustain current operations. Much of the infrastructure is damaged from the environment.

Project Description: Install an FTI that would provide necessary tactical communications infrastructure, enabling units to train at any hour of the day or night without deploying to the field. When linked to the I3A, FTI could also provide connectivity for the command and control integration of live-fire and simulation training. The FTI will consist of a group of antennas strategically placed throughout the installation and training areas that will allow radios within military vehicles to receive and process both voice and data signals. Four antennas will be installed at each proposed site located on the island of Hawai'i. The antennas are vertical whips. Two will be approximately 4 feet long and 2 inches in diameter and two will be approximately 10 feet long and 2 inches in diameter. All antennas on PTA will require new support structures. No red warning lights would be required. Each fenced site area will be 20 feet by 25 feet, including a 15-foot-by-20-foot concrete pad for the support structure and shed. Sites will be accessed via existing roads in all cases. Personnel will visit the sites prior to and after Army training sessions. No security lighting will be installed at the sites. Equipment sheds will house 4 radios and 4 batteries. Antennas at Mauna Loa Observatory would be sited adjacent to existing communications towers and equipment.

Estimated Utility Requirements: Estimated energy usage is 5,915-kilowatt hours per year. The existing power grid distribution system will be used. Continued availability of these services is anticipated.

Table D-2

Location	Latitude	Longitude	UTM	Elevation (feet)	Total Height ¹ (feet)	Equipment Shed ²	Electric Power Source

Figure D-31

Installation Information Infrastructure Architecture at PTA

Graphics Code: P11

Project #: None

Project Title: Installation Information Infrastructure Architecture (I3A)

Project Location: PTA

Project Size: Approximately 62,000 feet of communications pathway.

Construction Timeframe: 2005

Background: I3A is required to upgrade the telecommunications infrastructure to support transformation projects throughout PTA. The telecommunications infrastructure is not sufficient to support the heavy IT demands required to train a SBCT.

Project Description: Install fiber optic and copper cabling within the cantonment area, training ranges, and other support facilities. This IT backbone will provide sufficient access between the various transformation projects and the voice and data network within the cantonment area at PTA and eventually back to the Mission Support Training Facility on SBMR. This connectivity is required to conduct sophisticated war-fighting simulation exercises. The pathway within the cantonment area will consist of an underground duct system, fiber cables and copper cables. The pathway outside the cantonment area will consist of an aerial pole, fiber cables and copper cables.

Estimated Utility Requirements: I3A will provide the telecom utility requirements. There are no power requirements for the I3A pathway.

Figure D-32

Reduced Land Acquisition Area for South Range

Graphics Code: S8

Project #: 55270

Project Title: South Range Land Acquisition

Project Location: SBMR South Range Acquisition Area

Project Size: Approximately 100 acres

Construction Timeframe: September 2004 to June 2005

Background: A motor pool study completed in June 2000 categorized most of the motor pools as substandard because they lack the necessary building and hardstand space to perform required vehicle maintenance. To bring the motor pool facilities to Army standards, additional acreage is needed for expansion and upgrades. SBMR does not have available open acreage for these expansions.

Project Description: Acquire approximately 100 acres of fee simple land from Campbell Estate adjacent to the south boundary of SBMR. The land would be used to construct a motor pool (Project 57421), with associated vehicle parking areas, administrative and maintenance facilities, and required storm drainage facilities.

Estimated Utility Requirements: No utility service is required as a part of this project; however, project 57421, Motor Pool, will be built on this site and supplied with utilities from the existing SBMR utility grid.

Figure D-33

Qualification Training Range QTR2 at Pōhakuloa Training Area

Graphics Code:**Project #:** 57461**Project Title:** Qualification Training Range (QTR2)**Project Location:** PTA**Project Size:** 5,154 square feet of support structures and 120 acres of training range**Construction Timeframe:** September 2005 to September 2006

Background: Sufficient throughput capacity to support qualification training of soldiers in the 2nd Brigade and the balance of the 25th Infantry Division does not now exist. This project, in conjunction with construction of QTR1 at Schofield Barracks, will provide the required capacity.

Project Description: Construct a standard Qualification Training Range near Range 8 at Pōhakuloa Training Area, consisting of 12 lanes of Combat Pistol/MP Firearms Qualification Course, 24 lanes of Modified Record Fire Range, 12 lanes of Multipurpose Machine Gun/Sniper Range, and 50 lanes of Basic 10/25 Meter Firing Range (Zero). Other primary facilities include stationary infantry target emplacements, moving infantry target emplacements, zero panel emplacements, and standing silhouette emplacements. Supporting facilities include all construction within the perimeter of the range complex, which consists of information systems requirements, demolition, earthwork electrical service, limit markers, fencing, lighting, berms, parking, service roads, site drainage, erosion control, and site improvements. Proposed range support facilities include an operations/storage building (796 square feet), two general instruction buildings (1,593 square feet), three zero control stations (192 square feet), two ammunition breakdown buildings (237 square feet), a latrine (204 square feet), an indoor mess hall (764 square feet), and a bleacher enclosure (592 square feet).

Estimated Utility Requirements: This project will require connecting to the primary power distribution system. The project would include providing power from the overhead 12.47-kilovolt, three-phase primary line near the weather tower, approximately 29,857 feet from the project site. A 100 kVA, single-phase primary line will be constructed to bring primary power to the range site. Once at the site, primary power will be run underground to feed a pad-mounted transformer located near each control tower. All buildings will be supplied with 120/240-volt, single-phase, secondary power underground from the pad-mounted transformers. Secondary power of 120/240 volts will be run from each control tower power panel underground to the target cable junction boxes. Range targets will be fed using 240-volt, single-phase secondary power. The heated/illuminated range limit markers at 300 meters on the modified record fire range require 120-volt circuits. The heated/illuminated range limit markers at 31 meters on the pistol range require a 120-volt circuit. Nineteen AWG twisted pair copper cables will be required to operate the range target systems. The controls for targets require 120/240 volts. Voltage available to each target will be no less than 95 percent of its rated operating voltage. A separate 120-volt outlet is required in each target emplacement for target thermalization. Air conditioning, estimated at 20 tons, will be provided in the instruction buildings and range control towers. Telephone service is available within 1,220 meters of the site. Lines will be run overhead to the site with the primary power line and then underground between buildings. Telephone service will be provided at the control towers and other applicable buildings. All sewage on the site will be collected in the aerated vault latrines and removed by pumper truck, so no sewage lines or septic field would be required. All water needed will be trucked in, so no water line, distribution systems, or wells would be required. The availability of these utilities is expected to continue.

APPENDIX E

AGENCY COORDINATION

DEPARTMENT OF THE ARMY
U.S. ARMY ENGINEER DISTRICT, HONOLULU
FORT SHAFTER, HAWAII 96858-5440

January 6, 2003

REPLY TO
ATTENTION OF:

Environmental Technical Branch
Engineering and Construction Division

Mr. Paul Henson
Field Supervisor
U.S. Fish and Wildlife Service
Pacific Islands Ecoregion
300 Ala Moana Boulevard, Room 3-122
Box 5008
Honolulu, Hawaii 96850

Dear Mr. Henson:

The U.S. Army is intending to coordinate with the U.S. Fish and Wildlife Service (Service) in accordance with the Fish and Wildlife Coordination Act of 1934 [16 U.S.C. 661 *et seq.*; 48 Stat. 401], as amended, for a proposal to transform the 2nd Brigade of the 25th Infantry Division to a Stryker Brigade Combat Team (SBCT). The transformation of the Army's 2nd Brigade to a SBCT is a major undertaking entailing a series of changes in equipment, force structure, training practices, and new facilities. The proposed action would require construction of two military vehicle trails on Oahu and one military vehicle trail on the Island of Hawaii. The military vehicle trails would have stream crossings that may affect aquatic resources. The coordination is necessary to determine if the action or the resources are significant enough to warrant Service input into the planning and design of the project to minimize impacts to stream wildlife. We have been coordinating with Mr. Gordon Smith of your office and are arranging for field trips to view stream crossings. If you have any questions please contact Mr. Steve Kim at telephone number (808) 438-3072.

Sincerely,

James L. Bersson, P.E.
Chief, Engineering and
Construction Division

FAX (808) 441-5821

July 1, 2002

R. Michael Laurs, Laboratory Director
National Marine Fisheries Service
F/SWC2, Honolulu Laboratory
2570 Dole Street
Honolulu, Hawaii 96822-2396

Subject: Interim Brigade Combat Team (IBCT) EIS

Dear Mr. Laurs,

Tetra Tech is preparing an environmental impact statement (EIS) in accordance with the National Environmental Policy Act (NEPA) to evaluate the potential effects associated with the proposed action of the Army IBCT project, in which the Army proposes to transform the 2nd Brigade into an IBCT, and to enhance training capabilities in Hawaii.

The proposed action results from the need of the US Army to become more strategically responsive in the spectrum of military operations. This goal will be obtained by adjusting aspects of doctrine, training, leadership, organizations, material, and soldiers within the 2nd Brigade. The changes extend to doctrinal and involve force structure, or how many soldiers are in each type of unit. They extend also to equipment, whether new or modernized.

Pursuant to NEPA, the potential environmental and socioeconomic effects associated with the transformation of the 2nd Brigade will be evaluated. This EIS focuses on site-specific issues. Of the many sites affected, three are thought to potentially involve marine life. These sites are Pohakuloa Training Area (PTA) on the big island of Hawaii, Dillingham and Makua Military Reservation (MMR), both on Oahu. Proposed changes to PTA include improving an existing tank trail to an all weather road, and the use of Kawaihae Harbor as a disembarkation point for training at PTA. Kawaihae Harbor is currently used in this capacity. Project actions would be limited to the harbor and inland activities. Activities at Dillingham and MMR would be limited to an increase of training at the sites. The transformation would result in an increase in soldiers and vehicles over the existing brigade.

The purpose of this letter is to obtain your input in identifying marine species and communities within the project region that are recognized as significant or are of special concern to your agency. These species and communities may consist of:

Rare, threatened, or endangered species;
Species protected by statute;
Commercial fish or shellfish species;
Recreationally important fish or invertebrate species; and
Marine communities (vertebrate, invertebrate, or plant) that are considered sensitive or are of limited distribution.

To facilitate the EIS schedule, we would appreciate receiving your comments and materials within 30 days. If you foresee a delay in responding to this request, or if you have any questions, please contact me at (415) 974-1221, or George Redpath, the project manager, in Hawaii at (808) 441-5830.

Respectfully,
Tetra Tech

RE: Stryker Brigade Combat Team
Consultation number I-PI-02-234:MMD

Colonel Anderson:

We have reviewed the letter received July 1, 2003, regarding the transformation of one of the two Legacy brigades of the 25th Infantry Division (Light) to a Stryker Brigade Combat Team (SBCT). This transformation entails a series of changes in equipment, force structure, training practices and new facilities. The National Oceanic and Atmospheric Administration, National Marine Fisheries Service (NOAA Fisheries) provides the following comments and information under our statutory authorities under the Endangered Species Act of 1973, as amended, 16 U.S.C. 1531 *et seq.* (ESA), and the Marine Mammal Protection Act of 1972, as amended 16 U.S.C. 1361 *et seq.* (MMPA).

Proposed actions that may affect marine protected species include the ocean transport of equipment. NOAA Fisheries concurs that the slow speeds (less than 11 knots) of the logistic support vessels (LSVs) make collisions with protected species unlikely and, therefore, not likely to adversely impact protected species. [There have been no reports of an LSV striking a protected species during the past 10 years of LSV operations in Hawaiian waters.] As a precautionary measure, vessel operators will be made aware of the regulations regarding protected species in Hawaii and instructed not to approach within 100 yards of any adult humpback whale or 300 yards of humpback whale mother/calf pairs.

The proposed construction and use of the military vehicle trail could impact protected species in the nearshore marine environment. However, provided best engineering practices to minimize erosion and properly contain potential petroleum spills are incorporated into the project plans, NOAA Fisheries concurs that vehicle trail construction is not likely to adversely impact protected species. NOAA Fisheries recommends also incorporating the following Best Management Practices (BMPs) to protect listed or otherwise protected species which may come into the nearshore project area.

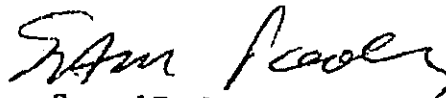

1.) All project personnel should be apprised of the status of the listed species and the protections afforded to the species under federal laws. A brochure explaining the laws and guidelines for listed species in Hawaii may be downloaded from http://www.nmfs.noaa.gov/prot_res/MMWatch/hawaii.htm

2.) If during project activities, protected species enter the project area, activities should cease until the animal(s) voluntarily leaves the area.

Helicopter flights over the marine and nearshore environments could also potentially impact protected species in the area. Local Flying Rules have been changed to prohibit flight within 1000 feet of any marine mammal. Provided these flight procedures are formally incorporated into the Local Flying Rules, NOAA Fisheries concurs that this activity is not likely to adversely affect marine mammals.

Provided the above conditions are met, NOAA Fisheries concurs with the determination of the Army that the transformation of a Legacy Brigade to a SBCT is not likely to adversely affect federally listed species under our jurisdiction. However, should any activity associated with the proposed action result in the taking of any protected species the Pacific Islands Regional Office should be promptly notified at (808) 973-2937. Should you have any questions regarding these comments or the consultation process please contact David Nichols or Margaret Akamine at the above contact number.

Sincerely,

Samuel Pooley
Acting Regional Administrator

Subject: ICBT Draft EIS

The National Marine Fisheries Service (NMFS), Pacific Islands Area Office (PIAO), has received your letter announcing the preparation of an EIS on the transfer of the 2nd Brigade into an Interim Brigade Combat Team (ICBT). The letter, dated 1 July 2002, was addressed to NMFS Honolulu Laboratory Director Michael Laurs. PIAO did not receive a copy until 25 November 2002.

The letter contains a summary of proposed activities at several sites which will occur because of this action. These sites include Dillingham and Makua Military Reservations on Oahu, and Pohakuloa Training Area and Kawaihae Harbor on the island of Hawaii. Based on the summary information in the letter, NMFS believes the proposed action will have a minimal impact on those marine species and habitats for which we have a responsibility. However, we request a copy of the full Draft EIS in order to insure that any potential impact from the proposed action will be minimal.

Sincerely,

John Naughton
Pacific Islands Environmental Coordinator

Re: Biological Opinion on Routine Military Training and Transformation of the 2nd Brigade 25th Infantry Division (Light), U.S. Army Installations on the Island of Hawaii (1-2-2003-F-02)

Dear Colonel Anderson:

This biological opinion responds to your request for formal consultation with the U.S. Fish and Wildlife Service (Service) pursuant to section 7 of the Endangered Species Act of 1973, as amended (Act). Your request was dated April 25, 2003, and was received April 28, 2003. The statutory deadline for completing this consultation, September 10, 2003, was extended by mutual agreement to December 23, 2003, due to the complexities of this consultation. At issue are the impacts that proposed actions may have on threatened and endangered species and their habitats on the U.S. Army Garrison Hawaii (Army) installation called Pohakuloa Training Area (PTA) on the island of Hawaii (Figure 1). Species included in this consultation include 15 plants: *Asplenium fragile* var. *insulare*, *Haplostachys haplostachya*, *Hedyotis coriacea*, *Isodendron hosakae*, *Lipochaeta venosa*, *Neraudia ovata*, *Portulaca sclerocarpa*, *Silene hawaiiensis*, *Silene lanceolata*, *Solanum incompletum*, *Spermolepis hawaiiensis*, *Stenogyne angustifolia*, *Tetramolopium arenarium*, *Vigna o-wahuensis*, *Zanthoxylum hawaiiense*; one mammal, the Hawaiian hoary bat (*Lasiurus cinereus semotus*); and designated critical habitat for one avian species, palila (*Loxioides bailleui*). Since palila and akiapolaau (*Hemignathus munroi*) have not been observed within the action area for almost 20 years, these species will not be addressed further in this biological opinion. Biological surveys to determine the status and abundance of nene (*Branta sandvicensis*), Hawaiian dark-rumped petrel (*Pterodroma phaeopygia sandwichensis*) and io or Hawaiian hawk (*Buteo solitarius*) will be conducted as part of your Project Description. This additional information will assist us in determining if these three species may be affected by Legacy and/or Stryker Brigade Combat Team Transformation (SBCT) training actions. If you determine and we concur there is a may affect to any or all of these avian species, then the Army will reinitiate this consultation to address potential effects to these species.

Re: Biological Opinion on Routine Military Training and Transformation of the 2nd Brigade 25th Infantry Division (Light), U.S. Army Installations on the Island of Oahu (1-2-2003-F-04)

Dear Colonel Anderson:

This biological opinion responds to your request for formal consultation with the U.S. Fish and Wildlife Service (Service) pursuant to section 7 of the Endangered Species Act of 1973, as amended (Act). Your request was dated April 25, 2003, and was received April 28, 2003. The statutory deadline for completing this consultation, September 10, 2003, was extended by mutual agreement until October 24, 2003, due to the complexities associated with finalizing a biological opinion of this magnitude. At issue are the impacts that the proposed actions may have on threatened and endangered species and their habitats on six Army installations on Oahu to include: 37 plants, 11 snails, 1 mammal, and 2 avian species, and designated critical habitat for the Oahu elepaio (*Chasiempis sandwichensis* spp. *ibidis*) (Appendix 1). Based on the information provided in the Programmatic Biological Assessment for Routine Military Training and Transformation of the 2nd Brigade 25th Infantry Division (Light), U.S. Army, Oahu, Hawaii (Biological Assessment) we concur with the determination that the Oahu creeper (*Paroreomyza maculata*) and the Hawaiian hoary bat (*Lasiurus cinereus semotus*) will not be adversely affected by the actions, and therefore, these species will not be addressed further in this biological opinion.

The biological opinion was prepared using the following information: 1) Biological Assessment; 2) Preliminary Draft Wildland Fire Management Plan Pohakuloa and Oahu Training Areas (WFMP), March 2002; 3) information from our files; and, 4) informal consultation between the Army and the Service.

Six Army installations are considered in this consultation to include: 1) Dillingham Military Reservation (DMR); 2) Kahuku Training Area (KTA); 3) Kawaihoa Training Area (KLOA); 4)

Dear Dr. Henson:

I am pleased to provide you with copies of the final Biological Assessments (BA) for Programmatic Section 7 Consultation on Routine Military Training and SBCT Transformation for the Islands of Oahu and Hawaii. The purpose of this action is to initiate Section 7 consultation in accordance with the Endangered Species Act. I look forward to working with you to identify specific conservation measures to offset likely adverse impacts on listed and proposed threatened and endangered species during the formal Section 7 process.

Point of contact for this action is Joel Godfrey, Directorate of Public Works, Environmental Division, 656-2878 x1050.

Sincerely,

David L. Anderson

Subject: Fish and Wildlife Coordination Act Planning Aid Letter for the Schofield Barracks–Helemano Military Reservation, Schofield Barracks–Dillingham Military Reservation, and the Pohakuloa Training Area–Kawaihae Harbor Road Improvements Related to the U.S. Army's Force Transformation of the 2nd Brigade, 25th Infantry Division (Light), Schofield Barracks, Hawaii

Dear Lieutenant Colonel Press:

The Fish and Wildlife Coordination Act of 1934 [16 U.S.C. 661 *et seq.*; 48 Stat. 401], as amended (FWCA), was established to provide a framework to fully consider fish and wildlife conservation measures as a component of Federal projects that may significantly impact important water resources. The U.S. Fish and Wildlife Service (Service) is providing this Planning Aid Letter (PAL) for three proposed road projects: the Schofield Barracks–Helemano Military Reservation (HMR), Schofield Barracks–Dillingham Military Reservation (DMR), and Pohakuloa Training Area (PTA)–Kawaihae Harbor Road. This letter has been prepared under the authority of and in accordance with provisions of FWCA; the Federal Clean Water Act of 1977 [33 U.S.C. 1251 *et seq.*; 62 Stat. 1155], as amended (CWA); and the Endangered Species Act of 1973 [16 U.S.C. 1531 *et seq.*; 87 Stat. 884], as amended (ESA). These comments are also consistent with the National Environmental Policy Act of 1969 [42 U.S.C. 4321 *et seq.*; 83 Stat. 852], as amended (NEPA), and other authorities mandating Service concern for environmental values.

The Department of Defense is preparing an Environmental Impact Statement for programmatic changes related to Army Force Transformation in Hawaii. The proposed changes are associated with the conversion of the 2nd Brigade, 25th Infantry Division (Light) to an Stryker Brigade Combat Team (SBCT). This proposed transformation will require changes in military land use,

training patterns, and military infrastructure including training and maneuver areas for 400 Stryker armed vehicles. It is anticipated that this will result in a greater need for roadways dedicated to military use. Three road construction projects are proposed: (1) Schofield Barracks-HMR Road, which would involve acquiring access, paving, and installing electrical and telecommunications conduit primarily on existing private unpaved agricultural roads that extend from Schofield Barracks to HMR (approximately six miles); (2) Schofield Barracks-DMR Road (Dillingham Trail), which would involve acquiring access and paving existing private agricultural roads that extend from Schofield Barracks to DMR (approximately 15 miles); and (3) Kawaihae Harbor-PTA (Pohakuloa Military Trail) which would involve acquiring access, paving, and installing electrical and telecommunications conduits primarily on an abandoned military trail that once extended from Kawaihae Harbor to PTA (approximately 27 miles).

Note that the Improvements to Drum Road Project, which involves widening, paving, and installing electrical and telecommunications conduits on the existing unpaved road that extends from Helemano Military Reservation (HMR) to the Kahuku Training Area (KTA) and passes through the Kawaihae Training Area (KLOA), is a closely related project that is progressing on a separate planning and review schedule. The Service previously provided a PAL regarding the Drum Road project to your office (November 2002), and have prepared a Draft FCWA report on that project (May 2003). Importantly, if the Improvements to Drum Road project proceeds as proposed, and if the Army transformation takes place, use of the newly paved Drum road will be a significant component of SBCT training.

Under NEPA and other relevant authorities, all components of the Army Transformation are considered a single Federal action for which cumulative environmental impacts, including potential impacts to fish and wildlife resources, are required to be addressed as a whole. For example, if constructed, the Drum Road, Schofield-HMR, and Dillingham Trail projects together would transect every watershed on the entire north shore of Oahu from Kahuku Point almost to Kaena Point. This is the least developed region on heavily urbanized Oahu, and represents almost one quarter of the circumference of the island. The area is recognized to contain significant marine and freshwater resources. Combined, the geographical extent of these roads is one of the largest transportation infrastructure development projects to be proposed in the State of Hawaii in the last several decades. Because planning for the Army Transformation projects are underway in a phased approach, with projects being designed and reviewed "separately," the Service reminds the Corps that, to comply with NEPA guidelines, the impacts of the various projects must be considered cumulatively, both in the context of programmatic analysis as well as project-specific and site-specific analyses.

A Federal project of this magnitude triggers multiple aspects of review by local, State, and Federal agencies, and by different functional programs within a single agency. In addition to the FWCA investigations and NEPA reviews by the Service for this project, the Service is also consulting under section 7 of the ESA, and will participate in the review of permitting under CWA sections 404 and 401. Please be advised that Service recommendations for conservation

measures regarding terrestrial resources potentially impacted by the road projects will be formulated through the section 7 process. Service recommendations regarding protection of Federal trust resources in the aquatic environment will be developed through FWCA and CWA-related reviews.

The following information was developed from information including project descriptions and maps provided to the Service by the Corps, a review of information contained in Service files, results of a site visit to the Oahu proposed road alignments, and a general knowledge of the areas under consideration. In addition, we consulted with the State of Hawaii Department of Land and Natural Resources, Division of Aquatic Resources, particularly the Hawaii Island district staff regarding the potential effects of the Kawaihae Harbor-PTA road.

Schofield Barracks-HMR Road

This road project would be constructed on existing unpaved agricultural roads that cross lands currently under pineapple cultivation at elevations of 850 to 1,100 feet (ft) above mean sea level (msl). Kaukonahua and Poamoho streams form deep forested gulches along this alignment. These two perennial streams would be crossed with new stream crossing structures at elevations of approximately 700 to 800 ft msl.

Schofield Barracks-DMR Road (Dillingham Trail)

This project would also be located on existing agricultural roads. The alignment would descend from Schofield Barracks through approximately three miles of land that is under pineapple cultivation, and the remaining distance would traverse lands that were previously under sugarcane cultivation but now are in various diversified crops including seed corn, orchard crops, banana and coffee. As currently proposed, this road would depart from the Schofield-HMR Road in the upland area between Kaukonaha and Poamoho streams. The road would then cross Kaukonaha Stream again in its lower reaches (20 ft msl) near the Waialua neighborhood known as Ranch Camp where there is currently a bridge that was put in place by the sugar plantation. Subsequently, the road would cross several intermittent streams and drainageways, the largest of which is Makaleha Stream near Dillingham Ranch.

Kawaihae Harbor-PTA (Pohakuloa Military Trail)

This project would cross a variety of leeward Big Island terrestrial habitat types from an elevation of 6,500 ft msl at PTA down to sea level at Kawaihae Harbor. In the immediate vicinity of PTA there is a mosaic of native forest and shrubland interspersed with barren lava flows. The proposed alignment descends towards pasture lands dominated by kikuyu grass that is broken by occasional gulches, cinder cones and low hills (e.g., Waikii Ranch area, Popoo Gulch). The lower section of the proposed road alignment passes through arid kiawe scrub and lava fields. A number of threatened and endangered terrestrial plant and animal species are found in this vicinity. Please refer to documents associated with the ESA section 7 consultation for the Service position on conservation measures to address concerns regarding listed species. The proposed road would cross

Waiulaula Gulch, which is formed by the confluence of Waikoloa and Keanuimano streams. This stream system is perennial in its upper reaches and intermittent in its middle and lower reaches.

Aquatic Resources

The proposed Schofield-HMR and Schofield-DMR roads cross Kaukonahua and Poamoho streams, which flow from the crest of the Koolaus in an east-to-west direction. The Schofield-DMR road also crosses Makaleha Stream, which flows down the north-facing slopes of Mt. Kaala and the Waianae Range. The PTA-Kawaihae road crosses Waiulaula Gulch. Kaukonahua and Poamoho streams are considered perennial throughout their courses; Waiulaula stream is considered an "interrupted stream" because it is perennial in its upper reaches but flows intermittently in its middle and lower reaches; and Makaleha Stream is intermittent throughout. Numerous smaller un-named drainages are also crossed by the proposed road alignments.

Streams throughout Hawaii, including the north shore Oahu streams and Waiulaula Stream and its tributaries, have been altered for over a century by agricultural diversions. These human-caused modifications to surface and ground water systems have profoundly altered natural hydrologic regimes. These dams usually divert all flowing water out of the stream channel, leaving the reach below the dam completely dry for extended periods of time. For example, Kaukonahua Stream is one of the most significant freshwater features in the entire state. It is the longest watershed in Hawaii, extending over thirty miles from its headwaters to its confluence with the sea. Kaukonahua Stream is dammed and now forms the largest impoundment in the state, Wahiawa Reservoir. This impoundment was created to store water for sugar cane cultivation. Several miles of stream channel below the dam are now dry most of the time, and the aquatic habitats that once existed in the lower stream channel are now almost entirely eliminated. No structural modifications were incorporated into the design of dams built in the early days of the plantation era to facilitate passage of aquatic organisms within natural stream channels, nor have current environmental considerations led to water resource management for the maintenance of stream flows in the reaches below the dams. To the contrary, these diversion structures were specifically designed to be highly efficient in capturing and diverting as much of the stream flow as possible, particularly during periods of moderate and low flow, when agricultural demand for water resources is high, and coincidentally when the need for water to support aquatic life is most acute.

The dewatering of streams in the project areas is significant because the native freshwater fish and larger freshwater invertebrates of Hawaii's streams (Table 1) are migratory and are, therefore, dependent upon adequate instream flows to complete their life cycle. These species exhibit a diadromous life cycle known as amphidromy in which adults live and spawn in the stream environment, newly hatched larvae are dispersed downstream to the ocean where the larvae persist in the marine environment until they undertake a remarkable upstream migration. Several species are capable of ascending vertical or overhanging waterfalls, and some species are found in high elevation perennial sections of intermittent or interrupted (diverted) streams, above reaches that do not contain perennially flowing water.

Table 1. Migratory native freshwater organisms of Hawaii.

Scientific name	Hawaiian name	Biogeographic status	Type of organism
<i>Awaous guamensis</i>	O'opu nakea	indigenous	Freshwater fish (family Gobiidae)
<i>Lentipes concolor</i>	O'opu alamo'o	endemic	Freshwater fish (family Gobiidae)
<i>Stenogobius hawaiiensis</i>	O'opu naniba	endemic	Freshwater fish (family Gobiidae)
<i>Sicyopterus stimpsoni</i>	O'opu nopili	endemic	Freshwater fish (family Gobiidae)
<i>Eleotris sandwicensis</i>	O'opu akupa	endemic	Freshwater fish (family Eleotridae)
<i>Atyoida bisulcata</i>	Opae kala'ole	endemic	Freshwater shrimp Crustacean
<i>Macrobrachium grandimanus</i>	Opae 'oeh'a	endemic	Freshwater prawn Crustacean
<i>Neritina granosa</i>	Hihirwai	endemic	Freshwater snail Mollusk

Moderate numbers of most, if not all, of these species have been reported from lower and mid elevation areas of Kaukonahua Stream and Poamoho Stream, both of which may be effected by the proposed road projects (refer to the Hawaii Stream Assessment, the Hawaii Natural Heritage Program database, and the Oahu Training Areas Integrated Natural Resources Management Plan). At least two native fish species (*Awaous guamensis* and *Lentipes concolor*) are known to occur in moderate to low numbers in Waiulaula Stream (Bob Nishimoto, DLNR, pers. com; Pete Hendicks, DLNR, pers. com). No larger aquatic species are expected to be found in Makaleha Stream because it is dry most of the time. In addition to these native species, a considerable number of introduced aquatic species are known to occur in these streams and associated waterbodies (ditches and reservoirs).

Wildlife Resources

Hunting of feral pigs, goats and sheep in the lands adjacent to the road projects is fairly common, particularly the higher elevation areas near PTA. In addition, some upland game bird hunting is undertaken in these areas. The Service supports managed hunting of feral ungulates as a means to reduce their numbers for the purpose of watershed preservation and to reduce threats to rare, threatened and endangered animals and plants. Conservation management of State lands that are

designated as public hunting areas is strongly encouraged by the Service. Support of State hunting programs on these lands through the Service's Division of Federal Aid amounts to several hundred thousand dollars a year. In addition, adjacent landowners are generally in support of limiting feral ungulate populations because of the need to conserve watershed resources and to limit crop damage. Therefore, continued access to these lands during and after construction of the proposed road projects is necessary for the ongoing wildlife management task of controlling feral ungulates.

Planning Recommendations

The Service recommends that planning for the road projects incorporate stream protection measures both for the permanent installation and maintenance of the larger, more heavily used roadways, as well as for temporary construction related impacts. These goals should be accomplished by considering the following objectives in the design, engineering, and construction phases of the project:

1. Minimize concentration of runoff water volume and velocity, and reduce soil and sediment movement to maintain adequate water quality.
 - This objective should be accomplished by appropriate placement of surface cross drains to avoid discharges of runoff and roadway contaminants directly into stream channels or onto erodible slopes, and by providing buffers, grass swales, or sediment basins between cross drain outlets and stream channels.
2. Prevent stream crossings from being a direct source of sediment to streams and from degrading water quality by providing for unobstructed migratory passage for native aquatic migratory organisms.
 - This objective should be accomplished by the use of bottomless arch culverts and bridges that span the stream channel and adjacent streambanks wherever feasible. (Site specific information on stream flow characteristics may dictate special engineering considerations necessary to ensure uninterrupted fish passage.) At a minimum, bridges should be installed where ever stream flow is perennial (e.g., Kaukonahua and Poamoho streams) or where migration of native fauna is dependent upon intermittent flow (e.g., Waiulaula Stream). Culvert designs that retain natural bottom substrate and are large enough in diameter to allow adequate illumination by natural light should be used at all other stream crossings that exhibit characteristics of supporting intermittent flow. A plan that outlines removal of existing bridges and culverts should be developed, and demolition activities should be conducted in a manner that minimizes input of material into the aquatic environment.
3. Stringent application of effective best management practices (BMPs) throughout project construction. These BMPs should be tailored to specifically recognize the challenges posed

by the location and climatic conditions found along the proposed road alignments. A variety of sources should be consulted regarding BMP development and standard operating procedures for the construction phase of these projects, particularly the Corps Regulatory Branch and the Hawaii Department of Health, Clean Water Branch. BMPs should incorporate specific guidance on the following:

- in-stream construction should be scheduled to occur during low-flow time periods;
 - at the onset of periods of persistent or torrential rain in any season, construction should be halted, and exposed erodible areas should be secured;
 - project-related materials (fill, revetment rock, pipe etc.) should not be stockpiled in a stream channel or adjacent riparian zone;
 - all project-related materials and equipment (backhoes, trucks, etc) placed in the water should be free of pollutants;
 - contamination (including alien species introductions or disposal of trash or debris) in stream channels, riparian areas, or adjacent marine environments should not result from project-related activities;
 - fueling of project-related vehicles and equipment should take place away from the water and a contingency plan to control petroleum products accidentally spilled during the project should be developed. Absorbent pads and containment booms should be stored on-site to facilitate the clean-up of petroleum spills; and
 - turbidity and siltation from project-related work should be minimized and contained to within the vicinity of the site through the appropriate use of effective silt containment devices and the curtailment of work during adverse weather conditions.
4. Maintenance of access to lands used by hunters, wildlife managers, and natural resource personnel should continue during construction and operation of the military roads. Placement of gates, security checkpoints and other infrastructure should not impede hunter access to State lands or access to private lands by those who have permission to enter from the landowner.

As stated above, aquatic resources of concern are found in moderate to low numbers in the proposed project area. If the Army follows the above recommendations to avoid and minimize potential impacts to these resources, overall project impacts to fish and wildlife are not anticipated to be significant as defined by the FWCA. The Service will continue to track the development of these projects, and in particular the implementation of the conservation efforts suggested above, throughout the environmental review process. This will include reviews of Environmental Assessments and Environmental Impact Statements under NEPA, and reviews of

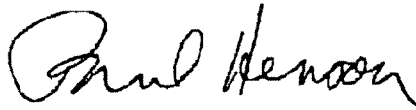

Lt. Colonel David C. Press

8

permit actions under section 404 of the CWA. Unless the nature of the project changes or the Service is made aware of new information regarding fish and wildlife resources that may be potentially effected by the road projects, no field investigation and report under section 2(b) of the FWCA anticipated to be necessary.

The Service appreciates the opportunity to provide this Planning Aid Letter for the Army transformation road projects. If you have questions regarding this letter, please contact Fish and Wildlife Biologist Gordon Smith at 808/541-3441.

Sincerely,

A handwritten signature in cursive script, reading "Paul Henson".

Paul Henson, Ph.D.
Field Supervisor

Subject: Fish and Wildlife Coordination Act Planning Aid Letter for the proposal to
construct a Battle Area Complex (BAX) at Schofield Barracks, Oahu, Hawaii

Dear Lieutenant Colonel Press:

The Fish and Wildlife Coordination Act of 1934 [16 U.S.C. 661 *et seq.*; 48 Stat. 401], as amended (FWCA), was established to provide a framework to fully consider fish and wildlife conservation measures as a component of Federal projects that may significantly impact important water resources. The U.S. Fish and Wildlife Service (Service) is providing this Planning Aid Letter (PAL) for the Schofield Barracks Battle Area Complex (BAX). This letter has been prepared under the authority of and in accordance with provisions of FWCA; the Federal Clean Water Act of 1977 [33 U.S.C. 1251 *et seq.*; 62 stat. 1155], as amended (CWA); and the Endangered Species Act of 1973 [16 U.S.C. 1531 *et seq.*; 87 Stat. 884], as amended (ESA). These comments are also consistent with the National Environmental Policy Act of 1969 [42 U.S.C. 4321 *et seq.*; 83 Stat. 852], as amended (NEPA), and other authorities mandating Service concern for environmental values.

The proposed project is associated with the conversion of the 2nd Brigade, 25th Infantry Division (Light) to a Stryker Brigade Combat Team (SBCT). This proposed transformation will require changes in military land use, training patterns, and military infrastructure including training and maneuver areas for 400 Stryker armed vehicles. It is anticipated that this will result in a greater need for roadways dedicated to military use. The proposed BAX would be constructed at McCarthy Flats on the west side of Beaver Road and north of Trimble Road, on the existing range complex and range impact area. The construction of the BAX would occupy approximately 600 acres of previously altered land for military use. This range will support mounted and dismounted infantry platoon tactical and live-fire operations either independently of, or simultaneously with, supporting tactical vehicles.

In addition to the FWCA Planning Aid Letter and NEPA review by the Service for this project, the Service is also consulting under section 7 of the ESA, and will participate in the review of the U.S. Army Corps of Engineers (Corps) permitting under CWA sections 404 and 401 if required. Please be advised that Service recommendations for conservation measures regarding terrestrial resources potentially impacted by transformation projects will be formulated through the section 7 process. Service recommendations regarding protection of Federal trust resources in the aquatic environment will be primarily developed through FWCA and CWA-related reviews.

The following information was developed from project descriptions and maps provided to the Service by the Corps, a review of information contained in Service files, results of a site visit to the proposed BAX site, and a general knowledge of the areas under consideration.

Schofield Barracks Vehicle Crossings

A total of five stream crossings sites were surveyed at Schofield Barracks Range on August 29, 2003. All stream sites were dry and had no aquatic resources present. Streams surrounding the Schofield Barracks Range are known to be intermittent throughout the year, and on occasion have pulse flows during heavy rain events. Each stream site surveyed on the Schofield Barracks Range had little potential for fish and wildlife habitat due to the absence of flowing water and absence of quality in-stream substrate (e.g., gravel, cobbles). Three of the five sites visited contained grasses and shrubs growing directly in the stream channel and the other two sites contained dried mud and fine sediments in the channel. Five of the six stream sites received direct sunlight and were without riparian vegetation. Two of the proposed vehicle crossing sites in the Waikoloa Gulch have high erosion potential due to large areas of exposed-loose soil upland of the gulches. Portions of the gulches are deep (20 to 50 feet) and are surrounded by large flat plateaus covered by *Panicum maximum* (guinea grass) and other grasses. To accommodate military activities, the grasses and shrubs growing on the plateaus are consistently cleared by burning and bulldozing. The proposed stream crossing sites in the Mohiakea Gulch were not surveyed due to military training activities on that day, however the topography and proximity of the two sites strongly indicate that conditions are similar.

The proposed BAX gulch crossings are located on tributaries to Kaukonahua stream, which flows from the crest of the Koolaus in an east-to-west direction to Waialua Bay on the north shore of Oahu. Streams throughout Hawaii, including streams of the north shore of Oahu such as Kaukonahua Stream and its tributaries, have been altered for over a century by agricultural diversions. These human-caused modifications to surface and ground water systems have profoundly altered natural hydrologic regimes. These dams usually divert all flowing water out of the stream channel, leaving the reach below the dam completely dry for extended periods of time. For example, Kaukonahua Stream is one of the most significant freshwater features in the entire state. It is the longest watershed in Hawaii, extending over thirty miles from its headwaters to its confluence with the sea. Kaukonahua Stream is dammed and now forms the largest impoundment in the state, Wahiawa Reservoir. This impoundment was created to store water for sugar cane cultivation. Several miles of stream channel below the dam are now dry

most of the time, and the aquatic habitats that once existed in the lower stream channel are now almost entirely eliminated. No structural modifications were incorporated into the design of dams built in the early days of the plantation era to facilitate passage of aquatic organisms within natural stream channels, nor have current environmental considerations led to water resource management for the maintenance of stream flows in the reaches below the dams. To the contrary, these diversion structures were specifically designed to be highly efficient in capturing and diverting as much of the stream flow as possible, particularly during periods of moderate and low flow, when agricultural demand for water resources is high, and coincidentally when the need for water to support aquatic life is most acute.

The dewatering of streams in the project areas is significant because the native freshwater fish and larger freshwater invertebrates of Hawaii's streams (Table 1) are migratory and are, therefore, dependent upon adequate instream flows to complete their life cycle. These species exhibit a diadromous life cycle known as amphidromy in which adults live and spawn in the stream environment, newly hatched larvae are dispersed downstream to the ocean where the larvae persist in the marine environment until they undertake a remarkable upstream migration. Several species are capable of ascending vertical or overhanging waterfalls, and some species are found in high elevation perennial sections of intermittent or interrupted (diverted) streams, above reaches that do not contain perennially flowing water. Moderate numbers of most, if not all, of these species have been reported from lower and mid elevation areas of Kaukonahua Stream upstream of the proposed BAX gulch crossings (refer to the Hawaii Stream Assessment, the Hawaii Natural Heritage Program database, and the Oahu Training Areas Integrated Natural Resources Management Plan). However, no larger aquatic species are expected to be found in either Mohiakea Gulch or Waikoloa Gulch because they are dry most of the time.

Recommendations

The Service recommends that planning for the Schofield Barracks BAX incorporate stream protection measures both for the permanent installation and maintenance of the larger, more heavily used roadways, as well as for temporary construction related impacts. These goals should be accomplished by considering the following objectives in the design, engineering, and construction phases of the project:

1. Minimize concentration of runoff water volume and velocity, and reduce soil and sediment movement to maintain adequate water quality.
 - This objective should be accomplished by appropriate placement of surface cross drains to avoid discharges of runoff and roadway contaminants directly into stream channels or onto erodible slopes, and by providing buffers, grass swales, or sediment basins between cross drain outlets and stream channels.
2. Prevent stream crossings from being a direct source of sediment to streams.

Table 1. Migratory native freshwater organisms of Hawaii.

Scientific name	Hawaiian name	Biogeographic status	Type of organism
<i>Awaous guamensis</i>	O'opu nakea	indigenous	Freshwater fish (family Gobiidae)
<i>Lentipes concolor</i>	O'opu alamo'o	endemic	Freshwater fish (family Gobiidae)
<i>Stenogobius hawaiiensis</i>	O'opu naniha	endemic	Freshwater fish (family Gobiidae)
<i>Sicyopterus stimpsoni</i>	O'opu nopili	endemic	Freshwater fish (family Gobiidae)
<i>Eleotris sandwicensis</i>	O'opu akupa	endemic	Freshwater fish (family Eleotridae)
<i>Atyoida bisulcata</i>	Opae kala'ole	endemic	Freshwater shrimp Crustacean
<i>Macrobrachium grandimanus</i>	Opae 'oeh'a	endemic	Freshwater prawn Crustacean
<i>Neritina granosa</i>	Hihiwai	endemic	Freshwater snail Mollusk

- This objective can be accomplished by using bridges, culverts, Texas swales (concrete swale), or gabion swales which span the stream channel and allow for vehicles to cross without directly coming into contact with stream substratum.
3. Stringent implementation of effective best management practices (BMPs) throughout project construction. These BMPs should be tailored to specifically recognize the challenges posed by the location and climatic conditions found along the proposed BAX gulch crossings. A variety of sources should be consulted regarding BMP development and standard operating procedures for the construction phase of these projects, particularly the Corps Regulatory Branch and the Hawaii Department of Health, Clean Water Branch. BMPs should incorporate specific guidance on the following:
- in-stream construction should be scheduled to occur during no-flow time periods;
 - at the onset of periods of persistent or torrential rain in any season, construction should be halted, and exposed erodible areas should be secured;
 - project-related materials (fill, revetment rock, pipe etc.) should not be stockpiled in a stream channel or adjacent riparian zone;
 - all project-related materials and equipment (backhoes, trucks, etc) placed in the water should be free of pollutants;
 - contamination (including alien species introductions or disposal of trash or debris) in stream channels, riparian areas, or adjacent marine environments should not result from project-related activities;
 - fueling of project-related vehicles and equipment should take place away from the water and a contingency plan to control petroleum products accidentally spilled during the project should be developed. Absorbent pads and containment booms should be stored on-site to facilitate the clean-up of petroleum spills; and
 - turbidity and siltation from project-related work should be minimized and contained to within the vicinity of the site through the appropriate use of effective silt containment devices and the curtailment of work during adverse weather conditions.

As stated above, aquatic resources of concern are found in low numbers upstream of the proposed project area. If the Army follows the above recommendations to avoid and minimize potential impacts to these resources, overall project impacts to fish and wildlife are not anticipated to be significant as defined by the FWCA. The Service will continue to track the development of these projects, and in particular the implementation of the conservation efforts suggested above, throughout the environmental review process. This will include reviews of Environmental Assessments and Environmental Impact Statements under NEPA, and reviews of

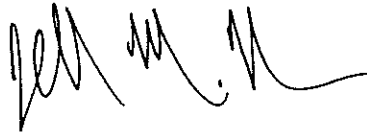

Lt. Colonel David C. Press

6

permit actions under section 404 of the CWA. Unless the nature of the project changes or the Service is made aware of new information regarding fish and wildlife resources that may be potentially effected by the road projects, no field investigation and report under section 2(b) of the FWCA will be necessary.

The Service appreciates the opportunity to provide this Planning Aid Letter for the Schofield Barracks BAX projects. If you have questions regarding this letter, please contact Fish and Wildlife Biologist, Ray Hoy or Gordon Smith at 808/792-9431.

Sincerely,

A handwritten signature in black ink, appearing to read 'Gina Shultz', with a stylized flourish at the end.

 Gina Shultz,
Acting Field Supervisor

CEPOH-EC-R

MEMORANDUM FOR: Chief, CEPOH-EC-T *Ø 9/5/02*

DATE: 4 September 2002

SUBJECT: Certification of Wetland, Dillingham Military Reservation, Oahu Island

1. This is in response to your MFR dated 23 August 2002 regarding the subject project. Farley Watanabe of my staff has reviewed the drawings, database, and report for this project. The documentation complies with the procedures of the 1987 Corps Wetlands Delineation Manual and is adequate for certification purposes.
2. Based on the information provided, the map (Figure 6) included in the report entitled "*Wetland Survey of Dillingham Military Reservation*" which identified a perched wetland is hereby certified. The previously identified wetland identified in the agency ITAM (Figure 1) is not considered a jurisdictional wetland due to the absence of the hydrology indicator as required by the 1987 Corps Wetlands Delineation Manual.
3. Since wetlands are affected over time by both natural and man-made activities, we can expect local changes to occur in wetland boundaries. For the referenced maps, the wetland jurisdictional delineation is considered valid for a period of five years from the date of this memorandum (i.e., 4 September 2007). New information of local changes will require evaluation and may be used to revise delineations before the expiration date.
4. If you have any questions, please contact Mr. Watanabe at 438-7701 and refer to File Number 200200518.

George P. Young, P.E.
Chief, Regulatory Branch

Subject: Amendment to Saddle Road Palila MOU; Transfer of Implementation Responsibilities

Dear Mr. Buck:

The Federal Highway Administration (FHWA) - Central Federal Lands Highway Division (CFLHD), in cooperation with the State of Hawaii Department of Transportation (HDOT) and the U.S. Department of the Army (DOA), is proposing to improve State Route 200, Saddle Road, in the County of Hawaii.

The initial segment of construction will realign the portion of existing Saddle Road that passes through the DOA's Pohakuloa Training Area to a location north of the base. This realignment will pass through critical habitat of an endangered bird, the Palila. To compensate for the impact to this habitat, a mitigation plan was developed and agreed to by seven federal and state agencies in 1999. The plan is outlined in the Memorandum of Understanding Regarding Implementation of the Saddle Road Palila Critical Habitat Impact Mitigation (Palila MOU). Table A of the Palila MOU summarizes the critical elements of the mitigation plan, their anticipated cost, the proposed funding sources, and the agency responsible for the implementation of each item of work. Under the terms of the original Palila MOU, the Department of Land and Natural Resources (DLNR) was identified as the agency responsible for carrying out the following elements of the mitigation plan: (1) predator and alien species control for ten years; (2) ungulate fencing at Pu'u Mali; (3) cattle fencing at Pu'u Mali and Ka'ohe lease lands; and, (4) mowing of the Ka'ohe mitigation site for a period of five years.

CFLHD representatives discussed the performance and scheduling of the DLNR mitigation elements with you and Mr. Roger Imoto via several telephone calls in October. Based on these conversations, it was our understanding that DLNR did not have sufficient staff at this time to undertake the first three of these elements and complete them within the needed timeframe.

Subsequent to these conversations, a meeting was held in Hilo on November 13 with Mr. Imoto and members of his staff, USGS-BRD, U.S. Fish & Wildlife Service, and FHWA to reach an understanding on how best to accomplish the predator and alien species control and fencing of the mitigation sites. As a result of this meeting, it was agreed that USGS-BRD would conduct the predator and alien species control work over the 10-year mitigation period and that CFLHD would install the fencing at Pu'u Mali and Ka'ohe. DLNR would continue to be responsible for the mowing of the Ka'ohe lease land area. Therefore it is proposed that the Palila MOU be amended to:

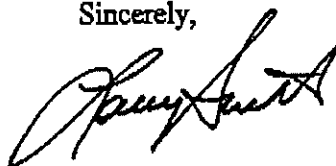

- Reassign responsibility for predator and alien species control from DLNR to USGS-BRD.
- Reassign responsibility for the installation of the fencing at the Pu'u Mali and Ka'ohe sites from DLNR to FHWA.

We are forwarding three originals of Amendment #1 to the Palila MOU stipulating the above changes. If you agree, please sign and return all three originals of the amendment to this office in the enclosed franked and self-addressed envelope. The three originals of amendment #1 will then be forwarded to USGS-BRD for their signature. Upon obtaining signatures from both agencies, we will return one original signed amendment to you for your records. A copy of the signed amendment will also be provided to the other original Palila MOU signatory agencies that are not directly impacted by these changes.

We also propose to improve communications and coordination among the Palila MOU signatory agencies. We have recommended to USGS-BRD that they provide regular status updates to your Big Island staff of their 'on-the-ground' efforts that are undertaken as part of the Predator and Alien Species Control and Palila Relocation and Monitoring work. In addition, Ms. Jodi Chew, FHWA Hawaii Division, will oversee the implementation of the mitigation during the 10-year life of the plan. Ms. Chew will conduct annual meetings with the key implementing agencies at which the prior year's efforts will be reviewed and upcoming year's plan coordinated and agreed upon. Additional meetings will be scheduled on an as needed basis, and may include field inspections as appropriate. Your staff will be invited to all such meetings.

We wish to thank you and Mr. Imoto for your assistance and cooperation in resolving this matter in a highly professional manner. If you have any questions regarding this issue or any other matters related to the Saddle Road project, please contact Ms. Chew at (808) 541-2700, extension 328, or Mr. Dave Gedeon, CFLHD Saddle Road Project Manager, at (303) 716-2131.

Sincerely,

Larry C. Smith, P.E.
Division Engineer

MEMORANDUM OF UNDERSTANDING
REGARDING IMPLEMENTATION OF THE SADDLE ROAD PALILA CRITICAL
HABITAT IMPACT MITIGATION
(PALILA MOU)

AMENDMENT NUMBER 1

The 1999 Palila MOU formed the basis for the interagency implementation of the Palila mitigation related to the Saddle Road improvement project. Signatory agencies to the Palila MOU include: the Federal Highway Administration (FHWA) - Central Federal Lands Highway Division (CFLHD), the Hawaii Department of Transportation (HDOT), the Department of the Army - Military Traffic Management Command (MTMC), the U.S. Army Garrison - Hawaii (USAG-HI), U.S. Fish & Wildlife Service (USFWS), Department of Land and Natural Resources (DLNR), and the U.S. Geological Services - Biological Research Division (USGS-BRD).

The Final EIS and Record of Decision for Saddle Road were signed in late 1999. Palila mitigation related to the Saddle Road project was initiated in fiscal year 2000 using USAG-HI Ecosystem Management Funds in support of USGS-BRD's Palila relocation and monitoring and related mitigation efforts. An easement setting aside the Pu'u Mali and Ka'ohe mitigation sites was executed on November 27, 2002 and extends through November 26, 2012.

The USFWS and USGS-BRD have releases of Palila scheduled for the fall and winter of 2003/2004 that require the prior or simultaneous implementation of predator and alien species control at or near the easement lands. DLNR was identified in the Palila MOU as the agency responsible for carrying-out predator and alien species control, as well as ungulate fencing of the Pu'u Mali and cattle fencing of the Ka'ohe sites. DLNR does not have sufficient staff at present to perform these efforts within the timeline required.

Therefore, it is mutually agreed that the Palila MOU shall be amended as follows:

- A. USGS-BRD will conduct the predator and alien species control work over the 10-year mitigation period.
- B. FHWA - CFLHD will install the ungulate fencing at Pu'u Mali and cattle fencing at Ka'ohe.
- C. DLNR will remain responsible for the mowing of the Ka'ohe lease land area for a period of 5 years.
- D. The implementation cost of each of these mitigation elements remains the same as shown in Table A of the Palila MOU.

Larry C. Smith, FHWA-CFLHD

REPLY TO
ATTENTION OF

DEPARTMENT OF THE ARMY
HEADQUARTERS, UNITED STATES ARMY GARRISON, HAWAII
SCHOFIELD BARRACKS, HAWAII 96857-5000

DEC 17 2003

Office of the Garrison Commander

Mr. David W. Blane
Director
Hawai'i Coastal Zone Management Program
Office of Planning
Dept. of Business, Economic Development and Tourism
P.O. Box 2359
Honolulu, Hawai'i 96804

Dear Mr. Blane:

Pursuant to Section 307 of the Coastal Zone Management Act of 1972 (16 U.S.C. § 1456), the US Army has determined that implementing the Stryker Brigade Combat Team project in the State of Hawai'i is consistent with the Hawai'i Coastal Zone Management Program (CMP). This letter, the attached Coastal Zone Management (CZM) Assessment Form and the Stryker Brigade Combat Team Draft Environmental Impact Statement (DEIS) serve as a Coastal Consistency Determination, as required by the National Oceanic and Atmospheric Administration regulations for federal consistency with approved coastal management programs (15 C.F.R. 930).

Background. The attached EIS is being prepared in accordance with the National Environmental Policy Act of 1969 (NEPA) and addresses in detail the specific impacts to resources, including consistency of the proposed action with the CMP. The US Army Hawai'i (USARHAW) is the lead agency on this proposed project. The project would occur on land that is or will be wholly owned or leased by the US Army on the islands of O'ahu and Hawai'i, at six installations: Pōhakuloa Training Area (PTA) on the Island of Hawai'i and Schofield Barracks Military Reservation (SBMR) including East Range, Wheeler Army Airfield (WAAF), Kahuku Training Area (KTA), Kawialoa Training Area, and Dillingham Military Reservation (DMR) on O'ahu. Public scoping meetings were held in Wahiawā, Honolulu, Hale'iwa, Kahuku, Wai'anae, and Hilo, and the Army published early notice of the meeting times and locations. Public hearings for comment on the DEIS were also held at most of the same locations.

Project Description. As described in the DEIS, the Army proposes to transform the 2nd Brigade to a Stryker Brigade Combat Team (SBCT), including enhancing training capabilities in Hawai'i to support the nationwide transformed forces. The purpose of the proposed action is to assist in bringing the Army's Interim Force to operational capability and to provide realistic field training in Hawai'i. Twenty-eight projects are proposed for USARHAW that would improve on the existing support structure and training facilities to provide the necessary training required for an SBCT. Reconfiguring maneuver areas, establishing combat training facilities more appropriate to the types of threats the Army expects to encounter, and strengthening

infrastructure are planned to ensure that SBCT's leaders and its soldiers would be prepared for the full spectrum of military operations.

Documentation and Analysis. The Army has prepared extensive documentation and analysis to comply with requirements of NEPA, the National Historic Preservation Act (NHPA), the Endangered Species Act (ESA), and other federal and state laws. The SBCT Draft EIS is enclosed. Other documentation, such as the final draft Programmatic Agreement, dated December 5, 2003, in compliance with Section 106 of the NHPA and a letter of concurrence from NOAA Fisheries for compliance with Section 7 of the ESA are included with this submittal. The enclosed DEIS addresses the specific CMP policies under the specific environmental consequences section for each installation. The CMP policy areas are addressed in the following relevant DEIS sections:

CMP

Recreational Resources
Historic Resources
Open Space and Scenic Resources
Coastal Ecosystems
Economic Uses
Coastal Hazards
Managing Development
Public Participation
Beach Protection
Marine Resources

DEIS

Land Use/Recreation
Cultural Resources
Land Use/Recreation & Visual Resources
Biology and Water Resources
Socioeconomics and Environmental Justice
Geological Resources
Land Use
Public Involvement (Section 1.8)
Geological Resources/Water Resources
Biological Resources/Water Resources

Conclusion. USARHAW has determined that implementing the proposed SBCT project on the islands of O'ahu and Hawai'i, in the State of Hawai'i, would be consistent with the Hawai'i Coastal Zone Management Program. Please review the enclosures and forward a letter of concurrence. Pursuant to 15 C.F.R. § 930.41, the Hawai'i Coastal Zone Management Program has 60 days from receipt of this letter in which to concur with or object to this Consistency Determination, or to request an extension, in writing under 15 C.F.R. § 930.41(b). Hawai'i's concurrence will be presumed if its response is not received by USARHAW on the 60th day from receipt of this determination. The state's response should be sent to:

Cindy Barger
U.S. Army Engineer District, Honolulu District
Programs and Project Management Division
SBCT EIS Project Manager
Building 230, Room 306
CEPOH-PP-E
Fort Shafter, HI 96858-5440

If additional information is required, please contact Ms. Cindy Barger at 808-438-4812 or SBCT_EIS@poh01.usace.army.mil.

Sincerely,

ENCLOSURE 1: SBCT Coastal Consistency Determination

HAWAI'I CZM PROGRAM FEDERAL CONSISTENCY ASSESSMENT FORM

RECREATIONAL RESOURCES

Objective: Provide coastal recreational opportunities accessible to the public.

Policies:

- 1) Improve coordination and funding of coastal recreation planning and management.
- 2) Provide adequate, accessible, and diverse recreational opportunities in the coastal zone management area by:
 - a) Protecting coastal resources uniquely suited for recreational activities that cannot be provided in other areas;
 - b) Requiring replacement of coastal resources having significant recreational value, including but not limited to surfing sites and sandy beaches, when such resources will be unavoidably damaged by development; or requiring reasonable monetary compensation to the State for recreation when replacement is not feasible or desirable;
 - c) Providing and managing adequate public access, consistent with conservation of natural resources, to and along shorelines with recreational value;
 - d) Providing an adequate supply of shoreline parks and other recreational facilities suitable for public recreation;
 - e) Encouraging expanded public recreational use of county, state, and federally owned or controlled shoreline lands and waters having recreational value;
 - f) Adopting water quality standards and regulating point and non-point sources of pollution to protect and where feasible, restore the recreational value of coastal waters;
 - g) Developing new shoreline recreational opportunities, where appropriate, such as artificial reefs for surfing and fishing; and
 - h) Encouraging reasonable dedication of shoreline areas with recreational value for public use as part of discretionary approvals or permits by the land use commission, board of land and natural resources, County planning commissions; and crediting such dedication against the requirements of section 46-6.

Check either "Yes" or "No" for each of the following questions:

		<u>Yes</u>	<u>No</u>
1.	Will the proposed action involve or be near a dedicated public right-of-way?	X	___
2.	Does the project site abut the shoreline?	X	___
3.	Is the project site near a State or County park?	X	___
4.	Is the project site near a perennial stream?	X	___

ENCLOSURE 1: SBCT Coastal Consistency Determination

- | | | | |
|----|---|---|-----|
| 5. | Will the proposed action occur in or affect a surf site? | X | ___ |
| 6. | Will the proposed action occur in or affect a popular fishing area? | X | ___ |
| 7. | Will the proposed action occur in or affect a recreational or boating area? | X | ___ |
| 8. | Is the project site near a sandy beach? | X | ___ |
| 9. | Are there swimming or other recreational uses in the area? | X | ___ |

Discussion:

1. The proposed action is near numerous public highways and trails. Public access on these rights-of-way would not be impeded.
2. The project site abuts the shoreline at Kawaihae Harbor, however, no changes to the Harbor are planned. While Dillingham Military Reservation (DMR) property includes shoreline areas, no project measures take place on or near the shoreline.
3. The following public parks are near one or more of the project sites. None of these parks would be adversely affected by the proposed action.
 - a. On O'ahu: Mokuleia Beach Park, Wahiawa State Freshwater Park (Lake Wilson), Sacred Falls State Park, and Kahana Valley State Park, which are on the east side of the Koolau Mountain ridge.
 - b. On the Island of Hawai'i: Mauna Kea State Park and Pu'ukohola Heiau National Historic Site.
4. The military vehicle trails on O'ahu (Dillingham Trail, Helemano Trail, and Drum Road) will cross numerous perennial streams, and the PTA Trail will cross the perennial Waikoloa Stream. Additional information regarding streams is discussed below under question 6 of Coastal Ecosystems.
5. Mokuleia Beach Park, across Farrington Highway from the Dillingham Military Reservation, has some surf sites. Although a surf site is located at Kawaihae on the reef between the south small boat harbor and the entrance channel, it would not be affected by the proposed action. Theater Support Vessels may be introduced as part of future operations. Impacts from those vessels would be considered under a separate NEPA document and Coastal Consistency Determination if they were to be introduced.
6. Mokuleia Beach Park attracts fishermen (shorecasting and diving); it is located across the highway from Dillingham Military Reservation and would not be affected by the proposed activities.
7. Kawaihae has two small boat harbors, one at the north end and one at the south end. The proposed activities would occur in the commercial port area and, therefore, would not affect recreational boating. There is some hunting allowed on Army lands (especially at PTA but also in State lands within the Kahuku Training Area and Kawailoa Training Area). New training requirements would change access to these hunting areas but access would not be closed. These hunting areas are not in or near shoreline areas.
8. Dillingham Military Reservation is located across the highway from Mokuleia Beach Park, which features a sandy beach. However, the activities at DMR would have no impact on the beach. Likewise, the activities at the Kawaihae Harbor commercial port would not affect the small sandy beach at the north end of the harbor.
9. Swimming, diving, shorecasting, and picnicking at Mokuleia Beach Park would not be affected by activities at DMR. The recreational areas of Kawaihae Harbor are used by local residents for shoreline recreational activities, including fishing, canoe paddling, sailing, windsurfing, swimming, scuba diving, snorkeling, and

ENCLOSURE 1: SBCT Coastal Consistency Determination

picnicking. None of these activities would be affected by the proposed action, which would occur in the commercial portion of the harbor.

HISTORIC RESOURCES

Objective: Protect, preserve, and where desirable, restore those natural and man-made historic and pre-historic resources in the coastal zone management area that are significant in Hawaiian and American history and culture.

Policies:

- 1) Identify and analyze significant archaeological resources;
- 2) Maximize information retention through preservation of remains and artifacts or salvage operations; and
- 3) Support State goals for protection, restoration, interpretation, and display of historic resources.

Check either "Yes" or "No" for each of the following questions:

	<u>Yes</u>	<u>No</u>
1. Is the project site within a historic/cultural district?	X	___
2. Is the project site listed on or nominated to the Hawaii or National register of historic places?	X	___
3. Does the project site include undeveloped land which has not been surveyed by an archaeologist?	X	___
4. Has a site survey revealed any information on historic or archaeological resources?	X	___
5. Is the project site within or near a Hawaiian fishpond or historic settlement area?	X	___

Discussion:

1. The construction of some project facilities would require demolishing some buildings that are over 50 years old and may be eligible for the National Register of Historic Places (NRHP). Constructing proposed action facilities could have significant impacts on historic buildings at Kahuku Training Area (KTA) and Pōhakuloa Training Area (PTA). The greatest number and intensity of impacts from the proposed action would occur at SBMR and PTA. These two areas are the sites of the greatest amount of project-related ground-disturbing activities, and therefore the greatest risk to archeological resources.
2. Prehistoric and historic resources found on SBCT project areas include historic and prehistoric archaeological sites, Areas of traditional importance (ATIs), traditional cultural properties (TCPs), historic buildings, structures, and districts, Cold War properties, historic landscapes, and monuments and memorials.
3. Draft TCP surveys have been completed at PTA and SBMR, and others are underway at KTA and Kawaihoa Training Area (KLOA).
4. So far, more than 500 archaeological sites have been identified within the region of influence (ROI) for SBCT project activities in Hawai'i. Of these, two sites are listed on the NRHP, while the others have not yet been assessed for eligibility.

ENCLOSURE 1: SBCT Coastal Consistency Determination

- Archeological sites exist on all project installations. Possible historical settlements can be found at all main project areas. Possible fishpond sites are located at SBMR.

Mitigation Summary:

Cultural resources impacts related to the proposed action vary depending on the location and the nature of the project. The five significant impacts to cultural resources primarily relate to the construction phase of SBCT-related projects and to training range activities at PTA, DMR and SBMR. A Programmatic Agreement (PA) is currently being developed that provides a mechanism for the Army to comply with Section 106 of the NHPA for proposed SBCT activities. The Army is consulting with the SHPO, the Advisory Council on Historic Preservation (ACHP), Native Hawaiian organizations, and other interested parties in accordance with Section 106 procedures regarding all historic properties affected by SBCT project activities. Proposed mitigation measures for archaeological resources would include surveys to identify sites, evaluation of NRHP eligibility, avoidance or data recovery of eligible sites, and archeological monitoring plans. Proposed mitigation measures for architectural resources would include evaluation of NRHP eligibility and avoidance or documentation of eligible buildings subject to demolition. Proposed mitigation measures for impacts on ATIs would include avoidance, limiting visual impacts by site location or design, and consultation with the Native Hawaiian community.

SCENIC AND OPEN SPACE RESOURCES

Objective: Protect, preserve and where desirable, restore or improve the quality of coastal scenic and open space resources.

Policies:

- Identify valued scenic resources in the coastal zone management area;
- Insure that new developments are compatible with their visual environment by designing and locating such developments to minimize the alteration of natural landforms and existing public views to and along the shoreline;
- Preserve, maintain and where desirable, improve and restore shoreline open space and scenic resources; and
- Encourage those developments that are not coastal dependent to locate in inland areas.

Check either "Yes" or "No" for each of the following questions:

	<u>Yes</u>	<u>No</u>
1. Does the project site abut a scenic landmark?	___	X
2. Does the proposed action involve the construction of a multi-story structure or structures?	X	___
3. Is the project site adjacent to undeveloped parcels?	X	___
4. Does the proposed action involve the construction of structures visible between the nearest coastal roadway and the shoreline?	___	X
5. Will the proposed action involve construction in or on waters seaward of the shoreline? On or near a beach?	___	X

Discussion:

- No structures or developed areas abut scenic landmarks. Antenna support structures would be built in training areas. Although 25 single pole antennas would be constructed as part of the project only six have the potential to impact on the visual resources. Three antennas would be constructed at SBMR, two on DMR and one

ENCLOSURE 1: SBCT Coastal Consistency Determination

approximately 1.5 miles (2.4 kilometers) south of DMR on the ridge. The DMR antennas would be visible from designated scenic areas along Farrington Highway and the coastline. These views would be partially screened by existing vegetation. Although this area has experienced a high degree of alteration from development and agriculture, a significant but mitigable impact would result because the proposed 100-foot (30.5-meter) structure would introduce a distinct vertical element that would be out of character with the existing views.

2. SBCT project sites at SBMR, KTA, DMR and PTA are adjacent to undeveloped parcels. None of these parcels are in a shoreline area, although DMR can be seen from the shoreline. SBCT-related construction and antenna support structures on KTA would be only partially visible along most of the north coastal area due to a bluff just inland of the Kamehameha Highway that obstructs views.
3. None of the installations are located between the shoreline and the nearest highway.
4. None of the installations are located seaward of the shoreline nor will any work be done there.

Mitigation Summary:

Proposed mitigation measures include enhancing existing site conditions to help screen the proposed antenna support structures and support shed from the surrounding area. Where practicable, permanent screening could be achieved with native tree and shrub plantings that complement natural and ornamental plantings, earthen berms that mimic the color and texture of the surrounding area, and fencing designed to fit in with the surrounding area. The antenna support structure site would be developed to conserve existing natural features, including terrain and vegetative cover, to the extent feasible.

SBCT project measures include constructing roads and military vehicle trails between training areas. These roads and trails would reduce military traffic on public roadways, including those in coastal areas. All proposed roads and trails are inland and not visible from coastal areas.

COASTAL ECOSYSTEMS

Objective: Protect valuable coastal ecosystems from disruption and minimize adverse impacts on all coastal ecosystems.

Policies:

- 1) Improve the technical basis for natural resources management;
- 2) Preserve valuable coastal ecosystems of significant biological or economic importance;
- 3) Minimize disruption or degradation of coastal water ecosystems by effective regulation of stream diversions, channelization, and similar land water uses, recognizing competing water needs; and
- 4) Promote water quantity and quality planning and management practices, which reflect the tolerance of fresh water and marine ecosystems and prohibit land and water uses, which violate State, water quality standards.

Check either "Yes" or "No" for each of the following questions:

	<u>Yes</u>	<u>No</u>
1. Does the proposed action involve dredge or fill activities?	___	X
2. Is the project site within the Shoreline Setback Area (20 to 40 feet inland of the shoreline)?	X	___
3. Will the proposed action require some form of effluent discharge into a body of water?	___	X

ENCLOSURE 1: SBCT Coastal Consistency Determination

4.	Will the proposed action require earthwork beyond clearing and grubbing?	X	___
5.	Will the proposed action include the construction of special waste treatment facilities, such as injection wells, discharge pipes, or cesspools?	___	X
6.	Is an intermittent or perennial stream located on or near the project site?	X	___
7.	Does the project site provide habitat for endangered species of plants, birds, or mammals?	X	___
8.	Is any such habitat located nearby?	X	___
9.	Is there a wetland on the project site?	___	X
10.	Is the project site situated in or abutting a Natural Area Reserve?	X	___
11.	Is the project site situated in or abutting a Marine Life Conservation District?	___	X
12.	Is the project site situated in or abutting an estuary?	___	X

Discussion:

1. No dredge or fill activities will take place.

2. The project will take place in shoreline areas that are already developed for project purposes. No new development will take place in these areas and there will be no changed conditions regarding coastal ecosystems.

3, 5. There will be no effluent discharges to a body of water nor are there any new waste treatment facilities proposed.

4. The project includes construction of a two-lane 43 kilometer gravel road with a right of way from Kawaihae Harbor to PTA. However, no significant impacts from potential runoff are expected for marine wildlife resources or coral ecosystems. The expected increase in erosion to the ocean would be within the natural range that exists due to rainfall and runoff variation. Impacts on marine wildlife and coral ecosystems in the ROI waters are not considered to be significant

6. SBCT activities include using Kawaihae Harbor, though SBCT does not include any project measures regarding constructing or deepening harbors.

I. SBMR.

- a. Main Post. Figure 5-24 of the enclosed DEIS shows the watersheds and principal drainage features and water bodies within the SBMR Main Post. SBMR lies near the drainage divide between the Kaukonahua watershed and the Waikele watershed. These watersheds stretch across the Schofield plateau, from the ridgeline of the Ko'olau Range to the ridgeline of the Wai'anae Range. The Kaukonahua watershed is bordered on the north by the Poamoho watershed. The main drainages at SBMR are the Waikōloa Gulch and the Waikele Stream. Two other streams that drain the north part of SBMR are tributaries to the Kaukonahua Stream—Mohiākea Gulch and Haleauau Gulch. Kaukonahua Stream drains northward, through the area underlain by the Waialua aquifer system, joining the Poamoho Stream to form the Ki'iki'i Stream, which discharges to Kaiaka Bay, just east of Waialua.
- b. SRAA. The South Range Acquisition Area is a 1,400-acre (567-hectare) area that borders the southern boundary of the Main Post west of WAAF. It is drained by Waikele Stream and its tributaries and lies entirely within the portion of the watershed of Waikele Stream that is upstream of WAAF.
- c. SBER. Schofield Barracks East Range occupies a portion of the Waipahu/Waiawa watershed in the Pearl Harbor hydrologic sector, just south of the hydrologic divide that separates it from the Central

ENCLOSURE 1: SBCT Coastal Consistency Determination

hydrologic sector. Figure 5-25 shows the principal drainage and surface water features in SBER. Most of SBER is drained by the South Fork of Kaukonahua Stream, which discharges to the Wahiawā Reservoir. The Kaukonahua Stream, downstream of Wahiawā Reservoir, ultimately discharges to Kaiaka Bay at Hale‘iwa.

- II. DMR. DMR is in the Kawaihāpai watershed (see Figure 3-6 and Figure 6-10 of the DEIS). There are several unnamed intermittent streams and no perennial streams on DMR, although potential wetland areas have been identified and are undergoing investigation to determine if they qualify as jurisdictional wetlands. The State of Hawai‘i Department of Health classified the waters as Class 2 waters.
- III. KTA. Figure 7-12 of the enclosed DEIS shows surface water features and watershed boundaries on KTA, which straddles the northern Ko‘olau Mountain Range and contains portions of four watersheds. On the west side of KTA is the Paumalū watershed. The Paumalū watershed includes drainages from Paumalū Stream on the west to Waiale‘e Gulch on the east. The headwaters of the Paumalū Stream are in the Pūpūkea Paumalū Forest Reserve, most of which is within the boundaries of KTA. KTA does not include the downstream portion of the Paumalū Stream, but most of the watershed east of the Paumalū drainage, almost to the Kamehameha Highway, is on KTA. To the east of Paumalū watershed and wedged between it and the ‘Ō‘io watershed farther to the east is the Kawela watershed, which includes the streams that drain to Kawela Bay—Pahipahi‘ālua Stream and Kawela Stream. East of Paumalū and Kawela watersheds is the ‘Ō‘io watershed, which includes the upper portions of drainages from ‘Ō‘io Gulch east to Kea‘aulu Gulch, which discharges at the town of Kahuku. KLOA does not have any coastal riparian resources.
- IV. PTA. Figure 8-21 of the DEIS shows the watersheds and principal drainage features in the PTA. On the Island of Hawai‘i, PTA lies within the Northwest Mauna Loa and the West Mauna Kea watersheds, which drain to the northern Hualālai and southern Kohala coasts, respectively. The PTA Trail is mainly within the West Mauna Kea watershed. The two watersheds are underlain by aquifer “sectors” of the same name. There are no surface streams, lakes, or other bodies of water within PTA boundaries due to low rainfall, porous soils, and lava substrates. There are no perennial streams near the PTA installation. However, the proposed PTA-Kawaihae Tank Trail would cross the Waikoloa Stream, which is a perennial stream, about six miles east of Kawaihae Harbor. According to the US EPA 305(b) list, Waikoloa Stream water quality is impaired, although not threatened, due to the presence of nutrients (nitrogen- and phosphorous-containing compounds), pathogens (coliform bacteria), and turbidity.

7, 8. The proposed action would affect biological resources identified within the SBCT ROI, which include general plants, animals, and vegetation communities as well as sensitive species and sensitive habitats. Sensitive habitats refer to Biologically Sensitive Areas as identified in the O‘ahu and PTA INRMPs, wetlands, and federally designated critical habitat. Conservation measures described in US Fish and Wildlife Service (USFWS) Recovery Plans for federally listed species have been implemented to the greatest degree feasible to avoid, minimize, or compensate for impacts to listed species. These impacts are summarized below and discussed in detail in the enclosed DEIS in the appropriate chapter.

Fire is expected to have significant adverse and not mitigable impacts on sensitive species and sensitive habitats. The proposed live-fire training would increase the probability that there would be a wildland fire in the project ROI. Wildland Fire Management Plans are being developed to minimize the probability of fire and shorten the time and distance that the fire would extend. However, it is not within the Army’s ability to prevent and contain all fires. The combined impacts of fire at each of the proposed training areas where live fire would occur (PTA, SBMR, and KTA) would cause long-term loss or impairment of a substantial portion of natural habitat and the loss of individual plant or animals that in total would constitute a population level decline. The extensive damage that is caused both directly and indirectly by fire would significantly impact federally listed and sensitive species and cannot be mitigated to the less than significant level. The Army is currently undergoing Section 7 consultation with the USFWS to ensure the proposed action will not jeopardize the continued existence of federally listed species or adversely modify critical habitat.

ENCLOSURE 1: SBCT Coastal Consistency Determination

Project activities would cause both short-term and long-term impacts on sensitive plants and wildlife and include impacts as a result of training and construction activities. Impacts will include those to certain endemic bird species (such as the O'ahu 'elepaio and its federally designated critical habitat, and the palila and its federally designated critical habitat), as well as impacts to migratory birds. There would be impacts to sensitive plant and animal species from the spread of nonnative (alien) species, from fire, from loss of habitat (both general and sensitive), and from habitat degradation. Many native and endangered plants (e.g., *Urera kaalae*, *Platydesma cornuta*, *Sanicula purpurea*) are particularly susceptible to habitat disturbance by non-native species.

9. A wetland delineation of DMR was conducted in the spring and summer of 2002 following the US Army Corps of Engineers (ACOE) 1987 wetland delineation manual; results were published in a report dated August 2002. In a memorandum for the record, dated 4 September 2002, the Corps determined that the one wetland identified on DMR was not jurisdictional due to the absence of the hydrology indicator as required by the ACOE 1987 wetland delineation manual. The project would not affect this non-jurisdictional wetland.

10. Ka'ala Natural Area Reserve (NAR) is the highest point on O'ahu (4,020 feet) and dominates the northern section of the Wai'anae Mountain Range behind and to the west of SBMR. Pahole NAR encompasses a complex valley system in the northern Wai'anae Mountains and is located south/ southeast of DMR. These NARs are not in shoreline areas and do not contain coastal ecosystems.

11-12. The project does not abut a Marine Conservation District or an estuary.

Mitigation Summary:

Proposed mitigation measures for reducing sediment loading to streams for each installation are described in the environmental consequences sections in the DEIS. Under the proposed action, USARHAW would continue to implement land restoration measures in accordance with the installation watershed management plans and the Integrated Natural Resource Management Plan (INRMP). Proposed mitigation measures would include, but would not be limited to, implementing the Integrated Training Area Management program to identify and inventory land condition using a GIS database; coordinating between training planners and natural resource managers; implementing land rehabilitation measures in accordance with the INRMP; monitoring the effectiveness of the land rehabilitation measures; evaluating erosion modeling data to identify areas in need of improved management; and implementing education and outreach programs to increase user awareness of the value of good land stewardship. While the proposed action does not currently include proposals for dredge and fill of waters of the U.S., all construction in or alteration of streams would be reviewed by the Corps of Engineers prior to construction to determine if the activity is regulated under Section 404 of the Clean Water Act (Section 404). In accordance with Section 404, any dredge or fill activities in these streams associated with the crossings may require a Department of the Army permit. If a Department of the Army permit is required, then a Clean Water Act (CWA) Section 401 Water Quality Certification issued by the State of Hawai'i may also be required. The Army would design the stream crossings to avoid and minimize any dredge or fill impacts to the stream to the fullest extent practicable in compliance with Section 404. If the Corps determines that a Department of the Army permit is required, the Army would abide by all appropriate CWA regulations and permit processes administered by the Corps and Hawai'i.

Proposed mitigation for chemicals from training ranges could include controlling soil erosion as described above. In addition, surface water quality and soils would be monitored as a means of measuring potential future impacts. If impacts on surface water or soils were identified through monitoring, further mitigation could include characterizing and remediating contaminant source areas.

Proposed mitigation for impacts on federally listed species would include compliance with ESA. The effects of SBCT actions on listed species in the SBCT ROI are being evaluated as part of ESA Section 7 consultation with USFWS. The ESA incidental take statements (including all terms and conditions) as defined in the Biological Opinion and required by USFWS for this action would be implemented as part of this proposed action. These measures would help avoid effects and compensate for impacts on listed species that would result directly and indirectly from implementing the proposed action. The Army would use the following proposed mitigation measures to lessen the level of impact to a less than significant level. The Army would educate soldiers and others

ENCLOSURE 1: SBCT Coastal Consistency Determination

using the facilities and roads in the importance of cleaning vehicles and field gear. The Army would prevent weeds brought in by SBCT activities from becoming established by rigorously monitoring and eradicating new weeds. Vehicles would be confined to Heleman Trail, and personnel would be confined to their vehicles while on the trail, unless an emergency occurs.

Native plants would be used in any new landscaping or planting efforts where possible. Where possible, the Army would fence off any sensitive plants from activity that takes place within the ROI. Implementing an environmental management system would improve the identification and reduction of environmental risks inherent in mission activities. The Army would consult with the Invasive Species Council in compliance with Executive Order 13112, which determines federal agency duties in regard to preventing and compensating for invasive species impacts. Tactical Vehicle wash facilities are proposed at Schofield Barracks, KTA, and PTA. At these locations, the Army would inspect all vehicles and wash vehicles before allowing them to travel to other training ranges to minimize the spread of weeds and animal (invertebrate) relocations.

ECONOMIC USES

Objective: Provide public or private facilities and improvements important to the State's economy in suitable locations.

Policies:

- 1) Concentrate in appropriate areas the location of coastal dependent development necessary to the State's economy;
- 2) Insure that coastal dependent development such as harbors and ports, visitor industry facilities, and energy generating facilities are located, designed, and constructed to minimize adverse social, visual, and environmental impacts in the coastal zone management area; and
- 3) Direct the location and expansion of coastal dependent developments to areas presently designated and used for such development and permit reasonable long-term growth at such areas, and permit coastal dependent development outside of presently designated areas when:
 - a) Utilization of presently designated locations is not feasible;
 - b) Adverse environmental effects are minimized; and
 - c) Important to the State's economy.

Check either "Yes" or "No" for each of the following questions:

	<u>Yes</u>	<u>No</u>
1. Does the project involve a harbor or port?	X	___
2. Is the project site within a designated tourist destination area?	X	___
3. Does the project site include agricultural lands or lands designated for such use?	X	___
4. Does the proposed activity relate to commercial fishing or seafood production?	___	X
5. Does the proposed activity related to energy production?	___	X
6. Does the proposed activity relate to seabed mining?	___	X

Discussion:

1. SBCT activities include using Kawaihae Harbor. However, SBCT does not include any project measures regarding constructing or deepening harbors.

ENCLOSURE 1: SBCT Coastal Consistency Determination

2. While some installations are adjacent to conservation areas, no project sites abut designated tourist destination areas.
3. Agricultural land would be changed to training land at the South Range Acquisition Area, West PTA Acquisition Area, Dillingham Trail, Helemanō Trail, and PTA Trail.
4. Land use within the South Range and West PTA Acquisition Areas would be converted from agriculture to general training land. The South Range Acquisition Area would not be available for pineapple cultivation, and the West PTA Acquisition Area would not be available for cattle grazing. However, general military training within these areas is not expected to affect off-post land use. Land uses along Dillingham Trail and Helemanō Trail would be converted from agriculture (both Prime and Unique) to general training land. The PTA Trail alignment is generally along property boundaries and is not expected to adversely affect land use.
5. The Army's acquisition and use of the agricultural lands are exempted under 7 CFR 658 (Farmland Protection Policy Act), Section 658.3 (b). Acquisition or use of farmland by a Federal agency for national defense purposes is exempted by section 1547(b) of the Act, 7 U.S.C. 4208(b).

COASTAL HAZARDS

Objective: Reduce hazard to life and property from tsunami, storm waves, stream flooding, erosion, and subsidence.

Policies:

- 1) Develop and communicate adequate information on storm wave, tsunami, flood erosion, and subsidence hazard;
- 2) Control development in areas subject to storm wave, tsunami, flood, erosion, and subsidence hazard;
- 3) Ensure that developments comply with requirements of the Federal Flood Insurance Program; and
- 4) Prevent coastal flooding from inland projects.

Check either "Yes" or "No" for each of the following questions:

	<u>Yes</u>	<u>No</u>
1. Is the project site on or abutting a sandy beach?	___	X
2. Is the project site within a potential tsunami inundation area as depicted on the National Flood Insurance Program flood hazard map?	___	X
3. Is the project site within a potential flood inundation area according to a flood hazard map?	___	X
4. Is the project site within a potential subsidence hazard areas according to a subsidence hazard map?	___	X
5. Has the project site or nearby shoreline areas experienced shoreline erosion?	___	X

Discussion:

1. While DMR property includes shoreline areas and a small beach, no project measures take place on or near the shoreline.
2. None of the project areas is within a tsunami runup zone, although some may be marginally affected by flooding in the event of a tsunami, including areas near the shore at DMR and Kawaihae Harbor (terminus of the PTA Trail). The project is not expected to increase exposure to or hazards resulting from flooding.

ENCLOSURE 1: SBCT Coastal Consistency Determination

3. The only area in which existing flood zones have been identified is on the Waikele Stream west of Wheeler Army Air Field. Flooding there occurs within the gulch of Waikele Stream but can inundate facilities located within the gulch. The project is not expected to increase exposure to or hazards resulting from flooding.
4. The proposed action is not expected to result in any significant new hazards associated with earthquakes or liquefaction relative to existing conditions. The risk of strong ground shaking at the site of SBCT installation structures is relatively low due to low likelihood of earthquake on Oahu. Because of their distances from the south coast of the Island of Hawai'i, where most earthquakes are centered, impacts to SBCT structures at PTA will also be low.

MANAGING DEVELOPMENT

Objective: Improve the development review process, communication, and public participation in the management of coastal resources and hazards.

Policies:

- 1) Effectively utilize and implement existing law to the maximum extent possible in managing present and future coastal zone development;
- 2) Facilitate timely processing of application for development permits and resolve overlapping or conflicting permit requirements; and
- 3) Communicate the potential short- and long-term impacts of proposed significant coastal developments early in their life cycle and in terms understandable to the general public to facilitate public participation in the planning and review process.

Check either "Yes" or "No" for each of the following questions:

	<u>Yes</u>	<u>No</u>
1. Will the proposed activity require more than two (2) permits or approval? (Provide the status of each.)	X	___
2. Does the proposed activity conform with the State and County land use designations for the site?	See discussion	
3. Has or will the public be notified of the proposed activity?	X	___
4. Has a draft or final environmental impact statement or an environmental assessment been prepared?	X	___

Discussion:

1. The proposed action requires consultation with the SHPO and USFWS/National Marine Fisheries Service (NMFS) in accordance with Section 106 of the National Historic Preservation Act and Section 7 of the Endangered Species Act. Permits required by federal law, such as NPDES permits for construction would be applied for when site-specific construction details are determined. . The Section 106 and Section 7 consultations are ongoing concurrently with the NEPA process, and federal permits required for construction and operation will be obtained when more detailed plans become available.
2. In general, the proposed activities conform to state and county land use designations on properties currently in military use. Land use designations in the proposed acquisition areas and trail easements are, mainly agricultural and conservation uses. Following is a listing of the state and county land use designations for the affected parcels and military vehicle trail easements.

ENCLOSURE 1: SBCT Coastal Consistency Determination

- a. Schofield Barracks Main Post/Schofield Barracks East Range/Wheeler Army Airfield:
 - i. State Land Use Districts: Urban, Agriculture, and Conservation.
 - ii. City and County of Honolulu Central O‘ahu Sustainable Community Plan: in the Urban District—Residential, Golf Course, Military, Public Facilities; in the Agriculture and Conservation Districts—Military, Agriculture, Preservation.
 - iii. City and County Land Use Ordinance (zoning): urban and lower training areas—F-1 Military; mountainous areas—P-1 Restricted.
- b. South Range Acquisition Area:
 - i. State Land Use District: mostly Agriculture with a small portion in Conservation.
 - ii. City and County of Honolulu Central O‘ahu Sustainable Community Plan: Agriculture, Preservation.
 - iii. City and County Land Use Ordinance: Ag-1 Restricted, P-1 Restricted.
- c. Dillingham Military Reservation:
 - i. State Land Use Districts: mainly Agriculture with a small portion in Conservation.
 - ii. City and County of Honolulu North Shore Sustainable Communities Plan: Military.
 - iii. City and County Land Use Ordinance: Agriculture District—Ag-2 General; Conservation District—F-1 Military.
- d. Dillingham Trail:
 - i. State Land Use District: Agriculture.
 - ii. City and County of Honolulu North Shore Sustainable Communities Plan: Agriculture.
 - iii. City and County Land Use Ordinance: Ag-1 Restricted, Ag-2 General.
- e. Kahuku Training Area:
 - i. State Land Use Districts: Agriculture and Conservation.
 - ii. City and County of Honolulu Ko‘olau Loa Sustainable Communities Plan: Military.
 - iii. City and County Land Use Ordinance: Ag-2 General, P-1 Restricted.
- f. Kawaihoa Training Area:
 - i. State Land Use Districts: Conservation.
 - ii. City and County of Honolulu North Shore Sustainable Communities Plan: Preservation.
 - iii. City and County Land Use Ordinance: P-1 Restricted.
- g. Helemano Trail:
 - i. State Land Use District: Agriculture.
 - ii. City and County of Honolulu Central O‘ahu Sustainable Communities Plan: Agriculture.
 - iii. City and County Land Use Ordinance: Ag-1 Restricted.
- h. Drum Road:
 - i. State Land Use Districts: Agriculture, Urban, Conservation.
 - ii. City and County of Honolulu North Shore Sustainable Communities Plan: Agriculture.
 - iii. City and County Land Use Ordinance: Ag-1 Restricted, P-1 Restricted.
- i. Pohakuloa Training Area:
 - i. State Land Use Districts: mostly Conservation with a small portion in Agriculture.
 - ii. County of Hawai‘i General Plan: Conservation (existing plan and proposed revision).
 - iii. County of Hawai‘i Zoning: Forest Reserve and Open.
- j. West PTA Acquisition Area:
 - i. State Land Use District: Agriculture.
 - ii. County of Hawai‘i General Plan: Conservation: Intensive Agriculture, Extensive Agriculture (existing plan); Proposed Important Agricultural Lands, Extensive Agriculture (proposed revision).
 - iii. County of Hawai‘i Zoning: A-40a Agriculture.
- k. PTA Trail:
 - i. State Land Use Districts: mostly Agriculture with small portion in Urban.
 - ii. County of Hawai‘i General Plan: Extensive and Intensive Agriculture, Urban Expansion, Medium Density Urban, Industrial (existing plan); Proposed Important Agricultural Lands, Open Area, Extensive Agriculture, Proposed Industrial, Medium Low Density, Industrial (proposed revision).
 - iii. County of Hawai‘i Zoning: A-5a and A-40a Agriculture, Open.

ENCLOSURE 1: SBCT Coastal Consistency Determination

3. The public was notified of the proposed action during the scoping phase of the EIS process, including public notices (newspapers, website), mailings, press releases, and public scoping meetings. The same communication methods has been used to inform the public of the DEIS. See discussion under Public Participation that follows this section.
4. A DEIS has been prepared and is being circulated for public comment.

PUBLIC PARTICIPATION

Objective: Stimulate public awareness, education, and participation in coastal management.

Policies:

- 1) Maintain a public advisory body to identify coastal management problems and to provide policy advice and assistance to the coastal zone management program;
- 2) Disseminate information on coastal management issues by means of educational materials, published reports, staff contact, and public workshops for persons and organizations concerned with coastal-related issues, developments, and government activities; and
- 3) Organize workshops, policy dialogues, and site-specific mediations to respond to coastal issues and conflicts.

Discussion: Regarding Policy No. 3, Council on Environmental Quality regulations for Implementing NEPA and Army Regulation (AR) 200-2 guide public participation opportunities in the NEPA process. These include issuing in the *Federal Register* a notice of intent (NOI) to prepare an EIS, a public scoping process, a 45-day public review period for the draft EIS, and publication of the final EIS, accompanied by a 30-day mandatory waiting period before the Record of Decision (ROD) is issued. Following publication of the NOI, public notices were published in the major newspapers on the Island of Hawai'i and O'ahu announcing the time and location of seven public scoping meetings to solicit input and to obtain comments on the scope of the EIS. In addition the scoping meetings were announced in the April 8, 2000, issue of *The Environmental Notice*, published by the State of Hawai'i, Department of Health, Office of Environmental Quality Control. The scoping period was extended to 70 days, during which the public, organizations, and agencies were encouraged to provide comments.

At the public scoping meetings, approximately 100 individuals or persons representing organizations provided oral comments for the Army's consideration. The Army also received written comments from approximately 200 individuals and organizations in the form of e-mails, written letters, and form letters. The Army also received 21 comments to its World Wide Web site, 7 comments by telephone, and 77 comments at separate information meetings requested by groups and organizations. The Army compiled a scoping report, identifying and assessing the issues brought forth through the scoping process. The scoping meetings were held between April 16 and 30, 2002.

The Draft EIS was completed on October 3rd and is being circulated for public comment. Six public meeting were held between October 28th and November 6th. The 45-day public comment period was extended an additional 45 days; the close of public comment is now on January 3rd, 2004.

BEACH PROTECTION

Objective: Protect beaches for public use and recreation.

Policies:

- 1) Locate new structures inland from the shoreline setback to conserve open space and to minimize loss of improvements due to erosion;

ENCLOSURE 1: SBCT Coastal Consistency Determination

- 2) Prohibit construction of private erosion-protection structures seaward of the shoreline, except when they result in improved aesthetic and engineering solutions to erosion at the sites and do not interfere with existing recreational and waterline activities; and
- 3) Minimize the construction of public erosion-protection structures seaward of the shoreline.

Discussion: The proposed action does not include project measures in which structures would be built seaward of the shoreline.

MARINE RESOURCES

Objective: Implement the State's ocean resources management plan.

Policies:

- 1) Exercise an overall conservation ethic, and practice stewardship in the protection, use, and development of marine and coastal resources;
- 2) Assure that the use and development of marine and coastal resources are ecologically and environmentally sound and economically beneficial;
- 3) Coordinate the management of marine and coastal resources and activities management to improve effectiveness and efficiency;
- 4) Assert and articulate the interests of the State as a partner with federal agencies in the sound management of ocean resources within the United States exclusive economic zone;
- 5) Promote research, study, and understanding of ocean processes, marine life, and other ocean resources in order to acquire and inventory information necessary to understand how ocean development activities relate to and impact upon ocean and coastal resources; and
- 6) Encourage research and development of new, innovative technologies for exploring, using, or protecting marine and coastal resources.

Discussion:

The Army has prepared Integrated Natural Resource Management Plans that prescribe conservation measures for the habitat areas on installations that would be used under the proposed action. These include measures to protect aquatic health and water quality, watersheds and wetlands on training land. The effects of SBCT actions on listed species in the SBCT ROI are being evaluated as part of ESA Section 7 Consultation with the USFWS. The ESA incidental take statements (including all terms and conditions) as defined in the Biological Opinion and required by USFWS for this action would be implemented as part of this proposed action.

APPENDIX F

AIRSPACE INFORMATION

Airspace Use

DEFINITION OF AIRSPACE

Airspace, or that space which lies above a nation and comes under its jurisdiction, is generally viewed as being unlimited. However, it is a finite resource that can be defined vertically and horizontally, as well as temporally, when describing its use for aviation purposes. The scheduling, or time dimension, is a very important factor in airspace management and air traffic control.

Under Public Law 85-725, the Federal Aviation Administration (FAA) is charged with the safe and efficient use of the nation's airspace and has established certain criteria and limits to its use. The method used to provide this service is the National Airspace System. This system is "... a common network of U.S. airspace; air navigation facilities, equipment and services, airports or landing areas; aeronautical charts, information and services; rules, regulations and procedures, technical information and manpower and material)' (FAR/AIM, 2002).

TYPES OF AIRSPACE

There are two categories of airspace or airspace areas: (1) regulatory, consisting of controlled airspace (Class A, B, C, D, and E airspace areas in descending order of restrictive operating rules), restricted and prohibited areas; and (2) non-regulatory, consisting of military operations areas (MOAs), warning areas, alert areas, and controlled firing areas. Within these two categories, there are four types: controlled, uncontrolled, special use, and other airspace. The categories and types of airspace are dictated by: the complexity or density of aircraft movements; the nature of the operations conducted within the airspace; the level of safety required; and the national and public interest.

Controlled and Uncontrolled Airspace - Controlled and uncontrolled airspace is divided into six classes, dependent upon location, use and degree of control. Figure AS-I provides a depiction of the various classes of controlled airspace, which are briefly described below:

- Class A airspace, which is not specifically charted, is generally, that airspace from 18,000 feet mean sea level (MSL) up to and including flight level (FL) 600 (60,000 feet), including airspace overlying the waters within 12 nautical miles of the coast. Unless otherwise authorized, all aircraft must be operated under instrument flight rules (IFR) (FAR/AIM, 2002).
- Class B airspace is generally that airspace from the surface to 10,000 feet MSL surrounding the nation's busiest airports in terms of IFR operations or passenger enplanements. The configuration of each Class B airspace area is individually tailored and consists of a surface area and two or more layers and is designed to contain all published instrument procedures once an aircraft enters the airspace. An air traffic control clearance is required for all aircraft to operate in the area, and all aircraft that are so cleared receive separation services within the airspace (FAR/AIM, 2002).
- Class C airspace is, generally, that airspace from the surface to 4,000 feet above the airport elevation surrounding those airports that have an operational control tower, are serviced by a radar approach control, and that have a certain number of IFR operations or

passenger enplanements. Although the configuration of each Class C airspace area is individually tailored, the airspace usually consists of a 5 nautical mile radius core surface area that extends from the surface up to 4,000 feet above the airport elevation, and a 10 nautical mile radius shelf area that extends from 1,200 feet to 4,000 feet above the airport elevation (FAR/AIM, 2002).

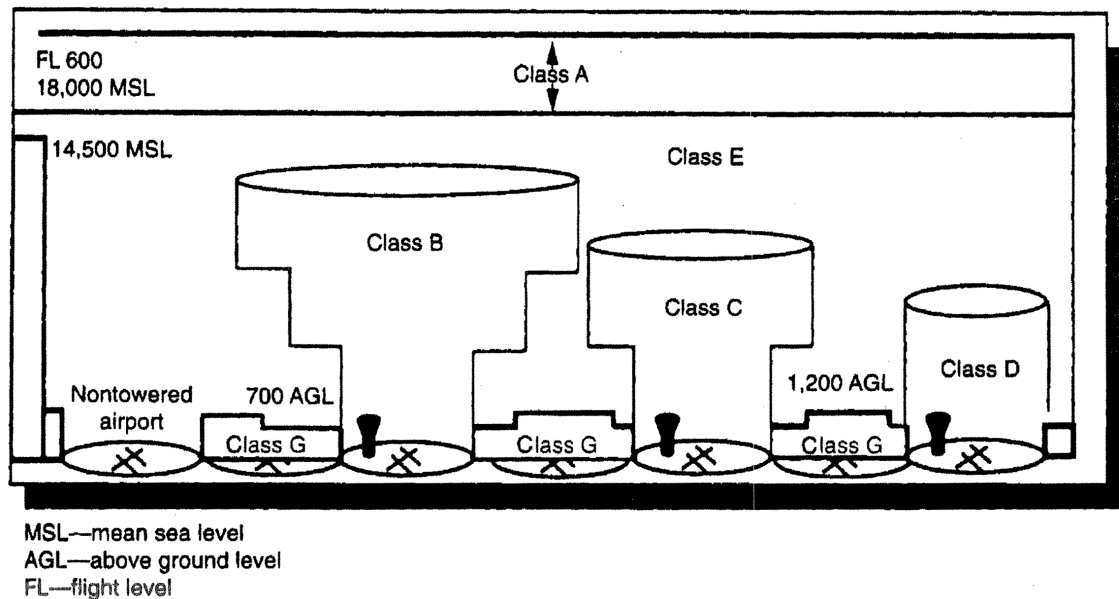

- Class D airspace is, generally, that airspace from the surface to 2,500 feet above the airport elevation surrounding those airports that have an operation control tower. The configuration of each Class D airspace area is individually tailored (FAR/AIM, 2002).
- Class E airspace, is controlled airspace that is not Class, A, Class B, Class C, or Class D airspace.

Uncontrolled airspace, or Class G airspace, has no specific definition but generally refers to airspace not otherwise designated and operations below 1,200 feet above ground level. No air traffic control service to either IFR or VFR aircraft is provided other than possible traffic advisories when the air traffic control workload permits and radio communications can be established (Illman, 1993, p. 42).

Special Use Airspace - Complementing the classes of controlled and uncontrolled airspace described above, are several types of special use airspace used by the military to meet its particular needs. Special use airspace consists of that airspace wherein activities must be confined because of their nature, or wherein limitations are imposed upon aircraft operations that are not a part of these activities, or both. Except for Controlled Firing Areas, special use airspace areas are depicted on aeronautical charts. Prohibited and Restricted Areas are regulatory special use airspace and are established in Federal Aviation Regulations (FAR) Part 73 through the rule-making process. Warning Areas, Military Operations Areas, Alert Areas, National Security Areas, and Controlled Firing Areas are non-regulatory special use airspace. Special use airspace descriptions, except National Security Areas and Controlled Firing Areas, are contained in FAA Order 7400.8. Special use airspace, except Controlled Firing Areas, are charted on IFR or Visual charts and include hours of operation, altitudes, and the controlling agency. These are described briefly below:

- Prohibited Areas contain airspace of defined dimensions identified by an area on the surface of the earth within which the flight of aircraft is prohibited. Such areas are established for security or other reasons associated with the national welfare. These areas are published in the Federal Register and are depicted on aeronautical charts. (FAR/AIM, 2002).

Figure AS-1 Types of Controlled and Uncontrolled Airspace

Source: FAR/AIM, 2002

- Restricted Areas contain airspace identified by an area on the surface of the earth within which the flight of aircraft, while not wholly prohibited, is subject to restriction. Activities within these areas must be confined, because of their nature, or limitations imposed upon aircraft operations that are not a part of these activities, or both. Restricted Areas denote the existence of unusual, often invisible, hazards to aircraft such as artillery firing, aerial gunnery, or guided missiles. Restricted Areas are published in the Federal Register and constitute FAR Part 73. (FAR/AIM, 2002).
- Warning Areas are airspace that may contain hazards to non-participating aircraft in international airspace. Warning Areas are established beyond the 3-nautical mile limit. Though the activities conducted within Warning Areas may be as hazardous as those in Restricted Areas, Warning Areas cannot be legally designated as Restricted Areas because they are over international waters. (FAR/AIM, 2002). By Presidential Proclamation No. 5928, the United States territorial limit was extended from 3 to 12 nautical miles in 1988 (54 FR 264, 1989). Special FAR 53 establishes certain regulatory warning areas within the new (3 to 12 nautical mile) territorial airspace to allow continuation of military activities while further regulatory requirements are determined. The current Warning Area expansion continues in effect until January 15, 1996 (FAR/AIM, 2002).
- Military Operations Areas (MOAs) consist of airspace of defined vertical and lateral limits established for the purpose of separating certain non-hazardous military training activities from IFR traffic. Whenever a MOA is being used, non-participating IFR traffic may be cleared through a MOA if IFR separation can be provided by Air Traffic Control. Otherwise, Air Traffic Control will reroute or restrict non-participating IFR (FAR/AIM, 2002).

- Alert Areas are depicted on aeronautical charts to inform non-participating pilots of areas that may contain a high volume of pilot training or an unusual type of aerial activity. All activity within an Alert Area is conducted in accordance with FAR'S, without waiver, and pilots of participating aircraft as well as pilots transiting the area are equally responsible for collision avoidance. (FAR/AIM, 2002).
- Controlled Firing Areas contain activities which, if not conducted in a controlled environment, could be hazardous to non-participating aircraft. The distinguishing feature of the Controlled Firing Area, as compared to other special use airspace, is that activities are suspended immediately when spotter aircraft, radar, or ground lookout positions indicate an aircraft might be approaching the area. They are not charted since they do not cause a non-participating aircraft to change its flight path. (FAR/AIM, 2002).
- National Security Areas consist of airspace of defined vertical and lateral dimensions established at locations where there is a requirement for increased security and safety of ground facilities. Pilots are requested to voluntarily avoid flying through the depicted National Security Area. When it is necessary to provide a greater level of security and safety, flight in National Security Areas may be temporarily prohibited by regulation under the provisions of FAR Part 99.7. (FAR/AIM, 2002).

Other Airspace Areas - Other types of airspace includes: airport advisory areas; military training routes; temporary flight restrictions areas; flight limitations/prohibitions areas; parachute jump aircraft operations areas; published VFR routes; and, terminal radar service areas (FAR/AIM, 2002). Of these, military training routes are described below:

- Military Training Routes (MTRs), a joint venture by the FAA and the DOD, are mutually developed for use by the military for the purpose of conducting low-altitude, high speed training. The routes above 457 m (1,500 ft) above ground level, identified by three number characters (e.g., IR-206, VR-207), are developed to be flown, to the maximum extent possible, under instrument flight rules. The routes at 457 m (1,500 ft) above ground level and below, identified by four number characters (e.g., IR-1206, VR-1207), are generally developed to be flown under visual flight rules. Generally, military training routes are established below 3,048 m (10,000 ft) mean sea level for operations at speeds in excess of 250 knots. However, route segments may be defined at higher altitudes for purposes of route continuity (Aeronautical Information Manual, 2000). Route width is normally 9 km (5 nm) either side of centerline. In addition to the instrument and visual flight rules routes, there are slow speed low altitude routes used for military air operations at or below 457 m (1,500 ft) at airspeeds of 250 knots or less (National Imagery and Mapping Agency, 2001).

APPENDIX G-1

AIR QUALITY BACKGROUND INFORMATION

BACKGROUND INFORMATION ON AIR QUALITY

Air Pollution Terminology

The discussion of air pollution issues requires an understanding of terms that have a technical meaning. It is especially important to understand the distinction between air pollutant emissions and ambient air quality. Other important terminology includes: primary pollutants, secondary pollutants, and pollutant precursors; aerosols and particulate matter; and ozone precursor emissions terminology.

Emissions and Ambient Air Quality. The term "pollutant emissions" refers to the amount (usually stated as a weight) of one or more specific compounds introduced into the atmosphere by a source or group of sources. In practice, most pollutant emissions data are presented as "emission rates": the amount of pollutants emitted during a specified increment of time or during a specified increment of emission source activity. Typical measurement units for emission rates on a time basis include pounds per hour, pounds per day, or tons per year. Typical measurement units for emission rates on a source activity basis include pounds per thousand gallons of fuel burned, pounds per ton of material processed, and grams per vehicle mile of travel.

The term "ambient air quality" refers to the atmospheric concentration of a specific compound (amount of pollutants in a specified volume of air) actually experienced at a particular geographic location that may be some distance from the source of the relevant pollutant emissions. The ambient air quality levels actually measured at a particular location are determined by the interactions among three groups of factors:

- emissions: the types, amounts, and locations of pollutants emitted into the atmosphere;
- meteorology: the physical processes affecting the distribution, dilution, and removal of these pollutants; and
- chemistry: any chemical reactions that transform pollutant emissions into other chemical substances.

Ambient air quality data are generally reported as a mass per unit volume (e.g., micrograms per cubic meter of air) or as a volume fraction (e.g., parts per million by volume).

Primary Pollutants, Secondary Pollutants, and Pollutant Precursors. Air pollutants are often characterized as being "primary" or "secondary" pollutants. Primary pollutants are those emitted directly into the atmosphere (such as carbon monoxide, sulfur dioxide, lead particulates, and hydrogen sulfide). Secondary pollutants are those (such as ozone, nitrogen dioxide, and sulfate particles) formed through chemical reactions in the atmosphere; these chemical reactions usually involve primary pollutants, normal constituents of the atmosphere, and other secondary pollutants.

Those compounds which react to form secondary pollutants are referred to as reactive pollutants, pollutant precursors, or precursor emission products. Some air pollutants (such as many organic gases and suspended particulate matter) are a combination of primary and secondary pollutants.

The distinction between primary and secondary pollutants is more than a matter of semantics; important air quality management implications are also involved. The ambient concentration of primary pollutants depends on the spatial concentration of the emission sources, the rate of pollutant emissions, and the degree to which the emitted pollutants are dispersed or removed from the atmosphere between the emission source and the location of interest. Air quality problems involving primary pollutants (such as carbon monoxide) often can be traced to a single pollutant source or a concentrated group of sources emitting large quantities of the pollutant. Additionally, the responsible emission source will be relatively close to the location of the air quality problem. The distance between the emission source and the location of a ground-level air quality problem depends largely on the height at which the emissions are released into the atmosphere.

When an air quality problem involves a secondary pollutant (such as ozone), the spatial relationship between emission sources and ambient air quality problems becomes much more complicated. Because secondary pollutants are not emitted directly into the atmosphere, observed ambient concentrations may not show a clear correlation with the spatial distribution of sources emitting the pollutant precursors. The time factor involved in the chemical reactions producing secondary pollutants allows emissions from numerous sources to become dispersed and mixed together. As a result, the observed ambient pollutant concentrations are due as much to the cumulative areawide emissions of precursors as to the spatial concentration of emission sources.

Aerosols and Particulate Matter. Most people would interpret the term "aerosol" as indicating some type of liquid droplet or mist sprayed into the air. Similarly, most people would interpret the term "particulate matter" as implying a solid particle (such as dust or fly ash). In the air pollution field, however, the terms "aerosol" and "particulate matter" are used interchangeably; both terms can refer to either liquid or solid material suspended in the air.

Ozone Precursor Emissions. Ozone, a major component of photochemical smog, is the secondary pollutant of greatest concern in most parts of the country. The pollutant emissions generally categorized as ozone precursors fall into two broad groups of chemicals: nitrogen oxides and organic compounds. Many different terms are used to refer to these groups of ozone precursors. As indicated below, the various terms are seldom used in a rigorous chemical sense.

The terms "nitrogen oxides" and "oxides of nitrogen" are used interchangeably to refer to the combination of nitric oxide (designated by the chemical symbol NO) and nitrogen dioxide (designated by the chemical symbol NO₂). This combination of nitrogen oxides often is designated by the symbol NO_x. Although there are five different oxides of nitrogen, the terms "nitrogen oxides", "oxides of nitrogen", and "NO_x" generally refer only to the combination of NO and NO₂. NO₂ is itself a secondary pollutant formed primarily from nitric oxide.

Organic compound precursors of ozone are routinely described by a number of variations on three terms: hydrocarbons (HC), organic gases (OG), and organic compounds (OC). These three basic terms are often modified by adjectives such as total, reactive, or volatile. The result is a rather

confusing array of acronyms: HC (hydrocarbons), THC (total hydrocarbons), RHC (reactive hydrocarbons), TOG (total organic gases), ROG (reactive organic gases), TOC (total organic compounds), ROC (reactive organic compounds), and VOC (volatile organic compounds). An additional term, NMHC (nonmethane hydrocarbons), is also used on occasion.

To a chemist, most of these terms differ from each other in some significant way. In the air pollution control field, however, they are used as two groups of interchangeable terms. THC, TOG, and TOC imply a comprehensive grouping of chemicals including some (such as methane and many chlorinated organic compounds) that have no significant role in photochemical reactions in the lower atmosphere. The other terms (HC, RHC, ROG, ROC, VOC, and NMHC) imply a grouping of chemicals limited to those that play a meaningful role in photochemical reactions in the lower atmosphere.

From a purely chemical standpoint, the "hydrocarbon" terminology (HC, THC, RHC, and NMHC) often is inappropriate; many of the compounds of concern are organic compounds, but not hydrocarbons. The "reactive organic gases" (ROG) terminology incorrectly implies that compounds which condense into an aerosol droplet cease to play a role in smog photochemistry. The "volatile organic compound" (VOC) terminology incorrectly implies that emissions occur only through an evaporation process. The phrase "reactive organic compounds" (ROC) usually is the most accurate ozone precursor terminology, but the ROC acronym is not in widespread use. Since there already are too many acronyms for ozone precursors, the ROG acronym is the most reasonable one to use, and will be used in this document.

Air Quality Standards

Air quality management programs have evolved using two distinct management approaches: one approach based on setting and achieving ambient air quality standards, and a parallel approach of setting emission limits for individual sources of air pollutants considered to be hazardous.

The ambient standards approach to air quality management typically entails:

- setting ambient air quality standards for acceptable exposure to selected air pollutants;
- conducting monitoring programs to identify locations exposed to air pollutant concentrations exceeding the standards; and
- developing programs and regulations designed to reduce or eliminate the identified high exposure conditions in a timely manner.

The hazardous air pollutant emission limits approach to air quality management typically entails:

- identifying specific chemical substances that are potentially hazardous to human health, and then
- setting emission limits to regulate the amount of those substances that can be released by individual commercial or industrial facilities or by specific types of equipment.

Ambient Air Quality Standards for Criteria Pollutants. Air quality programs based on ambient air quality standards typically address air pollutants that are produced in large quantities by widespread types of emission sources and which are of public health concern because of their toxic

properties. The U.S. Environmental Protection Agency (EPA) has established ambient air quality standards for several different pollutants, which often are referred to as criteria pollutants (ozone, nitrogen dioxide, carbon monoxide, sulfur dioxide, suspended particulate matter, and lead). Federal ambient air quality standards apply to outdoor locations to which the general public has access. Standards for suspended particulate matter have been set for two size fractions: inhalable particulate matter (PM₁₀), fine particulate matter (PM_{2.5}). In the case of some air pollutants, separate standards have been set for different averaging times. Federal ambient air quality standards are based primarily on evidence of acute and chronic health effects.

Some states have adopted ambient air quality standards that are more stringent than the comparable federal standards or address pollutants that are not covered by federal ambient air quality standards. Most state ambient air quality standards are based primarily on health effects data, but can reflect other considerations such as protection of crops, protection of materials, or avoidance of nuisance conditions (such as objectionable odors). Table 1 summarizes federal and state ambient air quality standards applicable in Hawai'i.

Air pollutants covered by federal and state ambient air quality standards can be categorized by the nature of their toxic effects as:

- irritants (such as ozone, particulate matter, nitrogen dioxide, sulfur dioxide, and hydrogen sulfide) that affect the respiratory system, eyes, mucous membranes, or the skin;
- asphyxiants (such as carbon monoxide and nitric oxide) that displace oxygen or interfere with oxygen transfer in the circulatory system, affecting the cardiovascular and central nervous systems;
- necrotic agents (such as ozone, nitrogen dioxide, and sulfur dioxide) that directly cause cell death; or
- systemic poisons (such as lead particles) that affect a range of tissues, organs, and metabolic processes.

Ozone, suspended particulate matter, and carbon monoxide are the air pollutants of greatest concern in most parts of the country. Ozone is a strong oxidizing agent that reacts with a wide range of materials and biological tissues. Ozone is a respiratory irritant that can cause acute and chronic effects on the respiratory system. Recognized effects include reduced pulmonary function, pulmonary inflammation, increased airway reactivity, aggravation of existing respiratory diseases (such as asthma, bronchitis, and emphysema), physical damage to lung tissue, decreased exercise performance, and increased susceptibility to respiratory infections. In addition, ozone is a necrotic agent that causes significant damage to leaf tissues of crops and natural vegetation. Ozone also damages many materials by acting as a chemical oxidizing agent. Because of its chemical activity, indoor ozone levels are usually much lower than outdoor levels.

Suspended particulate matter represents a diverse mixture of solid and liquid material having size, shape, and density characteristics that allow the material to remain suspended in the air for meaningful time periods. The physical and chemical composition of suspended particulate matter is highly variable, resulting in a wide range of public health concerns.

TABLE 1. AMBIENT AIR QUALITY STANDARDS APPLICABLE IN HAWAII

POLLUTANT	SYMBOL	AVERAGING TIME	STANDARD AS PARTS PER MILLION BY VOLUME		STANDARD AS MICROGRAMS PER CUBIC METER		VIOLATION CRITERIA	
			HAWAII	NATIONAL	HAWAII	NATIONAL	HAWAII	NATIONAL
Ozone	O ₃	8 Hours	0.08	0.08	157	157	If exceeded on more than 1 day per year	If exceeded by the mean of annual 4th highest daily values for a 3-year period
Carbon Monoxide	CO	8 Hours	4.5	9	5,000	10,000	If exceeded on more than 1 day per year	If exceeded on more than 1 day per year
		1 Hour	9	35	10,000	40,000	If exceeded on more than 1 day per year	If exceeded on more than 1 day per year
Inhalable Particulate Matter	PM ₁₀	Annual Arithmetic Mean	---	---	50	50	If exceeded	If exceeded as a 3-year single station average
		24 Hours	---	---	150	150	If exceeded on more than 1 day per year	If exceeded by the mean of annual 99th percentile values over 3 years

TABLE 1 (continued). AMBIENT AIR QUALITY STANDARDS APPLICABLE IN HAWAII

POLLUTANT	SYMBOL	AVERAGING TIME	STANDARD AS PARTS PER MILLION BY VOLUME		STANDARD AS MICROGRAMS PER CUBIC METER		VIOLATION CRITERIA	
			HAWAII	NATIONAL	HAWAII	NATIONAL	HAWAII	NATIONAL
Fine Particulate Matter	PM2.5	Annual Arithmetic Mean	---	---	---	15.0	---	If exceeded as a 3-year spatial average of data from designated stations

		3 Hours	0.5	0.5	1,300	1,300	If exceeded on more than 1 day per year	If exceeded on more than 1 day per year

TABLE 1 (continued). AMBIENT AIR QUALITY STANDARDS APPLICABLE IN HAWAII

POLLUTANT	SYMBOL	AVERAGING TIME	STANDARD AS PARTS PER MILLION BY VOLUME		STANDARD AS MICROGRAMS PER CUBIC METER		VIOLATION CRITERIA	
			HAWAII	NATIONAL	HAWAII	NATIONAL	HAWAII	NATIONAL
Lead Particles (TSP Sampler)	Pb	Calendar Quarter	---	---	1.5	1.5	If exceeded	If exceeded
Hydrogen Sulfide	H ₂ S	1 Hour	0.025	---	35	---	If exceeded on more than 1 day per year	---

Notes:

All standards except the national PM₁₀ and PM_{2.5} standards are based on measurements corrected to 25 degrees C and 1 atmosphere pressure.

The national PM₁₀ and PM_{2.5} standards are based on direct flow volume data without correction to standard temperature and pressure.

Decimal places shown for standards reflect the rounding precision used for evaluating compliance.

Gaseous pollutant concentration equivalencies (parts per million by volume versus micrograms per cubic meter) are nominal values accounting for rounding conventions; exact equivalencies may be different.

Except for the 3-hour sulfur dioxide standard, the national standards shown are the primary (health effects) standards.

The national 3-hour sulfur dioxide standard is a secondary (welfare effects) standard.

The national PM₁₀ standards were adopted in 1987; revised violation criteria were adopted for attainment areas in 1997.

The original violation criteria for the national PM₁₀ standards will remain in effect for PM₁₀ nonattainment areas until EPA takes actions required by Section 172(e) of the Clean Air Act or approves emission control programs for the relevant PM₁₀ state implementation plan.

TABLE 1 (continued). AMBIENT AIR QUALITY STANDARDS APPLICABLE IN HAWAII

Notes (continued):

Violation criteria for all standards except the national annual standard for PM_{2.5} are applied to data from individual monitoring sites.

Violation criteria for the national annual standard for PM_{2.5} are applied to a spatial average of data from one or more community-oriented monitoring sites representative of exposures at neighborhood or larger spatial scales (40 CFR Part 58).

The "10" in PM₁₀ and the "2.5" in PM_{2.5} are not particle size limits; these numbers identify the particle size class (aerodynamic equivalent diameters in microns) collected with 50% mass efficiency by certified sampling equipment. The maximum particle size collected by PM₁₀ samplers is about 50 microns aerodynamic equivalent diameter; the maximum particle size collected by PM_{2.5} samplers is about 6 microns aerodynamic equivalent diameter. (40 CFR Part 53).

Data Sources:

40 CFR Parts 50, 53, and 58.

Hawaii Administrative Rules Chapter 11-59 (August 28, 2001).

Many components of suspended particulate matter are respiratory irritants. Some components (such as crystalline or fibrous minerals) are primarily physical irritants. Other components are chemical irritants (such as sulfates, nitrates, and various organic chemicals). Suspended particulate matter also can contain compounds (such as heavy metals and various organic compounds) that are systemic toxins or necrotic agents. Suspended particulate matter or compounds adsorbed on the surface of particles can also be carcinogenic or mutagenic chemicals.

Public health concerns for suspended particulate matter focus on the particle size ranges likely to reach the lower respiratory tract or the lungs. Inhalable particulate matter (PM₁₀) represents particle size categories that are likely to reach either the lower respiratory tract or the lungs after being inhaled. Fine particulate matter (PM_{2.5}) represents particle size categories likely to penetrate to the lungs after being inhaled. The "10" in PM₁₀ and the "2.5" in PM_{2.5} are not upper size limits. These numbers refer to the particle size range collected with 50% mass efficiency by certified sampling devices; larger particles are collected with lower efficiencies and smaller particles are collected with higher efficiencies.

In addition to public health impacts, suspended particulate matter causes a variety of material damage and nuisance effects: abrasion; corrosion, pitting, and other chemical reactions on material surfaces; soiling; and transportation hazards due to visibility impairment.

Carbon monoxide is a public health concern because it combines readily with hemoglobin in the blood, and thus reduces the amount of oxygen transported to body tissues. Relatively low concentrations of carbon monoxide can significantly affect the amount of oxygen in the blood stream since carbon monoxide binds to hemoglobin 200-250 times more strongly than oxygen. Both the cardiovascular system and the central nervous system can be affected when 2.5-4.0 percent of the hemoglobin in the blood is bound to carbon monoxide rather than to oxygen. Because of its low chemical reactivity and low solubility, indoor carbon monoxide levels usually are similar to outdoor levels.

Hazardous Air Pollutants. Air quality programs based on regulation of other hazardous substances typically address chemicals used or produced by limited categories of industrial facilities. Programs regulating hazardous air pollutants focus on: substances that alter or damage the genes and chromosomes in cells (mutagens); substances that affect cells in ways that can lead to uncontrolled cancerous cell growth (carcinogens); substances that can cause birth defects or other developmental abnormalities (teratogens); substances with serious acute toxicity effects; and substances that undergo radioactive decay processes, resulting in the release of ionizing radiation. Federal air quality management programs for hazardous air pollutants focus on setting emission limits for particular industrial processes rather than setting ambient exposure standards. Some states have established ambient exposure guidelines for various hazardous air pollutants, and use those guidelines to as part of the permit review process for industrial emission sources.

The State of Hawai'i has adopted ambient concentration guidelines for hazardous air pollutants. Those guidelines are used as part of the permit review process for emission sources that require state or federal air quality permits. The Hawai'i ambient exposure guidelines for hazardous air pollutants (Hawai'i Administrative Rules Title 11 Chapter 60.1, Section 179) include the

following:

- for non-carcinogenic compounds, an 8-hour average concentration equal to 1 percent of the corresponding 8-hour permissible exposure limit (PEL) value adopted by the Occupational Safety and Health Administration (OSHA);
- for non-carcinogenic compounds, an annual average concentration equal to 1/420 (0.238 percent) of the 8-hour PEL value adopted by OSHA;
- for non-carcinogenic compounds for which there is no OSHA-adopted PEL, the Director of Health is authorized to set ambient air concentration standards on a case-by-case basis so as to avoid unreasonable endangerment of public health with an adequate margin of safety; and
- for carcinogenic compounds, any ambient air concentration that produces an individual lifetime excess cancer risk of more than 10 in 1 million assuming continuous exposure for 70 years.

Air Quality Planning Programs

The federal Clean Air Act requires each state to identify areas which have ambient air quality in violation of federal standards. States are required to develop, adopt, and implement a State Implementation Plan (SIP) to achieve, maintain, and enforce federal ambient air quality standards in these nonattainment areas. Deadlines for achieving the federal air quality standards vary according to air pollutant and the severity of existing air quality problems. The SIP must be submitted to and approved by EPA. SIP elements are developed on a pollutant-by-pollutant basis whenever one or more air quality standards are being violated.

The status of areas with respect to federal ambient air quality standards is categorized as nonattainment, attainment (better than national standards), unclassifiable, or attainment/cannot be classified. For most air pollutants, initial federal status designations are made using only two categories (either nonattainment and unclassifiable/attainment, or nonattainment and attainment/cannot be classified). For simplicity and clarity, the federal unclassifiable and attainment/cannot be classified designations will be called unclassified in this document. The unclassified designation includes attainment areas that comply with federal standards as well as areas for which monitoring data are lacking. Unclassified areas are treated as attainment areas for most regulatory purposes. Areas that have been reclassified from nonattainment to attainment of federal air quality standards are automatically considered "maintenance areas", although this designation is seldom noted in status listings. The entire state of Hawai'i is categorized as attainment or unclassified for each of the federal ambient air quality standards.

Existing Air Quality Conditions

The State of Hawai'i currently operates 9 ambient air quality monitoring stations on the Island of O'ahu, 1 station on the Island of Kaua'i, 2 stations on the Island of Maui, and 5 stations on the Island of Hawai'i. All of the monitoring stations are located in coastal regions, with many of the monitoring stations located in or near urbanized areas. None of the monitoring stations are located at or near Army training areas. The monitoring stations on Maui are located to monitor the air

quality impacts of sugar cane burning. The monitoring stations on the Island of Hawai'i have been located primarily to monitor the impacts of emissions from volcanic eruptions and geothermal development. Based on available monitoring data and the locations of recognized emission sources, EPA has concluded that no locations in Hawai'i exceed federal ambient air quality standards. Consequently, the entire state is considered to be in attainment of all federal ambient air quality standards.

Most of the monitoring data collected in recent years shows that ambient air quality levels are well below the values of the relevant state and federal ambient air quality standards. Two factors help maintain good air quality conditions in Hawai'i: the isolated location of the state, and the small size of the islands. The state's isolated location prevents other areas from contributing background pollutant concentrations. The small size of the islands in the state minimizes the time air masses remain over land areas, and hence limits the accumulation and development of high air pollutant concentrations. The small size of the islands combined with relatively persistent trade wind directions also minimize recirculating airflow patterns that contribute to air pollution buildup in continental areas. The isolated location and small size of Hawai'i are particularly important in minimizing ozone concentrations, since climatic factors (warm temperatures and high sunlight intensities) are otherwise favorable for the photochemical reactions that produce ozone. Although overall conditions generally minimize air pollution levels, high intensity emission sources or extended periods of light and variable winds can allow the development of localized air quality problems.

As illustrated in Table 2, only two pollutants (ozone and PM₁₀) have approached or exceeded relevant state or federal standards. Up until September 2001, the state of Hawai'i had a very stringent 1-hour ozone standard of 100 micrograms per cubic meter (0.05 parts per million). This one-hour ozone standard was typically exceeded on several days each year at the Sand Island monitoring station in the Honolulu area. In September 2001 the state 1-hour ozone standard was replaced with an 8-hour average standard numerically equal to the federal 8-hour ozone standard. Available data show that ozone levels in Hawai'i have not approached or exceeded the 8-hour ozone standard.

PM₁₀ concentrations at some locations have approached or exceeded the state and federal 24-hour standard of 150 micrograms per cubic meter. Maximum 24-hour PM₁₀ concentrations often exceed 100 micrograms per cubic meter at one or both monitoring stations on Maui, and sometimes exceed 100 micrograms per cubic meter at the Pearl City and Kapolei monitoring stations on O'ahu. The high PM₁₀ concentrations at monitoring stations on Maui are associated with agricultural burning activities. The high PM₁₀ concentrations at Pearl City and Kapolei have been attributed to the use of fireworks during New Year's Day celebrations. Two episodes of 24-hour PM₁₀ concentrations over 150 micrograms per cubic meter have been recorded at Pearl City in 2000, with one additional episode in 2001. The two episodes in 2000 represented a violation of the state 24-hour PM₁₀ standard, but did not constitute a violation of the federal 24-hour PM₁₀ standard.

TABLE 2. MAXIMUM AIR POLLUTANT CONCENTRATIONS ON O'AHU AND HAWAI'I

ISLAND	POLLUTANT	AVERAGING TIME	PEAK CONCENTRATION, MICROGRAMS PER CUBIC METER					HAWAI'I STANDARD	FEDERAL STANDARD
			1997	1998	1999	2000	2001

	H2S	1 HOUR	nd	nd	nd	nd	nd	35	NA
	Number of Events Over Standard								
HAWAI'I	OZONE	1 HOUR	13	7	8	0	1	100	
	PM10	24 HOUR	0	0	0	2	1	150	
	OZONE	1 HOUR	nd	nd	nd	nd	nd	100	235
		ANNUAL	nd	nd	nd	nd	nd	70	100
		1 HOUR	nd	nd	nd	nd	nd	10,000	40,000
	SO2	3 HOUR	nd	nd	652	438	461	1,300	1,300
		24 HOUR	nd	nd	111	94	101	365	365
		ANNUAL	nd	nd	6	6	8	80	80
	PM10	24 HOUR	nd	nd	30	23	20	150	150
		ANNUAL	nd	nd	15	18	12	50	50
	H2S	1 HOUR	nd	nd	nd	13	8	35	NA

Notes:

nd = no data

NA = not applicable; data reported for trend analysis purposes, but no applicable federal or state standards

Numbers in **bold** = values exceeding the most stringent applicable state or federal standard.

The Hawai'i 1-hour ozone standard was replaced in September 2001 by an 8-hour standard numerically identical to the federal 8-hour ozone standard.

Based on conventional power function extrapolations and the relationship between peak 1-hour and annual average ozone levels, peak 8-hour ozone levels are probably about 80 to 85 micrograms per cubic meter.

Data Sources: Hawai'i Department of Health Clean Air Branch 1998, 1999, 2000, 2001, 2002.

Climate and Meteorology Conditions

The most prominent feature of the circulation of air across the tropical Pacific is the persistent trade-wind flow in a general east-to-west direction. The trade winds blow across Hawai'i from the northeast quadrant about 80 to 95 percent of the time from May through September and about 50 to 80 percent of the time from October through April. In addition to the trade winds, wind patterns are influenced by major storm systems and by topographic features that alter or channel prevailing wind directions. Topographic features have additional influences on local wind patterns in coastal areas, with up slope/down slope flow patterns often reinforcing sea breeze/land breeze patterns. Local winds tend to move inland from the coast during mid-morning to early evening periods, then reverse direction and flow off-shore during night and early morning hours. The on-shore sea breeze component tends to be stronger than the off-shore land breeze component. Sea breeze/land breeze patterns are most common on the south and west coasts of the Hawaiian Islands.

The combination of a dominant trade wind pattern and limited seasonal changes in the length of day and night combine to limit seasonal variations in weather conditions in Hawai'i. Weather conditions in Hawai'i show a two season pattern, with a winter season of seven months (October through April) and a summer season of five months (May through September). The summer months generally are warmer and drier than the winter months. Most major storms occur during the winter season. Seasonal variations in temperature conditions are mild at lower elevations, with daytime temperatures commonly between 75 and 90 degrees Fahrenheit (24 to 32 Celsius) and nighttime temperatures between 65 and 75 degrees Fahrenheit (18 to 24 Celsius). Topographic features exert a strong influence on rainfall amounts, and also influence temperature patterns at higher elevations. Rainfall amounts range from less than 20 inches per year (51 centimeters per year) on the southern and western coastal areas to over 300 inches per year (762 centimeters per year) on the windward slopes of the high mountains or near the summits of lower mountains on Kaua'i, O'ahu, and Maui.

KEY ACRONYMS

ACGIH: American Conference of Governmental Industrial Hygienists
CO: carbon monoxide
EPA: U.S. Environmental Protection Agency
NESHAP: national emission standards for hazardous air pollutants
NIOSH: National Institute of Occupational Safety and Health
NO: nitric oxide
NO₂: nitrogen dioxide
NO_x: oxides of nitrogen (nitric oxide plus nitrogen dioxide)
NSPS: new source performance standards
NSR: new source review
ODC: ozone depleting chemicals
OSHA: Occupational Health and Safety Administration
PEL: permissible exposure limit (an 8-hour time weighted average concentration value)
PM₁₀: inhalable particulate matter
PM_{2.5}: fine particulate matter
PSD: prevention of significant deterioration
REL: recommended exposure limit (a workday-based time weighted average concentration)
ROG: reactive organic gases or reactive organic compounds
SIP: State Implementation Plan
SO_x: sulfur oxides
TLV: threshold level value (an 8-hour time weighted average concentration value)
TSP: total suspended particulate matter

GLOSSARY OF AIR QUALITY TERMS

Aerodynamic Equivalent Diameter. A standardized method for characterizing the aerodynamic properties of suspended particles according to their relative settling velocities. The aerodynamic equivalent diameter of a particle is the diameter of a sphere with a 1 gram per cubic centimeter density which would have the same settling velocity as the real particle.

Aerosol. Solid or liquid material having size, shape, and density characteristics that allow the material to remain suspended in the atmosphere for more than a few minutes. A synonym for suspended particulate matter.

Air Basin. A regional area defined for air quality management purposes based on considerations that include the constraints of topographic features on meteorology and pollutant transport patterns, and political jurisdiction boundaries that influence the design and implementation of air quality management programs.

Ambient Air. Outdoor air in locations accessible to the general public.

Ambient Air Quality Standards. A combination of air pollutant concentrations, exposure durations, and exposure frequencies that are established as thresholds above which adverse impacts to public health and welfare may be expected. Ambient air quality standards are set on a national level by the U.S. Environmental Protection Agency. Ambient air quality standards are set on a state level by public health or environmental protection agencies as authorized by state law.

Aromatics. A class of organic compounds with a chemical structure based on a 6-member double-bonded carbon ring; examples include benzene, toluene, xylene, and naphthalene.

Attainment Area. An area considered to have air quality as good as or better than the National Ambient Air Quality Standards. An area may be an attainment area for one pollutant and a non-attainment area for others.

Cancer. A class of diseases characterized by uncontrolled growth of somatic cells. Cancers are typically caused by one of three mechanisms: chemically induced mutations or other changes to cellular DNA; radiation induced damage to cellular chromosomes; or viral infections that introduce new DNA into cells.

Carbon Monoxide (CO). A colorless, odorless gas which is toxic because it reduces the oxygen-carrying capacity of the blood.

Carcinogen. A chemical substance or type of radiation that can cause cancer in living organisms.

Chlorofluorocarbons (CFCs). A family of inert, nontoxic, and easily-liquefied chemicals used in refrigeration, air conditioning, packaging, insulation, or as solvents or aerosol propellants. Because CFCs are not destroyed in the lower atmosphere they drift into the upper atmosphere where they can be decomposed by high intensity ultraviolet radiation. The chlorine released when CFCs decompose reacts with and destroys ozone in the stratosphere.

Cutpoint Diameter (D50 diameter). A term used to characterize the collection efficiency of particulate matter sampling devices. The 50 percent mass collection efficiency size (D50 diameter) is commonly used as a simple description of sampling device performance. The D50 cutpoint diameter is not a particle size limit; it is merely the size range (as an aerodynamic equivalent diameter) at which the sampling device collects 50 percent of the ambient particle mass. Size categories of suspended particulate matter are typically designated according to the D50 cutpoint of the relevant sampling equipment.

Criteria Pollutant. An air pollutant for which there is a national ambient air quality standard (carbon monoxide, nitrogen dioxide, ozone, sulfur dioxide, inhalable particulate matter, fine particulate matter, or airborne lead particles).

***De Minimis* Level.** A threshold for determining whether various regulatory requirements apply to a particular action or facility. In an air quality context, *de minimis* thresholds typically are based on emissions, facility size, facility activity levels, or other indicators.

Fugitive Emissions. Emissions that could not reasonably be confined or collected in a stack, vent, or similar device that would allow application of emission control equipment.

Hazardous Air Pollutant (HAP). Air pollutants which have been specifically designated by relevant federal or state authorities as being hazardous to human health. Most HAP compounds are designated due to concerns related to carcinogenic, mutagenic, teratogenic properties; severe acute toxic effects; or ionizing radiation released during radioactive decay processes.

Hydrocarbons. A class of organic compounds composed solely of carbon and hydrogen atoms; often used loosely to include substituted hydrocarbons. Hydrocarbons are a subclass of organic compounds. This term is frequently misused as a synonym for "organic compounds".

Maintenance Area. An area that currently meets federal ambient air quality standards but which was previously designated as a nonattainment area. Federal agency actions occurring in a maintenance area are still subject to Clean Air Act conformity review requirements.

Microgram. One one-millionth of a gram.

Micron. A unit commonly used to describe particle size. One one-millionth of a meter (one micrometer).

Mutagen. A chemical substance or physical agent that causes a permanent change to the genes of a cell.

Nitric Oxide (NO). A colorless toxic gas formed primarily by combustion processes that oxidize atmospheric nitrogen gas or nitrogen compounds found in the fuel. A precursor of ozone, nitrogen dioxide, numerous types of photochemically generated nitrate particles (including PAN), and atmospheric nitrous and nitric acids. Most nitric oxide formed by combustion processes is converted into nitrogen dioxide by subsequent oxidation in the atmosphere over a period that may range from several hours to a few days.

Nitrogen Dioxide (NO₂). A toxic reddish gas formed by oxidation of nitric oxide. Nitrogen dioxide is a strong respiratory and eye irritant. Most nitric oxide formed by combustion processes is converted into nitrogen dioxide by subsequent oxidation in the atmosphere. Nitrogen dioxide is a criteria pollutant in its own right, and is a precursor of ozone, numerous types of photochemically generated nitrate particles (including PAN), and atmospheric nitrous and nitric acids.

Nitrogen Oxides (NO_x). A group term meaning the combination of nitric oxide and nitrogen dioxide; other trace oxides of nitrogen may also be included in instrument-based NO_x measurements. A precursor of ozone, photochemically generated nitrate particles (including PAN), and atmospheric nitrous and nitric acids. See also Reactive Odd-Nitrogen (NO_y).

Nonattainment Area. An area that does not meet a federal or state ambient air quality standard. Federal agency actions occurring in a federal nonattainment area are subject to Clean Air Act conformity review requirements.

Organic Compounds. Compounds of carbon containing hydrogen and possibly other elements (such as oxygen, sulfur, or nitrogen). Major subgroups of organic compounds include hydrocarbons, alcohols, aldehydes, carboxylic acids, esters, ethers, and ketones. Organic compounds do not include crystalline or amorphous forms of elemental carbon (graphite, diamond, carbon black, etc.), the simple oxides of carbon (carbon monoxide and carbon dioxide), metallic carbides, or metallic carbonates.

Ozone (O₃). A compound consisting of three oxygen atoms. Ozone is a major constituent of photochemical smog that is formed through chemical reactions in the atmosphere involving reactive organic compounds, nitrogen oxides, and ultraviolet light. Ozone is a toxic chemical that damages various types of plant and animal tissues and which causes chemical oxidation damage to various materials. Ozone is a respiratory irritant, and appears to increase susceptibility to respiratory infections. A natural layer of ozone in the upper atmosphere absorbs high energy ultraviolet radiation, reducing the intensity and spectrum of ultraviolet light that reaches the earth's surface.

Particulate Matter. Solid or liquid material having size, shape, and density characteristics that allow the material to remain suspended in the atmosphere for more than a few minutes. Particulate matter can be characterized by chemical characteristics, physical form, or aerodynamic properties. Categories based on aerodynamic properties are commonly described as being size categories, although physical size is not used to define the categories. Many components of suspended particulate matter are respiratory irritants. Some components (such as crystalline or fibrous minerals) are primarily physical irritants. Other components are chemical

irritants (such as sulfates, nitrates, and various organic chemicals). Suspended particulate matter also can contain compounds (such as heavy metals and various organic compounds) that are systemic toxins or necrotic agents. Suspended particulate matter or compounds adsorbed on the surface of particles can also be carcinogenic or mutagenic chemicals.

PM₁₀ (inhalable particulate matter [EPA]). A fractional sampling of suspended particulate matter that approximates the extent to which suspended particles with aerodynamic equivalent diameters smaller than 50 microns penetrate to the lower respiratory tract (tracheo-bronchial airways and alveoli in the lungs). In a regulatory context, PM₁₀ is any suspended particulate matter collected by a certified sampling device having a 50% collection efficiency for particles with aerodynamic equivalent diameters of 9.5-10.5 microns and an maximum aerodynamic diameter collection limit less than 50 microns. Collection efficiencies are greater than 50% for particles with aerodynamic diameters smaller than 10 microns and less than 50% for particles with aerodynamic diameters larger than 10 microns. NOTE: the ACGIH definition of inhalable particulate mass is based on a D₅₀ of 100 microns aerodynamic equivalent diameter.

PM_{2.5} (fine particulate matter [EPA]). A fractional sampling of suspended particulate matter that approximates the extent to which suspended particles with aerodynamic equivalent diameters smaller than 6 microns penetrate into the alveoli in the lungs. In a regulatory context, PM_{2.5} is any suspended particulate matter collected by a certified sampling device having a 50% collection efficiency for particles with aerodynamic equivalent diameters of 2.0-2.5 microns and an maximum aerodynamic diameter collection limit less than 6 microns. Collection efficiencies are greater than 50% for particles with aerodynamic diameters smaller than 2.5 microns and less than 50% for particles with aerodynamic diameters larger than 2.5 microns.

Permissible Exposure Limit (PEL). An occupational air quality standard adopted by the Occupational Safety and Health Administration (OSHA). OSHA PELs are typically adopted as 8-hour time-weighted averages.

Peroxyacetyl Nitrate (PAN). A toxic organic nitrate compound formed by photochemical reactions in the atmosphere. PAN is a strong respiratory and eye irritant, and a strong necrotic agent affecting plant tissues. Also called peroxyacetic nitric anhydride. A number of similar organic nitrate compounds are formed along with PAN during photochemical smog reactions. In relatively remote rural areas PAN and related organic nitrates, together with nitric acid, are often the dominant atmospheric nitrogen compounds.

Precursor. A compound or category of pollutant that undergoes chemical reactions in the atmosphere to produce or catalyze the production of another type of air pollutant.

Reactive Organic Compounds (ROC). The most technically accurate term for the organic precursors of ozone and other photochemically generated pollutants. The more commonly used term is “reactive organic gases (ROG)”.

Reactive Organic Gases (ROG). Organic compounds emitted into the air which have photochemical reaction rates sufficient to be considered precursors of ozone. Organic compounds which are not considered reactive in the lower atmosphere include methane, ethane,

acetone, methyl acetate, carbonic acid, ammonium carbonate, methylene chloride, methyl chloroform, and numerous fully-saturated chloro-fluorocarbon compounds. The term “reactive organic compounds” (ROC) would be technically more accurate, since many of the compounds of concern may be present in both gaseous and aerosol states (e.g., as atmospheric aerosols or as liquid films condensed on atmospheric particles in dynamic equilibrium with gas phase vapors). But the acronym ROC is not in common use, and there are far too many acronyms already in use for organic compound emissions.

Recommended Exposure Limit (REL). An occupational air quality guideline recommended by the National Institute of Occupational Safety and Health (NIOSH). NIOSH RELs are typically adopted as time-weighted averages for workdays of up to 10 hours in a 40-hour workweek.

Respirable Particulate Matter (ACGIH definition). Approximately PM₁₀ with a 2% collection efficiency at 25 microns aerodynamic equivalent diameter. The collection efficiency curve may differ from EPA PM₁₀ certification requirements.

Short-Term Exposure Limit (STEL). An occupational exposure standard adopted by OSHA or an occupational exposure guideline recommended by ACGIH or NIOSH that is typically based on a 15-minute time-weighted average which should not be exceeded at any time during a workday. In some cases, exposure duration periods shorter than or longer than 15 minutes are specified.

State Implementation Plan (SIP). Legally enforceable plans adopted by states and submitted to EPA for approval, which identify the actions and programs to be undertaken by the State and its subdivisions to achieve and maintain national ambient air quality standards in a time frame mandated by the Clean Air Act.

Sulfur Dioxide (SO₂). A pungent, colorless, and toxic oxide of sulfur formed primarily by the combustion of fossil fuels. It is a respiratory irritant, especially for asthmatics. A criteria pollutant in its own right, and a precursor of sulfate particles and atmospheric sulfuric acid.

Sulfur Oxides (SO_x). A group term meaning the combination of sulfur dioxide and sulfur trioxide; treated as a precursor of sulfur dioxide, sulfate particles, and atmospheric sulfuric acid.

Teratogen. A chemical substance or physical agent that causes birth defects through abnormal development or malformation of a fetus.

Thoracic Particulate Matter (ACGIH definition). Approximately PM₄ with a 1% collection efficiency at 10 microns aerodynamic equivalent diameter.

Threshold Limit Value (TLV). An occupational air quality guideline recommended by the American Conference of Governmental Industrial Hygienists (ACGIH). ACGIH TLVs are typically adopted as 8-hour time-weighted averages.

Total Suspended Particulate Matter (TSP). A sampling of suspended particulate matter collected by a standard high volume sampler. The original federal particulate matter standards were based on TSP sampling. The original standards did not define any required collection efficiency parameters for high volume samplers, resulting in significant variability of collection efficiencies for different particle size ranges. TSP samplers are most effective in collecting particles with aerodynamic equivalent diameters smaller than 100 microns, but collection efficiency varies with wind speed and relative sampler orientation to wind direction. The 50 percent cutpoint diameter of TSP samplers typically falls between 15 and 70 microns.

Toxic. Poisonous. Exerting an adverse physiological effect on the normal functioning of an organism's tissues or organs through chemical or biochemical mechanisms following physical contact or absorption.

Toxic Agent. A chemical compound or a mixture of compounds that exerts an adverse physiological effect on a living organism.

Transportation Control Measures (TCMs). Steps taken by a locality to adjust traffic patterns (e.g., bus lanes, right turn on red) or reduce vehicle use (ridesharing, high-occupancy vehicle lanes) to reduce vehicular emissions of air pollutants.

Vehicle Miles Traveled (VMT). The cumulative amount of vehicle travel within a specified geographical area over a given period of time.

APPENDIX G-2

CONSTRUCTION EMISSION ESTIMATES

APPENDIX G2: CONSTRUCTION EMISSION ESTIMATES

This appendix provides summaries of construction emission estimates for projects proposed under the Proposed Action or the RLA Alternative. The appendix includes the fugitive dust and vehicle emission rate database used in the analysis plus summaries of annual construction emissions by installation. Summaries for the military vehicle trail construction projects include summaries of equipment use estimates by construction stage.

The detailed spreadsheets documenting the equipment emission rate database and the components of the emission calculations generally do not lend themselves to hard copy printing. Electronic versions of the spreadsheets can be made available on request.

DEFAULT CONSTRUCTION SITE FUGITIVE DUST EMISSION RATE ESTIMATES:

AP-42 5th Ed., Sect. 13.2.3 assumption:	1.2	TSP tons/acre-month, assuming 30 single-shift work days per month
	80.00	TSP pounds/acre/workday, single shift
CARB Area Source Methodology, Section 7.7 (adjusted for no control measures):		
Simple site grading, but no major cut-and-fill or excavation activity:	0.3432	TSP tons/acre-month, assuming 21 single-shift work days per month
	32.69	TSP pounds/acre/workday, single shift
	0.22	PM10 tons/acre-month, assuming 21 single-shift work days per month
	20.95	PM10 pounds/acre/workday, single shift
With major excavation & earthmoving:	1.3104	TSP tons/acre-month, assuming 21 single-shift work days per month
	124.80	TSP pounds/acre/workday, single shift
	0.84	PM10 tons/acre-month, assuming 21 single-shift work days per month
	80.00	PM10 pounds/acre/workday, single shift

Note: CARB estimates range from 40.9% to 156% of the generalized AP-42 daily TSP rate.

All data reflect typical loam type soil conditions. Loess deposits, peat soils, or poorly consolidated volcanic ash deposits can have significant wind erosion rates in addition to fugitive dust associated with direct disturbance by construction activity.

The data account for typical on-site construction activities, including site clearing, grading, foundation excavation, on-site vehicle traffic, etc.

If the project will require substantial off-site excavation of fill material from major borrow areas, emissions associated with borrow pit excavation, truck loading, and off-site unpaved haul road traffic may warrant additional separate analysis.

Small quantity off-site borrow pit activities and low volume haul road traffic may not warrant additional analysis, since the data are quite generalized to begin with.

The EPA estimate is based on TSP monitoring procedures at shopping center and apartment construction sites, and assumes 30 single-shift workdays per month.

CARB estimates are based on site activity data from construction projects in California and Nevada. Site activity was evaluated using EPA operation-specific emission factors to arrive at the overall PM10 emission rate estimates for construction activity.

CARB assumes that standard dust control practices provided 50% dust control at the monitored project sites. The data above have been adjusted to uncontrolled factors.

CARB assumes that PM10 accounts for about 64% of fugitive TSP ($PM_{10} \times 1.56 = TSP$). The CARB TSP estimates presented above are back-calculated values.

Given the procedures used to derive the CARB emission rate estimates, it should be valid to use the estimated TSP rates in combination with a project-specific PM10 fraction based on soil conditions.

NOTE: If using the CARB PM10 emission rate estimates directly, set the PM10 Portion of Fugitive Dust to 100%.

CARB also assumes 5 day/week construction activity (about 21 days/month) instead of the EPA assumption of 30 days/month.

The low range of CARB estimates is for typical residential, commercial, or office development with site grading but no major excavation or cut and fill earthmoving.

The high end of the CARB estimate is for major construction operations with substantial earthmoving activity.

Silty Loam	0 - 28.5 %	50 - 87.5 %	0 - 50 %	50 - 100 %	30 - 70 %
Clay Loam	28.5 - 40 %	15 - 52.5 %	20 - 45 %	55 - 80 %	35 - 60 %
Loam	7.5 - 28.5 %	30 - 50 %	25 - 52.5 %	47.5 - 75 %	30 - 50 %
Sandy Clay	35 - 55 %	0 - 17.5 %	45 - 65 %	35 - 55 %	20 - 40 %
Sandy Soils:					
Sandy Clay Loam	20 - 35 %	0 - 27.5 %	45 - 80 %	20 - 55 %	15 - 40 %
Sandy Loam	0 - 20 %	0 - 50 %	42.5 - 85 %	15 - 57.5 %	10 - 35 %
Loamy Sand	0 - 15 %	0 - 30 %	70 - 90 %	10 - 30 %	5 - 25 %
Sand	0 - 10 %	0 - 15 %	85 - 100 %	0 - 15 %	0 - 10 %

Notes:

Soil texture classes and associated clay, silt, and sand fractions are based on the U.S. Department of Agriculture soil texture classification system.

Clay = soil particles with a sieve diameter below 2 microns (but may form much larger particle aggregates).

Silt = soil particles with a sieve diameter between 2 and 50 microns.

Fine silt: 2 - 10 microns; medium silt: 10 - 20 microns; coarse silt: 20 - 50 microns.

Sand = soil particles with a sieve diameter between 50 and 2,000 microns.

Very fine sand: 50 - 100 microns; fine sand: 100 - 250 microns; medium sand: 250 - 500 microns; coarse sand: 500 - 1000 microns; very coarse sand: 1000 - 2000 microns.

1 micron = 0.001 millimeters = 0.00003937 inches

PM10 = inhalable particulate matter (a size-dependent fractional sampling of particles smaller than 50 microns aerodynamic equivalent diameter). PM10 samplers collect essentially 100% of submicron particles, 50% of 10 micron aerodynamic diameter particles, and 0% of particles larger than 50 microns aerodynamic equivalent diameter.

A sieve diameter is the width of the minimum screen opening (usually square) through which a particle will pass. Because soil particles often have complex shapes, the sieve diameter normally will be larger than the minimum physical dimension and smaller than the maximum physical dimension of the particle.

An aerodynamic equivalent diameter is a mathematical abstraction, not a physical dimension. The aerodynamic equivalent diameter is the diameter of a sphere with unit density (1 gram per cubic centimeter) having the same gravitational settling velocity as the actual particle under consideration. Settling velocities are influenced by physical size and shape, as well as by particle density. In most cases, the aerodynamic equivalent diameter can be approximated by the equivalent spherical diameter (volume diameter) of the particle.

See the USDA National Soil Characterization Database (http://soils.usda.gov/soil_survey/nscd/main.htm) for more precise size fractions of dominant soil series types.

Wild, Alan. 1993. Soils and the Environment: An Introduction. Cambridge University Press.

Warrick, A. W. 2000. Soil Physics. Pages A-1 through A-17 in Malcolm E. Sumner (ed.), Handbook of Soil Science. CRC Press.

DEFAULT DUST CONTROL PROGRAM EFFECTIVENESS VALUES:

50%	typical measures, arid areas
65%	aggressive measures, arid areas
70%	typical measures, areas with frequent rain
85%	typical measures, areas where natural soils seldom dry out

Note: disturbed areas and soil stockpiles can dry out more readily than natural soils.

Construction site water trucks typically have tank capacities of 500 - 1,200 gallons. A 600 gallon tank is a 2.5 ton load, and a 1,200 gallon tank is a 5 ton load. At 6 mph with a 10-foot spray width, a water truck can cover about 7.3 acres per hour. Tank size and spray intensity will determine acreage covered per tank load. A rate of 600 gallons applied to 5 acres (120 gallons per acre) would be an application depth of 0.11 mm (0.0044 inches); a rate of 300 gallons per acre would be an application depth of 0.28 mm (0.01 inches). Effective dust control in arid areas probably requires cumulative daily application of 600 + gallons per acre (generally in two or more sprinkling passes). It takes 1,070 gallons/acre to achieve a 1 millimeter water application rate.

Water application rate (per pass):	600	gallons/acre	0.133680556	cu ft per gallon
	0.5612	mm depth	43,560	sq ft per acre
	0.0221	inches depth	25.40	mm per inch

WATER TRUCK ACTIVITY CALCULATIONS:

Average Area to be Sprinkled on Any Day:	12.5	acres
Daily Number of Sprinkling Passes:	2	passes
Water Application Rate Per Pass:	600	gallons/acre
Average Truck Speed:	5	mph
Average Spray Width:	10	feet
Water Truck Tank Size:	600	gallons
Average Tank Filling Rate:	200	gallons per minute
Average Transit Time Each Way:	3	minutes each way to/from fill location
Average Connect Plus Disconnect Time:	2	minutes per tank fill
Time Required for Tank Refilling:	11	minutes (including travel to/from fill location)
Required Truck Loads Per Day:	25.0	loads
Truck Fills Per Day:	25.0	loads
Acres Sprayed per Tank Load:	1.00	acres per load
Acres Sprayed Per Hour of Driving Time:	6.06	acres per hour
Driving Time per Complete Pass for Site:	2.06	hours
Daily Total Water Truck Operating Time:	8.71	cumulative hours
Number of Water Trucks Used On Site:	6	trucks
Daily Operating Hours per Truck:	1.45	hours per truck
Average Active Hours Per Day Per Truck:	2	hours per day per truck
Average Operating Time Factor per Truck:	73%	hourly operating time factor

ESTIMATED EMISSIONS FOR CONSTRUCTION OF POHAKULOA TANK TRAIL

EQUIPMENT USE SUMMARY:

PROJECT STAGE	ACTIVITY DURATION, DAYS	ACREAGE SUBJECT TO DISTURBANCE	NUMBER OF EQUIPMENT ITEMS	CUMULATIVE HOURS OF EQUIP USE	OFF-SITE FILL HAULING	
					TRUCK LOADS TO/ FROM SITE	TYPICAL LOADS PER DAY
RIGHT-OF-WAY CLEARING	200	126.0	15	12,480	850	4
ROADBED GRADING	200	163.6	45	39,850	12,426	62
ROAD SURFACING	167	83.3	51	33,792	20,149	122
	0	0.0	0	0	0	0
TOTALS OR AVERAGES:	250	163.6	82	86,122	33,425	134

Linear work progressions with overlap among activity stages reduces the total construction period to about 250 workdays (March 2006 - March 2007).

TYPICAL CONSTRUCTION DAY EMISSIONS:

PROJECT STAGE	COMPONENT	DAILY EMISSIONS, POUNDS PER DAY				
		ROG	NOx	CO	SOx	PM10

APPENDIX G-3

VEHICLE EMISSION ESTIMATES

APPENDIX G3: VEHICLE EMISSION ESTIMATES

This appendix provides summaries of vehicle emission estimates for military vehicles and for the net increase in personal vehicles associated with personnel who would be added by the Proposed Action or the RLA Alternative. Military vehicle emission estimates have been developed for each installation under each alternative assuming a mix of six vehicle types: stryker vehicles, humvees (HMMWVs), 2.5-ton light tactical trucks (LMTVs), 5-ton medium tactical trucks (MTVs), 10-ton heavy tactical trucks (HEMTTs), and heavy cargo transporters (PLS and HET vehicles). Vehicle use and emission estimates are summarized by alternative and installation for paved road travel, unpaved road travel, and vehicle activity in off-road maneuver areas. Emission estimates for the net increase in personal vehicle commute trips assume all added personnel will require off-post housing, and that ridesharing and transit use will account for 5 percent of commute travel.

The detailed spreadsheets documenting the emission calculations generally do not lend themselves to hard copy printing. Electronic versions of the spreadsheets can be made available on request.

TOTALS	659	168	11	1,911	100.00%

VEHICLE MILEAGE ASSUMPTIONS, PROPOSED ACTION AND REDUCED LAND ACQUISITION:

VEHICLE TYPE	NUMBER OF VEHICLES	ANNUAL USE DAYS PER VEH	PER VEHICLE MILES/USE-DAY	ASSUMED MI/YR/VEH	% VMT BY VEH TYPE
STRYKER	296	150	10	1,500	24.24%
HMMWV	490	185	12	2,220	59.39%
LMTV	105	180	8	1,440	8.26%
MTV	75	150	8	1,200	4.91%
HEMTT	25	60	25	1,500	2.05%
PLS, HET	14	50	30	1,500	1.15%
TOTALS	1,005	167	11	1,822	100.00%

Notes:

HMMWV = high mobility multipurpose wheeled vehicle (humvee)

LMTV = light medium tactical vehicle (2.5 ton truck)

MTV = medium tactical vehicle (5 ton truck)

HEMTT = heavy expanded mobility tactical truck (10 ton truck)

PLS = palletized load system truck (25+ ton capacity)

HET = heavy equipment transporter (60+ ton capacity)

The high-low range of vehicle requirement estimates for individual range facilities yield fleet-wide annual average vehicle use values ranging from 37 to 301 use-days per year per vehicle.

The use estimates assumed above yield a fleet-wide weighted annual average slightly below the 169 use-day per vehicle mid-point value.

Stryker mileage split 50% on roadways, 50% off-road. Roadway type split 25% paved roads, 75% unpaved roads.

HMMWV mileage split 2/3 on roadways, 1/3 off-road. Roadway type split 50% paved roads, 50% unpaved roads.

LMTV and MTV mileage split 75% on roadways, 25% off-road. Roadway type split 50% paved roads, 50% unpaved roads.

HEMTT, PLS, and HET heavy truck mileage split 75% on roadways, 25% off-road. Roadway type split 75% paved roads, 25% unpaved roads.

ADDED MILITARY PERSONNEL UNDER SBCT

CALENDAR YEAR for vehicle activity data:	2005	2005

WORK DAYS PER YEAR:	240	240	240
ANNUAL COMMUTE TRAFFIC VMT:	3,327,564	0	3,327,564
EMISSIONS, TONS PER YEAR:			
ROG	8.20	0.00	8.20
CO	67.01	0.00	67.01
NOx	7.48	0.00	7.48
SOx	0.05	0.00	0.05
PM10	11.33	0.00	11.33

Notes:

ROG = Reactive Organic Gases (ozone and PM10 precursors)

NO_x = Nitrogen Oxides (Nitrogen Dioxide plus Nitric Oxide; ozone, NO₂, and PM₁₀ precursors)

CO = Carbon Monoxide

SO_x = Sulfur Oxides (mostly Sulfur Dioxide and Sulfur Trioxide; SO₂ and PM₁₀ precursors)

PM10 = Inhalable Particulate Matter [Note: the "10" in PM10 is a certified sampler 50% collection efficiency size, not an upper size limit] PM10 emission rates include direct exhaust, tire and brake wear, and resuspended roadway dust.

APPENDIX G-4

FUGITIVE DUST EMISSION ESTIMATES

APPENDIX G4: FUGITIVE DUST EMISSION ESTIMATES

This appendix provides a summary of fugitive dust emissions that would be generated by military vehicle travel on unpaved roads or on unpaved vehicle maneuver areas under all project alternatives. Emission estimates are presented for travel on gravel roads, dirt roads, and off-road maneuver areas at each installation under each alternative. The summarized emission estimates are based on current AP-42 procedures (EPA 1998). Vehicle use assumptions (consistent with those used for Appendix G3) also are presented.

The detailed spreadsheets documenting the emission calculations generally do not lend themselves to hard copy printing. Electronic versions of the spreadsheets can be made available on request.

Notes:

Fugitive dust calculations are based on the current EPA AP-42 Section 13.2.2 (1998 equation version), including the low speed adjustment factor. Vegetation cover is used as a linear correction factor for vehicle activity in off-road areas.

Source:

U.S. Environmental Protection Agency. 1998. Compilation of Air Pollutant Emission Factors (AP-42) 5th Edition, Volume I, Supplement E, Section 13.2.2 (Unpaved Roads).

EPA FUGITIVE DUST EQUATIONS FOR UNPAVED ROADS

gallons/liter = 0.264172052
grams/pound = 453.5923745
mile/kilometer = 0.621371192

FUGITIVE DUST FROM UNPAVED AREAS:

Five alternative equations are available for estimating fugitive PM10 from vehicle use on unpaved areas (unpaved roads, tank trails, or off-road areas):

Emission rate equation in AP-42 Fifth Edition, Volume I, Section 13.2.2 (EPA 1995):

$$\text{PM10 tons/day} = 0.36 \times 5.9 \times [(\% \text{ silt+clay})/12] \times (\text{mph}/30) \times (\text{tons GVW}/3)^{(0.7)} \times [(\# \text{ wheels}/4)^{(0.5)}] \times [(365 - \text{precip days})/365] \times (\text{VMT}/\text{day}) / (2000 \text{ lbs/ton})$$

Emission rate equation in AP-42 Fifth Edition, Volume I, Supplement E, Section 13.2.2 (EPA 1998):

$$\text{PM10 tons/day} = 2.6 \times [((\% \text{ silt+clay})/12)^{(0.8)}] \times (\text{mean vehicle weight in tons}/3)^{(0.4)} \times [(365 - \text{precip days})/365] \times (\text{VMT}/\text{day}) / [(\text{surface moisture } \%/0.2)^{(0.3)}] \times (2000 \text{ lbs/ton})$$

where "mean vehicle weight in tons" is a weighted average of all vehicle traffic on a particular road segment or off-road area.

Note: this equation overpredicts emissions at speeds below 15 mph. An optional multiplier of (mean vehicle speed)/15 can be used as a correction factor.

Emission rate equation A in proposed revision to AP-42 Fifth Edition, Volume I, Section 13.2.2 (EPA 2001):

$$\text{PM10 tons/day} = 1.5 \times [((\% \text{ silt+clay})/12)^{(0.9)}] \times (\text{mean vehicle weight in tons}/3)^{(0.45)} \times [(365 - \text{precip days})/365] \times (\text{VMT}/\text{day}) / (2000 \text{ lbs/ton})$$

where "mean vehicle weight in tons" is a weighted average of all vehicle traffic on a particular road segment or off-road area.

Emission rate equation B Option 1 in proposed revision to AP-42 Fifth Edition, Volume I, Section 13.2.2 (EPA 2001):

$$\text{PM10 tons/day} = 1.8 \times [(\% \text{ silt+clay})/12] \times [(\text{mean vehicle speed in mph}/30)^{(0.5)}] \times [(365 - \text{precip days})/365] \times (\text{VMT}/\text{day}) / [(\text{surface moisture } \%/0.5)^{(0.2)}] \times (2000 \text{ lbs/ton})$$

where "mean vehicle speed in mph" is a weighted average of all vehicle traffic on a particular road segment or off-road area.

Emission rate equation B Option 2 in proposed revision to AP-42 Fifth Edition, Volume I, Section 13.2.2 (EPA 2001):

$$\text{PM10 tons/day} = 1.7 \times [((\% \text{ silt+clay})/12)^{(0.8)}] \times (\text{mean vehicle speed in mph}/30) \times [(365 - \text{precip days})/365] \times (\text{VMT}/\text{day}) / [(\text{surface moisture } \%/0.5)^{(0.2)}] \times (2000 \text{ lbs/ton})$$

where "mean vehicle speed in mph" is a weighted average of all vehicle traffic on a particular road segment or off-road area.

NOTE:

When any of the above equations are applied to off-road vehicle activity that is not on established trails, the percent vegetation cover can be used as an additional linear control factor. The multiplier factor would be (1-vegetation cover fraction).

SUMMARY OF MILITARY VEHICLE DRIVING ESTIMATES
PAVED ROADS, UNPAVED ROADS, AND OFF-ROAD AREAS

PAVED ROAD TRAVEL ANALYSIS

ALTERNATIVE	NOMINAL LOCATION	CUMULATIVE VEH-HOURS	PERCENT OF TOTAL

Notes:

HMMWV = high mobility multipurpose wheeled vehicle (humvee)

LMTV = light medium tactical vehicle (2.5 ton truck)

MTV = medium tactical vehicle (5 ton truck)

HEMTT = heavy expanded mobility tactical truck (10 ton truck)

PLS = palletized load system truck (25+ ton capacity)

HET = heavy equipment transporter (60+ ton capacity)

The high-low range of vehicle requirement estimates for individual range facilities yield fleet-wide annual average vehicle use values ranging from 37 to 301 use-days per year per vehicle.

The use estimates assumed above yield a fleet-wide weighted annual average slightly below the 169 use-day per vehicle mid-point value.

Stryker mileage split 50% on roadways, 50% off-road. Roadway type split 25% paved roads, 75% unpaved roads.

HMMWV mileage split 2/3 on roadways, 1/3 off-road. Roadway type split 50% paved roads, 50% unpaved roads.

LMTV and MTV mileage split 75% on roadways, 25% off-road. Roadway type split 50% paved roads, 50% unpaved roads.

HEMTT, PLS, and HET heavy truck mileage split 75% on roadways, 25% off-road. Roadway type split 75% paved roads, 25% unpaved roads.

APPENDIX G-5

WIND EROSION EMISSION ESTIMATES

APPENDIX G5: WIND EROSION EMISSION ESTIMATES

This appendix provides a summary of fugitive dust emissions that would be generated by wind erosion from areas disturbed by off-road vehicle maneuver activity under all project alternatives. Emission estimates are presented for each installation under each alternative. Also presented are charts summarizing the wind erosion emission rate estimates developed for each installation. Wind erosion emission rates were developed by a special emission rate model that accounts for the silt content of affected soils, the frequency of precipitation events, unusual soil density properties, local wind speed frequency distributions, and the expected extent of vegetation cover that would be maintained on the affected areas. The extent of vegetation cover on the affected areas was estimated from vehicle use intensity parameters using vehicle activity data consistent with the off-road vehicle use estimated summarized in Appendix G3.

The detailed spreadsheets documenting the emission calculations generally do not lend themselves to hard copy printing. Electronic versions of the spreadsheets can be made available on request.

Notes:

PM10 = inhalable particulate matter (below 50 microns aerodynamic equivalent diameter); the "10" in PM10 is a 50% mass collection efficiency size for sampling devices, not a size limit.

VMT = vehicle miles of travel

PM10 wind erosion emission rates (pounds per acre per year) account for soil texture category, the local wind speed frequency distribution, and local precipitation frequency. Low wind speeds and high precipitation frequency normally eliminate wind erosion hazards at Schofield Barracks.

VMT estimates are derived from estimated vehicle use frequencies, with total use allocated by range to paved roads, unpaved roads, and off-road areas.

Annual VMT estimates are converted into nominal cumulative vehicle track acreage assuming 12-inch tire widths.

Cumulative annual track acreage is compared to available maneuver area acres to derive a use intensity ratio.

Percentage point reductions in baseline vegetation cover factors are estimated from the use intensity ratio; a use intensity ratio of 200 assumed to indicate complete loss of vegetation.

Bare soil PM10 emission rates are reduced by vegetation cover according to a non-linear relationship (23% vegetation cover provides a 50% reduction in wind erosion).

WIND SPEED CHARTS

APPENDIX G6: WIND SPEED CHARTS

This appendix provides charts illustrating the wind speed frequency distributions for the Remote Automated Weather Stations (RAWS) which the Army has installed at various locations at or near each installation. The plotted data generally reflect three years of hourly data for the period of mid-1999 through mid 2002. In some cases, only two years of data were available.

Electronic versions of the spreadsheets tabulating the wind speed data for each station can be made available on request.

APPENDIX H-1

NOISE BACKGROUND INFORMATION

BACKGROUND INFORMATION ON NOISE

Noise Measurements and Terminology

Introduction. Sound is caused by vibrations that generate waves of minute air pressure fluctuations in the air. The number of pressure fluctuations per second is reported as cycles per second or Hertz (Hz). Different frequencies of vibration produce different tonal qualities for the resulting sound. Air pressure fluctuations that occur from 20 to 20,000 times per second can be detected as audible sound. Frequencies below 20 Hz are called infrasound frequencies. Frequencies above 20,000 Hz are called ultrasound frequencies. Although not audible, some infrasound frequencies can be felt as vibrations.

Human hearing varies in sensitivity for different acoustic frequencies. In addition, relative sensitivity to different acoustic frequencies also varies with the intensity of the sound. Peak sensitivity to pure tones typically occurs at frequencies between 2,000 Hz and 6,000 Hz. Relative sensitivity remains fairly high between about 250 Hz and 2,000 Hz. Relative sensitivity drops off above 7,000 Hz and below 200 Hz. Normal speech typically spans a frequency range from about 125 Hz to about 6,000 Hz, but is dominated by sounds in the range of 500 to 3,000 Hz. The frequency range for adult males tends to be lower than that for adult females, while the frequency range for children's speech tends to be higher than that for adult females.

Figure 1 illustrates the relative sensitivity of human hearing to pure tones at various magnitudes. Hearing sensitivity is plotted as relative sensitivity to tones at "equal loudness" levels of 20, 40, 60, and 80 phons. The numerical value of an equal loudness curve in phons is equal to the loudness of a 1,000 Hz tone at the specified decibel level (for example, 60 phon is the loudness of a 1,000 Hz tone at 60 dB). Also shown for comparison are the two most commonly used decibel weighting systems (A-weighted and C-weighted). Decibel weighting systems are discussed in more detail below.

Measurements and descriptions of sounds are usually based on various combinations of the following factors:

- The vibration frequency characteristics of the sound, measured as sound wave cycles per second (Hertz); this determines the "pitch" of a sound;
- The total sound energy being radiated by a source, usually reported as a sound power level;
- The actual air pressure changes experienced at a particular location, usually measured as a sound pressure level; the frequency characteristics and sound pressure level combine to determine the "loudness" of a sound at a particular location;
- The duration of a sound; and
- The changes in frequency characteristics or pressure levels through time.

FIGURE 1
HEARING SENSITIVITY AT DIFFERENT LOUDNESS LEVELS

Data Sources: Scharf (1998, page 1185) and Ford (1987, page 2/14).

Sound level meters typically report measurements as a single composite decibel (dB) value. Decibel scales are a logarithmic index based on ratios between a measured value and a reference value. In the field of acoustics, decibel scales are proportional to the logarithm of ratios between the actual pressure fluctuations generated by sound waves compared to a standard reference pressure value of 20 micropascals (0.000000418 pounds per square foot or 0.0000000029 pounds per square inch). More specifically, a decibel is 10 times the logarithm of the squared pressure ratio, which is equal to 20 times the logarithm of the direct pressure ratio.

Modern sound level meters measure the actual air pressure fluctuations at a number of different frequency ranges, most often using octave or 1/3 octave intervals. The pressure measurements at each frequency interval are converted to a decibel index and adjusted for a selected frequency weighting system. The different adjusted decibel values for the octave or 1/3 octave bands are then combined into a composite sound pressure level for the appropriate decibel scale. Most sound level meters do not save or report the detailed frequency band pressure level measurements. A more sophisticated and expensive instrument (a spectrum analyzer) is required to obtain dB measurements for discrete frequency bands.

General Purpose Decibel Scales. Because the human ear is not equally sensitive to all audible sound frequencies, frequency weighting schemes have been developed to approximate the way the human ear responds to noise levels. The "A-weighted" decibel scale (dBA) is the most widely used for this purpose, with different dB adjustment values specified for each octave or 1/3 octave interval. The A-weighted scale significantly reduces the measured pressure level for low frequency sounds and slightly reduces the measured pressure level for some high frequency sounds.

Other frequency weighting schemes are used for specialized purposes. The "C-weighted" decibel scale (dBC) originally was developed to approximate human hearing sensitivity to high sound pressure levels. In current practice, the C-weighted scale often is used to characterize low frequency sounds capable of inducing vibrations in buildings or other structures. The C-weighted scale makes only minor reductions to the measured pressure level for low frequency components of a sound while making slightly greater reductions to high frequency components than does the A-weighted scale. Figure 2 illustrates the 1/3 octave band weighting factors used for the A-weighted and C-weighted decibel scales.

The shape of the A-weighting curve in Figure 2 looks slightly different from that shown in Figure 1 because the figures have different X-axis scales. In addition, it is important to recognize that the relative hearing sensitivity curves shown in Figure 1 are for pure tones, not the broad spectrum ambient noise to which people normally are exposed. Although the A-weighted decibel scale illustrated in Figure 2 is only a very simplified approximation of relative hearing sensitivity, it has proven more useful than other decibel weighting schemes as an indicator of human response to general noise conditions. Table 1 summarizes typical dBA levels for various noise sources and noise conditions.

FIGURE 2
DECIBEL WEIGHTING SCALE CORRECTION FACTORS

Data Source: Ford (1987, page 2/14).

TABLE 1. A-WEIGHTED DECIBEL VALUES FOR EXAMPLE NOISE SOURCES

CHARACTERIZATION	dBA	EXAMPLE NOISE CONDITION OR EVENT	OTHER NOISE EXAMPLES
Threshold of pain	145	---	---
	140	---	---
	135	---	---
	130	Surface detonation, 30 pounds of TNT at 1,000 feet	---

Possible building damage	120	Mach 1.1 sonic boom under aircraft at 12,000 feet	Air raid siren at 50 feet; B-1 flyover at 200 feet
Threshold for immediate NIPTS	115	F/A-18 aircraft takeoff with afterburner at 1,600 feet	Commercial fireworks (5 lb charge) at 1,500 feet
	110	Peak crowd noise, pro football game, open stadium	Peak noise 50 feet behind firing position at rifle range
	105	Emergency vehicle siren at 50 feet	Pile driver peak noise at 50 feet
	100	F/A-18 aircraft departure climbout at 2,400 feet	Jackhammer at 10 feet; B-52 flyover at 1,000 feet
Extremely noisy	95	Locomotive horn at 100 feet; 2-mile range fog horn at 100 ft	Wood chipper processing tree branches at 30 feet
8-hour OSHA limit	90	Heavy truck, 35 mph at 20 ft; Leaf blower at 5 ft	Person yelling at 5 feet; Dog barking at 5 feet
Very noisy	85	Power lawn mower at 5 feet; City bus at 30 feet	Pneumatic wrench at 50 feet; Jet ski at 20 feet
	80	2-Axle commercial truck, 35 mph at 20 feet	Gas well drilling rig at 50 ft; Table saw at 50 feet
Noisy	75	Street sweeper at 30 feet; Idling locomotive, 50 ft	Beach with medium wind and surf
Moderately noisy	70	Auto, 35 mph at 20 ft; 300 ft from busy 6-lane freeway	Stream bank at small/medium waterfall (10 feet)
	65	Typical daytime busy downtown background conditions	Tree branches rustling in strong wind; Beach, light wind and surf
	60	Typical daytime urban mixed use area conditions	Normal speech at 5 feet
	55	Typical urban residential area away from major streets	Leaves/tall grass rustling in light/moderate wind
	50	Typical daytime suburban background conditions	Open field, summer night, insects

TABLE 1 (continued). A-WEIGHTED DECIBEL VALUES FOR EXAMPLE NOISE SOURCES

CHARACTERIZATION	dBA	EXAMPLE NOISE CONDITION OR EVENT	OTHER NOISE EXAMPLES
Quiet	45	Typical rural area daytime background conditions	---
	40	Quiet suburban area at night	---
Very quiet	35	---	---
	30	Quiet rural area, winter night, no wind	Quiet bedroom at night, no air conditioner
	25	---	---
	20	Empty recording studio	Barren area: no wind, water, insects, or animals
Barely audible	15	---	---
	10	Audiometric testing booth	---
	5	---	---
Threshold of Hearing	0	---	---

Notes:

NIPTS = noise-induced permanent threshold shift (permanent hearing damage)

OSHA = Occupational Safety and Health Administration

Indicated noise levels are average dBA levels for stationary noise sources or peak dBA levels for brief noise events and noise sources moving past a fixed reference point.

Average and peak dBA levels are not time-weighted 24-hour average CNEL or Ldn levels.

Decibel scales are not linear. Apparent loudness doubles with every 10 dBA increase in noise level, regardless of the dBA value.

Data compiled from various published sources, monitoring studies, and noise modeling analyses.

Source: Data compiled by Tetra Tech staff.

Other frequency weighting schemes that have been developed include the B-weighted and D-weighted decibel scales. The B-weighted scale was an attempt to approximate human perception of loudness for moderately high sound pressure levels. The D-weighted scale was developed as an attempt to correlate jet aircraft noise with annoyance. The B-weighted scale and the D-weighted scale are rarely used, although a few older models of sound level meters still provide for B-weighted or D-weighted measurements.

Unweighted decibel measurements are used for refined analyses that require data on the frequency spectrum of a sound (e.g., when determining the sound absorption or sound transmission properties of materials). As a direct measure of the pressure fluctuations associated with sound, unweighted decibel measurements also have considerable usefulness in evaluating noise-induced vibrations. Unweighted decibel measurements sometimes are termed flat or linear measurements. The term "overall sound pressure level" (OASPL) sometimes is used as a technical term to describe unweighted decibel measurements. Unfortunately, the phrase "overall sound pressure level" also is used in a generalized sense to refer to composite dBA or dBC measurements (combined measurements across the range of frequency bands being measured). For most noise sources, unweighted dB measurements are less than 1 dB higher than corresponding C-weighted dB measurements.

In practice, unweighted decibel measurements reflect the unmodified microphone response of a sound level meter. While most microphones provide a flat response across most of the frequency spectrum, there are no formal standards for unweighted decibel measurements. A formal Z-weighting scale is being adopted as an international standard that will replace unweighted decibel measurements with measurements adjusted to a flat response across the entire frequency spectrum from 10 Hz to 20,000 Hz. As a practical matter, this will have little effect on reported decibel measurements, but it will assure consistency among different measurement instruments.

Evaluations of blast noise or sonic boom events sometimes use a peak overpressure measurement. The peak overpressure normally is an unweighted decibel measurement for the dominant octave band or 1/3 octave band component of a sound. In most cases, the specific octave or 1/3 octave band for the peak overpressure measurement is not reported. The peak overpressure level will be slightly less than the corresponding composite unweighted decibel measurement.

Varying noise levels often are described in terms of the equivalent constant decibel level. Equivalent noise levels (L_{eq}) are not a simple averaging of decibel values, but are based on the cumulative acoustical energy associated with the component decibel values. L_{eq} values sometimes are referred to as energy-averaged noise levels. As a consequence of the calculation procedure, high dB events contribute more to the L_{eq} value than do low dB events.

L_{eq} values are used to develop single-value descriptions of average noise exposure over various periods of time. Such average noise exposure ratings often include additional weighting factors for potential annoyance due to time of day or other considerations. The L_{eq} data used for these average noise exposure descriptors generally are based on A-weighted sound level measurements.

Statistical descriptions (L_x , where x represents the percent of the time when noise levels exceed the specified decibel level) also are used to characterize noise conditions over specified periods of time. L_1 , L_5 , and L_{10} descriptors can be used to characterize peak noise levels, while L_{90} , L_{95} , and L_{99} descriptors can be used to characterize "background" noise levels. It should be noted that the L_{50} value (the sound level exceeded 50 percent of the time) will seldom be the same as the L_{eq} value for the period being analyzed. For relatively continuous noise conditions, the L_{eq} value often is between the L_{30} and the L_{40} values for the measurement period. If impulse noise events are common, the L_{eq} value may be close to the L_{10} value for the measurement period.

Decibel Scales Reflecting Annoyance Potential. Average noise exposure over a 24-hour period often is presented as a day-night average sound level (L_{dn}). L_{dn} values are calculated from hourly L_{eq} values, with the L_{eq} values for the nighttime period (10 p.m. - 7 a.m.) increased by 10 dB to reflect the greater disturbance potential from nighttime noises. Because of the time period weighting, an L_{dn} value will be 6.4 dB greater than the corresponding 24-hour L_{eq} value for a constant noise level. For most real noise conditions, the corresponding L_{dn} and 24-hour L_{eq} values will differ by less than this.

The community noise equivalent level (CNEL) also is used to characterize average noise levels over a 24-hour period, with weighting factors for evening and nighttime noise levels. L_{eq} values for the evening period (7 p.m. - 10 p.m.) are increased by 5 dB while L_{eq} values for the nighttime period (10 p.m. - 7 a.m.) are increased by 10 dB. Because of the time period weighting, a CNEL value will be 6.7 dB higher than the corresponding 24-hour L_{eq} value for a constant noise level. For most real noise conditions, the corresponding CNEL and 24-hour L_{eq} values will differ by less than this.

The CNEL value will be slightly higher than (but generally within 1 dB of) the L_{dn} value for the same set of noise measurements. Only in situations with high evening period noise levels will CNEL values be meaningfully different from L_{dn} values. Because of the small difference between them, CNEL and L_{dn} ratings normally are considered interchangeable.

Single-value average noise descriptors (such as L_{dn} or CNEL values) are applied most often to variable but relatively frequent sources of noise. Typical urban noise conditions, highway traffic, major rail yards, heavily used rail lines, and major commercial airports are examples where CNEL and L_{dn} descriptors are most appropriate.

A slightly modified version of the L_{dn} and CNEL calculations is used in some computer models that evaluate aircraft noise along low altitude military training routes. An additional penalty factor of up to 11 dB is added to the standard L_{dn} or CNEL calculation to account for startle effects and added disturbance caused by very rapid increases in noise level during low altitude flyover events. The resulting "onset rate adjusted" L_{dn} or CNEL value is often designated as L_{dnmr} . The magnitude of the added penalty factor depends on flight speed, flight altitude, and aircraft type. The maximum penalty factor (11 dB) is added for conditions in which noise levels increase from background conditions to the peak level in less than one second.

Noise Descriptors for Discrete Noise Events. Many people are skeptical about using 24-hour average noise descriptors to evaluate the annoyance potential of isolated short-duration noise events. Although this skepticism is often misplaced, other types of noise evaluations can be used. Lightly used rail lines, aircraft activity at small general aviation airports, testing of emergency generators, pile driving, and blasting activities sometimes are evaluated using other types of noise descriptors. Peak noise levels, the duration of individual noise events, and the repetition pattern of events often are used to describe intermittent or short duration noise conditions. Statistical descriptions (L_x values) and event-specific Leq values also can be used to characterize discrete noise events.

Impulse sounds usually are defined as noise events producing a significant increase in sound level but lasting less than two seconds (often less than one second). Examples of impulse noise sources include pile driving, punch presses, gunshots, fireworks, sonic booms, and blasting activities. Impulse noises usually are described using the sound exposure level (SEL) descriptor. In addition to impulse type noise events, the SEL descriptor often is used for a variety of longer duration discrete noise events (such as aircraft flyover events and train passby events). The SEL measure represents the cumulative (not average) sound exposure during a particular noise event, integrated with respect to a one-second time frame. The SEL descriptor sometimes is labeled SENEL (single event noise exposure level), L_{AE} , L_{AX} , or L_E .

SEL measurements are equivalent to the Leq value of a one-second noise event producing the same cumulative acoustic energy as the actual noise event being analyzed. In effect, an SEL measure "spreads" or "compresses" the noise event to fit a fixed one-second time interval. If the actual duration of the noise event is less than one second, the SEL value will be less than the Leq value for the event. If the duration of the noise event exceeds one second, the SEL value will exceed the Leq of the event.

Impulse noises of substantial magnitude (e.g., blasting or sonic booms) often are characterized using unweighted (flat) or C-weighted SEL measures. Annoyance from such sources often involves induced structural vibrations as well as the loudness of the noise event. Unweighted and C-weighted decibel scales have proven more useful than the A-weighted scale for such evaluations. Less intense impulse noises often are characterized using an A-weighted SEL measure.

Most SEL measurements are performed using procedures that restrict the time interval over which actual measurements or subsequent calculations are made. Sometimes this involves defining the noise event as the period when sound levels exceed a particular threshold level. In other cases, the calculations are restricted to that portion of the noise event when sound levels are within a defined increment (generally 10 - 30 dB) of the peak sound level. The measurement restrictions noted above are done as a practical expediency to minimize manual computations, to accommodate monitoring instruments with a limited measurement range, or to systematically define discrete noise events against fluctuating background noise conditions. Due to the logarithmic nature of decibel units, these measurement restrictions normally have little effect on the calculated SEL value.

If individual noise events are repeated frequently, it is possible to calculate Ldn or CNEL values based on typical SEL values and the number of occurrence of such noise events during daytime, evening, and nighttime periods. Such computation procedures often are used to estimate noise levels around airports or railway lines.

Special Aircraft Noise Descriptors. The maximum dBA (Lmax), average dBA (Leq), and Ldn or CNEL measures are the most understandable descriptions of aircraft noise and the easiest to relate to land use compatibility criteria. In addition, Ldn and CNEL descriptions normally are used for airport land use compatibility studies. But for historical reasons and to maintain consistency with international aircraft certification procedures, most testing of aircraft noise levels is done as SEL values or as EPNL (effective perceived noise level) values.

The Federal Aviation Administration (FAA) sets most aircraft noise standards using EPNL values. The FAA sets noise standards for small propeller-driven aircraft using instantaneous peak dBA (Lpk) values, and allows small helicopters to be certified using SEL noise limits. The FAA requires testing to demonstrate compliance with adopted standards before issuing airworthiness certification for new or modified aircraft types.

EPNL values are not measured directly, but must be computed from other measurements. Calculation of EPNL values requires measurement of the time history of takeoff, landing approach, or other flyover events using a frequency spectrum analyzer that records average unweighted dB values for 1/3 octave bands during each 1/2 second interval of the flyover event. The 1/3 octave spectrum is recorded for 24 frequency bands with center frequencies ranging from 50 Hz to 10,000 Hz. The portion of the flyover event when noise levels are within 10 dB of the peak level is then used in the EPNL calculation. The unweighted dB values for each 1/3 octave band in each 1/2 second interval are converted to “perceived noisiness” (noy) values, which are another type of decibel scale. For each 1/2 second interval, the noy data are combined across the various 1/3 octave bands and converted into PNL (perceived noise level) values for that time interval. The noy data for each 1/3 octave band at each time interval are also evaluated to produce a correction factor that is added to the PNL value to generate tone-corrected perceived noise level (PNLT) values for each 1/2 second interval. The PNLT values for each 1/2 second time interval are then combined to produce the final EPNL value for the overall flyover event. EPNL values are essentially a type of time-averaged noise level, but the frequency weighting scheme is not like conventional A- or C-weighting schemes. The numerical values of EPNL data are substantially higher than the corresponding values of time-averaged dBA (Leq) measurements.

It should be noted that while most aircraft noise standards are set as EPNL values, the FAA uses Ldn and CNEL criteria for evaluating land use compatibility issues around airports.

Working With Decibel Values.

Numerical dB ratings for different noise sources cannot be added directly to give the dB rating of the combination of these sources. Decibel values are 10 times the logarithm of a squared pressure ratio, and must be converted back into squared pressure ratio values before being added together or

averaged in a time-weighted manner. The resulting composite squared pressure ratio value can then be converted back into a composite decibel rating. For simplicity, the procedure for combining decibel values is often referred to as "energy averaging".

Time-Weighted Averages. The calculation procedure used for computing average noise levels (Leq values) results in high dB events contributing significantly more to the final Leq value than do background low dB conditions. For example, a single 1-second episode of 90 dBA introduced into a 1-hour constant background noise condition of 45 dBA will result in a 1-hour Leq value of 54.9 dBA. A 5-second episode of 90 dBA in a 1-hour background condition of 45 dBA results in a 1-hour Leq of 61.5 dBA. And a cumulative total of 20 seconds of 90 dBA in a 1-hour background condition of 45 dBA results in a 1-hour Leq of 67.5 dBA.

Even in the context of 24-hour averages, brief noise events have a noticeable effect. A 5-second episode of 90 dBA in a 24-hour background condition of 45 dBA raises the 24-hour Leq to 49.5 dBA. A cumulative total of 20 seconds of 90 dBA in a 24-hour background condition of 45 dBA results in a 24-hour Leq of 54.2 dBA.

Cumulative Effect of Multiple Noise Sources. Two noise sources producing equal dB ratings at a given location will produce a composite noise level 3 dB greater than either sound alone. When two noise sources differ by 10 dB, the composite noise level will be only 0.4 dB greater than the louder source alone.

Detectable Noise Level Changes. Hearing sensitivity to dB changes tends to increase at higher noise levels, except for very high frequency sounds (Scharf 1998, 1191). At moderate noise levels for sounds dominated by mid-range frequencies, the loudness discrimination threshold is typically between 1 and 2 dBA for sounds in the 30 to 50 dBA range and between 1 and 1.5 dBA for sounds in the 50 to 80 dBA range. For tones in the 1000 Hz octave band, the loudness discrimination threshold typically drops from about 1.5 dBA at 30 to 40 dB to between 0.5 and 1 dBA at 80 dBA. Outside a laboratory setting, most people have difficulty distinguishing the louder of two noise sources that differ by less than 1.5 dB.

Decibel Changes Versus Perceived Loudness. In general, a 10 dB increase in noise level is perceived as a doubling (100% increase) in loudness. A 1.5 dB increase represents an 11% increase in loudness, 2 dB increase is a 15 percent increase in loudness, a 3 dB increase is a 23 percent increase in loudness, and a 5 dB increase is a 41 percent increase in loudness. Conversely, a 1.5 dB reduction represents a 10% decrease in loudness, 2 dB reduction is a 13% decrease in loudness, a 3 dB reduction is a 19% decrease in loudness, a 5 dB reduction is a 29% decrease in loudness, and a 10 dB reduction is a 50% decrease in loudness. The sensitivity of the human ear to changes in loudness varies somewhat according to both the acoustical frequencies of the sound and the intensity (dB range) of the sounds. But in general, most people cannot distinguish noise level changes that vary by less than 10% in relative loudness.

Sound Attenuation Considerations. When distance is the only factor considered, sound levels from an isolated noise source would be expected to decrease by about 6 dB for every doubling of distance away from the noise source. When the noise source is essentially a continuous line (e.g., vehicle traffic on a highway), noise levels would be expected to decrease by about 3 dB for every

doubling of distance, due to the additive effects of a linear array of noise sources. Ground conditions that absorb sound often result in noise drop-off rates of about 4.5 dB for every doubling of distance from a linear noise source such as highway traffic.

Sound levels at various locations away from a noise source are influenced by factors other than just distance from the noise source. Ground surface conditions, topographic features, and structural barriers can absorb, reflect, or scatter sound waves, resulting in lower noise levels (increased sound attenuation rates). Atmospheric conditions (wind speed and direction, humidity levels, temperature, and air pressure) and the frequency characteristics of the sound itself also affect sound attenuation rates. The vertical variation in wind, temperature, pressure, and humidity conditions also affects sound attenuation rates.

The atmosphere absorbs some of the energy content of sound waves, thus increasing sound attenuation rates over long distances. Such atmospheric absorption is greatest for high frequency components of a sound, resulting in a lower pitch to the sound at greater distances. Atmospheric absorption is most strongly dependent on temperature and humidity conditions, with a somewhat complex relationship among temperature, humidity, and the frequency components of the sound. Overall, atmospheric absorption is greatest for high frequency sounds under conditions of low relative humidity and moderately cool temperatures. Atmospheric absorption is least for low frequency sounds at high relative humidity and moderate temperatures.

Sound waves reflected by topographic features, buildings, or other structures can result in higher sound levels than expected in front of the reflecting object. The effects of reflected sound waves can be important in urban areas, partially off-setting the shielding effect of buildings and other structures.

Temperature inversions and altitudinal changes in wind conditions can at times diffract and "focus" sound waves to a location at considerable distance from the noise source. In such situations, the vertical changes in atmospheric conditions affect sound waves much the way lenses and prisms can bend and focus light rays.

Effects of Noise

There are numerous ways to categorize the environmental and health effects of noise. Most effects of noise can be categorized as:

- physiological effects on people;
- human psychological or behavioral effects;
- human activity interference effects;
- physical effects on buildings and structures; or
- physiological and behavioral effects on wildlife and livestock.

Several of the categories outlined above overlap to various degrees. There are various degrees of cause-effect interactions between physiological effects and psychological or behavioral effects. And activity interference is, to a certain extent, a behavioral effect. Nevertheless, the five categories listed above provide a convenient context for discussing the effects of noise.

Physiological Effects. Physiological effects of noise on people can be grouped into three broad categories: noise-induced hearing loss, sleep disturbance, and general stress-related physiological effects. Noise-induced hearing loss and sleep disturbance are the most thoroughly studied and most easily documented effects. Most information on the physiological effects of noise relates to audible sounds. Effects of infrasound (acoustic frequencies below 20 Hz) and ultrasound (acoustic frequencies above 20,000 Hz) have received less study, although exposure to intense infrasound frequencies may induce damaging vibrations in body tissues. Ward (1998, 1200) notes that a physical sensation of sound in the middle ear often occurs when unweighted sound pressure levels reach about 105 dB; physical discomfort often is reported for unweighted sound pressure levels of about 120 dB; a pain sensation typically occurs at an unweighted sound pressure level of about 140 dB; and the eardrum can be ruptured by unweighted sound pressure levels above 170 dB. Corresponding dBA thresholds normally would be several dB lower than the unweighted dB values.

Noise-Induced Hearing Loss. Hearing loss generally is measured as a change in audibility thresholds over a range of standard octave band frequencies (e.g., at 250, 500, 1000, 2000, 3000, 4000, and 8000 Hz). Humes (1998, 1210) notes that for hearing loss determinations in adults, the normal threshold of hearing for pure tones generally is assumed to be:

- 45 dB at 125 Hz,
- 25.5 dB at 250 Hz,
- 11.5 dB at 500 Hz,
- 7 dB at 1000 Hz,
- 9 dB at 2000 Hz,
- 9.5 dB at 4000 Hz, and
- 13 dB at 8000 Hz.

Initial hearing loss typically appears in the 4000 Hz octave band. Over time, progressive hearing loss increases in this octave band and spreads to higher and lower octave bands. The extent of hearing loss in any octave band typically is characterized as (Humes 1998, 1212):

- normal (threshold loss of up to 25 dB);
- mild (threshold loss of 26 to 40 dB);
- moderate (threshold loss of 41 to 55 dB);
- moderately severe (threshold loss of 56 to 70 dB);
- severe (threshold loss of 71 to 90 dB); or
- profound (threshold loss of more than 90 dB).

A distinction often is made between temporary and permanent hearing threshold shifts. A temporary hearing threshold shift occurs if normal hearing sensitivity returns after a period without exposure to high noise levels. The period required for recovery from temporary threshold shift effects can range from minutes to several hours, depending on the intensity and duration of the noise exposure that produced the threshold shift. Even when recovery from temporary threshold shifts routinely occurs, permanent loss of hearing sensitivity still can occur as a result of long term cumulative noise exposure. Permanent loss of hearing sensitivity (a permanent increase in the hearing threshold at one or more frequency bands) occurs in two ways:

- as a progressive, long term result of cumulative noise exposure; and
- as an immediate result of exposure to high noise levels, regardless of exposure duration.

The U.S. Environmental Protection Agency (EPA) identified an annual average 24-hour Leq of 70 dBA as a long term noise exposure limit that should protect the general public against hearing damage with an adequate margin of safety (EPA 1974, 28-32). Noise levels obviously vary during the course of a day, but a 24-hour Leq of 70 dBA implies that there would not be any extended periods of exposure to high noise levels. To put a 24-hour Leq of 70 dBA in perspective, each of the following noise exposure conditions would generate a 24-hour Leq of 70 dBA or more:

- an 8-hour work day with an average noise exposure of 74.8 dBA (for example: 21 minutes at 85 dBA, 30 minutes at 80 dBA, 30 minutes at 75 dBA, and 6 hours 39 minutes at 70 dBA) and 16 hours at any noise level below 70 dBA;
- 2 hours 25 minutes at 80 dBA and 21 hours 35 minutes at any noise level below 70 dBA;
- 46 minutes at 85 dBA and 23 hours 14 minutes at any noise level below 70 dBA;
- 15 minutes at 90 dBA and 23 hours 45 minutes at any noise level below 70 dBA;
- 5 minutes at 95 dBA and 23 hours 55 minutes at any noise level below 70 dBA; or
- 1.5 minutes at 100 dBA and 23 hours 58.5 minutes at any noise level below 70 dBA.

The National Institute for Occupational Safety and Health (NIOSH) has determined that above a critical sound intensity, the mechanism of hearing damage changes from one based on cumulative noise exposure (the combination of magnitude and duration of sound) to a mechanism based on sound intensity alone, regardless of duration (NIOSH 1996). NIOSH estimates 115 to 120 dBA as the critical noise level at which human hearing is subject to instantaneous permanent damage effects. Without adequate hearing protection, any exposure to noise levels above 115 dBA is likely to cause some degree of permanent hearing threshold shift.

Sleep Disturbance. Sleep is made up of a cycle through a succession of stages having fairly distinctive physiological and neural activity patterns. It is customary to recognize five stages of sleep based on neural activity patterns: stages 1 through 4 are progressively deeper stages of sleep without dream activity, and REM (rapid eye movement) sleep is the stage in which dreams occur. The initial period of sleep typically involves a progression from sleep stage 1 to sleep stage 4, followed by a return to sleep stage 2, and then a period of REM sleep. There may be a brief period of awakening at the end of REM sleep. This basic sequence typically is repeated four or five times during the night, although the distribution of time spent in different sleep stages changes as the sleep stage episodes are repeated. The amount of stage 3 and stage 4 sleep generally declines and the amount of REM sleep generally increases toward the end of the overall sleep cycle.

Sleep disturbance can occur as inappropriate awakening from sleep or as a non-typical change in sleep stage. Most research has focused on awakening from sleep, since that is the easiest sleep disruption to recognize. It is important to note that periodic awakening from sleep during the night is a normal part of the sleep cycle for many people. It also is important to recognize that there are many different causes for sleep disruption, ranging from medical conditions to psychological problems to physical disturbance conditions. Sleep disruption is most likely to occur during sleep stages 1 and 2 or during REM sleep. Sleep stages 3 and 4 are less sensitive to disruption than are other sleep stages. Children exhibit a significantly higher proportion of stage 3 and stage 4 sleep than do adults, and consequently tend to experience less sleep disruption than adults. Noise is only one of many factors that can disrupt normal sleep cycles. But whatever the cause, sleep disturbance can result in a variety of physiological, behavioral, and activity interference consequences.

Sleep disturbance from noise is influenced by many factors, including whether sleep is occurring in familiar or unfamiliar locations; the magnitude, duration, and variability of intruding noises; and the predictability of intruding noise conditions. Many studies of sleep disturbance have focused on aircraft flyover noise events near commercial and military airfields. The Federal Interagency Committee on Noise (1992) developed an equation to predict the probability that discrete aircraft flyover events would awaken adults during normal sleep. An updated analysis of available data recently produced a revised equation (Federal Interagency Committee on Aviation Noise 1997). These equations used indoor SEL values for individual flyover events as the predictive noise measure.

Stress-Related Physiological Effects. Noise is a recognized contributor to generalized stress conditions, but it is difficult to distinguish the contribution of noise exposure versus other factors to overall stress conditions at any given time. General physiological indicators of stress, such as changes in cardiovascular and endocrine conditions, undoubtedly accompany any stress reactions related to noise exposure. Loud noises in general tend to produce dilation of the pupil of the eye, increased heart rate, and vasoconstriction of the extremities (Ward 1998, 1997).

Psychological and Behavioral Effects. General annoyance is the most common reaction to noise, although stress-related behavioral changes or reactions also occur. Annoyance related to noise conditions depends on many factors in addition to the magnitude, duration, variability, and time of day of noise events. Personal attitudes and opinions concerning recognizable noise sources can be an important influence. A person's previous exposure to various noise conditions also is important in shaping personal reaction to ongoing or new noise conditions. Nevertheless, numerous studies and surveys have been performed to characterize the extent of annoyance associated with various noise sources and noise levels. Most of these studies and surveys have evaluated annoyance to noise from transportation sources (highway traffic, rail traffic, and aircraft flight operations) because those are the dominant noise sources affecting urban areas.

Several different equations have been developed to estimate the fraction of the population that will rate itself as "highly annoyed" under different average noise level exposure conditions. Other equations have been developed to relate average noise exposure conditions for high energy impulse noise events to the fraction of the population that will be highly annoyed. Most of these equations use the 24-hour Ldn noise value as the predictor of annoyance.

Startle reactions to sudden, unexpected loud noises produce an immediate contraction of the orbital eye muscles and the flexor muscles of the legs, arms, and back; this results in an automatic eyeblink and crouching movement (Ward 1998, 1199). If loud impulse noise events are repetitive and relatively predictable, the intensity of the startle reaction tends to be significantly reduced. Startle reactions can pose a safety hazard under some conditions.

Insomnia (chronic difficulty in falling asleep or chronic difficulty staying asleep) is a symptom of other medical or psychological conditions. Underlying medical problems can include use or withdrawal from various medicines or drugs, endocrine disturbances, biorhythm disruption such as jet lag, or diseases such as arthritis. Psychological conditions such as anxiety or depression also can cause insomnia. The extent to which noise conditions actually produce insomnia (as opposed to occasional awakening from sleep) is not clear.

Activity Interference Effects. Annoyance and noise-related stress conditions can result in a wide range activity interference including speech and communication interference, interference with cultural activities, reduced work productivity, and disruption of leisure activities. If such activity interference is a long-term condition, then noise conditions can lead to land use compatibility problems. Noise-related land use compatibility problems have led various federal, state, and local agencies to develop a wide range of noise guidelines and regulations (see section 3.6.4, below).

Physical Effects on Buildings and Structures. Physical effects of noise on buildings and other structures occur primarily through airborne or ground vibrations. Most ground vibrations are generated by underground sources or by sources in physical contact with the ground surface. Open air noise sources rarely generate detectable ground vibrations. Although many people attribute building vibration and object shaking to ground vibrations, most such events are caused by vibrations induced by airborne sound. Direct ground vibration is important only at locations close to the vibration source. Sonic booms and blast noise events are the major sources of airborne vibrations that can be strong enough to create detectable vibrations in buildings or structures.

Vibration intensities can be measured in many different ways, but movement velocity units (such as inches per second) are commonly used. Common vibration criteria and guidelines can be summarized as follows (U.S. Army Center for Health Promotion and Preventive Medicine 1999). Most people can detect structural vibrations at an intensity of 0.08 inches per second. Vibrations become noticeable at an intensity of 0.20 inches per second. Many people rate a vibration intensity of 0.38 inches per second as unpleasant, and an intensity of 0.8 inches per second as disturbing. A vibration intensity of 0.1 inches per second can cause loose objects to rattle. A vibration intensity of 0.5 inches per second often is used as a guideline for avoiding minor cracking in poorly fitted loose glass windows or in stressed plaster. A vibration intensity limit of 2 inches per second often is used as a guideline for avoiding damage to lightweight structures. Cracking of concrete may occur at vibration intensities above 4 inches per second. Minor structural damage is likely at a vibration intensity of 5.4 inches per second.

A peak unweighted noise level of 120 dB is likely to induce a structural vibration intensity of about 0.1 inches per second, which is detectable and can cause loose objects to rattle. A peak unweighted noise level of 134 dB can produce a vibration intensity of 0.5 inches per second. A peak

unweighted noise level of 175 dB can produce a vibration intensity of 2 inches per second, which is near the threshold for damage to lightweight structures. The peak unweighted noise level must exceed 185 dB to produce vibration intensities of 4 inches per second or more.

Physiological and Behavioral Effects on Wildlife and Livestock. Because several aspects of underwater acoustics are significantly different from open air acoustics, it is useful to separate the discussion of the effects of noise on terrestrial wildlife and livestock from the discussion of effects of noise on aquatic and marine species. Differences in sound level measurement conventions and differences in the physics of sound propagation also make it convenient to separate the discussion of noise impacts in aquatic and marine environments from noise impacts on terrestrial species.

Terrestrial Wildlife and Livestock. Noise effects on wildlife and livestock are similar in most respects to noise effects on people, with potential physiological, behavioral, and activity interference effects. Potential physiological effects include a generalized increase in stress conditions, loss of hearing sensitivity, and effects of sleep disturbance. In general, loss of hearing sensitivity from prolonged exposure to loud noises or from short term exposure to intense impulse noise is likely to be the most important physiological effect. Potential behavioral effects of noise are best categorized as general disturbance and potential disruption or reproductive and brood rearing behaviors. Potential activity interference effects include changes in habitat use patterns and interference with vocal or non-vocal communication and signaling.

Although the acoustic frequency range for hearing and relative sensitivity to different acoustic frequencies vary among species, the hearing range for most terrestrial vertebrates broadly overlaps that of people. The hearing range for some species extends beyond the frequency range for people at either high or low frequencies. Most species also show a relative sensitivity pattern of peak sensitivity to mid range frequencies, with reduced sensitivity to low and high frequencies.

Many reports of apparent noise disturbance to terrestrial wildlife fail to distinguish between disturbance from noise per se and disturbance from visible activity. In general, most terrestrial wildlife are more easily disturbed by visible activity than by noise alone. Behavioral accommodation to noise conditions is common among vertebrates, especially when noise occurs in isolation from visible activity. It should be noted, however, that behavioral accommodation to noise conditions does not preclude physiological effects from noise exposure. When animals learn to associate particular noises with active disturbance conditions (such as snowmobile, vehicle, aircraft, or boat activity), noise per se can become an important disturbance factor. Migratory waterfowl, in particular, seem to be relatively sensitive to noise disturbance, especially when noise is associated with potential active disturbance factors such as boats, aircraft, or helicopters.

Aquatic and Marine Wildlife. Much of the research on noise effects on aquatic and marine species has focused on marine mammals rather than on fish, amphibians, reptiles, or invertebrates. Richardson, Greene, Malme, and Thomson (1995) provide a useful review of underwater noise as it affects marine mammals. Although the general concerns regarding noise effects on aquatic and marine species are similar to those for terrestrial species, aquatic and marine conditions tend to make sound and vibration relatively more important than in terrestrial environments. Except in shallow water areas, light penetration is limited in aquatic and marine environments. Consequently, vision is typically a short-range sense in aquatic and marine species. Sound and

vibration, on the other hand, can be transmitted long distances in aquatic and marine conditions. As a result, sound production, hearing, and vibration detection tend to be more important to marine and aquatic species than to terrestrial species.

Various factors that distinguish underwater acoustics from open air acoustics need to be recognized in order to properly interpret data from underwater sound level measurements. Absorption of acoustic energy occurs for all acoustic frequencies in air, but is negligible for low acoustic frequencies in pure water. Some dissolved minerals, such as magnesium sulfate and boric acid, absorb energy from low frequency sounds in water, but the extent of low frequency sound absorption is much less in marine conditions than in air. In most cases, low frequency sounds can be transmitted over substantial distances in aquatic and marine environments. Sound propagation underwater also tends to be more complicated than sound propagation in open air. Water pressure, density, temperature, and salinity conditions have a more pronounced effect on sound propagation in underwater conditions than do temperature and humidity conditions in the open air. Sound transmission underwater can be channeled in depth zones that are bounded by strong salinity and density gradients.

Standard conventions for measuring sound underwater differ significantly from the conventions used for measuring airborne sound. Underwater sound measurement conventions were developed primarily in the context of geophysical studies, physical oceanographic studies, and military sonar system development studies. In contrast, measurement conventions for airborne sound were developed primarily in the context of studies related to hearing and acoustic communication. Although decibel units are used for both airborne and underwater sound, the standard reference pressure used to compute decibel values is different. The reference pressure for computing decibel values for airborne sounds is 20 micropascals. The reference pressure used for computing decibel values for underwater sound is 1 micropascal. As a result, a sound pressure level measured underwater yields a decibel value 26 dB higher than if the same physical sound pressure were measured as airborne sound.

Additional differences in measurement conventions also complicate comparison of sound level data for airborne and underwater sound. Various frequency weighting schemes (especially A-weighting and C-weighting) are commonly employed with airborne sound measurements. Frequency weighting schemes are rarely employed with underwater sound measurements. Sound level measurements integrated across a broad spectrum of acoustic frequencies are used for most airborne sound measurements, but are less common in data for underwater sound level measurements. In many cases, underwater sound level measurements are made for a single acoustic frequency or a narrow band of frequencies. Many underwater sound level measurements are restricted to frequencies below 1,000 Hz.

Differences in reference distances used for conventional data reporting further complicate the comparison of data from underwater measurements with those from open air measurements. Many reported underwater noise measurements are presented as an equivalent “source level” value: the unweighted dB value that would be measured at a distance of 1 meter (3.3 feet) if the total acoustic energy produced by the source was generated by an idealized point. Except in occupational noise studies, most data on airborne noise generation is standardized to distances of 50 feet (15.2 meters) or more from the source without conversion to an equivalent point source. Adjustments to a

common measurement convention must be made when trying to compare noise data from open air measurements with data from underwater measurements, but can be difficult to do for physically large sources of sound. The combination of a low reference pressure value and the convention of presenting data as equivalent source level values results in high numerical values for underwater sound data compared to data for airborne sounds. The equivalent source level convention is very useful for mathematical modeling purposes, but it overstates the true physical sound pressure levels experienced in underwater environments when the noise source is physically large.

There is considerable variation in the range of acoustic frequencies involved in hearing and sound production among aquatic and marine species. While the dominant communication frequencies overlap with the range of human hearing, some species are sensitive to very high ultrasound frequencies or to very low infrasound frequencies. Whales and dolphins that use echolocation signals produce and respond to sound frequencies as high as 60,000 Hz or more. Some seals also produce clicks and other high frequency sounds above 20,000 Hz. At the other extreme, some whales produce very low frequency sounds in the infrasound range below 20 Hz.

As with terrestrial wildlife, noise effects on aquatic and marine species include physiological effects, general disturbance, disruption of reproductive behavior, and other activity interference. Potential physiological effects include a generalized increase in stress conditions, loss of hearing sensitivity, and effects of sleep disturbance. In general, loss of hearing sensitivity from prolonged exposure to loud noises or from short term exposure to intense impulse noise is likely to be the most important physiological effect. Potential activity interference effects include changes in feeding or resting habitat use patterns, changes in migration or other travel routes, and interference with vocal or non-vocal communication and signaling.

There is ample evidence that underwater noise can cause general disturbance of most marine mammal species. Vessel noise, drilling platform noise, geophysical survey noise sources, and underwater construction noise have all been implicated in marine mammal disturbance. The distance at which behavioral changes occur provides clear evidence that noise, as opposed to visible activity, is the primary disturbance trigger. Visible activity also can be an additional disturbance factor, especially for species that spend time at the water surface. Disturbance of fully submerged animals by airborne noise sources (such as aircraft and helicopters) is much less common, since most airborne sound is reflected from the water surface. Only when an airborne sound source is essentially overhead will airborne noise effectively penetrate below the water surface. Species that spend part of their time out of the water react to airborne sound in much the same way as terrestrial wildlife. As is the case for terrestrial wildlife, many marine and aquatic species develop tolerance to noise sources that do not create other adverse interactions.

Regulatory Context

Federal Legislation. The Noise Pollution and Abatement Act of 1970 (Title IV of the Clean Air Act, 42 USC 7627) established an Office of Noise Abatement and Control within EPA. EPA was directed to investigate and identify the effects of noise levels on public health and welfare, including: psychological and physiological effects on humans; effects of sporadic extreme noise as compared with constant noise; effects on wildlife and property; effects of sonic booms on

property; and such other matters as may be of interest in the public welfare. Title IV of the Clean Air Act also requires other federal agencies and departments to consult with EPA regarding methods for abating objectionable or nuisance condition noise impacts that result from activities they carry out or sponsor.

The federal Noise Control Act of 1972 (42 USC 4901 *et seq.*) established a requirement that all federal agencies must administer their programs in a manner that promotes an environment free from noise that jeopardized public health or welfare. EPA was given the responsibility for: providing information to the public regarding identifiable effects of noise on public health or welfare, publishing information on the levels of environmental noise that will protect the public health and welfare with an adequate margin of safety, coordinating federal research and activities related to noise control, and establishing federal noise emission standards for selected products distributed in interstate commerce (construction equipment; transportation equipment; motors and engines; and electrical or electronic equipment). Aircraft, aircraft engines, military weapons, military combat equipment, rockets and other equipment used by the National Aeronautics and Space Administration, and various other items were excluded from the definition of products distributed in commerce. States and political subdivisions thereof retain the right to establish and enforce controls on environmental noise through the licensing, regulation, or restriction of the use, operation, or movement of products or combinations of products. The federal Noise Control Act also directed all federal agencies to comply with federal, state, interstate, and local noise control and abatement requirements to the same extent that any person is subject to such requirements.

Although the EPA can require other federal agencies to justify their noise regulations with respect to the policy requirements of the federal Noise Control Act, each federal agency retains authority to adopt noise regulations pertaining to agency programs. The Occupational Safety and Health Administration (OSHA) has primary authority for setting workplace noise exposure standards. Due to aviation safety considerations, the FAA has primary jurisdiction over aircraft noise standards.

Federal Interagency Noise Committees. The Federal Interagency Committee on Urban Noise (FICUN) was formed in 1979 to review various federal agency programs related to noise impacts on land use. The committee included representatives of the Department of Transportation, Department of Housing and Urban Development, Environmental Protection Agency, Department of Defense, and the Veterans Administration. The 1980 report issued by FICUN summarized federal agency noise policies and programs. In addition, it identified the Ldn noise metric as the most appropriate noise descriptor to use for evaluating noise in the context of land use compatibility issues. The 1980 FICUN report also included a chart of compatible and incompatible noise levels for various categories of land use.

The Federal Interagency Committee on Noise (FICON) was formed in 1990 to review federal agency policies concerning the assessment of airport noise issues. Participating agencies included the Department of Transportation, Department of Defense, Department of Justice, Department of Housing and Urban Development, Environmental Protection Agency, Veterans Administration, and the Council on Environmental Quality. The 1992 report prepared by the committee confirmed the use of the Ldn noise metric as the primary basis for assessing land use

compatibility issues, but also recognized that supplementary noise descriptors could be useful to further explain noise impacts on a case-by-case basis. The 1992 FICON report recognized the maximum A-weighted decibel level (L_{max}) as useful for evaluating short-term individual aircraft flyover events.

The Federal Interagency Committee on Aviation Noise (FICAN) was established in 1993 to provide an on-going forum for coordination and review of federal agency activities related to aviation noise issues. Agency participation in FICAN includes the Federal Aviation Administration, the Department of Transportation (Office of the Secretary), U.S. Army, U.S. Navy, U.S. Air Force, National Aeronautics and Space Administration, National Park Service, Department of Housing and Urban Development, Environmental Protection Agency, and the Centers for Disease Control and Prevention (National Center for Environmental Health). Periodic reviews conducted by FICAN have continued to support the use of L_{dn} values as the primary indicator of land use compatibility conditions in terms of aviation noise. FICAN has, however, also supported the use of supplemental noise descriptors (such as L_{max}, SEL, or time above a threshold level) to provide information that is not easily communicated by L_{dn} values (FICAN 2002).

Department of Defense Noise Guidelines. The Department of Defense began development of noise evaluation programs in the early 1970s. Initial program development involved the Air Installation Compatible Use Zone (AICUZ) program for military airfields. Early application of the AICUZ program emphasized Air Force and Navy airfields. The Army implemented the program as the Installation Compatible Use Zone (ICUZ) program by addressing both airfield noise issues and other major noise sources such as weapons testing programs and firing ranges. Joint Air Force, Army, and Navy planning guidelines were issued in 1978 (Department of Defense 1978). The 1978 guidelines use annual average L_{dn} values to categorize noise exposure conditions on military installations. Three broad noise exposure zones are used as the basis for characterizing various land use compatibility conditions:

- Zone 1 = areas with L_{dn} levels below 65 dB
- Zone 2 = areas with L_{dn} levels of 65-75 dB
- Zone 3 = areas with L_{dn} levels above 75 dB

The guidelines indicate that all land uses are compatible with Zone 1 noise levels. Educational, medical, and residential land uses generally are not compatible with Zone 2 noise levels unless special acoustic treatments and designs are used to ensure acceptable interior noise levels. Acoustical insulation also may be needed for administrative and office facilities located in Zone 2 areas. Residential, medical, and educational land uses are not compatible with Zone 3 noise levels. Industrial, manufacturing, and office land uses may be acceptable in Zone 3 areas if special building designs and other measures are implemented.

The Army has recently supplemented the original 1978 guidelines to develop a more comprehensive Environmental Noise Management Program (ENMP). The ENMP program incorporates ICUZ evaluations as one component of the program. Other components of the EMP include programs for handling noise complaints and undertaking supplemental noise evaluations when warranted by the nature of discrete noise events. Criteria for evaluation of noise levels

have been expanded beyond the normal A-weighted Ldn descriptor to include the use of C-weighted Ldn values to characterize major blast noise sources and the use of peak unweighted decibel values to characterize small arms firing (Table 2).

More recent guidance for ENMP evaluations (U.S. Army 2002) notes that “average busy day” noise contours may be more appropriate than annual average noise contours for installations where activity levels vary significantly over the course of a year. In addition, the recent guidance recommends the use of A-weighted Ldn values for evaluating land use compatibility issues related to small arms ranges.

The Army Center for Health Promotion and Preventive Medicine (CHPPM) assists Army installations in development of environmental noise management plans. In addition, CHPPM also undertakes special noise studies to evaluate noise problems associated with various types of noise sources. When investigating noise conditions related to weapons firing or ordnance detonations, CHPPM typically measures peak unweighted decibel levels and/or C-weighted SEL levels. Table 3 summarizes the noise criteria most often used by CHPPM when evaluating blast noise issues.

Executive Order 13045. Executive Order 13045 (issued on April 21, 1997) requires federal agencies to review their programs and actions in order to identify and assess environmental health risks and safety risks that might disproportionately affect children. The executive order notes that children may be disproportionately sensitive to environmental health and safety risks because:

- children’s neurological, immune, digestive, and other bodily systems are still developing;
- children consume more food and fluids in proportion to their body weight than do adults;
- children breathe more air in proportion to their body weight than do adults;
- children’s size and weight may diminish the degree of protection they receive from standard safety features; and
- children’s behavior patterns may make them more susceptible to accidents because they are less able to protect themselves.

Although noise is not expressly mentioned in the executive order, noise is a routine consideration in environmental health and safety programs.

TABLE 2. NOISE ZONES DEFINED IN ARMY REGULATION 200-1

NOISE ZONE	GENERAL NOISE SOURCES, A-WTD Ldn RANGE	SMALL ARMS, PEAK UNWEIGHTED dB RANGE	OTHER IMPULSE NOISE SOURCES, C-WTD Ldn RANGE	PERCENT OF POPULATION HIGHLY ANNOYED	ACCEPTABILITY FOR NOISE-SENSITIVE LAND USES
I	Up to 65 dBA	up to 87 dB Pk	up to 62 dBC	less than 15%	Acceptable
II	65 - 75 dBA	87 - 104 dB Pk	62 - 70 dBC	15% - 39%	Normally Unacceptable
III	over 75 dBA	over 104 dB Pk	over 70 dBC	over 39%	Unacceptable

Notes:

Noise levels from all sources should be evaluated in terms of annual averages of the identified noise metric.

Noise from transportation sources (aircraft and vehicles) and common industrial sources should be evaluated using A-weighted Ldn values.

Noise from small arms ranges should be evaluated using peak unweighted dB values until the Z-weighting standard is adopted, at which time peak Z-weighted decibel values should be used.

Noise from other impulsive sources (such as armor, artillery, and demolition activities) should be evaluated using C-weighted Ldn values.

Noise-sensitive land uses include housing, schools, and medical facilities.

Compatibility determinations for existing conditions and proposed actions should be supplemented by descriptions of projected noise increases and potential public reaction where:

- (1) the noise environment is determined by a few infrequent but very high level noise sources (such as blast events over 110 dBC SEL);
- (2) single event noise levels from the proposed action are 10 dB or more greater than existing levels;
- (3) where the A-weighted Ldn is between 60 and 65 dBA and the proposed action would increase the Ldn value by 3 dB or more;
- (4) where the A-weighted Ldn is above 65 dBA and the proposed action would increase the Ldn value by 1.5 dB or more.

Department of the Army. 1997. Army Regulation 200-1: Environmental Protection and Enhancement. Chapter 7: Environmental Noise Management Program.

TABLE 3. CHPPM BLAST NOISE ASSESSMENT CRITERIA

PREDICTED IMPULSE SOUND LEVEL		RISK OF COMPLAINT	RECOMMENDED ACTION
PEAK UNWEIGHTED dB LEVEL	C-WEIGHTED SEL VALUE		
less than 115 dB	less than 90 dBC	low risk of complaints	No restrictions
115 - 130 dB	90 - 105 dBC	moderate risk of complaints	Postpone non-critical tests if possible
130 - 140 dB	105 - 115 dBC	high risk of complaints; possiblility of damage	Postpone all but extremely important tests
over 140 dB	over 115 dBC	threshold for permanent hearing damage; high risk of physiological and structural damage claims	Postpone all explosive operations

Notes:

CHPPM normally uses peak unweighted dB measurements to investigate blast noise complaint issues.

For rapid-fire test events with major weapons, noise level criteria should be reduced by 15 dB.

C-weighted SEL values often are used to predict the potential for sleep disturbance.

State and Local Regulations. The State of Hawai'i has adopted statewide noise standards that apply to fixed noise sources, construction equipment, and similar sources. The noise standards are phrased as property line noise limits, and vary according to the zoning district of the impacted property. Separate noise standards have been established for non-impulse noise and impulse noise. The standards for non-impulse noise are summarized in Table 4. The standards for impulse noise are summarized in Table 5. All of the noise limits are specified as noise levels which can be exceeded no more than 10% of the time in any 20-minute period.

**TABLE 4. STATE OF HAWAII COMMUNITY NOISE STANDARDS
FOR NON-IMPULSE NOISE**

ZONING DISTRICT GROUP	EXAMPLE ZONES	DAYTIME NOISE LIMIT FOR NON-IMPULSE NOISE (7 a.m. to 10 p.m.)	NIGHTTIME NOISE LIMIT FOR NON-IMPULSE NOISE (10 p.m. to 7 a.m.)
CLASS A	Residential Conservation Preservation Open Space Public Space	L10 less than or equal to 55 dBA during any 20-minute period	L10 less than or equal to 45 dBA during any 20-minute period
CLASS B	Multi-Family Dwellings Apartments Business Commercial Hotel Resort	L10 less than or equal to 60 dBA during any 20-minute period	L10 less than or equal to 50 dBA during any 20-minute period
CLASS C	Agriculture Country Industrial	L10 less than or equal to 70 dBA during any 20-minute period	L10 less than or equal to 70 dBA during any 20-minute period

Notes:

L10 = noise level exceeded 10% of the time during the specified time interval.

Noise limits are based on the zoning district of the property affected by a noise source.

Class A, Class B, and Class C noise limits apply to any lands having zoning designations equivalent to the listed example zones.

For mixed zoning districts, the primary land use designation shall be used to determine the applicable noise limits.

Noise limits apply to any point at or beyond the property line of the noise source.

Noise sources covered by these noise limits include stationary noise sources and equipment used for agricultural, construction, or industrial activities.

Compliance with the non-impulse noise limits shall be based on A-weighted noise level measurements made with the instrument in the slow response setting (1 second integration).

Source: Hawaii's Administrative Rules, Title 11, Chapter 46.

**TABLE 5. STATE OF HAWAI'I COMMUNITY NOISE STANDARDS
FOR IMPULSE NOISE**

ZONING DISTRICT GROUP	EXAMPLE ZONES	DAYTIME NOISE LIMIT FOR IMPULSE NOISE (7 a.m. to 10 p.m.)	NIGHTTIME NOISE LIMIT FOR IMPULSE NOISE (10 p.m. to 7 a.m.)
CLASS A	Residential Conservation Preservation Open Space Public Space	L10 less than or equal to 65 dBA during any 20-minute period	L10 less than or equal to 55 dBA during any 20-minute period
CLASS B	Multi-Family Dwellings Apartments Business Commercial Hotel Resort	L10 less than or equal to 70 dBA during any 20-minute period	L10 less than or equal to 60 dBA during any 20-minute period
CLASS C	Agriculture Country Industrial	L10 less than or equal to 80 dBA during any 20-minute period	L10 less than or equal to 80 dBA during any 20-minute period

Notes:

L10 = noise level exceeded 10% of the time during the specified time interval.

Noise limits are based on the zoning district of the property affected by a noise source.

Class A, Class B, and Class C noise limits apply to any lands having zoning designations equivalent to the listed example zones.

For mixed zoning districts, the primary land use designation shall be used to determine the applicable noise limits.

Noise limits apply to any point at or beyond the property line of the noise source.

Noise sources covered by these noise limits include stationary noise sources and equipment used for agricultural, construction, or industrial activities.

Compliance with the impulse noise limits shall be based on A-weighted noise level measurements made with the instrument in the fast response setting (125 millisecond integration).

OSHA	Occupational Safety and Health Administration
SEL	Sound Exposure Level

GLOSSARY OF COMMON NOISE LEVEL DESCRIPTOR DESIGNATIONS

CNEL	<i>Community Noise Equivalent Level.</i> A 24-hour average noise level rating with a 5 dB penalty factor applied to evening noise levels and a 10 dB penalty factor applied to nighttime noise levels. Lden is a seldom-used alternative unit designation.
dB	<i>Decibel.</i> A generic term for measurement units based on the logarithm of the ratio between a measured value and a reference value. Decibel scales are most commonly associated with acoustics (using air pressure fluctuation data); but decibel scales sometimes are used for ground-borne vibrations or other types of measurements.
dBA	<i>A-Weighted Decibel.</i> A frequency-weighted decibel scale that approximates the relative sensitivity of human hearing to different frequency bands of audible sound.
dB C	<i>C-Weighted Decibel.</i> A frequency-weighted decibel scale that correlates well with the physical vibration response of buildings and other structures to airborne sound.
dB P	<i>Peak Unweighted Decibel (or Linear Peak Decibel) .</i> A unit designation for the peak unweighted decibel level. The peak unweighted decibel measurement sometimes is designated as LFpk (for flat-weighted peak level).
DNL	<i>Day-Night Average Sound Level.</i> A 24-hour average noise level rating with a 10 dB penalty factor applied to nighttime noise levels. Ldn is an alternative unit designation.
EPNL	<i>Effective Perceived Noise Level.</i> A complex weighted decibel scale used internationally for aircraft and aircraft engine noise certification requirements. EPNL values cannot be measured directly, but must be calculated from other data.
Hz	<i>Hertz.</i> A standard unit for describing acoustical frequencies measured as the number of air pressure fluctuation cycles per second. For most people, the audible range of acoustical frequencies is from 20 Hz to 20,000 Hz.
LAE	<i>Sound Exposure Level.</i> An alternative unit designation for SEL. Might be confused with A-weighted Leq, which sometimes is designated as LAeq
LAX	<i>Sound Exposure Level.</i> An alternative unit designation for SEL, but could be confused with the Lx designation for A-weighted measurements.

Ld	<i>Daytime Average Sound Level.</i> An Leq value based either on a 15-hour time period between 7:00 a.m. and 10:00 p.m. (used for Ldn calculation) or on a 12-hour time period between 7:00 p.m. and 7:00 a.m. (used for CNEL calculation). Also used for specifying noise limits in some local noise ordinances (time period may vary).
Ldn	<i>Day-Night Average Sound Level.</i> A 24-hour average noise level rating with a 10 dB penalty factor applied to nighttime noise levels. DNL is an alternative unit designation.
Ldnmr	<i>Onset Rate Adjusted Day-Night Average Sound Level.</i> A modified version of the Ldn descriptor that is used for evaluation of low altitude aircraft flight noise. Additional penalty factors of up to 11 dB are added to the basic Ldn calculation, with the precise value dependent on both the magnitude of noise level increase during a flyover event and the duration of the noise level rise from background noise levels to the maximum instantaneous noise level.
Le	<i>Evening Average Sound Level.</i> An Leq value based on a 3-hour time period between 7:00 p.m. and 10:00 p.m. (used primarily for CNEL calculation).
LE	<i>Sound Exposure Level.</i> An alternative unit designation for SEL, but easily confused with the Le descriptor.
Leq	<i>Equivalent Average Sound Pressure Level (or Energy-Averaged Sound Level).</i> The decibel level of a constant noise source that would have the same total acoustical energy over the same time interval as the actual time-varying noise condition being measured or estimated. Leq values must be associated with an explicit or implicit averaging time in order to have practical meaning. The use of A-weighted, C-weighted, or unweighted (flat) decibel units sometimes is indicated by LAeq, LCeq, or LFeq, respectively.
Lmax	<i>Maximum Sound Pressure Level.</i> The highest decibel level measured during a stated or implied monitoring period or noise event. The Lmax value recorded by a sound level meter depends on the time factor used for integration of instantaneous sound pressure level measurements. For most modern sound meters, this is 1 second when the instrument is set for the slow sampling rate and 1/8 second when the instrument is set for the fast sampling rate. The use of A-weighted, C-weighted, or unweighted (flat) decibel units sometimes is indicated by LAmx, LCmax, or LFmax, respectively.

Lmin	<i>Minimum Sound Pressure Level.</i> The lowest decibel level measured during a stated or implied monitoring period or noise event. The Lmin value recorded by a sound level meter depends on the time factor used for integration of instantaneous sound pressure level measurements. For most modern sound meters, this is 1 second when the instrument is set for the slow sampling rate and 1/8 second when the instrument is set for the fast sampling rate. The use of A-weighted, C-weighted, or unweighted (flat) decibel units sometimes is indicated by LAmin, LCmin, or LFmin, respectively.
Ln	<i>Nighttime Average Sound Level.</i> An Leq value based on a 9-hour time period between 10:00 p.m. and 7:00 a.m. (used for both Ldn and CNEL calculations). Also used for specifying noise limits in some local noise ordinances (time period may vary).
Lp	<i>Sound Pressure Level.</i> An alternative unit designation for SPL, but might be confused with the Lpk descriptor. Weighting system confusion with the dBP unit designation also is possible. The Lp or SPL designation typically is used for the current sound pressure level as displayed on an operating sound level meter.
Lpk	<i>Instantaneous Peak Sound Pressure Level.</i> The highest instantaneous decibel level detected during a monitoring interval. The reported value depends somewhat on the instrument detector setting (slow, fast, or impulse sampling rate). Some sound level meters allow the decibel weighting for the Lpk measurement to be set independently from the decibel weighting used for the normal time-integrated monitoring. Lpk will differ from Lmax when the instrument samples more frequently than the minimum integration time. For many modern sound level meters, the slow sampling rate is 8 readings per second and the fast sampling rate is either 16 or 32 readings per second. A separate impulse sampling rate also may be available (typically at the fast sampling rate but with a special detector that can track a noise level rise over time intervals as short as 20 to 60 microseconds (0.02 to 0.06 milliseconds). The use of A-weighted, C-weighted, or unweighted (flat) decibel units sometimes is indicated by LApk, LCpk, or LFpk, respectively.
Lx	<i>Percentile Sound Pressure Level.</i> The decibel level exceeded x percent of the time during a monitoring episode. Sometimes designated as Ln or Lnn, although those designations are easily confused with the nighttime average noise level descriptor used for Ldn and CNEL estimates.
Noy	<i>Noy.</i> A linear scale of perceived noisiness developed in connection with the PNL decibel weighting system. The noy scale is linear with respect to 40 dB PNL; consequently, a noise rated at 3 noy is perceived to be three times as noisy as a sound of 40 dB PNL.

Phon	<i>Phon.</i> A unit of equal perceived loudness for pure tones. Phon values are indexed to the unweighted decibel value for tones at 1000 Hz. The phon value for any given tone is based on the dB value of a 1000 Hz tone that has the same perceived loudness as the tone under consideration.
PNL	<i>Perceived Noise Level.</i> A decibel weighting system originally developed for evaluation of aircraft noise levels. In current practice, the PNL descriptor is used primarily as a step in the computation of EPNL values which are used for aircraft noise level certification purposes. PNL values sometimes are designated as PNdB. Lpn is a seldom-used alternative designation for PNL.
PNLT	<i>Tone-Corrected Perceived Noise Level.</i> A decibel weighting system originally developed for evaluation of aircraft noise levels by adjusting PNL values for the presence of dominant pure tones. In current practice, the PNLT descriptor is used primarily as a step in the computation of EPNL values which are used for aircraft noise level certification purposes.
OASPL	<i>Overall Sound Pressure Level.</i> This term is used in two different contexts. As a technical term, it is a composite unweighted decibel value based on measurements across a broad spectrum of acoustical frequencies. In more generic usage, it simply means a composite sound pressure level (typically an A-weighted level) that reflects the overall spectrum of acoustical frequencies associated with a given sound.
rms	<i>Root Mean Squared.</i> A mathematical calculation technique that determines the average of absolute deviations (whether positive or negative) from a reference or mean value. The numerical deviation from the reference value is squared to generate a positive numerical value; the mean of a sequence of such squared deviation values is then determined; and the square root of that mean value is then taken to provide the average of the numerical deviations. This is the technique used in sound level meter circuitry to measure physical air pressure fluctuations so that sound pressure levels can be calculated.
SEL	<i>Sound Exposure Level.</i> The SEL measure represents the cumulative (not average) sound exposure during a particular noise event, integrated with respect to a one-second time frame. SEL measurements are equivalent to the Leq value of a one-second noise event producing the same cumulative acoustic energy as the actual noise event being analyzed. In effect, an SEL measure "spreads" or "compresses" the noise event to fit a fixed one-second time interval. If the actual duration of the noise event is less than one second, the SEL value will be less than the Leq value for the event. If the duration of the noise event exceeds one second, the SEL value will exceed the Leq of the event. SEL values can have any specified decibel weighting. Blast noise SEL values frequently are given as C-weighted decibels. SEL values for sources such as aircraft flyover events or train passby events typically are given as A-weighted decibels.

SENEL	<i>Single Event Noise Exposure Level.</i> An older term identical to SEL, but implying the use of A-weighted decibels. In current practice, the SEL designation is used more often than the SENEL designation.
Sone	<i>Sone.</i> A linear scale of equal perceived loudness indexed to the perceived loudness of a 40 dB tone at 1000 Hz. The sone scale is linear with respect to a 40 dB tone at 1000 Hz; consequently, a noise rated at 3 sones is perceived to be three times as loud as a 40 dB tone at 1000 Hz.
SPL	<i>Sound Pressure Level.</i> A decibel level calculation based on the measurement of instantaneous pressure fluctuations over and under the prevailing barometric pressure. The root mean squared (rms) pressure measurements are converted to a pressure ratio using 20 micropascals as the reference pressure. The sound pressure level in decibels is calculated as 10 times the logarithm of the square of the pressure ratio. Most sound level meters integrate the SPL readings over minimum time intervals that depend on user-set detector sampling rates. Most sound level meters also allow the user to specify a decibel weighting for the SPL measurements. Modern sound level meters typically sample 8 times per second at a slow setting and 16 or 32 times per second at a fast setting. When set to the slow sampling setting, modern sound level meters average SPL readings over a 1 second interval and use those 1-second Leq values for other time period integrations. The basic data integration period will be 1/8 of a second when a fast sampling rate setting is used. SPL (Lp), Lmax, Lmin, and Lx data typically are based on the 1-second (slow response) or 1/8 second (fast response) Leq values.

APPENDIX H-2

CONSTRUCTION NOISE ANALYSES

APPENDIX H2: CONSTRUCTION NOISE ANALYSES

This appendix provides a database of construction equipment noise generation estimates plus charts illustrating predicted noise levels in the vicinity of selected construction projects that are proposed under the Proposed Action or the RLA Alternative. The selected construction projects were chosen because of their relative proximity to noise sensitive land uses, the types of construction activity expected to occur, and the scale of the anticipated construction activity. Consequently, the illustrated noise levels for different construction activity phases provide a reasonable guide to noise levels expected during construction activities at the remaining construction projects.

The detailed spreadsheets documenting the construction noise analysis generally do not lend themselves to hard copy printing. Electronic versions of the spreadsheets can be made available on request.

CONSTRUCTION EQUIPMENT NOISE GENERATION DATABASE

LOOKUP CODE	ITEM	DEFAULT REFERENCE dBA LEVEL	REFERENCE DISTANCE (feet)	ABSORPTION COEFFICIENT (dB/100 meters)	GENERAL dB RANGE FOR EQUIPMENT	GSA NOISE LIMITS (dBA at 50 ft)	DEFAULT % OPERATING TIME IN ACTIVE HOURS	SHORT NAME FOR HEADERS

Notes: Available data indicate that some types of equipment frequently exceed noise limits adopted by GSA. Auxiliary power units and ground power units included as additional portable generator examples. APU's are typically 80 - 400 hp. Gas turbine GPU's are typically 200 - 600 hp. Piston (gasoline) GPU's are mostly in the smaller size ranges. Data for welders, concrete saws, plate compactors, and aerial lifts are a best guess based on comparison to other items.

Noise generation data for construction equipment comes from various sources, including:

U.S. Environmental Protection Agency. 1971. Noise From Construction Equipment and Operations, Building Equipment, and Home Appliances. (NTID300.1). Prepared by Bolt, Beranek and Newman. U.S. Government Printing Office. Washington, DC.

APPENDIX H-3

VEHICLE NOISE ESTIMATES

APPENDIX H3: VEHICLE NOISE ESTIMATES

This appendix summarizes vehicle noise generation estimates for various military and civilian vehicle types. In addition, the appendix provides summaries of vehicle noise levels expected during convoy travel along military vehicle trails or along unpaved roadways on military installations. The tables in this appendix supplement the vehicle noise charts presented in the text of the EIS.

The detailed spreadsheets documenting the noise calculations generally do not lend themselves to hard copy printing. Electronic versions of the spreadsheets can be made available on request.

1,000 FT FROM EDGE	50.4	53.4	56.4	1,000

Noise modeling used the FHWA Traffic Noise Prediction Model, assuming:

- 6,000 foot road segment length
- 30 foot road width (including shoulders)
- 100% heavy trucks
- 25 mph average vehicle speed
- receptors perpendicular to mid-point of road segment

APPENDIX H-4

AIRCRAFT NOISE EMISSION ESTIMATES

APPENDIX H4: AIRCRAFT NOISE ESTIMATES

This appendix provides a summary of expected 1-second maximum noise levels during flyover events by different types of aircraft and helicopters. The tabular data summary complements the flyover event noise level chart presented in the text of the EIS. In addition, this appendix presents the letter reports prepared by the Army summarizing noise data collected during evaluation of the Shadow 200 UAV.

The detailed spreadsheets documenting the noise calculations generally do not lend themselves to hard copy printing. Electronic versions of the spreadsheets can be made available on request.

ESTIMATED 1-SECOND L_{max} NOISE LEVELS FOR AIRCRAFT AND HELICOPTER FLYOVER EVENTS

25,000	29.0	28.0	40.9	36.3	38.0	34.9	37.9	35.3	27.7	6.5

Notes:

The U.S. Air Force OMEGA10R noise model estimates SEL and L_{pk} noise levels for aircraft flyover events, but a 1-second L_{max} noise level is more representative of how people hear peak flyover event noise levels.

SEL and L_{pk} data from the OMEGA10R model were converted to estimated 1-second L_{max} values by simulating the time history of the flyover event using the SEL data for the reference distance of 315 feet as a control value.

The flyover simulation model divides the flyover event into 25 time intervals, with the duration of each interval dependent on aircraft flight speed and the assumed length of the audible flight track (2 nautical miles for both approach and departure segments).

The relatively low flight speed of helicopters required an adjustment to the maximum interval Leq value in order to estimate 1-second L_{max} noise levels from the 5.3-second interval Leq values.

For helicopters, the simulated maximum interval Leq value from the time history simulation was increased by 3.5 dBA when the difference between the maximum simulated noise level and the OMEGA10R instantaneous L_{pk} value exceeded 5 dBA.

For fixed wing aircraft, no adjustments were made to the simulated maximum noise level at 315 feet since simulated interval durations were between 2 and 3 seconds.

Estimated L_{max} values for distances other than 315 feet were scaled from the distance profile of L_{pk} values generated by the OMEGA10R model.

Estimated L_{max} values for 50 feet based on drop-off rate for the 100 to 200 foot distance range.

Noise levels for the twin engine CH-53D helicopter estimated as 1.76 dBA lower than the data available for the three engine CH-53E model.

Noise levels for the twin engine AH-1W helicopter estimated as 3 dBA higher than the data available for the single engine AH-1G model.

The estimated L_{max} values for the UAV were derived using a distance attenuation model applied to reported L_{max} data for the UAV engine at a high power setting.

Source: Tetra Tech analyses.

Sound Level Measurements on the Shadow Tactical Unmanned Aerial Vehicle: Fort Huachuca, AZ
(provided via e-mail from Roger K. Baker, UAVS Project Office, Redstone Arsenal, to John Gallup)

1. The measurements were taken on 10 Jan 01, during the approximate time period of 1615 hours until 1730 hours. The test was conducted at Rugge Hamilton Airfield at Fort Huachuca, AZ. The temperature during this time period varied from 51 degrees F and 54 degrees F. The relative humidity varied from 49 to 53 percent. The average wind speed during this time period varied from 6 to 9 miles per hour, with gusts of up to 12 miles per hour.

2. The sound level measurements were obtained with a Bruel and Kjaer type 2209 sound level meter with a type 1613 octave filter set, which were calibrated on 22 Jun 00.

3. The sound level measurements obtained were the following:

a. The distance from the TUAV to the location where the sound level was 85 dB(A), 103 dB(A), and 108 dB(A), at 90 degree increments from the direction in which the TUAV was pointed. The location at which these sound levels occurred was determined with the TUAV engine at low RPM and also at high RPM. Due to the limited amount of test time allotted for this test (one hour and fifteen minutes), the sound measurements were made at 90 degree increments around the TUAV, rather than the desired 45 degree increments. The sound level measurements were taken on a paved, level airstrip and the plane was repositioned at 90 degree increments in order to achieve the correct orientation between the TUAV and the sound measurement location.

b. At the operator position at a distance of 100 feet to the side of the TUAV (the operator controls are on a 100 foot cable), with the TUAV engine at low RPM, the decibel levels were measured at each of the octave frequency bands by use of the octave filter set on the sound level meter.

4. The following are the distances from the Shadow TUAV to the 85 dB(A) levels when the TUAV engine is at low RPMs.

Distance from nose of TUAV	62 ft 5 in
Distance from right wing of TUAV	64 ft 9 in
Distance from tail of TUAV	44 ft 8 in
Distance from left wing of TUAV	76 ft 9 in

5. The following are the distances from the Shadow TUAV to the 103 dB(A) levels when the TUAV engine is at low RPMs.

Distance from the nose of TUAV	5 ft
Distance from right wing of TUAV	11 ft 3 in
Distance from tail of TUAV	9 ft 4 in
Distance from left wing of TUAV	11 ft 3 in

6. The following are the distances from the Shadow TUAV to the 108 dB(A) levels when the TUAV engine is at low RPMs.

Distance from right wing of TUAV	8 ft
Distance from left wing of TUAV	7 ft 6 in

In the direction of the TUAV nose and tail, the location of the 108 dB(A) level is on top of the TUAV when the engine is at low RPM.

7. The following are the distances from the Shadow TUAV to the 85 dB(A) levels when the TUAV engine is at high RPMs.

Distance from nose of TUAV	276 ft
Distance from right wing of TUAV	338 ft
Distance from tail of TUAV	75 ft 2 in
Distance from left wing of TUAV	346 ft

8. The following are the distances from the Shadow TUAV to the 103 dB(A) levels when the TUAV engine is at high RPMs.

Distance from nose of TUAV	53 ft
Distance from right wing of TUAV	64 ft 6 in
Distance from tail. of TUAV	45 ft 3 in
Distance from left wing of TUAV	62 ft 2 in

9. The following are the distances from the Shadow TUAV to the 108 dB(A) levels when the TUAV engine is at high RPMs.

Distance from nose of TUAV	31 ft 7 in
Distance from right wing of TUAV	42 ft 8 in
Distance from tail of TUAV	23 ft 9 in
Distance from left wing of TUAV	37 ft 9 in

10. At the operator position, which is 100 feet to the side of the Shadow TUAV, the following are the dB levels measured at the octave frequency bands when the TUAV engine is at low RPMs. Also included is the linear (unweighted) dB level at this location under the same conditions. Most of the time that the Shadow TUAV operator is performing operations, the TUAV engine is at low RPMs.

31.5 hz	77 dB
63 hz	73 dB
125 hz	78 dB
250 hz	85 dB
500 hz	84 dB
1000 hz	75 dB
2000 hz	68 dB
4000 hz	70 dB
8000 hz	72 dB
16,000 hz	65 dB
31,500 hz	52 dB
Linear dB	89 dB

Sound Level Measurements on the Shadow Tactical Unmanned Aerial Vehicle: White Sands Missile Range, NM

(provided via e-mail from Roger K. Baker, UAVS Project Office, Redstone Arsenal, to John Gallup)

1. Objective

To assess the noise levels from the Shadow TUAV engine and the Ground Control Station (GCS) generator.

2. Criteria

For steady state noise levels, the hearing protection requirements are established through the Health Hazard Assessment process. The following guidelines should be used for steady state noise levels:

- a. Greater than or equal to 85 dB(A), but less than or equal to 103 dB(A), personnel must wear single protection.
- b. Greater than 103 dB(A), but less than or equal to 108 dB(A), personnel must wear earplugs and noise muffs or noise attenuating helmets in combination (that is, double hearing protection). Exception: If the operation requires the Kevlar infantryman's helmet and compatible noise muffs are not available, personnel must wear earplugs and comply with the time limits for daily noise exposure in table 6-2
- c. Greater than 108 dB(A), but less than or equal to 129 dB(A), personnel must wear double hearing protection and comply with the time limits on daily exposure in table 6-3. (Table 6-3 states that for dB(A) of 114 the time limit is 2 hours per day, for dB(A) of 117 the time limit is 1 hour per day, and for dB(A) of 120 the time limit is 30 minutes per day.)
- d. Greater than 129 dB(A), TSG must approve exposure. (Department of the Army Pamphlet 40-501, para 6-2b.

3. Test Procedures

- a. For the sound levels on the Shadow TUAV engine, measurements were taken on 20 August 2001 from 1120 until 1150 hours. The test was conducted at the helipad behind the Cox Range Control Building at White Sands Missile Range, NM. The temperature during this time was approximately 90 degrees F. The relative humidity was 28%. The wind direction was 150 degrees at 6.6 knots with a maximum of 14.8 knots.
- b. For the sound levels on the GCS generators (an Isuzu 10 KVA model 3LD1 and a Honda 2.5 KVA model CB 2500x) and on the inside of the GCS, measurements were

taken on 10 October 2001 from 1030 to 1100 hours. The test was conducted at the helipad behind the Cox Range Control Building at White Sands Missile Range NM. The temperature during this time was approximately 71 degrees F. The relative humidity was 32%. The wind direction was 074 degrees at 4 – 7 knots.

c. The sound measurements were taken with a Simpson type 884-2 sound level meter which was calibrated on 4 Apr 01.

4. Test Findings

a. The sound level measurements obtained from the Shadow engine were the following:

1. The distance from the TUAV to the location where the sound level was 85 dB(A), 103 dB (A), and 108 dB(A), at 45-degree increments from the direction in which the TUAV was pointed. The location at which these sound levels occurred was determined with the TUAV engine at 6600 RPM. The tests were conducted on a dirt field with natural desert vegetation. There was one 380 HMMWV directly to the right of the Shadow. The distance from the Shadow to the HMMWV was approximately 64' (to the door of the vehicle). This is the deployment configuration of the Shadow.

Direction	Distance to 108 dB(A)	Distance to 103 dB(A)	Distance to 85 dB(A)
South (Nose)	12' 5"	22'	106' 10"
Southwest (45 degrees between right wing and nose)	16' 5"	23' 5"	123' 6"
West (right wing)	25' 10"	40' 4"	163' 10"
Northwest (45 degrees between right wing and tail)	5' 10"	10' 10"	197' 5"
North (tail)	inside box	6' 2"	84' 6"
Northeast (45 degrees between tail and left wing)	27' 6"	41'	204' 2"
East (left wing)	21' 5"	36' 11"	174' 6"
Southeast (45 degrees between left wing and nose)	17' 7"	26' 9"	139' 10"

2. Measurements were also taken from the start up position of the crew chiefs and the operator position which is 75 feet from the side of the TUAV. The operator controls are on a 75-foot cable. The following are the measurements taken from the crew chiefs and operators positions.

Left crew chief	120 dB(A)
Right crew chief	116 dB(A)
Operator	94 dB(A)

b. The sound level measurements at crewman occupied locations inside the GCS with the Isuzu generator on and all fans on were 75 dB(A), with the door open or shut. The sound level measurements were obtained at the ear level height of seated and standing crewmen.

c. The sound level measurements of the Isuzu generator taken in three places instead of the usual eight. The generator is in a tunnel between the back of the vehicle cab and the front of the shelter on the curbside and the three places were at 45-degree increments to the right of the generator. Three feet to the right front of the generator the sound measurement was 85 dB(A). Five feet directly in front of the generator on the curbside of the vehicle the sound measurement was 85 dB(A). Two feet two inches to the right rear of the generator the sound measurement was 85 dB(A).

d. The sound level measurements of the Honda generator were taken by a person standing next to the generator, holding the sound level meter at approximately ear level. The sound levels were 75 dB(A) in any position.

5. Technical Analysis

According to the criteria guidelines, the following level of hearing protection is required:

- a. No hearing protection is required inside the GCS or around the Honda generator.
- b. Single ear protection would be required of the operator and also within five feet of the Isuzu generator.
- c. The Right crew chief would be limited to one hour with double hearing protection.
- d. The left crew chief would be limited to 30 minutes with double hearing protection.

- e. Personnel within twenty eight feet of the TUAV would require double hearing protection and would have to limit the time spent within that circle in accordance with table 6-3 of DA PAM 40-501. Personnel within forty-one feet but no closer than twenty-eight feet would require double hearing protection. Personnel within two hundred and four feet but no closer than forty-one feet would require single hearing protection.

LTC Robert Wallace), 5001 Eisenhower Avenue, Alexandria, VA
22333-0001

FOR U.S. Army Aviation and Missile Command (AMSAM-MMC/
Mr. Harold Allen), Redstone Arsenal, AL 35898-5000

SUBJECT: Updated Health Hazard Assessment Report on the Shadow
200, Tactical Unmanned Aerial Vehicle (TUAV), Block I, Project
No. 69-37-7732-02

1. References.

a. Memorandum, USACHPPM, MCHB-TS-OHH, 18 Dec 00, subject:
Initial Health Hazard Assessment Report (IHAR) on the Shadow
200, Tactical Unmanned Aerial Vehicle (TUAV), Block 1, Project
No. 69-37-7732-01.

b. Memorandum, Electronic Proving Ground, CSTE-DTC-WS-EP-
SE, Ft. Huachuca, AZ, 26 Nov 01, subject: Update to Limited
Safety Release Recommendation for the Shadow 200 Tactical
Unmanned Aerial Vehicle (TUAV) Block I.

c. DA PAM 40-501, 10 Dec 98, Hearing Conservation Program.

2. As requested, we have completed an updated Health Hazard
Assessment Report (HHAR) on the Shadow 200, Tactical Unmanned
Aerial Vehicle (TUAV), Block 1, Project No. 69-37-7732-02. This
memorandum will serve as the updated HHAR.

a. The initial HHAR, reference 1a, identified the need for
steady-state noise data for a complete assessment of the system.
That noise data is provided in reference 1b.

Use of trademarked names does not imply endorsement by the
U.S. Army but is intended only to assist in identification
of a specific product.

Readiness thru Health

MCHB-TS-OHH

SUBJECT: Updated Health Hazard Assessment Report on the Shadow 200, Tactical Unmanned Aerial Vehicle (TUAV), Block I, Project No. 69-37-7732-02

This updated HHAR is provided to you on behalf of the Office of The Surgeon General (OTSG) since the U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM) is designated as the Executive Agent for the Army's HHA Program.

b. Incorporate the steady-state noise hazard and associated recommendations into MANPRINT and System Safety Issue/Hazard Tracking Logs. Please provide us with a copy of your program's documented risk mitigation and management decisions associated with the steady-state noise hazard addressed in this updated HHAR (e.g., Safety and Health Data Sheet, Programmatic Environmental Safety and Occupational Health Evaluation, Human Systems Integration Report, or other appropriate documents).

3. The Shadow 200, Block 1, TUAV provides reconnaissance, surveillance, and target acquisition to U.S. Army brigades and regiments at an initial range of 50 km, day or night, in limited adverse weather conditions. It is intended for use in environments where real-time information is needed, but manned aircraft are unavailable, or excessive risk or other conditions render use of manned aircraft imprudent. A more detailed system description is provided in reference 1a.

4. Identification of Health Hazard Issue. Steady-state noise.

5. Assessment of Health Hazard Issue. Steady-state noise.

a. Medical criteria and health effects. Health effects and criteria associated with steady-state noise are presented in Appendix A.

b. Health hazard assessment.

(1) Potential sources of high steady-state noise for the TUAV, addressed in this updated HHAR, are the Shadow 200 Air Vehicle engine and ground control station (GCS) generators.

MCHB-TS-OHH

SUBJECT: Updated Health Hazard Assessment Report on the Shadow 200, Tactical Unmanned Aerial Vehicle (TUAV), Block I, Project No. 69-37-7732-02

(2) Steady-state noise data on the Shadow 200 Air Vehicle were measured at the helipad behind the Cox Range Control Building at White Sands Missile Range, NM. The engine was operating at 6600 RPM (reference 1b). Octave band data were not measured.

(a) The data documented the steady-state noise contours indicated below (figures are provided in Appendix B):

85 dBA contour - 61.9 meters (204.2 feet) (see Figure 1)
103 dBA contour - 12.5 m (41.0 ft.) (see Figure 2)
108 dBA contour - 8.4 m (27.5 ft.) (see Figure 3)
Contour overview (see Figure 4)

(b) Data for the TUAV crewmember positions are:

Left crew chief - 120 dBA
Right crew chief - 116 dBA
Operator's position (75 ft. from TUAV) - 94 dBA

(3) Shadow 200 Air Vehicle crew chief/operator positions.

(a) Data collected at the crew chief locations documented a worst case of 120 dBA. The DA PAM 40-501 hearing conservation requirement states that personnel must wear double hearing protective devices (HPDs) and comply with the time limits on daily exposures >108 dBA but ≤129 dBA (see Table below). Exception: The 108 dBA time-weighted average (TWA) limit may be increased if indicated through the calculation of

TABLE: Daily Steady-State Noise Exposure Limits When Double Hearing Protection is Worn (reference 1c)

dBA	Time Limit Per Day (24 hours)
111	4 hours
114	2 hours
117	1 hour
120	30 minutes
123	15 minutes
126	7.5 minutes
129	3.75 minutes

MCHB-TS-OHH

SUBJECT: Updated Health Hazard Assessment Report on the Shadow 200, Tactical Unmanned Aerial Vehicle (TUAV), Block I, Project No. 69-37-7732-02

the effectiveness of the specific hearing protector and the particular noise environment (reference 1c). This exception requires octave band noise data at the locations of interest.

(b) If 30 minutes per 24 hours is too restrictive (see Table above), obtain steady-state noise data at the crew chief's locations for the Shadow 200 Air Vehicle as follows: Provide steady-state noise data using "slow" meter response for both overall A-weighted levels and individual un-weighted octave band levels from 63 Hz to 8 kHz for a more in-depth analysis. This may show that double hearing protection is adequate for TUAV ground operations.

(4) The GCS generators.

(a) The steady-state noise levels for the GCS crewman occupied locations, with the tunnel generator (®Isuzu 10 kVA model 3LD1) operating and all GCS fans on, were 75 dBA with the door open or closed. No HPDs are required.

(b) The 85 dBA contour for the Isuzu 10 kVA GCS tunnel generator is 1.5 m (5 ft). Personnel within this noise contour must wear Army approved HPDs.

(c) Data for the ®Honda 2.5 kVA model CB 2500x support generator documented a steady-state noise level of 75 dBA at all operator positions. No HPDs are required.

®Isuzu is a registered trademark/tradename of American Isuzu Motors Inc., Engine Operations, Novi, MI.

®Honda is a registered trademark/tradename of American Honda Motor Co., Honda Power Equipment Group, Alpharetta, GA.

MCHB-TS-OHH

SUBJECT: Updated Health Hazard Assessment Report on the Shadow 200, Tactical Unmanned Aerial Vehicle (TUAV), Block I, Project No. 69-37-7732-02

6. Recommendations. Steady-state noise.

a. Shadow 200 Air Vehicle. A risk assessment code (RAC) of 2 [Hazard Severity (HS) II, Hazard Probability (HP) C] is assigned for failure to comply. A residual RAC of 4 (HS II, HP E) is assigned if recommendation 6a(2) is adopted. The residual RAC would likely be reduced further if engineering controls were adopted.

(1) Define and implement engineering noise control measures on the Shadow 200 Air Vehicle, if feasible.

(2) Include the following requirements in the TUAV technical and training manuals:

(a) Crew chief's location. Require all personnel at the crew chief's location (worst-case, 120 dBA) to wear Army-approved double HPDs (e.g., approved earplugs in combination with a noise-attenuating helmet or noise muffs) and comply with a time limit of 30 minutes exposure per 24 hours during operations.

(b) 85 dBA contour. Require all personnel to wear an Army-approved HPD when within 62 m (204 ft.) of an operating Shadow 200 Air Vehicle.

(c) 103 dBA contour. Require all personnel to wear Army-approved double HPDs when within 13 m (42 ft.) of an operating Shadow 200 Air Vehicle.

(d) 108 dBA contour. Require all personnel to wear Army-approved double HPDs when within 9 m (29 ft.) of an operating Shadow 200 Air Vehicle and limit exposure time per the above Table [paragraph 5b(3)(a)].

MCHB-TS-OHH

SUBJECT: Updated Health Hazard Assessment Report on the Shadow 200, Tactical Unmanned Aerial Vehicle (TUAV), Block I, Project No. 69-37-7732-02

b. The GCS generators. A RAC of 2 (HS II, HP C) is assigned for failure to comply. A residual RAC of 4 (HS II, HP E) is assigned if the following recommendation is adopted.

(1) Occupied GCS crew positions. No recommendation is necessary.

(2) Isuzu 10 kVA tunnel generator. Require all personnel within the 85 dBA contour of 1.5 m (5 ft.) of an operating onboard generator to wear Army-approved HPDs.

(3) Honda 2.5 kVA model CB 2500x support generator. No recommendation is necessary.

7. The Army's HHA Program provides you with information to minimize health risks to soldiers, compensation claims, and lost time resulting in improved soldier performance, training and readiness. The enclosure includes an estimate of medical costs avoided by taxpayers as a result of your program's implementation of our recommendations contained in his HHAR. The annual costs include one soldier injured and 5 lost workdays for a total annual medical cost avoided of over \$11,000. This is a 20-year estimated cost avoided of over \$225,000. These conservative estimates are based upon the purchase of 44 TUAV systems.

8. Direct inquiries regarding this updated HHAR to the HHA Program's point of contact (POC), Mr. Robert Gross, at DSN 584-2925 or COM 410-436-2925. The contributing program within USACHPPM is the Army's Hearing Conservation Program (Mr. Bill Corbin) at DSN 584-3797 or COM 410-436-3797. Please complete and return the electronic version of USACHPPM Form 323.

APPENDIX A

Health Effects and Criteria

1. Steady-state noise.

a. A steady-state noise level of 85 dBA or greater is considered hazardous (references A-1 and A-2). This limit assumes no more than 8 hours per day of exposure to high noise levels. For exposure exceeding 8 hours per day, noise levels below 85 dBA are potentially hazardous (reference A-2). Prolonged unprotected exposure to hazardous noise levels will cause loss of hearing.

b. Design limits. Use MIL-STD-1474D, Requirement 1, Table 1-1, Category D, (Steady-state Noise, Personnel Occupied Areas, 85 dBA) as the design limit noise level for the TUAV shelters if future modifications are required. Collect steady-state noise associated with the operation and maintenance of the TUAV in accordance with Requirement 1 (Steady-state Noise, Personnel Occupied Areas), MIL-STD-1474D (reference A-3) for an updated HHAR.

2. Hearing protection devices (HPDs).

a. All personnel exposed to hazardous noise must wear HPDs. The DA PAM 40-501 (reference A-2) lists HPDs approved for Army use.

b. Proper HPDs are fitted for size by properly trained personnel (if preformed earplugs or helmets), adequately maintained, and properly inserted/adjusted or worn by the wearer.

c. Double hearing protection consists of Army approved earplugs in combination with a noise-attenuating helmet or noise muffs.

APPENDIX I-1

**NATURAL HISTORY INFORMATION FOR SPECIAL
STATUS SPECIES FOUND IN SBCT ROI**

Appendix I-1

Biological Resource Information For Special Status and Protected Species Found In SBCT ROIs

I-1A: RECOVERY PLANS

SBMR

Plant

- *Abutilon sandwicense* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Alectryon macrococcus* var. *macrococcus* (USFWS, July 29, 1997 [USFWS 1997]) Maui plant cluster;
- *Alsinidendron trinerve* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Chamaesyce rockii* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Cyanea acuminata* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *C. grimseana* ssp. *grimseana* (USFWS, July 1995 [USFWS 1995]) Wai'anae Plant Cluster;
- *C. koolauensis* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *C. st-johnii* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *C. superba* (USFWS, July 1995 [USFWS 1995]) Wai'anae Plant Cluster;
- *Cyrtandra subumbellata* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Delissea subcordata* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Diellia falcata* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *D. unisora* (USFWS, July 1995 [USFWS 1995]) Wai'anae Plant Cluster;
- *Flueggea neowawraea* (USFWS, July 10, 1999 [USFWS 1999a]), Multi Island plants;
- *Gardenia mannii* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Hesperomannia arborescens* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu Plants;
- *Isodendron laurifolium* (USFWS, July 10, 1999 [USFWS 1999a]) Multi Island Plants;
- *I. longifolium* (USFWS, July 10, 1999 [USFWS 1999a]) Multi Island Plants;
- *Labordia cyrtandrae* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Lepidium arbuscula* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Lipochaeta lobata* var. *leptophylla* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu Plants;
- *Lobelia gaudichaudii* ssp. *koolauensis* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu Plants;
- *L. oahuensis* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu Plants;
- *Phyllostegia hirsute*, *P. mollis* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Phlegmariurus nutans* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu Plants;
- *Pteris lidgatei* (USFWS, April 10, 1998c [USFWS 1998c]) Four Hawaiian ferns;
- *Pritchardia kaalae* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Sanicula purpurea* (USFWS, July 10, 1999 [USFWS 1999a]) Multi Island Plants;
- *Schiedea hookeri*, *S. nuttallii* (USFWS, July 1995 [USFWS 1995]) Wai'anae Plant Cluster;
- *Tetramolopium lepidotum* ssp. *lepidotum* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Tetraplasandra gymnocarpa* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Urera kaalae* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Viola chamissoniana* spp. *chamissoniana* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- and
- *V. oahuensis* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants.

Wildlife

- Hawaiian hoary bat, USFWS May 11, 1998 (USFWS 1998a).

DMR

Plant

- *Schiedea kealiae* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Nototrichium humile* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Hibiscus brackenridgei* (USFWS, July 10, 1999 [USFWS 1999a]) multi-island plants; and
- *Cyperus trachysanthos* (USFWS, July 10, 1999 [USFWS 1999a]) multi-island plants.

Wildlife

- Hawaiian hoary bat (USFWS, May 11, 1998 [USFWS 1998a]); and
- Hawaiian seabirds (USFWS, April 25, 1983 [USFWS 1983b]).

KTA

Plant

- *Chamaesyce rockii* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Cyanea koolauensis*, *C. longiflora*, *C. grimseana* spp. *grimseana*, *C. crispa*, *C. humboldtiana*, (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Eugenia koolauensis* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Gardenia mannii* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Phyllostegia hirsuta* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants;
- *Tetraplasandra gymnocarpa* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants; and
- *Hesperomannia arboreescens* (USFWS, August 10, 1998 [USFWS 1998b]) O'ahu plants.

Wildlife

- Hawaiian hoary bat, USFWS May 11, 1998 (USFWS 1998a).

PTA

Plant

- *Asplenium fragile* var. *insulare* (USFWS, April 10, 1998 [USFWS 1998c]);
- *Hedyotis coriacea* (USFWS, July 10, 1999 [USFWS 1999a]);
- *Nerandia ovata* (USFWS, August 10, 1998 [USFWS 1998b]);
- *Silene hawaiiensis* (USFWS, September 26, 1996 [USFWS 1996]);
- *S. lanceolata* (USFWS, September 26, 1996 [USFWS 1996]);
- *Spermodopsis hawaiiensis* (USFWS, July 10, 1999 [USFWS 1999a]); and
- *Tetramolopium arenarium* (USFWS, September 26, 1996 [USFWS 1996]).

Wildlife

- Hawaiian hoary bat (USFWS, May 11, 1998 [USFWS 1998a]);
- Palila (USFWS, June 27, 1986 [USFWS 1986]);
- 'Akiapōlā'au (honeycreeper) (USFWS, February 3, 1983 [USFWS 1983c] Hawaiian Forest Birds, (4 spp.);

- Hawaiian goose, (USFWS, February 14, 1983 [USFWS 1983d]);
- Hawaiian hawk (USFWS, May 9, 1984 [USFWS 1984]);
- Hawaiian dark-rumped petrel (USFWS, April 25, 1983 [USFWS 1983b]) Hawaiian Seabirds.

•

I-1B SPECIAL STATUS PLANTS – NATURAL HISTORY INFORMATION AND SBCT LOCATION IF KNOWN

Status Key:

FE= Federally Listed as Endangered (ESA)

FT= Federally Listed as Threatened (ESA)

FSOC= Federally Listed as a Species of concern

FC= Federally Listed as a Candidate species for listing

SE= Hawaii state listed as endangered

SE*=The state endangered listing refers only to the populations on O‘ahu, Lana‘i, and Moloka‘i

G1 = Species critically imperiled globally (typically 1-5 current occurrences)

G2 = Species imperiled globally (typically 6-10 current occurrences)

G3 = Species very rare with restricted range

G4 = Species apparently globally secure

G5 = Species demonstrably globally secure

GH = Species known only from historical occurrences

T1 = Subspecies critically imperiled globally (typically 1-5 current occurrences)

T2 = Subspecies imperiled globally (typically 6-10 occurrences)

T3 = Subspecies either very rare and local throughout its range or found locally (even abundantly at some of its locations) in a restricted range, or because of other factors making it vulnerable to extinction throughout its range (21-100 occurrences).

T4 = Subspecies apparently globally secure

+ = Federal Birds of Conservation Concern Species

Abutilon sandwicense (FE/G1). *Abutilon sandwicense* has no common Hawaiian name and grows typically in dry to moist lowland forest in gulches and sometimes on steep slopes. This perennial shrub flowers in winter and spring, and though many of the seeds sprout, few plants grow to maturity. It is a federally listed endangered species, and critical habitat has been proposed for this species on O‘ahu. Historically *Abutilon sandwicense* was known over almost the entire length of the Wai‘anae Mountain range. The 14 remaining populations all fall within a 5-by-10-mile area and number under 300 individuals. The biggest threat to this endangered species is competition from alien plants and the associated habitat degradation. Fire and trampling by feral goats pigs and cattle are also seen as threats.

- **SBMR:** It is known to exist in the South Range land Acquisition (Honouliuli Preserve) project area (USFWS 1998b).

Alectryon macrococcus var. macrococcus (FE/G2). This species is generally found in native moist forest in gulches and on lower gulch slopes. It was formerly widespread on leeward coasts of Kaua‘i, Moloka‘i, Maui, and O‘ahu. Now the entire subspecies totals around 500. O‘ahu populations have about 400 of these plants, at numerous sites in the Wai‘anae Mountains and rarely in the Ko‘olau Mountains. The greatest threat is the black twig borer, which affects all trees of the species to varying degrees. Other threats include feral pigs and goats, which disturb habitat, and rats that prey on the seeds. Alien grasses also change the species’ habitat, ultimately increasing the frequency and size of fires (Wagner et al. 1999).

- **SBMR:** Three populations exist on the SBMR, in the west range.

A. trinerve (FE/G1). This species of typically grows on slopes in wet forests at higher elevations than *A. obovatum*. These erect subshrubs flower and fruit year-round and are typically known from the southern and north-central Wai'anae Mountains. There are three known populations, with around 44 individuals among them. Current serious threats to plants include competition from aggressive alien plants, especially the prickly Florida blackberry), habitat degradation associated with feral pigs, and human interference. As with all small populations of plants, reproductive ability may be compromised (Wagner et al. 1999; USFWS 1998b).

- **SBMR:** Suitable habitat exists for this plant on the training area. It is known from Mount Ka'ala.

Asplenium fragile var. insulare (FE/-). The fragile perennial fern grows in lava tubes and deep cracks with a moderate amount of soil or ash. In some settings it is also found in subalpine shrubland and dry forests. There are few threats to this fern, but grazed fronds have been observed.

- **PTA:** These ferns are known from Kīpuka 'Alalā, Kīpuka Kalawamauna, and in the Palila critical habitat, all within the ROI

Bobea sandwicensis (-/G2). ('ahakea). The 'ahakea tree grows in dry to moist forests, generally on gulch slopes, ridges, or old lava flows on O'ahu, Moloka'i, Lana'i, and Maui. This species can grow up to nearly 33 feet (Wagner et al. 1999).

- **DMR:** There is suitable habitat for this species on DMR.

B. timonioides (FSOC/G2) . This tree can grow to 33 feet high. It is found in dry to, occasionally, moist forest and benefits from weed removal in its habitat.

- **KTA:** There is one individual of this species known to occur at KTA.

C. olowaluana (FSOC/G2). This plant occurs as a small tree and generally live on older substrate with modest soil development. Much of its original habitat has been disturbed by wildfire, and feral animals have put significant pressure on this species. Feral sheep and goats frequently girdle the trees and push over and eat small trees and saplings.

- **PTA:** Populations are known on PTA at Kīpuka 'Alalā and Kīpuka Kalawamauna, with in the north and west of the installation. This plant occurs in the ROI.

C. rockii (FE/G1). 'Akoko is a compact shrub or small tree that is found in the wet forest and shrubland often dominated by 'ōhi'a or uluhe. Eleven of the remaining thirteen populations are found on the Kawaihoa Training Area land, though this species was formerly known scattered throughout the Ko'olau Mountains. The primary threats to this species include habitat degradation and destruction by feral pigs, potential impacts from military training and competition with alien plants.

- **SBMR:** This species is known to exist within the training area.
- **KTA:** Four of the eleven remaining populations of this species are found on KTA, though this species was at one time scattered throughout the Ko'olau Mountains.

Cyanea acuminata (FE/G1), C. grimseana (FE/G1), C. koolauensis (FE/G2), C. superba (FE/-) and C. st-johnii (FE/G1). While each of these *Cyanea* species is distinct, some generalizations can be made. They generally inhabit moist to wet slopes, gulches, stream banks, or

closed canopy forests at least 670 feet and not more than 3,000 feet in elevation in the Ko'olau Mountains. All species are negatively affected by habitat destruction from feral species, such as the pig, fruit predation by slugs and rats, species competition with aggressive alien plants, trampling by hikers, and over-collection. Impacts from military training are a potential threat to these plants and their habitats. Natural events, such as hurricanes and landslides, combined with small population numbers, also put these plants at the risk of extinction.

- **SBMR:** *Cyanea* species are known to occur at SBMR.
- **KTA:** A few individuals of these species can be found within the ROI.

Cyperus trachysanthos pu'uka'a (FE/G1). A densely clumped perennial member of the sedge family, this plant is found on wet slopes and at pond margins. Few recent collections have been made.

- **DMR:** The population of this plant at Ka'ena Point Natural Area has been extirpated, and it no longer occurs on DMR.

Cyrtandra dentata (FE/G1). This plant is found in moist to wet forests in the Wai'anae and Ko'olau mountains, these shrubs flower and fruit throughout the year. Though little scientific information is available about its life cycle, this shrubs has been observed flowering and fruiting from May to November. The primary threats to this species are feral pigs and goats and the associated habitat degradation, competition for light, space, and nutrients with aggressive alien plants, and fruit and seed predation by slugs, snails and rats.

- **KTA:** Each species has three populations in the ROI.

C. viridiflora (FE/-). This *Cyrtandra* species is found in moist to wet forests in the Wai'anae and Ko'olau mountain. Though little scientific information is available about its life cycle, this shrubs has been observed flowering and fruiting from May to November. The primary threats to this species are feral pigs and goats and the associated habitat degradation, competition for light, space, and nutrients with aggressive alien plants, and fruit and seed predation by slugs, snails and rats.

- **KTA:** Each species has three populations in the ROI.

C. subumbellata (FE/-). This plant is considered to be critically globally imperiled. These plants are found in moist to wet forests in the Wai'anae and Ko'olau mountain ranges. Though little scientific information is available about their life cycles, these shrubs have been observed flowering and fruiting from May to November. The primary threats to this species are feral hoofed species and the associated habitat degradation, competition for light, space, and nutrients with aggressive alien plants, and fruit predation by slugs.

- **SBMR:** This species is known to occur in the north and central koolau mountains east of Kawaihoa.

Cystopteris douglasii (FSOC/G2). This endemic fern is found in few high altitude locations on the Island of Hawai'i (Mauna Kea Master Plan, 2000). It is found in Myoporum forest and shrubland (Char 1991) and is threatened by general habitat disturbance.

- **PTA:** This plant occurs in Myoporum forest and shrubland (Char 1991) within the ROI.

Delissea subcordata (FE/G1). This is a small shrub, with few remaining plants. Suitable habitat exists for this plant on the training area and Wai'anae Mountains. It grows in moist forest, either under tree canopy or in sunny spots. These small shrubs were historically scattered throughout the Ko'olau Mountains (mostly central and southeastern); presently only 55 plants remain. In the Wai'anae Mountains they inhabit moist forests, either under canopy or in sunny spots. They are often found growing with *Cyanea* species.

- **SBMR:** Often found with *Cyanea* species and other *Delissea* species, this plant is known to exist on the SBMR training area in the west range.

Diellia falcata (FE/G1). *D. falcata* is a terrestrial fern that is found generally in deep shade or open understory in dry forest.

- **SBMR:** *D. falcata* is known from two sites on SBMR. . It is known to occur in the south range.

Diplazium molokaiense (FE/G1). This fern is known to occur on slopes in moist to wet forests along ridge crests and in cloudswept areas.

Dissochondrous biflorus (FSOC/G2). This tall perennial has a short, knotty underground stem. It can be found on slopes in moist forests.

Dubautia arborea (FSOC/-). This large shrub has been severely affected by feral animals. Formerly widespread on Mauna Kea, it is now only locally abundant in subalpine shrubland, woodland, and alpine desert.

- **PTA:** This species is confirmed in the western and southern portions of the range within the ROI.

D. sherffiana (FSOC/G1). This plant is a small spreading shrub that flowers from May to July on dry ridge tops. This species overlaps the range of *D. herbstobate* slightly and seems to have broader range through Wai'anae Mountains than does *D. herbstobate*. It is found mostly on wetter inland ridges. Threats from feral hoofed animals have been almost completely eliminated on ridge tops and within fenced areas, though after 20 years of impacts the habitat has degraded from alien species invasions and the threat and damage from wildfires has greatly increased. Its range spreads from coastal dry cliffs to wetter inland ridges, and it is threatened by fire.

- **SBMR:** This species is known to occur in the west range.

Eragrostis deflexa (FSOC/G1). Bent lovegrass is a perennial with small horizontal stems known historically from Hawai'i and Lana'i. It was thought to be extinct until it was recently rediscovered. This species is easily propagated and can grow on lava flows of vastly differing ages. Habitat invasion by alien plant species seems to be the greatest threat to *E. deflexa*.

- **PTA:** It was thought to be extinct until it was recently rediscovered on PTA. It is found in the PTA ROI.

Eugenia koolauensis (FE/G1). This small tree or shrub is found in moist forests and dry gulches. It commonly occurs in forests dominated by 'ōhi'a but the populations of this plant are small and removed from each other.

- **KTA:** There are 31 individuals in 'Ō'io, Kaunala, and Aimuu gulches in KTA.

Exocarpus gaudichaudii (FSOC/G1). Heau (Whisk broom sandalwood) is an uncommon small tree found sparsely populating moist ridges and shrublands. It grows in many types of forest communities associated with 'ōhi'a. This rare shrub/small tree was known from Hawai'i, Lana'i, Maui, and Moloka'i and is currently very rare on these islands. Its general substrate type is Mauna Loa pāhoehoe flows, ranging from 1,500 to 5,000 years old. Fire, though improbable in the *Metrosideros* forest, is a habitat threat (Shaw 1997) for this species.

- **SBMR:** this species is known to occur in the east range.
- **KTa:** Five populations are known within the ROI.
- **PTA:** It occurs only infrequently on PTA, in the western part of the installation, where there are estimated to be about a dozen plants.

Festuca hawaiiensis (FC/G1). Hawaiian fescue is a perennial tufted grass, and was known historically from Maui and Hawai'i but is now known only from the southwest portion of PTA at areas surrounding Kīpuka 'Alalā.

- **PTA:** It is known only from the southwest portion of PTA at areas surrounding Kīpuka 'Alalā.

Flueggea neowawraea (FE/-). Mēhamehame is a tree that can grow to almost 100 feet tall. Flowering appears to depend on weather patterns and is not necessarily synchronized. They grow in low moisture forests, though some remaining trees are mostly found on north-facing gulch slopes and bottoms. The black twig borer introduces pathogens, weakens the tree, and causes premature death. Chinese rose beetles can reduce the leaves to skeletons. Other threats include farming, ranching, development, alien plants, and feral hooved animals.

- **SBMR:** This plant is known to exist on the training area, specifically in the western fork of Palikea Gulch in the Mount Ka'ala NAR.

Gardenia mannii (FE/G1). (nanu). These are trees up to 50 feet tall, occurring in moist to occasionally wet forests that are dominated by 'ōhi'a, usually on moderate to steep gulch slopes. There are five known populations in the Wai'ānae Mountains. Military activity and training in the habitat area is a potential threat. Documented threats include fierce competition by alien plants (Koster's curse, prickly Florida blackberry, and strawberry guava), increased potential of destruction due to fire as a result of alien plant encroachment, and habitat disturbance. The small population size of this species increases its likelihood of extinction from reduced reproductive vigor.

- **SBMR:** This plant is known to exist in the western portion of the ROI. Specifically it is found in the Hale'au'au Gulch and the Honouliuli Preserve. These populations occur on land controlled by DOD for Kawaihoa and Kahuku training areas and SBMR. The number of plants is fewer than 100.
- **KTa:** There are presently five known populations in the Wai'ānae Mountains, on land controlled by DOD for Kawaihoa and Kahuku training areas and Schofield Barracks Military Reservation. The total number of plants is less than 100. There are three populations in the ROI, found in lower Pe'ahinai'a.

Haplostachys haplostachya (FE/G1). Hawaiian mint is a perennial subshrub is known to exist only on PTA, though it was formerly widespread on Kaua'i, Maui, and Hawai'i (Wagner et al 1999).

It grows almost exclusively on lava flows over 10,000 years old.. Habitat loss from encroaching fountain grass is a threat, but the primary threat is wildfire. Shaw (1997) mentions the lack of any other plants of this genus, increasing the importance of these plants.

- **PTA:** This plant occurs in the ROI.

Hedyotis coriacea (FE/G1). Kio'ele is a small erect shrub, believed to be extinct, but 31 populations have been found within the last few years. It is found in *Metrosideros* treeland of differing densities and understory composition (PCSU 2002). This plant is very palatable to goats and sheep and has been heavily browsed.

- **PTA:** It is known only from west PTA: Kīpuka Kalawamuauna Endangered Plants Habitat, near Charlie Circle, and near Kīpuka 'Alalā.

H. parvula (FE/-). An erect to sprawling shrub that grows typically on exposed ridges or cliff faces, it is native to the Wai'anae Mountains. Feral pigs and goats are a major threat. Alien plants alter the habitat, compete for valuable nutrients and light, and increase the incidence of wildfires.

Hesperomannia arborescens (FE/-). A shrubby tree scattered throughout the Ko'olau Mountains and is known from the central and southern Wai'anae Mountains on slopes and ridges in wet forest. This species is becoming increasingly rare. The primary threats to this species include habitat degradation and destruction by feral pigs, potential impacts from military training, and competition with alien plants. An additional threat is trampling by humans, as a hiking and hunting trail runs through one of the O'ahu population units. This species also occurs on West Maui. Current species tallies put the population on O'ahu at a maximum of 39.

- **SBMR:** Suitable habitat exists for this plant on the training area.
- **KTA:** It is known from the central and southern Wai'anae Mountains. Current species tallies put the population on O'ahu at a maximum of 39. Several populations are found on ridges in the ROI.

H. sandwicensis (FC/G1). This plant is a broad leaved herbaceous annual and can be found in any of the native vegetation communities on PTA. This plant is often browsed despite its stinging hairs.

- **PTA:** It can be found in any of the native vegetation communities on PTA. It is widespread throughout the ROI.

Hibiscus brackenridgei ssp. mokuleianus (FE/G1) (Mokuleianus Ma'ō hau hele). At the start of summer this plant goes dormant. New growth appears at the onset of the wet season. This species was previously more widespread in lowland dry areas, but habitat has been disturbed from centuries of habitation and agriculture. Primary threats include damage by the introduced Chinese rose beetle, habitat degradation, and increased threat of wildfire from encroachment of nonnative grasses.

H. brackenridgei ssp. mokuleianus (FE/G1). This sprawling shrub was previously more widespread in lowland dry areas, but the habitat has been changed from centuries of habitation and agriculture. With the encroachment of molasses grass, fire is becoming a more serious threat. The Mākua site has burned twice in the last 10 years, but this population survives.

- **DMR:** There is one population of two individuals just south of the DMR installation boundary.

***Hibiscus kokio* spp. *kokio* (FE/G2)** (Koki'o 'ula 'ula). This species is a shrub or small tree found scattered through wet or dry forests. Alien plant competition poses a great threat to this species.

- **DMR:** There is one individual on the boundary of DMR and Mokulē'ia Forest Reserve.

***Isodendron hosakae* (FE/-)**. (aupaka). This branched shrub occurs in dry shrubland generally associated with the native species of *Dodonaea*, *Sophora*, *Wikstroemia* and *Santalum* at PTA. The greatest threat to this plant is browsing by cattle.

- **PTA:** It is present on three cinder cones in the West PTA Acquisition Area within the ROI.

***I. longifolium* (FT/-)**. (aupaka). This shrub is found on steep slopes in native dominated forests that are moist to wet. Populations of these long-lived perennials are declining.

- **SBMR:** This species is found on the SBER.

***I. laurifolium* (FE/-)**. (aupaka). This plant grows on rocky cliff slopes in diverse forests that are moist to wet. Though these plants are long lived, populations are declining. Threats to this plant include feral pigs and goats and competition with alien plants.

- **SBMR:** This species is found on the SBER.

***Joinvillea ascendens* spp. *ascendens* (FC/G3)**. ('ohe). This grasslike herb can grow to 15 feet in height. It occurs on several Pacific islands and is rare in Hawai'i. It can be found infrequently along wet ridges and intermittent streams above 900 feet in elevation. Seedlings are rarely observed in Hawai'i forests and though the seeds do germinate in cultivation, the plants have not lived beyond the seedling stage. In areas of feral cattle there is extensive damage to these plants.

- **SBMR:** Suitable habitat for this plant occurs in the SBER.

***Labordia cyrtandrae* (FE/G1)**. Endemic to O'ahu, this rare shrub is found in moist valleys and forests. It grows with native plants, *Metrosideros polymorpha* and *Boehmeria grandis*. Few individuals remain, and habitat for this plant is threatened by alien plants and feral goats.

- **SBMR:** Populations of this plant are known to exist in the North Hale'au'au and North Mohiākea gulches of the SBMR training area. Also from Mount Ka'ala, and the western portion of SBMR.

***L. kaalae* (FC/G1)**. (kāmakahala). This shrub or small tree occurs on wet ridges in the Wai'anāe Mountain range.

- **SBMR:** Habitat for this species occurs in the training area.

***Lepidium arbuscula* (FE/G1)**. This plant is commonly found in the Wai'anāe Mountains on exposed ridges and cliffs.

- **SBMR:** There are two populations of this species on the training area.

***L. bidentatum* var. *o-waihiense* (FSOC/-)**. ('ānaunau, naunau, kūnānā). This subshrub has weakly erect stems and is widely distributed on coastal sites at low elevations and on steep dry rocky coastal slopes.

- **DMR:** Suitable habitat exists for this species on DMR.

Lipochaeta lobata var. *leptophylla* (FE/G2). (nehe). This perennial herb can be found in dry coastal habitats and occasionally in dry shrubland below 1200 feet in elevation.

- **SBMR:** The three known populations are known only from the Waiʻanae Mountains. Suitable habitat occurs for this species in the training area.

L. remyi (FSOC/G1). (nehe). This annual herb occurs in wet sites in dry forests of the northern Waiʻanae Mountains.

- **DMR:** Suitable habitat exists for this species on DMR.

L. tenuis (FSOC/G2). (nehe). This perennial herb is found only in the central Waiʻanae Mountains in moist forests, open streambeds and on slopes.

L. venosa (FE/-). (nehe) This is a somewhat shrubby herbaceous perennial. This plant is found sparsely in dry shrubland on the Island of Hawaiʻi above 2,200 feet in elevation. It is known from two locations within the Keamuku Parcel on montane dry shrubland dominated by introduced grasses. The major threats to this plant are habitat loss, cattle grazing, and fire.

- **PTA:** It is known from two locations within the West PTA Acquisition Area.

Lobelia gaudichaudii ssp. *gaudichaudii* (FSOC/-) . This plant is an unbranched shrub with woody stems.

- **KTA:** It is known only in the highest elevations of the northern and central Koʻolau Mountains. One quarter of the entire extant population exists within the ROI boundary. It is found in Lehua Maka Noe Bog in KLOA.

L. gaudichaudii var. *koolauensis* (FE/-) . This very rare perennial is found on wet cloudswept slopes associated with ʻōhiʻa lowland wet shrublands. This plant is an unbranched shrub with woody stems.

- **SBMR:** One population exists on the east range on a ridge above South Kaukonahua.

L. niihauensis (FE/G2). This sparingly branched shrub occurs rarely on moist to dry cliffs in the northern Waiʻanae Mountains.

L. oahuensis (FE/G1). (Pānaunau). This is an unbranched perennial shrub. The primary threats to *L. oahuensis* are the introduced plant Koster's curse and feral pigs.

- **SBMR:** Eleven populations of this plant remain in areas of forest that are often exposed to heavy winds and rain. Suitable habitat occurs for this species in the training area.

L. yuccoides (FSOC/G2). (Pānaunau). This unbranched perennial shrub has woody stems and is known from dry ridges in diverse moist forests in the Waiʻanae mountains.

***Melicope christophersonii*, *M. cinera* (FC/G1).** ‘alani is one of the largest flowering plant genera in Hawai‘i and ranges in size from a tree to a small shrub. It is often found in native-dominated moist forests. Competition with aggressive alien plants and the black twig borer are the primary threats to this plant, but lack of reproductive vigor and feral pigs and goats also affect the species and habitat.

***M. hawaiiensis* (FSOC/G2)** (formerly *Pelea hawaiiensis*). This tall shrub or tree occurs in dry or sometimes moist forests and is fairly widespread. Though there is low possibility of fires in the forests, wildfire would have a negative impact. Feral pigs, goats, and sheep have not been observed browsing on this species.

- **PTA:** There is habitat for this species on PTA.

***M. hiiakae*, *M. lydgatei* (FC/-).** This small tree (*Melicope hiiakae*) or shrub (*M. lydgatei*) can be found in native dominated moist forests in the Ko‘olau and Wai‘anae mountains. The primary threats to *M. lydgatei* are competition with aggressive alien plants, feral pigs and goats, and low seed production and fewer reproducing plants.

- **KTA:** This small tree (*Melicope hiiakae*) or shrub (*M. lydgatei*) can be found in native dominated moist forests in the Ko‘olau and Wai‘anae mountains. Fewer than 45 plants of *M. lydgatei* remain, in the Lower Pe‘ahinai‘a and the Poamoho Trail area. Six individuals of the very rare *M. hiiakae* are also found in the ROI.

***Myrsine fosbergii* (FC/-).** This branched shrub or small tree is known from the Ko‘olau Mountains where it is considered uncommon. It generally occurs at elevations exceeding 2,000 feet. *Myrsine* populations in general suffer from habitat degradation from feral pigs and possibly from military activities.

- **KTA:** Habitat for this species exists in the project area, but population data is not known.

***Neraudia ovata* (FE/G1).** This plant occurs as a sprawling shrub in open *Metrosideros* forest and *Myoporum* shrublands and is generally found on the leeward side of the Island of Hawaii. Threats to the eleven plants of this species that remain are browsing and associated habitat modifications from sheep and goats (PCSU 2002).

- **PTA:** This plant is found on the western boundary of the installation.

***Nototrichium humile* (FE/G2).** (kulu‘i). This basal-branching perennial shrub flowers heaviest in summer and spring. It is found throughout the Wai‘anae Mountain range on windward and leeward sides, on gulch slopes and bottoms, in the understory of dry forests, and on sparsely vegetated dry cliff faces and ledges. This plant is very susceptible to fire damage because its habitat extends to the lower drier reaches of the Wai‘anae Mountains. Major threats include feral hoofed animals and associated habitat destruction. Alien grasses that are highly flammable contribute to the habitat degradation and possible wild land fire damage.

- **DMR:** Two populations are documented on DMR: at Kapuni Gulch and in the Kealia land section.

***Phlegmarius nutans* (FE/-).** There is little life history information available for this clubmoss. It is presently found growing on tree trunks in only three locations in wet Ko‘olau forests, where four

individuals remain. Noxious alien plants, localized extinction, and feral pigs are all threats to *P. nutans*. Populations of this species are thought to be underreported because they are small plants.

- **SBMR:** It is known along the Schofield Waikāne Trail and on the SBER training area.
- **KTA:** Three individuals occur in the ROI.

Phyllostegia hirsuta (FE/G1); *P. mollis* (FE/G1). These erect herbs, vines, or subshrubs occur on steep shaded slopes in forests that are moist to wet. The primary threats to these plants are feral pig habitat destruction, potential impacts from military training, and intense competition with alien plants.

- **SBMR:** One population of *P. hirsuta* is documented on SBER at the South Kaukonahua Gulch. There are two populations of *P. mollis* on SBMR
- **KTA:** Ten individuals of *Phyllostegia hirsuta* occur in the ROI.

Plantago princeps var. *princeps* (FE/-). This is a woody shrub that lives in moist cliff habitat or in rainforest. Known populations in the Waiʻanae Mountains total about 200 plants. Wild pigs, goats, and weeds are responsible for this plant's habitat destruction. Feral pig rooting and habitat degradation and alien plant species competition are the largest threats to populations on wet sites, and goat browsing and alien plant competition are the major threats in dry areas.

- **SBMR:** At least one population exists on the SBMR. It is known from the western portion of the ROI.

Platydesma cornuta var. *cornuta* (FC/G2). This species is a rare palmlike shrub found in moist forests in the Koʻolau Mountains.

- **SBMR:** It is known at Kawailoa.
- **KTA:** Three populations are located in the ROI.

Platydesma cornuta var. *decurrens* (FC/G2). This plant is a rare palm-like shrub found in moist forests in the Koʻolau Mountains, or from the Waiʻanae Mountains.

- **SBMR:** At least one population is on the SBMR, in the western portion of the ROI.

Pleomele forbesii (FC/G1). This tree can grow to 21 feet tall. It is found in dry and moist forests. This plant is highly threatened by fire and alien plants.

- **SBMR:** One small population is found on the training area.

Portulaca sclerocarpa (FE/G1). This plant is a perennial herb found generally in subalpine woodland, primarily in dry habitats, such as bare cinder or steam vents. Low seed production and fewer reproducing plants is a major threat, and fountain grass is invading this species' habitat.

- **PTA:** There are small populations in the Kīpuka Kalawamauna Endangered Plants Habitat (Shaw 1997) at the western edge of the installation. Low seed production and fewer reproducing plants is a major threat, and fountain grass may be invading this species' habitat.

***Pritchardia kaalae* (-/G1).** This plant is a rare fan palm reaching up to 33 feet tall and found only in northern portions of the Wai'anae Mountains. It is found in moist to dry zones on moderately to very steep cliffs.

- **SBMR:** One population of this endangered plant is in the SBMR training area. It occurs at the SBMR west boundary within the Waianae Kai watershed protection area.

***Psychotria hexandra* ssp. *oahuensis* (FC/G4).** This tree or shrub found in moist to wet forests on O'ahu. It is known only from the Ko'olau Mountains, where there are fewer than 20 plants.

- **KTa:** It is known only from the Ko'olau Mountains, where there are fewer than 20 plants. There is one plant in the ROI.

***Pteralyxia macrocarpa* (FC/G2).** (kaulu). Known only from the 2 mountain ranges on O'ahu, this plant is scattered in valleys and on slopes in moist forests.

- **SBMR:** It is known only from the two mountain ranges on O'ahu. Suitable habitat occurs for this species in the training area, in the south and west portions of the ROI.

***Pteris lidgatei* (FE/G1).** This is a coarse fern found in lowland wet forests with over 100 inches of rainfall each year. It is commonly found on stream banks and near waterfalls in 'ōhi'a-dominated forests. Habitat destruction by wild pigs and the alien plant Koster's curse are both reasons for its decline.

- **SBMR:** Four individuals exist along the South Kaukonahua Gulch on the SBER
- **KTa:** Only three populations remain of this plant. Suitable habitat for this species is found in the training areas. Presently it is known from one site in the ROI.

***Sanicula purpurea* (FE/G1).** This perennial herb with thick, underground storage roots grows in moist areas, generally on slopes and in deep soil. Dormant through summer, the plant's new growth appears with the onset of the wet season. Goats are a major threat, mainly because they degrade the slopes where the plants grow and hasten erosion.

- **SBMR:** There is one population of *S. purpurea* on SBER.
- **KTa:** It occurs in open bogs in the Ko'olau Mountains. Fewer than 200 plants of this species exist. Three populations are known in the ROI.

***Schiedea hawaiiensis* (FSOC/-).** This climbing vine grows in dry shrubland and only one individual remains in the wild.

- **PTA:** Only one individual remains in the wild. It is reported on PTA from the western portion of the range within the ROI.

***S. hookeri* (FE/G1); *S. nuttallii* (FE/G1).** *S. nuttallii* is an erect subshrub in diverse moist forest, scattered through exterior valleys of the Wai'anae Mountains. *S. hookeri* is found in diverse moist forest in the north and central Wai'anae Mountains. They often grow alongside koa and 'ōhi'a. Feral pigs and goats are a major threat, as is the population disturbance associated with these invaders. Alien plants alter the habitat and compete for valuable nutrients and light. The increased incidence of

wildfires is also associated with alien grasses, and snails and slugs destroy seedlings and immature plants.

- **SBMR:** *Schiedea* spp. have been documented on SBMR in South Mohiākea Gulch. *S. hookerii* has been documented in the central and northern waianae mountains, and the western portion of SBMR.

S. kealiae (FE/G1). This species is a subshrub with a sprawling tendency. There remain fewer than 500 of this plant in the wild. It generally grows between 200 and 1,000 feet on dry cliff faces and steep slopes. *S. kealiae* is threatened by competition with alien plants and reduced reproductive vigor due to the small remaining populations. Naturally occurring rockslides and weather are also threats to this plant's continued existence. It is historically known from both the northern and southern Wai'anae Mountains.

- **DMR:** Found in Sapindus forest on steep cliffs, remaining populations are found at Ka'ena Point and on the cliffs above Dillingham Airfield. One population exists on DMR.

Sicyos lanceoloidea (FSOC/G1) ('ānunu). This plant is generally found as a trailing annual.. There are some revisions being made to this genus and *S. lanceoloidea* is not described in Manual of the Flowering Plants of Hawai'i, the most comprehensive guide to plants in the islands.

- **SBMR:** This species occurs in the western portion of SBMR.

Silene hawaiiensis (FT/G1). This plant is a subshrub with erect stems and is found on moist shrubland scattered on more recent Mauna Kea lava flows.

- **PTA:** It occurs from the northern boundary to Kīpuka 'Alalā on the west side and Pu'u Koli on the east side. It is highly palatable to feral sheep and goats, and feral pigs like the taproot (Shaw 1997 p. 66).

S. lanceolata (FE/G1). This plant is considered to be critically globally imperiled. It is a small sprawling shrub with smooth leaves found in moist shrubland areas. Feral pigs and goats are a major threat to this plant, as is the population disturbance associated with these invaders. It is known to be very palatable to feral sheep and goats (Shaw 1997 p. 70). Alien plants alter the habitat and compete for valuable nutrients and light. Fire has had a negative impact on the populations of *S. lanceolata*, and encroachment of fountain grass further threatens these plants (Shaw 1997 p. 70). The increased incidence of wildfires is also associated with alien grasses.

- **PTA:** It is found in the northwest and western portions of PTA, where critical habitat is proposed.

Solanum incompletum (FE/GH). This plant is a woody shrub that can grow to ten feet and has prominent red prickles. It occurs in diverse, arid to mesic, subalpine forest. The plant is known to fruit in late summer and early fall, though other life history details remain largely unknown. The primary threat to these plants is feral sheep browsing and associated habitat disturbance. They are also threatened by fountain grass encroachment and the increased likelihood of fires associated with this encroachment.

- **PTA:** One population remains on PTA. Critical habitat is proposed on PTA for this species.

S. sandwicense (FE/G1). (pōpolo). This species is a large sprawling shrub found on O’ahu and Kaua’i in moist forests dominated by diverse native species.

Spermolepis hawaiiensis (FE/G1). This plant is a slender herbaceous annual found in ‘Ōhi’a forests and lowland dry shrubland, and occasionally from cultivated fields at lower elevations. There is little information about the life history of this species. Major threats are habitat degradation by feral goats, competition with alien plants, and fire resulting from military training.

- **PTA:** The three populations on PTA total approximately 500 and are thus far the only known occurrence on the Island of Hawai’i. Critical habitat is proposed for this species on PTA.

Stenogyne angustifolia (FE/G1). This plant is a low-growing perennial vine that is widely distributed throughout vegetation communities. Rooting by feral pigs damages the underground stems, though the plant does not appear to suffer from heavy browsing (Shaw 1997 p. 81).

- **PTA:** It is widely distributed throughout vegetation communities on PTA.. 81). This plant is found in the ROI.

S. kanehoena (FE/G1). (ma’ohi’ohi). This species is a fuzzy, climbing vine.. The last population was known from Pu’u kanehoana in the Wai’anae Mountains on O’ahu in moist forest dominated by diverse native species. This population was found dead in 1997 though isolated individuals may still exist.

S. sherffii (FE/-). This climbing vine was found along the Peahenai’a Trail in the Ko’olau Mountains. This species is no longer known in wild populations.

- **KTA:** It was found along the Pe’ahināi’a Trail in the Ko’olau Mountains. This species is no longer known in wild populations though habitat still exists for it within the ROI.

Tetramolopium arenarium var. arenarium (FE/G1). This plant is a small erect shrub thought to be extinct until it was rediscovered in 1997 on PTA. Habitat for this plant is generally in *Dodonaea* mixed shrubland communities. Threats to this plant include habitat invasion by fountain grass, wildfire and dust (Shaw 1997).

- **PTA:** This plant is located within and critical habitat is proposed for it on PTA.

T. consaguinium ssp. leptophyllum (FSOC/G1). This plant is an erect shrub widely distributed in communities dominated by *Metrosideros*, *Dodonaea*, and *Myoporum*. This species is threatened by browsing and impacts from dust (Shaw 1997).

- **PTA:** Populations have been recorded at the southern boundary of the Kīpuka Kalawamauna Endangered Plants Habitat and Kīpuka ‘Alalā. It occurs within the ROI.

T. lepidoptum spp. lepidoptum (FE/G1). This erect shrub is known presently from the tops of grassy ridges and cliff faces in moist forest in the Wai’anae Mountains. Alien plants pose a significant threat to the habitat of this species.

Tetraplasandra gymnocarpa (FE/G1). This plant occurs as increasingly rare trees, now found only in the summit areas of the Ko’olau Mountains, in wet to moist forests.

- **SBMR:** One individual exists on SBER in South Kaukonahua Gulch.
- **KTA:** It is now found only in the summit areas of the Ko‘olau Mountains. Ten individuals are known from the Paumalū and Kaunala gulch areas of KTA.

Urera kaalae (FE/G1). This rare tree has a rapidly declining population found on gulch slopes.

- **SBMR:** One population of three individuals exists in the southern portion of the training area.

Vigna o-wahuensis (FE/-). (mohihihi). This is a slender twining herb. Very little is known about the life history of this plant. It grows in lowland dry and moist grasslands and shrublands at elevations up to 4,500 feet. It is often found associated with *Sida fallax* (ilima), *Chenopodium* species and *Dubautia menziesii*. Major threats include habitat degradation, alien plant competition, and fire.

- **PTA:** It is present in the West PTA Acquisition Area within the ROI.

Viola chamissoniana ssp. chamissoniana (FE/G3). This is a woody shrub found on both the windward and leeward sides of the Wai‘anae Mountains. It is generally found in moist habitats on cliffs and cliff faces with sparse to moderate vegetative cover. It usually grows in association with other natives. Feral pigs and goats are a major threat, as is the population disturbance associated with these invaders. Alien plants alter the habitat and compete for valuable nutrients and light. The increased incidence of wildfires is also associated with alien grasses.

- **SBMR:** Two populations exist in the southern portion of the training area.

Viola kauaensis (FE/-). This plant is a perennial herb from the Ko‘olau Mountains. *V. kauaensis* is found in open.

V. oahuensis (FE/G1). This is a small unbranched subshrub found in the wet forests of the Ko‘olau Mountains. These small plants occur with other natives on cloudswept summits.

- **SBMR:** There are five individuals along the summit of South Kaukonahua Gulch and Kahana.
- **KTA:** *V. oahuensis* is known from ten sites in the ROI.

Zanthoxylum hawaiiense (FE/G1). These are small to medium trees. Reported collection of this species from O‘ahu and Kaua‘i are erroneous (Wagner et. al. 1999). Major threats to this species are browsing, dust, and alien plant competition.

- **PTA:** This plant is found north of the Bobcat Trail.

Zanthoxylum oahuense (FC/G2). These small trees grow in moist to wet forest in the Ko‘olau Mountains.

- **SBMR:** There is one population on the SBMR training along the Schofield-waikane trail in the east range.
- **KTA:** This small tree is found in moist to wet forest in the Ko‘olau Mountains. This species is found only on O‘ahu, with about 250 trees island-wide. Ten trees occur in the ROI.

I-1C: SPECIAL STATUS WILDLIFE — NATURAL HISTORY INFORMATION AND SBCT LOCATION IF KNOWN

Status Key:

FE= Federally Listed as Endangered (ESA)

FT= Federally Listed as Threatened (ESA)

FSOC= Federally Listed as a Species of concern

FC= Federally Listed as a Candidate species for listing

SE= Hawaii state listed as endangered

SE*=The state endangered listing refers only to the populations on O‘ahu, Lana‘i, and Moloka‘i

G1 = Species critically imperiled globally (typically 1-5 current occurrences)

G2 = Species imperiled globally (typically 6-10 current occurrences)

G3 = Species very rare with restricted range

G4 = Species apparently globally secure

G5 = Species demonstrably globally secure

GH = Species known only from historical occurrences

T1 = Subspecies critically imperiled globally (typically 1-5 current occurrences)

T2 = Subspecies imperiled globally (typically 6-10 occurrences)

T3 = Subspecies either very rare and local throughout its range or found locally (even abundantly at some of its locations) in a restricted range, or because of other factors making it vulnerable to extinction throughout its range (21-100 occurrences).

T4 = Subspecies apparently globally secure

MMPA= Marine Mammal Protection Act regulated

Invertebrates

Achatinella mustelina (FE/SE/G1), *A. aperfulva* (FE/SE/G1), *A. byronii* (FE/SE/G1), *A. curta* (FE/SE/G1), *A. decipiens* (FE/SE/G1), *A. dimorpha* (FE/SE/G1), *A. leucorraphe* (FE/SE/G1), *A. pulcherima* (FE/SE/G1), *A. sowerbyana* (FE/SE/G1), *A. swiftii* (FE/SE/G1) and *A. valida* (FE/SE/G1). O‘ahu tree snails are also known as pūpū kani‘oe and are native to O‘ahu. They live in trees and bushes and feed on fungi found on the surface, primarily that growing on native plants (HINHP 1994). *Achatinella* snails are active during the night and remain sealed in leaves during the day. This species doesn’t reach sexual maturity until it is seven years old, after which time it gives birth to between one and four young a year. The breeding season is not known, but embryos can be found in the adult snail’s uterus at any point of the year (HINHP 1994). Although this species is limited to the Wai‘anae Mountains, it is believed to have historically occurred from sea level on O‘ahu’s windward coast to the uppermost reaches of the Ko‘olau Mountains (HINHP 1994). Some of the greatest threats to this species are introduced plants and animals, habitat degradation, fire, and collection.

- **SBMR:** *A. mustelina* has been recorded at several locations and during multiple surveys at SBMR. It is known from the lowland forest and moist ridges and cliffs at Pu‘u Kalena, Pu‘u Kamakali‘i, and Pu‘u Hāpapa in the Wai‘anae survey area of SBMR (R. M. Towill Corp. 1997b). This species is found in the Main Post ROI but is unlikely to occur at SBER due to lack of habitat. *A. apexfulva*, *A. byronii*, *A. decipiens*, *A. leucorraphe*, *A. sowerbyana*, and *A. swiftii* were observed along or off the Schofield Waikāne Trail in the Ko‘olau survey area of SBER, within the project ROI.
- **KTa:** O‘ahu tree snail has been recorded in surveys in the 1980s in KTa but has not been recorded in the area since then, despite surveys by Hadfield in 1984 and Christensen in 1985 (USARHAW and 25th ID [L] 2001a). *A. curta*, *A. dimorpha*, *A. sowerbyana*, *A. pulcherima*, *A. valida* could occur in the lowland forest and moist ridges and cliffs of KTa. *A. Pulcherima* has been

recorded at KLOA in the vicinity of the Helemanō drainage (PCSU 2001) and could occur in the ROI.

Amastra cylindrica (FSOC/G1), *A. micans* (FSOC/G1), *A. rubens* (FSOC/G1), *A. spirizona* (FSOC/G1), *Laminella sanguinea* (FSOC/G1), and *Leptachatina* sp. (FSOC/G1), *Leptachatina lepida* (FSOC). Amastrid land snails are native to the Hawaiian Islands. Amastrid land snails are likely threatened by habitat loss and introduced species that prey on them, compete for resources, and spread disease. The historical distribution of *A. rubens* includes Ka‘ala, Kukui‘ula, Mokulē‘ia, Mākaha, and Hale‘au‘au within the Wai‘anae Mountains (HINHP 1994b). Little is known about *Leptachatina*’s habitat preferences, life history, and historical range. Amastrid land snails are likely threatened by habitat loss and introduced predators that compete for resources and spread disease.

- **SBMR:** These species were recorded in the southern portion of the Wai‘anae survey area, between Pu‘u Hāpapa and Kaluaa Gulch, confirming them in the SBMR ROI.
- **PTA:** The *Leptachatina lepida* has been observed on PTA in Bobcat and ‘Alalā areas (USARHAW and 25th ID [L] 2001b).

Auriculella ambusta (-/G1), *A. sp. aff. castanea* (-/G1), *A. sp. aff. perpusilla* (-/G1), *A. tenella* (-/G1) *A. perpusilla* (FSOC/G1), *A. pulchra* (FSOC/G1), and *Partulina dubia* (FSOC/G1). Achatinellid land snails are endemic to the Hawaiian Islands. They live in trees and shrubs, primarily on native vegetation (R. M. Towill Corp. 1997b; HINHP 1994b). Current life history information is not well studied or understood for these species. Achatinellid land snails are known to feed on fungi on leaves. Achatinellid land snails are likely threatened by habitat loss and introduced species that prey on them, compete for resources, and spread disease.

- **SBMR:** These species have been observed at the Main Post in the Wai‘anae survey areas (R. M. Towill Corp. 1997b). *A. ambusta*, *A. new sp. aff. castanea*, *A. new sp. aff. perpusilla*, and *A. tenella* were observed in several locations during the Wai‘anae survey. *A. ambusta* was observed along Pu‘u Break Road, along Mt. Ka‘ala Natural Area Reserve and on the Schofield Barracks Forest Reserve. *A. new sp. aff. castanea* was detected at the southernmost portion of the Wai‘anae survey area. *A. new sp. aff. perpusilla* and *A. tenella* were recorded at the southernmost portion of the Wai‘anae, and *A. tenella* was observed again along the trail on the boundary of Mt. Ka‘ala Natural Area Reserve. *Partulina dubia* was also identified during the Wai‘anae survey within the Main Post ROI. Also, *A. perpusilla* and *A. pulchra* were recorded near the Schofield Waikāne Trail on the SBER during the Ko‘olau survey (R. M. Towill Corp. 1997b).
- **KTA:** *Auriculella ambusta*, *A. sp. aff. castanea*, *A. sp. aff. perpusilla*, *Partulina dubia* could occur in the KTA ROI, based on the availability of suitable habitat..

Euconulus (*Nesoconulus*) sp. cf. *gaetanoi* (FSOC/-). This species tend to inhabit areas with vegetation and primarily feed on the bacteria growing on leaves and other vegetation. Threats to this species include habitat destruction and the presence of introduced predatory snails.

- **PTA:** This species has been identified in the PTA ROI (PCSU 2002).

Helicoverpa confusa (FSOC/G1). Hawaiian helicoverpa moth is known to occur in the montane dry forests.

- **PTA:** This species occurs in the ROI (USARHAW and 25th ID [L] 2001b).

Hylaeus unica (FSOC/GH). The unique yellow-faced bee feeds on and provides their larvae with pollen and nectar. Some species in the family specialize in particular flower species, and others have more general preferences and are active only from the morning until the late afternoon (USGS 2001b). Unique yellow-faced bees compete with several alien species. Nonnative ants, wasps, and bees can be active for more hours during the day and have reduced the resources available to native bees, as well as physically excluded native bees from flowers (USGS 2001b).

- **SBMR:** The unique yellow-faced bee was observed in the Wai'anae survey area, along the Wai'anae Range on the Schofield Barracks Forest Reserve and to the northeast in Mt. Ka'ala Natural Area Reserve (R. M. Towill Corp. 1997b). This species has been confirmed in the SBMR ROI.

Megalagrion oahuensis (FSOC/G1). The O'ahu megalagrion damselfly is native to O'ahu, where it occurs most commonly on the leeward ridge crests. This species eats only other insects and breeds in damp leaf litter beneath fern banks (Polhemus 1997). Major threats to *Megalagrion* species include competition and predation from introduced species, such as fish, frogs and invertebrate species, and physical destruction of habitats.

- **SBMR:** The O'ahu megalagrion damselfly was found at SBMR on the Schofield Barracks Forest Reserve in the Wai'anae survey area and was detected in the Mt. Ka'ala Natural Area Reserve (R. M. Towill Corp. 1997b). It has been confirmed in both the SBMR and SBER ROI.
- **DMR:** Its reintroduction to DMR in 1999 was largely unsuccessful, due possibly to the previously undetected presence of crayfish in the DMR Pinao'ula'ula Stream (PCSU 2002).

M. xanthomelas (FC/G2). The orange-black megalagrion damselfly is a native to the Hawaiian Islands. It breeds in a wide range of habitats, including coastal wetlands, perennial streams, reservoirs, and ponds (NatureServe 2001). This species is an insectivore (eats only invertebrates) and primarily eats insect larvae. The introduction of nonnative predatory fish poses a major threat to this species.

Nesopupa (Infranesopupa) subcentralis (FSOC/-). This species tend to inhabit areas with vegetation and primarily feed on the bacteria growing on leaves and other vegetation. Threats to this species include habitat destruction and the presence of introduced predatory snails.

- **PTA:** This species has been identified in the PTA ROI (PCSU 2002)

Nesovitrea hawaiiensis (FSOC/-). This species tend to inhabit areas with vegetation and primarily feed on the bacteria growing on leaves and other vegetation. Threats to this species include habitat destruction and the presence of introduced predatory snails.

- **PTA:** This species has the potential to occur within the ROI.

Philonesia sp. (FSOC/-) This species tend to inhabit areas with vegetation and primarily feed on the bacteria growing on leaves and other vegetation. Threats to this species include habitat destruction and the presence of introduced predatory snails.

- **PTA:** This species has the potential to occur in the project area (PCSU 2002).

Pleuropoma sandwichiensis (FSOC/G1). The Helicinid land snail is native to the Hawaiian Islands. Historically this species was found in all eight Hawaiian Islands. Helicinid land snails are likely threatened by habitat loss and introduced species that prey on them, compete for resources, and spread disease.

- **SBMR:** Current records document it only at the Waiʻanae Mountains on Oʻahu (R. M. Towill Corp. 1997b; USARHAW and 25th ID [L] 2001a; PCSU 2001). This species was observed at the southern portion of the Waiʻanae survey area (R. M. Towill Corp. 1997b), which is part of the SBMR ROI.

Rhycogonus giffardi (FSOC/G1). Giffard's rhyncogonus weevil is endemic to the Island of Hawaii and is known to inhabit montane dry shrublands dominated by *Dodonaea*, dry to mesic forest, and woodland (25th ID [L] and USARHAW 2001b). The historic distribution of this species is limited to the North Kona District of Hawaii'i (25th ID [L] and USARHAW 2001b). Giffard's rhyncogonus weevils are herbivores. Weevils are threatened by fire and the resulting loss of habitat and food.

- **PTA:** It is known to inhabit PTA, having been identified in the native shrubland at Kīpuka Kalawamauna in 1998 (HINHP 1998; USARHAW and 25th ID [L] 2001b) and are confirmed in the ROI.

Striatura (Pesudohyalina) sp. cf. meniscus (FSOC/-), Striatura sp. (FSOC/-) This species tend to inhabit areas with vegetation and primarily feed on the bacteria growing on leaves and other vegetation. Threats to this species include habitat destruction and the presence of introduced predatory snails.

- **PTA:** These species have been identified in the PTA ROI (PCSU 2002).

Succinea konaensis (FSOC/-). This species tend to inhabit areas with vegetation and primarily feed on the bacteria growing on leaves and other vegetation. Threats to this species include habitat destruction and the presence of introduced predatory snails.

- **PTA:** This species has been identified in the PTA ROI (PCSU 2002).

Vitrina tenella (FSOC/-). This species tend to inhabit areas with vegetation and primarily feed on the bacteria growing on leaves and other vegetation. Threats to this species include habitat destruction and the presence of introduced predatory snails.

- **PTA:** This species has been identified in the PTA ROI (PCSU 2002).

Birds

Anas wyvilliana (FE/SE/G1). Hawaiian duck, also known as koloa maoli was historically known to all major Hawaiian Islands, except for Lanaʻi and Kahoʻolawe. It is now limited to Kauaʻi, Niʻihau, Oʻahu, Maui, and Hawaiʻi. The Hawaiian duck is found on the windward wetland complexes and the north shore (USFWS 1999c). This species' preferred habitat includes lowland marshes, reservoirs, pastures, and wetlands (USFWS 1999c). It nests on the ground, near water in well concealed and protected areas (NatureServe 2001). Food includes green algae, rice, grasses, grass seeds, earthworms, insects, and snails (NatureServe 2001). This species is threatened by the loss of wetland habitat.

Asio flammeus sandwichensis (FSOC+/SE*/G5T3). Pueo, also known as the short-eared owl is believed to be native to the Hawaiian Islands (HINHP 1994a). It is found in a range of habitats, such as pastures, grasslands, dry or wet forests, with either native or nonnative dominated vegetation and up to 7,900 feet above sea level (HINHP 1994a). Pueo feed heavily on introduced mammals, such as house mice and rats. They are active during the day, which is unusual for most owl species. It nests on the ground, usually on grass (HINHP 1994a). Young pueo have been observed in nest from March to November. Threats to this species include habitat loss and introduction of large mammals, such as mongooses, that prey on their eggs.

- **SBMR:** The pueo was observed in the SBMR ROI in the western portion of the Waiʻanae survey area, along the Waiʻanae Range, and on the Schofield Barracks Forest Reserve, in the vicinity of Mohiākea Gulch (R. M. Towill Corp. 1997b). A pueo was observed at the border or SBMR within the ROI (PCSU 2001).
- **DMR:** No pueo has been observed on DMR, but there are small portions of suitable habitat present (PCSU 2001), so it could occur in the area.
- **KTA:** Signs of this species at KTA were observed during previous studies (Shallenberger 1977; USARHAW and 25th ID [L] 2001a), and the pueo could occur in several areas of the KTA ROI.
- **PTA:** The pueo was observed in the PTA ROI by a Tetra Tech biologist during a site visit 12/30/02.

Branta sandvicensis (FE/SE/G1). Hawaiian goose, also known as nēnē, had an historical distribution which included lowland habitats that have since been destroyed or inhabited by invasive non-natives that prey on the Hawaiian goose (NatureServe 2001). The Hawaiian goose is known in portions of the Island of Hawaii, Maui, and a lowland area near Lihūʻe, Kauaʻi. It does not require open water and inhabits bare rocks and sparsely vegetated lava flows. The nēnē moves in the summer from barren lava areas to forage on nonnative grass dominated pastures (Virginia Tech 1998; NatureServe 2001). It feeds primarily on berries and native vegetation and nests in areas of low vegetation, along the edges of mesic to wet forest, shrub/scrub, grassland, and rugged lava flows in upland scrub growth (Virginia Tech 1998; 25th ID [L] and USARHAW 2001b). Nesting season is from October to March (NatureServe 2001). This species is threatened by predation by humans and introduced species and habitat loss/degradation.

- **PTA:** The Hawaiian goose has been found in several areas of PTA. Shallenberger in 1977 found droppings in Training Area 1, Training Area 23, and the southwest portion of the impact area. These sightings occurred within the project ROI.

Buteo solitarius (FE/SE/G1). The Hawaiian hawk, also known as 'io, is endemic to the Island of Hawaii. It inhabits cropland, hedgegrow, hardwood forest, herbaceous grassland, and hardwood woodland (NatureServe 2001). It breeds in the spring, with a peak in April and May (Virginia Tech 1998). It nests in a variety of habitats, from agricultural fields to native and nonnative forests. The Hawaiian hawk is an opportunistic feeder that eats birds, rodents, and insects. The Hawaiian hawk is threatened by the loss of nesting habitat and disruption of nests by human activity, which can easily cause nest abandonment. The USFWS created a recovery plan, which outlines protection and restoration measures necessary for the recovery of this species (USFWS 1984).

- **PTA:** This species has been observed on PTA and was recorded at Training Area 23 in a 1998 survey (USARHAW and 25th ID [L] 2001b). This species was observed during a 1977 and a 1998 survey of PTA (Shallenberger 1977; Schnell et al. 1998) confirming their occurrence in the ROI.

Chasiempis sandwichensis ibidis (FE/SE/G4T1). (O'ahu 'elepaio). This bird is native to O'ahu. This species inhabits native Hawaiian forest but is most common in riparian habitats, in moist forests with tall canopy and an extensive understory (Shallenberger and Vaughn 1978; USFWS 2001a). The 'elepaio appears to tolerate introduced species and disturbed environments, as demonstrated by its use of such environment. It is estimated however, to inhabit less than eight percent of its former range and is now confined to the Ko'olau and Wai'anae mountains (Na Manu 2002; USFWS 2001a). It breeds generally from January to June. It nests are built on several types of plants, nonnative as well as native. The 'elepaio feeds on arthropods, such as insects and spiders. Threats to this species include habitat loss, predation and spread of disease. Nonnative species are believed to be a significant cause of predation to this species and to serve as disease vectors. Critical habitat has been designated for the O'ahu 'elepaio (USFWS 2001b).

- **SBMR:** The 'elepaio was observed during the HINHP survey in the southern portion of the Wai'anae survey area, near Pu'u Hāpapa at SBER, along the Schofield Waikāne Trail (R. M. Towill Corp. 1997b).
- **DMR:** It has not been observed on DMR, but there is suitable habitat for it (PCSU 2001), so it could occur in the area.
- **KTA:** Shallenberger recorded the O'ahu 'elepaio at KTA in a 1977 survey (Shallenberger 1977; PCSU 2001), so it is known to occur in the ROI.

Chasiempis sandwichensis sandwichensis (+/G4). The 'elepaio is a rare species that is endemic to Hawai'i. This species inhabits native and nonnative forest and riparian habitats (NatureServe 2001). Their breeding season generally takes place from February to August. Nests are built in the fork or branches of trees such as the native 'ōhi'a or the nonnative java plum, fiddlewood and guava at heights of 7 to 52 ft (NatureServe 2001). The 'elepaio feeds on insects in areas of high foliage density (NatureServe 2001). It is unclear why adult 'elepaio adults are declining at PTA but further study is recommended and predator control is recommended (PCSU 2002, pg 78).

- **PTA:** This species has been recorded on PTA in the ROI (Gon et al. 1993, Table 10 [T30], Cooper et al. 1996).

Fulica alai (FE/SE/G2). Hawaiian coot, also known as 'alae ke'oke'o, was historically found on all of the larger Hawaiian Islands, except for Lana'i and Kaho'olawe. Kaho'olawe is the only main Hawaiian Island where the coot is not currently found. This species is found most frequently on the

east, west, and north shores of O‘ahu, and less frequently at the south shore and interior reservoirs (USFWS 1999c). The coot’s preferred habitat is herbaceous wetland, lagoon, river mouth/tidal river, low gradient, pool, and shallow water (NatureServe 2001). The coot feeds on a variety of foods, including seeds, berries, insects, small fish, and leaves (NatureServe 2001). Loss of wetland habitat is considered the greatest threat to this species (USFWS 1999c).

- **DMR:** It could occur in the DMR ROI, based on the presence of suitable foraging habitat in the area.

Gallinula chloropus sandvicensis (FE/-). Hawaiian moorhen, also known as ‘ālae‘ula, was once commonly found on most of the Hawaiian Islands, except Lana‘i and Kaho‘olawe (USFWS 1999c). Currently the species is found only on O‘ahu and Kaua‘i. Moorhens are known to forage at Pearl Harbor in semi-brackish water and in the Lualualei Valley in the leeward side of the island (USFWS 1999c). The moorhen’s preferred habitat is freshwater marshes, brackish marshes, waterways, and wetlands. The loss of wetland and marsh habitat is considered a major threat to this species.

- **DMR:** It could occur in the DMR ROI, based on the presence of suitable foraging habitat in the area.

Hemignathus munroi (FE/SE/G1). ‘Akiapōlā‘au, also known as the honeycreeper, is a Hawaiian endemic species inhabits mesic to wet ‘ōhi‘a, koa-‘ōhi‘a, and koa-māmā forests, and dry māmā and māmā-naio forests; it is most common in mesic koa forests and woodlands (Virginia Tech 1998). The species requires native forest or woodland vegetation for cover and shelter (Virginia Tech 1998). Little is known about ‘Akiapōlā‘au breeding and nesting. One nest site was recorded in an ‘ōhi‘a tree along a lateral fork 39 feet above ground. ‘Akiapōlā‘au feeds on invertebrates, especially insects. Threats to this species include loss of nesting and breeding habitat and harassment by humans from shooting and disrupting nesting activity.

- **PTA:** ‘Akiapōlā‘au has been observed on PTA (USARHAW and 25th ID [L] 2001b), although several surveys found no evidence of the species (Shallenberger 1977; David 1995; Schnell et al. 1999; Gon et al. 1993). In 1995 a lone female was found in Training Area 2 (David 1995). This species could occur in the ROI, based on availability of foraging areas.

Hemignathus virens virens (+/G3). Amakihi is a Hawaiian endemic species that is relatively common to a small portion of the islands. The ‘amakihi inhabits native forests and shrublands above 1,640 feet on the Island of Hawaii and Maui (NatureServe 2001). It nests in branches of māmā and naio trees from March through May (NatureServe 2001) and feeds mainly on insects and nectar. It is threatened by loss and degradation of habitat.

- **PTA:** It is a Hawaiian endemic species that is relatively common to a small portion of the islands. This species occurs in the ROI (PCSU 2002).

Himatone sanguinea (+/G4). ‘Apanane is the most abundant native bird to the Hawaiian Islands. It is considered an important species because of its native status and the devastation that introduced species have caused to native birds and is federally identified as a bird of conservation concern. The ‘apanane is found in moderate to high numbers in Hawai‘i, Maui, and O‘ahu. This species inhabits the hardwood forest, most commonly in the native and mixed native/nonnative forests in higher elevations in Hawai‘i. Nesting season is late fall through summer, and it nests in the tops of ‘ōhi‘a

trees and treefern fronds in lava tubes (NatureServe 2001). It feeds on insects and nectar. Subspecies have been threatened by habitat loss and degradation caused by introduced species.

- **PTA:** This species occurs in the PTA ROI (PCSU 2002).
- **KTA:** This species has been observed at KTA during Shallenberger's 1977 survey and in the 1989 survey of the estate of James Campbell's Kahuku property (R. M. Towill Corp. 1997b).

Himantopus mexicanus knudseni (FE/G5T2). The Hawaiian stilt, also known as ae'o, were historically found on all of the Hawaiian islands, with the exception of Lana'i, Kaho'olawe, and the Island of Hawaii (USFWS 1999c). This species is currently found on all of the Hawaiian Islands, except for Kaho'olawe. The O'ahu population, which supports the greatest number of stilts in all of the Hawaiian Islands, are primarily found on the north and windward coasts (USFWS 1999c). The preferred nesting habitat is exposed mudflats with low growing vegetation (USFWS 1999c). The stilt forages in shallow water and wetlands, with invertebrates, such as insects, making up most of its prey. The greatest threat to this species is the loss of wetland habitat (USFWS 1999c).

- **DMR:** It is known to DMR in areas potentially affected by the Proposed Action.

Loxoiides bailleui (FE/SE/G1). Palila also known as ou-po'opāpale and po'opāpale, inhabits dense māmane woodlands, sparse māmane woodlands, and to a lesser degree, pasture (USGS 2001a and 2001b). Palila is thought to have occurred prehistorically on O'ahu and Kaua'i at low elevations and was historically limited to portions of the Island of Hawaii, where it was found on the slopes of Mauna Kea and parts of Hualalai and Mauna Loa (USGS 2001b and 2001c). It is believed to inhabit less than five percent of its former range (NatureServe 2001; USGS 2001b and c). Nesting has been documented from January to October, with a peak in activity from April through September (USGS 2001 b and 2001c; NatureServe 2001). It nests in September in māmane or naio trees in higher density māmane-dominant forest (USGS 2001b and 2001c; NatureServe 2001). It feeds on māmane and insects. The Palila is sensitive to habitat degradation, particularly the loss of habitat due to fire (NatureServe 2001). It is also threatened by avian diseases and introduced species degradation of habitat and predation.

- **PTA:** Critical habitat has been designated on the Island of Hawai'i in two noncontiguous portions of Mauna Kea, along the northern boundary of PTA (USFWS 1977a and 1977b; USARHAW and 25th ID [L] 2001b). This species is known to occur on PTA along the upper slopes of Mauna Kea. Annual surveys have occurred along federally designated palila critical habitat on PTA (Figure 9.10-5), although no individuals have been identified since 1950 (USARHAW and 25th ID [L] 2001b; Gon et al. 1993). The recorded sighting of the Palila was within the PTA ROI.

Loxops coccineus wolstenholmii (-/G2). O'ahu 'ākepa is native to O'ahu. It generally inhabits montane 'ōhi'a-koa forest above the 3,000 foot level (Na Manu 2002). This species feeds on insects and nectar and often nests in tree cavities. The 'ākepa is threatened by deforestation and habitat degradation, which have caused the introduction of nonnative species. Nonnative species can act as

disease vectors and frequently prey on native species or out-compete them for resources (NatureServe 2001).

- **SBMR:** The ‘ākepa was observed in the Ko‘olau survey area on SBER, within the ROI.

Myadestes obscurus (+/G4). ‘Ōma‘o is a Hawaiian endemic species that has lost approximately 70 percent of its historic habitat (NatureServe 2001). It primarily inhabits mesic and wet native (*Metrosideros polymorpha*) and mixed ‘ōhi‘a and koa (*acacia koa*) forests above 3,300-foot elevation (NatureServe 2001). Nesting activities peak from April to July. The ‘ōma‘o is an opportunistic species that generally feeds on fruit and insects. Although this species appears to be stable, it has had lowered success in the recent past due to habitat loss and introduced species (NatureServe 2001).

- **PTA:** This species could be in the ROI, based on the availability of foraging areas.

Paroreomyza maculata (FE/SE/G1). O‘ahu creeper, also known as ‘āluahio, inhabits hardwood forest, occurring in mixed ‘ōhi‘a-koa forest, alongside ridges and valleys (NatureServe 2001). Although the O‘ahu creeper was found in the Wai‘anae and Ko‘olau Mountains in the late 19th century (HINHP 1994a), its numbers are so reduced that it is very rarely sighted. Its present distribution cannot be determined. Threats to this species include loss of habitat, through development and conversion of the forest, and introduced species, which prey on or out-compete the creeper or degrade its habitat (NatureServe 2001), through development and conversion of the forest, and introduced species, which prey on or outcompete with the creeper or degrade its habitat (NatureServe 2001).

- **SBMR:** Several O‘ahu creepers were observed along the Wai‘anae survey area, at Mt. Ka‘ala Natural Area Reserve, and at Schofield Barracks Forest Reserve, in the vicinity of Mohiākea Gulch. The O‘ahu creeper was observed along the Schofield Waikāne Trail and in the southern portion of the Ko‘olau survey area at SBER (R. M. Towill Corp. 1997b). These sightings confirm the presence of this species at both SBMR and SBER.
- **DMR:** It has not been recorded on DMR (PCSU 2001). The O‘ahu creeper is unlikely to occur on the DMR ROI due to lack of suitable habitat.
- **KTA:** This species could occur in the KTA ROI. This species is historically known to occur in the ROI but there have been no confirmed sightings at either location in the last 20 years (PCSU 2001).

Pterodromoa phaeopygia sandwichensis (FE/SE/G1). Hawaiian dark-rumped petrel, also known as ‘ua‘u, is an open ocean species that breeds along barren mountain slopes (NatureServe 2001). Originally it bred at low elevations throughout the Hawaiian Islands, but it presently breeds only in higher elevations (NatureServe 2001) in spring and summer. This species feeds primarily on fish and squid, although the young are also fed crustaceans. It is threatened by human hunting and introduced species, such as the mongoose, which preys on its eggs (USFWS 1983c).

- **PTA:** The dark-rumped petrel is believed to occur on PTA based on sightings of this species nearby and the availability of suitable habitat. A dark-rumped petrel was observed near PTA in a 1995 survey, and an unconfirmed report of a chick was made in 1990 (USARHAW and 25th ID [L.] 2001b). These sightings occurred within the project ROI.

Vestiaria coccinea (SE/G4). The i'iwi is an endemic forest bird, found most frequently in the upper canopies of 'ōhi'a (*Metrosideros*) forest at greater than 2,000 feet (NatureServe 2001). I'iwi primarily feeds on flower nectar of ohia but can also feed on foliage, insects, and spiders Threats to this species include habitat degradation and competition, predation, and the spread of disease from nonnative species (NatureServe 2001). Its rapid decline in Oahu is likely to have resulted due to a sensitivity to human induced disturbances (Gon et al. 1993, pg. 28).

- **SBMR:** The i'iwi has been observed at SBMR in the Mt. Ka'ala Natural Area Reserve and Schofield Barracks Forest Reserve and in the northern and central portions of the Ko'olau survey area in at SBER (R. M. Towill Corp. 1997b). This species is confirmed in the SBMR ROI.
- **DMR:** It has not been observed on DMR, which is not believed to have suitable habitat to support the species (PCSU 2001). This species is therefore not expected to occur in the DMR ROI.
- **KTA:** The i'iwi has never been reported on KTA and is unlikely to occur because there is very little suitable habitat to support it though the species has been observed on neighboring Kawaioloa Training Area, which the Drum Road and Helemanō Trail go through, and where suitable habitat is available. The species could occur in the ROI.
- **PTA:** This species occurs in the ROI, and was identified at PTA during a 1992 seabird survey (Gon et al. 1993, Table 10 [T30]).

Terrestrial Mammals

Lasiurus cinereus semotus (FE/SE/G5T2). Hawaiian hoary bat, also known as ‘ōpe‘ape‘a, is native to the Hawaiian Islands. This species is associated with native forests but has been observed among nonnative vegetation (USFWS 1999b). The hoary bat roosts in tree foliage; whether it prefers native trees has not been determined. Distribution of hoary bats once included most of Hawai‘i, Kaua‘i, and O‘ahu (USFWS 1999b; NatureServe 2001). Hoary bats are still considered common to Hawai‘i, but less so on the windward side (USFWS 1999b), and may be found primarily in the northern forested zone of Kaua‘i (NatureServe 2001). Bats found on O‘ahu and other Hawaiian Islands may be migrant individuals (USFWS 1999b). More surveys are needed to better understand the location of hoary bats on the Hawaiian Islands and to clear up seasonal gaps and contradictory information. Moths and other insects are the main prey of the hoary bat (USFWS 1999b). They frequently feed in clearings, such as fields, although in the fall and winter they have been observed foraging over a saltwater bay (NatureServe 2001). They are assumed to breed in the fall, based on mainland bat species closely related to the hoary bat (USFWS 1998a). Breeding populations are believed to be limited to the Island of Hawai‘i and possibly Kaua‘i. Although little scientific information is available to explain the decline in the population of the Hawaiian hoary bat, some potential causes include habitat loss from deforestation, contamination of prey from pesticides, and disturbance from human activities, such as military training. Activities of this kind can disturb roosting and cause the bats to abandon sites.

- **SBMR:** This species was detected on SBMR, in the Wai‘anae survey area. Hawaiian hoary bat is expected to occur at SBMR, based on the presence of suitable habitat. The hoary bat was also recorded near SBER, in the northern portion of the Ko‘olau survey area. The Hawaiian hoary bat is confirmed in the SBMR ROI, based on suitable habitat and proximity to recorded sightings.
- **DMR:** Although this species has not been confirmed on DMR, based on habitat requirements there is the potential for its occurrence there (PCSU 2001); therefore, the species could be found in DMR ROI.
- **KTA:** The Hawaiian hoary bat is expected to occur at KTA, based on the presence of suitable habitat (USARHAW and 25th ID [L] 2001a).
- **PTA:** The Hawaiian hoary bat has been recorded at multiple PTA locations, including Bradshaw AAF, which is part of the project ROI (Gon et al. 1993; Cooper et al. 1996).

Fish

***Leptipes concolor* (-/-/G3).** This goby species is endemic to the islands of Hawai'i. The goby's eggs are laid in nests in freshwater streams. Larvae are then carried downstream and into marine habitat. After several months they return to the streams, where they grow to adulthood and reproduce (NatureServe 2002).

There has been a large decline in the Oahu populations, where it is threatened by stream modifications and the introduction of nonnative fish (NatureServe 2002).

- KTA: *Leptipes concolor* has been recorded within the KTA ROI (Figure 7.10-3?) ((USARHAW and 25th ID [L] 2001a, HINHP 2002).

Marine Wildlife

Balaenoptera acutorostrata (MMPA). Minke whales are infrequently seen as solitary individuals around the northwest islands of Hawai'i, or also on the leeward sides of the islands (ONR 2000). Breeding appears to take place during winter in warmer waters, but little is known of their breeding behaviors in this area. There is little data on stock structure for these species in Hawaiian waters.

- **All Locations:** Minke whales may potentially occur in project area waters year round, most likely incidentally in the channels, on the leeward sides of the islands, or in offshore waters.

B. borealis (FE/MMPA). The IWC considers only one stock of the sei whale to exist in the North Pacific (NMFS 2000d), but some conflicting evidence exists for multiple stocks (Mizroch et al. 1984; Masaki 1977). Sei whales migrate from high latitude summer feeding grounds to lower latitude wintering areas, although little is known about the winter distribution of this species. They tend to move into offshore waters and are rarely seen off coastal areas; they seem to prefer open ocean (NMFS 2000d). There are no abundance estimates for this species in Hawaiian waters.

- **All Locations:** Sei whales are not expected to be found in project area waters.

B. edeni (MMPA). Bryde's whales are occasionally seen in the Hawaiian Islands, particularly in the northwest of the chain (Leatherwood et al. 1982); there was one documented sighting in 1977 near Kaua'i (DeLong and Brownell 1977). In the western North Pacific stock, estimates of the whale's numbers range from 10,000 to 49,000 (ONR 2000). Most likely due to this species' limited migration and confined distribution, the total world population is likely to be relatively small. There is conflicting data on the reproductive and migrating patterns of this species. Bryde's whale is unlikely to occur around the main Hawaiian Islands but is somewhat more commonly sighted by aerial or vessel surveys, or stranded (NMFS 2000g, 2000h). There is no data on stock structure or population numbers for these species.

- **All Locations:** Bryde's whales may potentially occur in project area waters year round, most likely as incidental transients.

B. musculus (FE/MMPA). As with the fin whale, additional evidence of the blue whale comes from acoustic recordings of its vocalizations (Thompson and Friedl 1982; Northrop et al. 1971; McDonald and Fox 1999). The stock structure of this species is uncertain, but the IWC and NMFS consider the North Pacific group to be one stock (NMFS 2000c).

- **All Locations:** This species is not expected to be found in project area waters. Blue whales are considered rare in project area waters, and there is only one published sighting record from 1966 (Berzin and Rovnin 1966) north of the main island chain.

B. physalus (FE/MMPA). The general distribution of fin whales is largely offshore, and abundance estimates indicate that this species is uncommon in the region (Balcomb 1987). Distribution and movement patterns for this species are assumed to consist of seasonal migrations between higher latitudes for foraging and lower latitudes for mating and calving. NMFS considers the fin whale stock found in Hawaiian waters as a separate stock (NMFS 2000b). Fin whales most likely migrate into

Hawaiian waters mainly in the fall and winter (Thompson and Friedl 1982; Northrop et al. 1968; McDonald and Fox 1999), based on acoustic recordings off O‘ahu and Midway islands.

- **All Locations:** This species is rarely sighted in project area waters but have been occasionally heard. Their distribution is largely offshore, and abundance estimates indicate that these species are uncommon in the region (Balcomb 1987). A multispecies feeding assemblage of 8 to 12 fin whales was observed in 1987 (Balcomb 1987) approximately 250 miles south of Honolulu. Additional sightings were reported north of O‘ahu in May 1976 and in the Kaua‘i Channel in February 1979 (Shallenberger 1981). More recently, a single fin whale was observed north of Kaua‘i during an aerial survey (Mobley et al. 1996). This species is not expected to be found in project area waters.

***Berardius bairdii* (MMPA).** Baird’s beaked whales are found in warm to cold temperate waters of the North Pacific. They have specific centers of abundance, some of which occur along the Emperor Seamounts, northwest of Hawaii. They occur inshore, but usually are found near or seaward of the continental shelf, especially around submarine escarpments and seamounts.

- **All Locations:** Baird’s beaked whales may potentially occur in project area waters year round,, most likely as incidental transients.

***Delphinus Delphis* (MMPA).** Common dolphins are pelagic (offshore) animals that eat fish and small squid. They are widely distributed, and tend to occur in tropical waters. They frequently adopt cooperative techniques to capture prey and herds will work together to dive and drive a school of fish to the surface. They are highly vocal animals and tend to occur in large active schools (1000-100,000 or greater in numbers).

- **All Locations:** These animals are less common than either the spinner or spotted dolphin groups and are unlikely in project area waters except as incidental transients.

***Eubalaena glacialis* (FE/MMPA).** The IWC and NMFS consider the North Pacific right whale stock to be one distinct stock (NMFS 2000e). The right whale is typically observed in temperate and subpolar waters.

- **All Locations:** Right whales occur rarely in the Hawaiian Islands area (Herman et al. 1980). A single right whale was observed in 1979 near Maui (ONR 2000) and another in 1996 (NMFS 2000e). This species is rare and is not expected to be found in project area waters.

***Globicephala macrorhynchus* (MMPA).** Pilot whale occurs off the Hawaiian Islands, and the most abundant species is the short-finned pilot whale (NMFS 2000l). This species occurs year-round in Hawaiian waters in herds of 20 to 40 individuals, with aggregations of over 100 occasionally observed (ONR 2000). The stock structure is poorly understood. The Hawaiian population estimates are approximately 1,800 animals (Mobley et al. 2000).

- **All Locations:** These animals are less common than either the spinner or spotted dolphin groups, but are known to pass through project area waters and have the potential to occur year round in all of the coastal waters off the seven islands. They have been confirmed in the DMR and PTA ROIs.

Grampus griseus (MMPA). Risso's dolphins are somewhat uncommon in Hawaiian waters. There have been four recorded strandings on the main seven islands (NMFS 2000u) and one documented group off the Kona Coast of the Island of Hawaii (Balcomb 1987). A recent aerial survey documented a sighting off the leeward side of O'ahu (Mobley et al. 2000).

- **All Locations:** These animals are less common than either the spinner or spotted dolphin groups. They may potentially occur in project area waters year round, most likely as incidental transients.

Kogia breviceps; K. simus (MMPA). The pygmy and dwarf sperm whale species are small, relatively solitary, apparently deep-diving whales that live in temperate to tropical deep waters from 60°N to 40°S around the world. They are especially common along continental shelf breaks. Based on their geographic distribution and the habitat of their preferred prey, both species are likely to be deep divers. Both species have been sighted in project area waters on several occasions over the last 20 years either by aerial or vessel surveys, or as strandings (NMFS 2000g, 2000h). There is no data on stock structure or population numbers for these species.

- **All Locations:** These animals are less common than either the spinner or spotted dolphin groups, but are known to pass through project area waters year round, and have the potential to occur in all of the coastal waters off the seven islands, most likely as incidental transients.

Megaptera novaeangliae (FE/MMPA). The waters off the coast of the project training areas are best known for their seasonal population of humpback whales, which are also the most abundant marine mammal in the project area (Mobley et al. 1999). The Hawaiian Islands serve as an important breeding ground for this species (Calambokidis et al. 1998). The humpback whale is the only one of the five endangered baleen whales that is known to be present historically in reasonably large numbers. The International Whaling Commission (IWC) and NMFS consider there to be three stocks of humpbacks in the North Pacific group, one of which is the Hawaiian population (NMFS 2000a). Humpback whales are found throughout the island chain and are most abundant in coastal waters of the main Hawaiian Islands, including Hawai'i and O'ahu, from November through April, with peak abundance occurring from late February through mid-March (Baker et al. 1981). Approximately two-thirds of the entire North Pacific humpback whale population (approximately 4,000 to 5,000 whales) migrate to Hawaiian waters to breed, calve, and nurse (NMFS 2000a). These whales are generally found in shallow water shoreward of the 600-foot depth contour (ONR 2000), although there have been reports of individuals up to 10.8 nautical miles off the west coast of the Island of Hawaii, over bottom depths of 4,593 feet. Cow/calf pairs appear to prefer very shallow water less than 60 feet (ONR 2000; Smultea 1992). Humpback whale (of varying pod sizes and types, including mother and calf pods) are commonly sighted off the O'ahu coast and may be expected in project area waters from late January through early April (Clark and Tyack 1998). Humpback whale mothers and calves prefer the calmer shallower waters often found on the leeward sides of the islands (Smultea 1992), and these pod compositions would be less commonly expected along the north shore of O'ahu. Some results suggest that habitat use patterns of females and calves in nearshore Maui waters might have decreased, perhaps due to increasing vessel and human activities (ONR 2000). Humpback whales are vulnerable to human disturbance in Hawaiian waters and possibly to vessel strikes. Hawai'i regulations prohibit boats from approaching within 100 yards of adult whales and within 300 yards of mother/calf pairs.

- **All Locations:** This species is confirmed in project area waters and is expected to occur consistently from January 1- April 30.

Mesoplodon and Ziphius spp. (MMPA). Beaked whales, a sub-group of cetaceans, is found year-round in Hawaiian waters. Beaked whale mainly forages offshore in relatively deep water (ONR 2000). Types of beaked whales that may occur include Baird's (*Berardius bairdii*), Blainville's (*Mesoplodon densirostris*), and Cuvier's (*Ziphius cavirostris*). Distributions and abundances of beaked whale in project area waters are still poorly understood. Cuvier's seems to be the most widely distributed in the main Hawaiian Islands (NMFS 2000m), and recent sighting records indicate this species off both O'ahu and Island of Hawaii shores (Mobley et al. 2000). Baird's beaked whale is considered unlikely to occur in the main Hawaiian Islands, though it has been observed on aerial surveys and vessel surveys (ONR 2000). Blainville's beaked whale is more common in Hawaiian waters than elsewhere in the North Pacific (NMFS 2000n) but is seen only occasionally, either in deeper offshore waters or off the coast of O'ahu and the Island of Hawaii (Mobley et al. 2000). There is no information on stock structure of these species.

- **All Locations:** This species is confirmed in project area waters and is expected to occur in small numbers year round.

Monachus schauinslandi (MMPA). The monk seal is the only pinniped species known to occur in the Hawaiian archipelago. This species occurs only in the Hawaiian Islands, where its greatest distribution and abundance occurs in the small, mostly uninhabited, northwest island chain. These are the islands and atolls stretching 1,100 nautical miles northwest of the main Hawaiian Islands, most of which are included in the Hawaiian National Refuge (NMFS 2000w). Incidental transients are known from all the main seven island chain, and there is a small uncounted population on the island of Ni'ihau (NMFS 2000w). The species is managed as one stock, though each island may in fact have its own subpopulations (NMFS 2000w). This seal tends to stay near land. Virtually nothing is known about the distribution and movement patterns of this species when they are at sea. Hawaiian monk seals have been counted since the late 1950s at the atolls, islands, and reef, where they haul out on the northwest Hawaiian Islands. Current estimates indicate that the monk seal population is declining and is believed to include approximately 1,000 animals. Hawaiian monk seals breed primarily at Laysan Island, Lisianski Island, and Pearl and Hermes reefs but also are known to use the Midway Islands, among other northwest Hawaiian Islands (NMFS 2000w). The colony on Midway was virtually eliminated by the US Navy, which has used the island since the early 1960s, but current counts suggest that the seals may be reestablishing themselves on Midway as a major breeding site.

- **All Locations:** This species occurs only in the Hawaiian Islands. Incidental transients are known from all the main seven island chain, and there is a small uncounted population on the island of Ni'ihau (NMFS 2000w). This species is expected to occur in project area waters year round in either the DMR or PTA ROI, though incidence would be low.

Orcinus orca (MMPA). The killer whale is found in all the world's oceans, from about 80°N to 77°S but is most common within 430 nautical miles of major continents in cold temperature to subpolar waters (ONR 2000). Killer whales in the Hawaiian archipelago are a distinct stock genetically (NMFS 2000i). Sightings occur anecdotally almost yearly in the main seven Hawaiian islands, but documented sightings are less common. No killer whales were sighted within 25 nautical miles of the

main island chain during a six-year aerial survey study (Mobley et al. 2000), but there have been two documented sightings or strandings in the last few decades (NMFS 2000i). Killer whales are more common in the French Frigate Shoals (NMFS 2000i). Sightings typically consist of small groups or single animals and can occur at any time of year (ONR 2000).

- **All Locations:** This species is confirmed in project area waters and is expected to occur in small numbers year round.

Peponocephala electra (MMPA). Melon-headed whale is generally distributed from 20°S to 20°N (ONR 2000). It is found in tropical and temperate waters throughout the world and has been commonly sighted off the south and eastern coasts off O‘ahu and the north coast of the Island of Hawaii (Mobley et al. 2000; NMFS 2000o). It typically occurs in large pods and could occur in the project area and may be incidentally sighted in waters adjacent to the islands’ north shores.

- **All Locations:** This species is confirmed in project area waters and is expected to occur in small numbers year round.

Physeter macrocephalus (FE/MMPA). The sperm whale is the only toothed whale in the project area. While sperm whales are listed as endangered, but they are considered to be the most abundant of the large whale species, numbering an estimated 1,900,000 animals worldwide (ONR 2000). While deep water is their typical habitat, sperm whale have been occasionally observed in shallower areas. When found relatively close to shore, sperm whales are usually associated with sharp increases in bottom depth, where upwelling occurs and biological production is high, implying the presence of a good food supply. Sperm whales have been sighted offshore of all of the main seven islands (NMFS 2000v), and they have been heard off O‘ahu year-round (NMFS 2000v). This species has the potential to occur in project area waters. Historically, sperm whaling grounds in the Pacific south of 40°N latitude were around the Hawaiian Islands, among other areas. Sperm whales are considered fairly common around Midway Atoll (ONR 2000). For stock assessment purposes, NMFS recognizes three discrete population centers of sperm whales, one of which is found in Hawai‘i (NMFS 2000v). Sperm whales can dive to depths of at least 6,562 feet and can remain submerged for an hour or more. During summer, they migrate to high latitudes, with mature males migrating much farther north than females and younger males. In the Pacific Ocean, females and younger whales usually remain in tropical and temperate waters, while males continue north to the Gulf of Alaska, the Aleutian Islands, and the Bering Sea or south to the Antarctic. Breeding herds are confined almost exclusively to warmer waters, and many of the larger males return to lower latitudes in winter to breed. Sperm whales in the Pacific Ocean during this time are usually distributed below 40°N latitude.

- **All Locations:** This species is confirmed in project area waters and is expected to occur in small numbers year round.

Pseudorca crassidens (MMPA); Feresa attenuate (MMPA). False killer whale is found occasionally in Hawaiian waters during all seasons (NMFS 2000j). Pygmy killer whale is found less frequently, but when it is sighted it is most commonly off the Island of Hawaii and off O‘ahu. Pygmy killer whale also occurs in all Hawaiian waters during all seasons (NMFS 2000k). Both species travel in groups of half a dozen to over several hundred individuals. Population estimates and stock information for both species is poorly understood (NMFS 2000j, 2000k).

- **All Locations:** This species is confirmed in project area waters and is expected to occur in small numbers year round.

Stenella attenuata (MMPA). Several species of pantropical spotted dolphins occur in Hawaiian waters, the most common of which is *Stenella attenuata* (NMFS 2000s). Spotted dolphins occur in smaller group sizes than spinners and sometimes can intermix in spinner dolphin groups (NMFS 2000s). Spotted dolphins occur both nearshore and offshore (ONR 2000). This species is common and abundant in Hawaiian waters, especially in the channels between the islands and on the leeward sides of the islands (NMFS 2000s). The Hawaiian spotted dolphin is a distinct stock, with a population estimate of approximately 3,000 animals (Mobley et al. 2000). The Hawaiian stock of striped dolphins is a distinct stock (NMFS 2000t), and there have been documented sightings off the leeward side of O‘ahu (NMFS 2000t). This animal is less common than either the spinner or spotted dolphin groups but has the potential to occur in all of the waters off the seven islands.

- **All Locations:** This species is confirmed in project area waters and is expected year round in large groups and with regular frequency.

S. longirostris (MMPA). Spinner dolphin is also very common and abundant in Hawaiian waters and can occur in huge groups of over 400 animals (NMFS 2000q). It gathers in large herds at night, offshore and in deep channels between the islands, for feeding. It tends to rest on the leeward sides of the islands. The Hawaiian spinner group is a distinct stock, with a population estimate of approximately 4,000 animals (Mobley et al. 2000). It is common on the leeward sides of both O‘ahu and the Island of Hawaii. There is some evidence that there may be a residential population of spinner dolphins off the coast of the Island of Hawaii (NMFS 2000q).

- **All Locations:** This species is confirmed in project area waters and is expected year round in large groups and with regular frequency.

S. coeruleoalba (MMPA). The Hawaiian stock of striped dolphins is also a distinct stock (NMFS 2000t), and there have been documented sightings off the leeward side of O‘ahu (NMFS 2000t). These animals are less common than either the spinner or spotted dolphin groups, but have the potential to occur in all of the coastal waters off the seven islands.

- **All Locations:** This species is confirmed in project area waters and is expected to occur in small numbers year round.

Steno bredanensis (MMPA). Rough-toothed dolphin is relatively common in the vicinity of the Hawaiian Islands in offshore waters, typically occurring over bottom depths greater than 1,640 feet (NMFS 2000r). This species usually travels in groups of three to four, many small groups sometimes using one area. There is no information on stock structure for this species.

- **All Locations:** This species is confirmed in project area waters and is expected to occur in small numbers year round.

Tursiops truncatus (MMPA). Bottlenose dolphin is common both along the coastlines and farther offshore (NMFS 2000p). It is considered to be frequent off all coasts of O‘ahu and the Island of Hawaii. The Hawaiian group is a separate stock of bottlenose.

- **All Locations:** This species is confirmed in project area waters and is expected year round in large groups and with regular frequency.

Sea Turtles

Caretta caretta (FT). Loggerheads do not nest in the Hawaiian Islands at all (NMFS 2000bb). Loggerheads occur circumglobally, inhabiting waters off the continental shelf in temperate, subtropical, and tropical waters. Loggerhead sea turtles are rare in Hawaiian nearshore waters (NMFS 2000bb; ONR 2000). They nest in the lower latitudes of the Atlantic coast. Nesting trends for the loggerhead are generally considered to be declining (NMFS 2000bb). Loggerheads take approximately 20 to 30 years to mature, so the suspected decline in immature loggerheads might not be apparent on nesting beaches for decades.

- **All Locations:** This species is uncommon in project area waters.

Chelonia mydas (FT). The most accurate abundance estimates in the project area are for adult female green turtles which nest annually on Hawaiian beaches (NMFS 2000x, 2000y). An estimated 450 to 475 green turtles nest annually in Hawaii (NMFS 2000x). The green sea turtle is considered the most abundant sea turtle in Hawaiian waters, with approximately 1,400 adult females (NMFS 2000x). It is hypothesized that green turtles in the Hawaiian archipelago could be a genetically distinct subpopulation (NMFS 2000x). During the breeding season, adult green sea turtles undertake long-distance oceanic migrations from feeding areas located throughout the Hawaiian archipelago to nesting beaches at French Frigate Shoals, Laysan Island, Lisianski Island, Pearl Reef and Hermes Reef, Kure Atoll, and Midway Island. The nearshore waters of Kaua‘i, especially the north shore area, are important habitats for subadult and adult green sea turtles returning from open ocean. Approximately 90 percent of green turtle nesting in the Hawaiian Islands occurs at French Frigate Shoals. Juveniles and subadult green turtles are abundant in the nearshore areas off the Island of Hawaii and O‘ahu, as well as off Maui, Kaho‘olawe, Moloka‘i, Kaua‘i, and Ni‘ihau (NMFS 2000x). This species is also commonly sighted at Midway Atoll but does not appear to breed there (ONR 2000).

- **All Locations:** The green sea turtle are the most abundant (ONR 2000; NMFS 2000x-z, 2000aa, 2000bb) in project area waters. Green sea turtles may occur in project area waters or on the coastline of the north shore.

Dermochelys coriacea (FE). Leatherbacks do not nest regularly or in great numbers in the Hawaiian Islands (NMFS 2000x, 2000aa). Adult leatherbacks are commonly sighted in the Pacific Ocean near the Hawaiian archipelago, primarily over deep oceanic waters. Leatherbacks do not nest regularly in the Hawaiian Islands. Leatherbacks could occur equally as frequently off any of the main seven islands, but they are often sighted off the north shores of both O‘ahu and the Island of Hawaii (NMFS 2000z; ONR 2000).

- **All Locations:** This species is expected in project area waters. They are more typically sighted along the north shore and in offshore waters (NMFS 2000z).

Eretmochelys imbricata (FE). The hawksbill turtle population is very small, with only 12 to 15 nests recorded each year (NMFS 2000y). While all age categories of hawksbills occur in Hawaiian waters, they are considered uncommon; a small number of hawksbills nest on the Island of Hawaii and on Molokai each year (NMFS 2000y). Their migration routes are unknown. No hawksbill turtles have been reported in the vicinity of Midway Atoll (ONR 2000).

- **All Locations:** The hawksbill is uncommon in project area waters and is not expected to occur there.

Lepidochelys olivacea (FT). Olive ridleys do not nest regularly or in great numbers in the Hawaiian Islands (NMFS 2000x, 2000aa). Olive ridley sea turtles are not common in Hawaiian waters, although they are the most abundant sea turtle in the eastern Pacific Ocean (NMFS 2000aa). Most records of this species in Hawaiian waters are from entanglements and strandings. There is only one report of a successful nesting in the Hawaiian Islands region, on Maui (NMFS 2000aa).

- **All Locations:** This species is uncommon in project area waters.

I-1D: CRITICAL HABITAT

SBMR

Plant

Proposed Critical habitat designation for plants includes the following species:

- *Abutilon sandwicense*;
- *Alectryon macrococcus*;
- *Chamaesyce rockii*;
- *C. acuminata*;
- *C. koolauensis*;
- *C. st-johnii*;
- *Cyrtandra subumbellata*;
- *Delissea subcordata*;
- *Diellia falcata*;
- *Flueggea neowawraea*;
- *Gardenia mannii*;
- *Hesperomannia arborescens*;
- *Isodendron laurifolium*;
- *I. longifolium*;
- *Labordia cyrtandrae*;
- *Lepidium arbuscula*;
- *L. lobata* var. *leptophylla*;
- *Lobelia gaudichaudii*;
- *L. oahuensis*;
- *Phlegmariurus nutans*;
- *Phyllostegia hirsuta*;
- *P. mollis*;
- *Pteris lidgatei*;

- *Sanicula purpurea*;
- *Tetraplasandra gymnocarpa*;
- *Tetramolopium lepidotum* ssp. *Lepidotum*;
- *Urea kaalae*;
- *Viola chamissoniana* ssp. *Chamissoniana*; and
- *V. oahuensis*.

Wildlife

The USFWS designated critical habitat for O‘ahu ‘elepaio on December 10, 2001 (USFWS 2001b) (Figure 5.10-6).

DMR

Critical habitat has been proposed or designated for several species on DMR and includes portions of the installation. USFWS has designated critical habitats for the following species:

Plant

- *Schiedea kealiae*, draft May 2002 (USFWS 2002b).

Wildlife

No federally designated critical habitat exists in the DMR ROI for wildlife.

KTA

Plant

Plants known on KTA with critical habitat proposed by the USFWS are *Cyanea koolauensis*, *Eugenia koolauensis*, *Gardenia mannii*, *Hesperomannia arborescens*, and *Tetraplasandra gymnocarpa*.

Wildlife

No federally designated critical habitat exists in the KTA ROI for wildlife.

PTA

Plant

- *Asplenium fragile* var. *insulare*;
- *Hedyotis coriacea*;
- *Neraudia ovata*;
- *Portulaca sclerocarpa*;
- *Silene hawaiiensis*;
- *S. lanceolata*;
- *Solanum incompletum*;
- *Spermolepis hawaiiensis*;
- *Tetramolopium arenarium* var. *arenarium*; and
- *Zanthoxylum hawaiiense*.

Wildlife

The USFWS in 1977 designated almost 109,000 total acres as critical habitat for the palila (*Loxiodes bailleui*) (USFWS 1977a and 1977b) (Figure 9.10-5).

Fish and Wildlife Service
Washington, DC 20240

September 14, 2000

To: Regional Directors

From: Director /s/ Jamie Rappaport Clark

Subject: Service Guidance on the Siting, Construction, Operation and Decommissioning of Communications Towers

Construction of communications towers (including radio, television, cellular, and microwave) in the United States has been growing at an exponential rate, increasing at an estimated 6 percent to 8 percent annually. According to the Federal Communication Commission's *2000 Antenna Structure Registry*, the number of lighted towers greater than 199 feet above ground level (AGL) currently number over 45,000 and the total number of towers over 74,000. Non-compliance with the registry program is estimated at 24 percent to 38 percent, bringing the total to 92,000 to 102,000. By 2003, all television stations must be digital, adding potentially 1,000 new towers exceeding 1,000 feet AGL.

The construction of new towers creates a potentially significant impact on migratory birds, especially some 350 species of night-migrating birds. Communications towers are estimated to kill 4-5 million birds per year, which violates the spirit and the intent of the Migratory Bird Treaty Act and the Code of Federal Regulations at Part 50 designed to implement the MBTA. Some of the species affected are also protected under the Endangered Species Act and Bald and Golden Eagle Act.

Service personnel may become involved in the review of proposed tower sitings and/or in the evaluation of tower impacts on migratory birds through National Environmental Policy Act review; specifically, Sections 1501.6, opportunity to be a cooperating agency, and 1503.4, duty to comment on federally-licensed activities for agencies with jurisdiction by law, in this case the MBTA, or because of special expertise. Also, the National Wildlife Refuge System Improvement Act requires that any activity on Refuge lands be determined as compatible with the Refuge system mission and the Refuge purpose(s). In addition, the Service is required by the ESA to assist other Federal agencies in ensuring that any action they authorize, implement, or fund will not jeopardize the continued existence of any Federally endangered or threatened species.

A Communication Tower Working Group composed of government agencies, industry, academic researchers and NGO's has been formed to develop and implement a research protocol to determine the best ways to construct and operate towers to prevent bird strikes. Until the research study is completed, or until research efforts uncover significant new mitigation measures, all Service personnel involved in the review of proposed tower sitings and/or the evaluation of the impacts of towers on migratory birds should use the attached interim guidelines when making recommendations to all companies, license applicants, or licensees proposing new tower sitings. These guidelines were developed by Service personnel from research conducted in several eastern, midwestern, and southern states, and have been refined through Regional review. They are based on the best information available at this time, and are the most prudent and effective measures for avoiding bird strikes at towers. We believe that they will provide significant protection for migratory birds pending completion of the Working Group's recommendations. As new information becomes available, the guidelines will be updated accordingly.

Implementation of these guidelines by the communications industry is voluntary, and our recommendations must be balanced with Federal Aviation Administration requirements and local community concerns where necessary. Field offices have discretion in the use of these guidelines on a case by case basis, and may also have additional recommendations to add which are specific to their geographic area.

Also attached is a [Tower Site Evaluation Form](#) which may prove useful in evaluating proposed towers and in

6. Tower designs using guy wires for support which are proposed to be located in known raptor or waterbird concentration areas or daily movement routes, or in major diurnal migratory bird movement routes or stopover sites, should have daytime visual markers on the wires to prevent collisions by these diurnally moving species. (For guidance on markers, see *Avian Power Line Interaction Committee (APLIC). 1994. Mitigating Bird Collisions with Power Lines: The State of the Art in 1994. Edison Electric Institute, Washington, D.C., 78 pp.*, and *Avian Power Line Interaction Committee (APLIC). 1996. Suggested Practices for Raptor Protection on Power Lines. Edison Electric Institute/Raptor Research Foundation, Washington, D.C., 128 pp.* Copies can be obtained via the Internet at <http://www.eei.org/resources/pubcat/enviro/>, or by calling 1-800/334-5453).
7. Towers and appendant facilities should be sited, designed and constructed so as to avoid or minimize habitat loss within and adjacent to the tower “footprint”. However, a larger tower footprint is preferable to the use of guy wires in construction. Road access and fencing should be minimized to reduce or prevent habitat fragmentation and disturbance, and to reduce above ground obstacles to birds in flight.
8. If significant numbers of breeding, feeding, or roosting birds are known to habitually use the proposed tower construction area, relocation to an alternate site should be recommended. If this is not an option, seasonal restrictions on construction may be advisable in order to avoid disturbance during periods of high bird activity.
9. In order to reduce the number of towers needed in the future, providers should be encouraged to design new towers structurally and electrically to accommodate the applicant/licensee’s antennas and comparable antennas for at least two additional users (minimum of three users for each tower structure), unless this design would require the addition of lights or guy wires to an otherwise unlighted and/or unguyed tower.
10. Security lighting for on-ground facilities and equipment should be down-shielded to keep light within the boundaries of the site.
11. If a tower is constructed or proposed for construction, Service personnel or researchers from the Communication Tower Working Group should be allowed access to the site to evaluate bird use, conduct dead-bird searches, to place net catchments below the towers but above the ground, and to place radar, Global Positioning System, infrared, thermal imagery, and acoustical monitoring equipment as necessary to assess and verify bird movements and to gain information on the impacts of various tower sizes, configurations, and lighting systems.
12. Towers no longer in use or determined to be obsolete should be removed within 12 months of cessation of use.

In order to obtain information on the extent to which these guidelines are being implemented, and to identify any recurring problems with their implementation which may necessitate modifications, letters provided in response to requests for evaluation of proposed towers should contain the following request:

“In order to obtain information on the usefulness of these guidelines in preventing bird strikes, and to identify any recurring problems with their implementation which may necessitate modifications, please advise us of the final location and specifications of the proposed tower, and which of the measures recommended for the protection of migratory birds were implemented. If any of the recommended measures can not be implemented, please explain why they were not feasible.”

APPENDIX J

CULTURAL RESOURCES

APPENDIX J-1

FINAL PROGRAMMATIC AGREEMENT AND CONSULTATION DOCUMENTATION

**Programmatic Agreement (PA)
among the United States Army Garrison, Hawaii,
the Hawai'i State Historic Preservation Office and the Advisory Council on Historic
Preservation for Section 106 Responsibilities for the Army Transformation of
the 2nd Brigade, 25th Infantry Division (Light) to a Stryker Brigade Combat Team
(SBCT)**

WHEREAS, on April 11, 2002, the Department of the Army (Army) issued its Record of Decision to proceed with a multi-year, phased, and synchronized process to transform the Army; and

WHEREAS, Army Transformation initially involves converting six Army brigades to Stryker Brigade Combat Teams (SBCT); and

WHEREAS, one of the six brigades identified by the Army for conversion to an SBCT is the Second (2nd) Brigade of the 25th Infantry Division (Light) (25 ID (L)), subject to evaluation of the potential effects of project and site specific proposals for transformation actions pursuant to the National Historic Preservation Act of 1966, as amended; and

WHEREAS, the U.S. Army Garrison, Hawaii (Installation), by and through the Garrison Commander, proposes to implement the Department of the Army decision to transform the 2nd Brigade of the 25th ID (L) to an SBCT; and

WHEREAS, twenty-eight (28) currently planned SBCT projects, listed in Appendix A, the introduction of the Stryker vehicle, and any future SBCT projects or activities, with potential adverse effects to historic properties within their areas of potential effects (APEs) are located at various Installations and sites on the islands of O'ahu and Hawai'i; and

WHEREAS, the Installation has determined that the implementation of these projects has the potential to adversely affect historic properties within their respective areas of potential effect (APEs) as indicated in Appendix A; and

WHEREAS, the Installation has determined that one of these projects is on Hickam Air Force Base National Historic Landmark and addressed in a separate EA; and one project is on the Wheeler Army Airfield National Historic Landmark and the Installation has determined that there are "no historic properties affected;" and

WHEREAS, the Installation has consulted with the Advisory Council on Historic Preservation (ACHP) and the State Historic Preservation Officer (SHPO), pursuant to Section 800.14 of the regulations (36 CFR Part 800) implementing Section 106 of the National Historic Preservation Act (16 USC 470f), and invites them to execute this programmatic agreement (PA); and

WHEREAS, the Installation has consulted with the Office of Hawaiian Affairs (OHA), National Park Service (NPS), Royal Order of Kamehameha I (ROOK), O'ahu Council of Hawaiian Civic Clubs (OCHCC), Hui Malama I Na Kupuna 'O Hawai'i Nei, O'ahu Island Burial Council (OIBC), Hawai'i Island Burial Council (HIBC), Historic Hawai'i Foundation (HHF), and Native Hawaiian organizations, families and individuals identified in Appendix D that attach traditional religious and cultural importance to cultural sites within the various project APEs and invites them to concur in this programmatic agreement (PA); and

WHEREAS, the consulting parties agree that because of the long time period and broad geographical extent of projects required to convert the 2nd Brigade of the 25th ID (L) to an SBCT, it is appropriate to set forth processes in this PA for the identification, evaluation, treatment, and management of historic properties (the Act, Section 301(5), 16 USC 470w) including properties of traditional religious and cultural importance to Native Hawaiian organizations, families and individuals (the Act, Section 101(d)(1)(A), 16 USC 470a); and

WHEREAS, the Installation has provided the public an opportunity to comment on this undertaking through the Agency's National Environmental Policy Act process and has incorporated the recommendations of the public and reviewing agencies into this agreement; and

WHEREAS, the definitions provided in 36 CFR Part 800 are applicable throughout this Programmatic Agreement.

NOW THEREFORE, the Installation, the SHPO, ACHP, NPS, OHA, ROOK, OCHCC, Hui Malama I Na Kupuna 'O Hawaii Nei, HHF, HIBC, and OIBC agree that Section 106 compliance for potential historic properties within the areas of potential effects of SBCT projects on the islands of O'ahu and Hawai'i will be administered according to the following stipulations to satisfy Installation's Section 106 responsibilities for all individual undertakings associated with the conversion of the 2nd Brigade of the 25th ID (L) to an SBCT.

STIPULATIONS

The U. S. Army Garrison, Hawaii will insure that the following measures are carried out:

I. Applicability.

A. The terms of this agreement apply to a program to convert the 2nd Brigade of the 25th ID (L) to an SBCT at various Installations and sites on O'ahu and Hawai'i, listed in Appendix A, and to take into account the effects of this program on historic properties within the areas of effect of projects associated with SBCT.

B. Only those resources that are listed on or meet the eligibility criteria for listing in the National Register of Historic Places (National Register) are historic properties, and a subset of these are of traditional religious and cultural importance.

C. This PA is subordinate to any rights Native Hawaiians and Native Hawaiian organizations may have under federal law as set described in 36 CFR 800.2 (c) (ii) (B).

II. Planning and Coordination of Installation Activities to Implement SBCT.

A. Personnel.

(1) The Installation will employ, maintain a contract with, or obtain through other means, qualified professionals who meet the Secretary of the Interior's Professional Qualifications Standards (48 FR 44738-9) in disciplines appropriate to carry out the Installation's NHPA responsibilities regarding identification and evaluation of historic properties and assessment and treatment of effects to such properties. Consultation with Native Hawaiians concerning the identification of sites of traditional religious and cultural importance is recognition of their expertise in these areas.

(2) The Installation will ensure that the Cultural Resources Manager (CRM) participates in Installation-level planning for proposed projects and activities related to SBCT that may affect historic properties.

B. Planning.

(1) The Installation will ensure that documents pertaining to the proposed SBCT projects are analyzed by the CRM to identify specific undertakings that may be subject to review pursuant to the terms of this PA throughout conversion of the 2nd Brigade of the 25th ID (L) to an SBCT. The documents to be analyzed will include, but are not limited to, military construction plans, troop training and range operation plans, Integrated Natural Resource Management Plans, ITAM program plans, tenant activities, and historic property renovation and demolition plans, insofar as these pertain to the conversion of the 2nd Brigade of the 25th ID (L) to an SBCT.

(2) The Installation will ensure that schedules and priorities are established and documented for identification, evaluation, and treatment of historic properties within the 28 APEs. The Installation will ensure that all relevant Installation offices are informed of the schedules and priorities, the potential of these undertakings to affect historic properties, the requirement to ensure that an analysis of alternatives is fully considered as early as possible in project planning, and of the requirement to complete the review of the undertaking pursuant to this PA.

(3) The Installation will ensure that the undertakings identified herein and all related activities are planned, reviewed, and carried out according to the terms of this PA.

III. Consultation with Native Hawaiians

- A. The Installation will identify Native Hawaiian organizations, families and individuals that may ascribe traditional religious and cultural importance to historic properties within the APEs of the SBCT projects.
- B. The Installation will consult with such Native Hawaiian organizations, families and individuals to solicit their assistance and advice in identifying properties of traditional religious and cultural importance within the proposed projects' APEs and in resolving concerns regarding confidentiality of information on historic properties.
- C. In recognition of the historic and cultural significance of the lands in the areas of potential effect for SBCT to Native Hawaiians and others, the Installation will generally look favorably on affording access for preservation and protection of historic sites to individuals and organizations, including any Native Hawaiian organization that attaches cultural significance to historic properties. Requests for such access need to be submitted in writing and will be considered in light of military operational requirements and anti-terrorist / force-protection security conditions and other pertinent circumstances as determined by the Installation at the time. Final approval or disapproval will be provided by the Installation in writing. Upon request, the Installation will consider events that celebrate and interpret historic activities tied to these lands.
- D. When an undertaking may affect properties of traditional religious and cultural importance to Native Hawaiians, the Installation will afford Native Hawaiian organizations, families and individuals the opportunity to participate as consulting parties in identification and evaluation of properties, and assessment and treatment of effects.
- E. The Installation, to show an understanding of the significance and respect properties of traditional religious and cultural importance, including burials and landscapes, play in the lives of Native Hawaiians, will work with a Cultural Monitor chosen from a list of available Cultural Monitors generated by Native Hawaiians from the area of concern, and provided to the Installation. These services will be obtained in accordance with applicable federal laws and guidance.
- (1) The Installation will provide timely notification of all site-specific projects and access for the participation of a Cultural Monitor.
- (2) A Cultural Monitor will demonstrate:
- a) a cultural affiliation with the affected project area;
 - b) familiarity with the affected and anticipated cultural properties in the project area; and
 - c) sensitivity and the ability to represent and communicate with the Installation on behalf of Native Hawaiians.

(3) During construction activities that are likely to impact properties of traditional religious and cultural importance, the Cultural Monitor will be utilized to provide additional assurances to Native Hawaiians that properties of traditional religious and cultural importance are being properly treated. A Cultural Monitor will act as an independent observer who is both knowledgeable and sensitive to Native Hawaiian site management and who has the trust of members of his community. The Cultural Monitor will work closely with archaeologists to provide a liaison with Native Hawaiians when properties of traditional religious and cultural importance are discovered or inadvertently impacted, and assist in the identification and treatment of such sites.

(4) The Cultural Monitor will be available for the duration of the construction phase of the project and coordinating closely with the Installation CRM. When the construction phase of a project is complete, the Installation will consult with signatory and concurring parties and consider whether to extend the services of the Cultural Monitor(s). Cultural Monitors must consider the working environment and dress accordingly.

IV. Identification, Evaluation, Assessment, and Treatment of Historic Properties.

A. General.

(1) All identification and evaluation of properties or potentially eligible properties for undertakings occurring as a result of SBCT will be conducted according to the Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation.

(2) The Installation will complete identification and evaluation of historic properties prior to implementation of SBCT undertakings.

B. Inventory.

(1) Phase I inventory efforts will include, but are not limited to, the examination and synthesis of existing information such as photographs, maps, drawings, archival research, oral histories, condition assessments of buildings and data results of pedestrian surveys.

(2) Consult with Native Hawaiian organizations, families and individuals to assist with identifying properties of traditional religious and cultural importance.

(3) Phase I inventories to identify properties or potentially eligible properties within the APEs of all the SBCT Transformation project areas, as identified in Appendix A are complete. All draft and final reports will be submitted to signatory and concurring parties under cover letter by the Installation that explains the purpose of the report and the action requested of the signatory or concurring party.

C. Evaluations of Significance for Properties - Phase II Inventory.

(1) Initial Phase I surveys have identified properties or potentially eligible properties that need to be evaluated in the proposed project APEs.

(2) For Phase II survey inventories of properties or potentially eligible properties, the Installation may apply the Installation historic context and/or other evaluation methods listed below to the criteria of eligibility outlined in 36 CFR Part 63 to make a determination of eligibility for the National Register of Historic Places for these, and any other properties or potentially eligible properties identified through future inventory surveys related to SBCT proposed projects or activities.

(a) Using the Installation historic context prepared for Integrated Cultural Resources Management Plan (ICRMP) (which includes the cultural landscape) as the basis for Installation identification, determinations of eligibility and treatment of all historic properties.

(b) Testing to determine the depth, extent, and age of cultural deposits at archeological sites to clarify site boundaries and determine site integrity.

(c) Assessing information provided by Native Hawaiian organizations, families, and individuals, and collecting further oral histories and archival information on identified traditional cultural properties and sacred sites, as required.

(d) Preparing historic structure reports and condition assessments to determine/assess the significance of historic buildings and structures.

(e) Employing such other methods as the parties may agree upon in this consultation.

(3) The results of these evaluations will form the basis for the Army to determine the eligibility of these properties for listing on the National Register of Historic Places.

D. Determinations of Eligibility

(1) The Installation will notify the SHPO of its determination(s) of eligibility. This notification will include a description of the respective APE.

(2) If SHPO disagrees with a determination of eligibility, they must notify the Installation within 30 days, documenting the reasons for the disagreement.

(a) The Installation reviews the documentation and revises the initial determination or consults with the SHPO to resolve the disagreement; or

(b) If the disagreement cannot be resolved through this consultation process, then the Army will forward to the Secretary of the Interior all disagreement documentation from SHPO along with all documentation resulting from the consultation process.

(c) The Secretary of the Interior reviews the documentation and makes a final determination.

(3) If evaluation efforts result in the identification of properties that are eligible for the National Register, the Installation will update its existing inventory to include these properties and, at the request of the appropriate Native Hawaiian organizations, families and individuals, the existence and location of such properties will be available only for Installation planning purposes and will not be disclosed to the public.

(4) Results of evaluations of site significance and determinations of eligibility by the Installation will be documented in an annual report, see Stipulation VI. B, which will be made available to all signatory and concurring parties to this PA.

E. Procedures for assessing effect

(1) The Installation's CRM, using available professional expertise, assesses effects of all undertakings on historic properties and properties of traditional religious and cultural importance.

(2) If a no effect to historic properties determination is made, CRM will document a finding of "no historic properties affected" and provide notice to the SHPO and other concurring parties. If within 30 days, or 45 days if the determination of effects is combined with the determination of eligibility, no objection to the "no historic properties affected" determination is made, then the Installation may proceed to implement the proposed project or activity.

(3) If a "no adverse effect to historic properties" determination is made, the CRM will notify the SHPO and other concurring parties and provide for a 30-day review. If within 30 days, or 45 days if the determination of effects is combined with the determination of eligibility, no objection to the "no adverse effect to historic properties" determination is made, then the Installation may proceed to implement the proposed activity.

(4) If SHPO or other concurring parties disagree with a "no historic properties affected" or a "no adverse effect to historic properties" determination, they must notify the Installation within the 30-day or 45-day review period documenting the reasons for the disagreement.

(a) The Installation reviews the documentation and revises the initial determination; or

(b) The Army will forward to the ACHP all disagreement documentation from SHPO or other concurring parties.

(c) ACHP reviews the documentation within 30 days and makes recommendations to the Installation. The Installation will consider ACHP's views before proceeding. If the ACHP does not provide a recommendation to the Army within the review period, the Army may assume that the ACHP concurs with the Army's findings.

(5) If implementation of the proposed project or activity will result in an adverse effect to a historic property, the Installation will modify the project or activity to avoid the adverse effect wherever possible and practical as determined by the Installation.

(6) The Installation will consult with SHPO and concurring parties when adverse effects to historic properties cannot be avoided and implement mitigation measures in accordance with the results of the consultation and/or Stipulation IV (7) (a-i).

(7) If a "historic properties adversely affected" determination cannot be resolved through project modification, the Installation will implement either the following mitigation measures or others developed in consultation with other signatory and concurring parties, as applicable, prior to the initiation of the activity affecting the historic property.

(a) For archaeological sites, data recovery measures may be implemented as mitigation. A data recovery plan will be developed by the CRM, in consultation with the SHPO and other consulting parties, and implemented by the Installation.

(b) For historic buildings, documentation of the affected structure will be carried out by the CRM, in accordance with appropriate HABS/HAER standards developed through consultation with the SHPO and any other concurring party as appropriate.

(c) For properties of traditional religious and cultural importance, information related to the property will be collected through oral history interviews and archival research in Hawaiian and English texts. The Army will consult with the SHPO and other consulting parties to discuss the scope and disposition of the materials.

(d) Archeological site protection measures may be developed and implemented by the Installation. Short-term measures, such as monitoring, will be followed during construction of SBCT Transformation projects and facilities. Long-term measures will be followed during training exercises and other on-going uses. Examples of Long-Term measures might include establishing buffer zones around archaeological and cultural sites or identifying such areas as mine fields for training purposes.

(e) Prior to any training exercise, existing site protection measures developed by the CRM will be reviewed by training personnel, summarized and disseminated to training units.

(f) Any mitigation measures developed in consultation will be documented in a formal mitigation plan, reviewed by all parties to this PA, signed and approved by the Garrison Commander, and implemented through the Installation Cultural Resources Management Program.

(g) Historic properties, including properties of traditional religious and cultural importance, in SBCT Transformation training areas will be monitored by the Installation CRM or by personnel delegated by the CRM. Monitoring will be done in accordance with Appendix B.

(h) The Installation will provide all of its relevant offices at the Installation, including fire-fighting, range, and training personnel, with copies of the site protection measures that are developed.

(i) The Installation will provide all consultation comments and mitigation treatment results in an annual report, see Stipulation VI. B.

F. Treatment of Human Remains - If human remains are inadvertently discovered during implementation of an undertaking or program activity, the Installation will ensure that all activity in the area immediately surrounding the discovery ceases and the appropriate Installation CRM is notified of the find. The Installation will ensure that the remains are secured from further disturbance or vandalism and covered for protection from the elements until the Installation in accordance with NAGPRA procedures and Appendix C, Inadvertent Discovery Plan, has determined the appropriate treatment in consultation with the O'ahu and Hawai'i Island Burial Councils and identified lineal descendants.

V. Additional Installation Management and Coordination Activities.

A. Project Monitoring.

(1) The Installation will insure that all excavations conducted as part of construction projects associated with the conversion of the 2nd Brigade of the 25th ID (L), especially those in areas of high archaeological sensitivity, are monitored by an archaeologist and a Cultural Monitor in accordance with Stipulation III.D.

(2) The Installation will insure that the CRM is staffed adequately to undertake these monitoring activities and produce written monitoring reports on an annual basis. The Installation will provide copies of these monitoring reports to all signatory and concurring parties to this PA. These reports will also be contained in the annual report on PA activities outlined in Stipulation VI (B).

B. Exempt Activities.

The parties to this PA have consulted and agree that certain routine activities may be exempt from consultation under this PA provided that the installation CRM finds that their effects on cultural resources in or eligible for the National Register will not be adverse based on criteria in 36 CFR Part 800.5. These activities include:

(1) Maintenance activities in areas that have been previously landscaped may be maintained by tree trimming, grass mowing and cutting, and similar basic landscape maintenance activities.

(2) Previously paved areas such as roads, parking areas, and paths may be maintained and repaved and/or resurfaced provided that heavy equipment is restricted to use in previously disturbed areas.

(3) Existing military facilities that have been determined not to be historic properties may be maintained and repaired. These facilities include but are not limited to buildings, water, sewer, telephone and communications lines and infrastructure, gas and electric utilities infrastructure.

(4) Continued use of impact areas, firing ranges, and other designated surface danger zones.

VI. Administrative Stipulations

A. Anti-Deficiency Act Compliance.

The stipulations of this PA are subject to the provisions of the Anti-Deficiency Act. If compliance with the Anti-Deficiency Act alters or impairs Installation's ability to implement the stipulations of this PA, the Installation will consult according to the amendment and termination procedures found at Stipulations VI. F and E of this PA.

B. Reporting and Annual Review.

(1) The Installation will provide all signatory and concurring parties with an annual report on or before July 1 of each year summarizing activities carried out under the terms of this PA.

(a) Annual reports will include a list of projects and program activities that summarize proposed project determinations of effect to historic properties, a summary of mitigation or treatment measures implemented to address the effects of undertakings, and a summary of consultation activities and the views of the SHPO and interested parties where appropriate. Determinations of Eligibility to the National Register of Historic Places will also be summarized. The annual monitoring report will be a part of this report.

(b) Cultural Resources Inventory Reports, Archaeological Monitoring Plans, Preservation or Mitigation Treatment Plans, Data Recovery Plans, and oral histories or ethnographic studies will be submitted, as they are developed and finalized, to the signatories and concurring parties to this PA.

(c) All annual reports will be produced through 2010 or completion of the transformation to a SBCT of the 2nd Brigade of the 25th ID (L).

(d) The signatories to this PA will review the annual report's information to determine what, if any, revisions or amendments to the PA are necessary. After the parties have had an opportunity to review the annual report, the Installation will sponsor a meeting to discuss the report and/or any related matters if requested to do so by any signatory or concurring party to this PA.

C. Dispute Resolution

(1) Should any signatory or concurring party to this PA object to any action carried out or proposed by the Installation with respect to implementation of this PA, the objecting party will send the objection, in writing, to the Garrison Commander at Schofield Barracks. The Installation will consult with the objecting party to resolve the objection. If the objecting party and the Installation cannot resolve the dispute, the Installation will consult with the SHPO and the other concurring parties to resolve the objection. If the objection cannot be resolved through this consultation process, or if the objection is from the SHPO, the Installation will forward all documentation relevant to the dispute to the ACHP. Within thirty calendar days after receipt of all pertinent documentation, the ACHP will exercise one of the following options:

(a) Advise the Installation that the ACHP concurs in the Installation's proposed final decision, whereupon the Installation will respond to the objection accordingly.

(b) Provide the Installation with recommendations, which the Installation will take into account in reaching a final decision regarding its response to the objection; or,

(c) Notify the Installation that the ACHP will comment pursuant to 36 CFR Part 800, and proceed to comment. The resulting comment will be taken into account by the Installation according to 36 CFR Part 800 and Section 110(l) of NHPA.

(2) Should the ACHP not exercise one of the above options within 30 days after receipt of all pertinent documentation, the Installation may assume the Council's concurrence with its proposed response to the objection.

(3) The Installation will take into account any ACHP recommendation or comment provided according to this stipulation with reference only to the subject of the objection; the Installation responsibility to carry out all actions under this PA that are not the subject of the objection will remain unchanged.

(4) Should an objection pertaining to this PA be raised at any time by a member of the public, including Native Hawaiian organizations, families and individuals, the objection will be submitted in writing to the Garrison Commander at Schofield Barracks. The Installation will notify the signatory and concurring parties to this PA and take the objection into account before proceeding with the undertaking at issue.

D. Monitoring of Programmatic Agreement

The SHPO and the ACHP Council may monitor any activities carried out pursuant to this Agreement, and the ACHP will review any activities if so requested. The Installation will cooperate with the SHPO and the ACHP should they request to monitor or to review project files for activities carried out pursuant to this Agreement.

E. Termination of the Programmatic Agreement.

(1) If the Installation determines that it cannot implement the terms of this PA, or if the SHPO or ACHP determines that the PA is not being properly implemented, the Installation, the SHPO, or ACHP may propose to the other parties to this PA that it be terminated.

(2) The party proposing to terminate this PA will so notify all parties to this PA, explaining the reasons for termination and affording them at least 30 days to consult and seek alternatives to termination.

(3) Should such consultation fail and the PA is terminated, the Installation will:

(a) Consult according to 36 CFR Section 800.14 to develop a new PA; or,

(b) Comply with 36 CFR Part 800 with regard to each undertaking.

F. Amendment of the Programmatic Agreement.

Any signatory or concurring party to this PA may propose to the Installation that the PA be amended, whereupon the Installation will consult with the other parties to this PA to consider such amendment. 36 CFR Section 800.14 will govern the execution of any amendment.

G. Expiration and Renewal of the Programmatic Agreement

This PA will take effect on the date it is signed by the last signatory and will remain in effect throughout the transformation of the 2nd Brigade of the 25th ID (L) to an SBCT in 2010. No extension or modification will be effective unless all signatories have agreed in writing.

H. This PA may be executed in counterpart signatures.

Execution and implementation of this PA evidences that the Installation has afforded the Council a reasonable opportunity to comment on the transformation of the 2nd Brigade 25th ID (L) to an SBCT at and by the US Army, Garrison, Hawai'i, and that the Installation has taken into account the effects of the undertaking on historic properties. Execution and compliance with this programmatic agreement fulfills the Installation's Section 106 responsibilities regarding the transformation of the 2nd Brigade of the 25th ID (L) to an SBCT.

APPENDIX A
SUMMARY OF SBCT TRANSFORMATION PROJECTS
IN O'AHU AND HAWAI'I ISLANDS

This appendix summarizes the proposed SBCT Transformation projects with possible impacts in the islands of O'ahu and Hawai'i. The information is presented in tabular form and sorted by Fiscal Year.

Summary of SBCT Transformation Projects in O'ahu and Hawai'i Islands

Fiscal Year	Project Number	Project Name	Sub-Installation of Project Location
2005	57183	Anti-armor Live Fire and Tracking Range	Pohakuloa

APPENDIX B
ARCHAEOLOGICAL SITE MONITORING
AND
ARCHAEOLOGICAL SITE PROTECTION OPTIONS

Archaeological Site Monitoring

Monitoring Sites for Major Training

Archaeological sites located in areas of troop concentrations (e.g., favored bivouac sites, fixed firing points, maneuver areas) will be monitored (inspected) on a regular basis to identify impacts from training. If necessary, the Installation will implement site protection measures for threatened sites if prudent (e.g., flagging, fencing), and to monitor the effectiveness of such measures. For the first year after the signing of this Programmatic Agreement, this will be done whenever a unit departs a Training Area, or range, and immediately following the training exercise. The monitor may accompany Range Control personnel in their regular performance of the clearance inspection before the unit departs the field (U.S. Army 1993: Chapter 2, Section 2-4b). After the first year, the monitoring will occur quarterly or after every major exercise involving battalion or larger units.

Monitoring Sites for Other Reasons

Monitoring of archaeological site conditions will be scheduled for other actions that will permit large numbers of personnel into areas of concentrated archaeological sites for a protracted period of time (e.g., construction of a new firebreak road or upgrading facilities), or in response to any report of non-permitted site access or vandalism. All archaeological sites within the actively used training areas will be monitored quarterly after the first year of this Programmatic Agreement.

Monitoring Records

All site monitoring will be documented, including date, name and title or rank of inspector, reason for inspection (e.g., name of military training unit and/or maneuver), sites visited, observed site conditions, and recommended site protection actions as appropriate. Sketch maps and/or photographs showing changes in site conditions will be included in the monitoring documentation record. For particular sites it may be advantageous to establish photographic vantage points, with photographs taken during each monitoring episode. Site monitoring efforts will be reported by the Installation Cultural Resources Manager (CRM) in the annual report.

Reporting Site Damage

The CRM will report to the Range Officer within 48 hours of his or her notice that humans or natural agents have damaged an archaeological site. The CRM's report will include (1) the circumstances of the site damage such as how and when the damage occurred and who was responsible, (2) assessment of the nature and extent of site damage including first-hand observations made by the CRM and/or his or her representative, with

reference to site conditions documented prior to the damage, (3) recommendations for treatment of the damaged site such as data recovery excavation or site fencing, and (4) suggestions to avoid damage to other sites potentially threatened by similar circumstances. Acting as the Installation Commander's representative, the CRM will notify the Hawai'i SHPO and OHA telephonically, via e-mail, or with written correspondence within five working days of the discovery and consult about treatment of the damaged resource. All incidents involving damage to archaeological sites will be summarized in the annual report.

Archaeological Site Protection Options.

The three management options for protecting sites are:

1. Manage sites in place as Training Restriction Areas
2. Establish physical barriers
3. Recover and document site data through the guided, intensive study of the research design.

Archaeological sites can be integrated into a military training scenario, for example, by assuming the role of training hazards (e.g., mine fields), thus protecting the sites while enhancing the training activity.

Individual archaeological sites or site concentrations threatened by military operations may be placed within designated *Exclusion Areas*, with corresponding land use regulations made part of the regular SOP for Installation users. The site concentration might be designated an exclusion area on updated versions of the Installation map, with users informed of the land use regulations via the *External SOP* or simple informative handouts. Site conditions within the exclusion area would be inspected periodically to ensure that this level of protection is adequate to preserve the resources.

Those archaeological resources subjected to ongoing or repeated, degrading impacts from human agents or other causes including feral game may best be managed by site fencing. Fenced sites will require periodic monitoring to ensure that the barriers remain in place and the markings do not unduly attract site vandals.

For less complex sites characterized by few data potentials and of no special importance to contemporary Native Hawaiians, data recovery study programs will be the most cost-effective management approach, especially for sites located in areas of more intensive military land-use.

APPENDIX C INADVERTENT DISCOVERY PLAN

1. Any employee (or contractor in the employ) of the Installation who knows or has reason to know that human remains or cultural items have been inadvertently discovered on land owned or controlled by the Installation, shall provide immediate telephone notification of the discovery, with written back-up to the Garrison Commander and the Installation Cultural Resources Manager.
2. The employee or contractor shall also stop any activity in the area of the discovery and make a reasonable effort to protect the human remains and cultural items.
3. Once contacted regarding an inadvertent discovery, the Installation will make an in situ examination of the condition, antiquity and cultural affiliation of the human remains and cultural items based upon applicable professional standards to determine whether the remains and cultural items are Native Hawaiian.
4. If the examination determines that the human remains or cultural items are Native Hawaiian, the Installation shall notify the State Historic Preservation Division, OHA and the appropriate Burial Council telephonically, via e-mail, or with written correspondence within 48 hours.
5. If the human remains and cultural items cannot be left in situ, their excavation and removal shall be undertaken by professional archaeologists employed by the Installation within 15 working days from the initial contact between the Installation and the Burial Council.
6. Prior to disposition of the human remains and cultural items, the Installation shall publish a general notice of the proposed disposition in a newspaper of general circulation in the area in which the remains were recovered. The notice shall provide information as to the nature and cultural affiliation of the remains and cultural items and shall solicit further claims of ownership. The notice shall be published at least twice, at one-week intervals, and transfer shall not take place until 30 days after the second notice to allow for any additional claimants to come forward.
7. If re-interment is on land owned or controlled by the Installation, the location of the re-interment shall only be reported to the claimant, the Garrison Commander, and the Cultural Resources Manager for the Installation.

APPENDIX D
CONSULTING PARTIES AND HAWAIIAN ORGANIZATIONS, GROUPS, AND
INDIVIDUALS

Consulting Parties, Hawaiian organizations, families, and individuals include, but are not limited to:

Office of Hawaiian Affairs Trustees

Associations of Hawaiian Civic Clubs

Life of the Land

Kamehameha Schools Trustees

Royal Order of Kamehameha, Hilo

Mr. Tom Lenchanko, Kahu of Kukaniloko

Kalani Flores, Kahuokahiku

Royal Order Of Kamehameha I (Statewide Organization)

Royal Order Of Kamehameha I, Hawai'i Chapter

Friends Of Honouliuli

Hawaiian Civic Club Of Wahiawa

Northshore Community Land Trust

The Friends Of Kukaniloko

`Ike`Aina – Native Hawaiian Land Trust

Wahiawa Community Business Association

Pohakuloa Training Area Cultural Advisory Committee (PTACAC)

Paniolo Preservation Society

HEADQUARTERS, UNITED STATES ARMY GARRISON, HAWAII
SCHOFIELD BARRACKS, HAWAII 96857-5000

January 30, 2004

REPLY TO
ATTENTION OF

Office of the Garrison Commander

Mr. Peter Young
State Historic Preservation Officer
Kakuhihewa Building, Room 555
601 Kamokila Boulevard
Kapolei, Hawaii 96707

Dear Mr. Young:

Enclosed is the United States Army Garrison, Hawaii's (USAG-HI) final Programmatic Agreement (PA) to meet Section 106 obligations under the National Historic Preservation Act of 1966, as amended, and Army Regulation 200-4. The PA outlines procedures the Army will follow for the proposed transformation to a Stryker Brigade Combat Team at several Army installations on the islands of Oahu and Hawaii.

This final PA incorporates several changes from the final draft PA recommended by the Advisory Council for Historic Preservation, the State Historic Preservation Office, the Office of Hawaiian Affairs, and/or the National Park Service. In short, these changes enhance the information sharing and consultation process, add the National Park Service and Waimea Hawaiian Civic Club as concurring parties, and eliminate prior appendices B (Phase I, II, and III Cultural Survey Updates) and E (References). The Army feels this PA addresses the interests of all concerned parties and will enable us to efficiently move forward with the Section 106 process for transformation to a Stryker Brigade.

We ask that you, or the appropriate representative of your organization, please sign the PA by February 18, 2004. We also ask that you please fax or electronically transmit the signature page to Dr. Laurie J. Lucking, Installation Cultural Resource Manager, as expeditiously as possible and mail the original. If you have questions regarding the PA, or require additional information, please contact Dr. Lucking at (808) 656-2878, ext 1052, fax (808) 656-1039, or via email at luckingl@schofield.army.mil.

Sincerely,

David L. Anderson

Office of the Garrison Commander

Mr. Peter T. Young
State Historic Preservation Officer
Kakuhihewa Building, Room 555
601 Kamokila Boulevard
Kapolei, Hawaii 96707

Dear Mr. Young:

The 25th Infantry Division (Light) and U.S. Army, Hawaii (the Army) is proposing conversion of the 2nd Brigade to a Stryker Brigade Combat Team (SBCT). The transformation of the 2nd Brigade includes development of 28 projects and potential land acquisition on both the Island of Oahu and Hawaii, and the introduction of a new tactical vehicle, the Stryker. A Programmatic Agreement (PA) is being finalized among the U. S. Army Garrison, Hawaii, the Hawaii State Historic Preservation Office, and the Advisory Council on Historic Preservation, to meet Section 106 responsibilities under the National Historic Preservation Act of 1966, as amended (NHPA). The draft PA defines procedures that the Army will follow for the identification and treatment of historic properties found to be within the Area of Potential Effect (APE) for the 28 proposed transformation projects and maneuver areas on existing ranges.

In a previous correspondence dated 13 May 2003, 10 of the 28 proposed project APEs were identified to have no cultural properties. The Army submitted a determination of effect, and your office concurred, with a finding of "no historic properties affected." As of September 2003, all Phase I surveys to identify the presence of cultural resources within proposed project APEs are complete. Two additional proposed projects have now been identified to have no historic properties.

The proposed Motor Pool project is located adjacent (South) to Schofield Barracks, on private lands proposed for purchase. The Schofield Barracks Motor Pool project (TMK 92005002) involves 167,775 square feet of new building space and 1,293,725 feet of hardened, paved surface for vehicle parking, for a total of approximately 34 acres. An archaeological survey was conducted in the fall of 2003 to identify historic properties within the APE of the Motor Pool. Documentation of the survey results is included in the soon to be finalized draft report, *Archaeological Reconnaissance Survey of U. S. Army Schofield Barracks Military Reservation, South Range Land Purchase, Oahu Island, Hawaii*, March 2003 by Garcia and Associates. No cultural items, features or sites were encountered in or within 100 meters of the proposed Motor Pool APE (see excerpt 1).

The second proposed project is the Fixed Tactical Internet (FTI) that includes 14 antenna locations on Oahu and 11 locations on the Island of Hawaii. Each antenna APE is approximately 20 x 25 feet. The antenna whips range in size from 4 to 10 feet, and will be mounted on existing masts or support structures. In some cases, support structures will need to be constructed. The new construction will consist of a 15 x 20 feet concrete pad for the support structure. Sites will be accessed by existing roads. On Oahu, 5 of the 14 antenna sites will be located within the Schofield Barracks Installation on existing antenna structures. Nine other antennas, located outside Schofield Barracks, required archaeological survey. At Pohakuloa Training Area (PTA), Island of Hawaii, 6 of the 11 antenna locations are within the cantonment area. The 5 remaining FTI locations are outside the PTA cantonment area and required archaeological survey.

Due to natural resources or maintenance concerns, 3 of the 14 proposed locations scheduled for archaeological survey had alternate FTI locations designated. All 14 proposed FTI locations, and 3 alternate (backup) FTI APEs were surface inventoried to identify any potential historic properties. No historic properties were identified at any FTI locations. A brief description of the FTI locations is summarized below. The 3 separate Memorandum for Record (MFR) survey reports are provided as reference (attachments 1, 2 and 3).

Oahu Island FTI locations

Since no historic properties were identified during archaeological investigations at the proposed Motor Pool and FTI project locations, the Army has made a **“no historic properties affected”** determination for these project APEs. In compliance with Section 106 of the NHPA, your review and concurrence to this determination is being requested. Should you require additional information about the undertakings, including field trips to any of the proposed APEs, the point of contact is Dr. Laurie J. Lucking, Installation Cultural Resource Manager, at telephone number 656-2878, ext 1052. A copy of this letter will be furnished to individuals listed on the attached Contact List.

Sincerely,

David L. Anderson
Colonel, U.S. Army
Commanding

Office of the Garrison Commander

Mr. Peter T. Young
State Historic Preservation Officer
Kakuhihewa Building, Room 555
601 Kamokila Boulevard
Kapolei, Hawaii 96707

Dear Mr. Young,

The 25th Infantry Division (Light) and U.S. Army Hawaii (the Army) is proposing conversion of the 2nd Brigade to a Stryker Brigade Combat Team (SBCT). The transformation of the 2nd Brigade includes development of 28 projects and potential land acquisition on both the islands of Oahu and Hawaii, and the introduction of a new tactical vehicle, the Stryker. A Programmatic Agreement (PA) is being developed among the 25th Infantry Division (Light) and United States Army, Hawaii, the Hawaii State Historic Preservation Office, and the Advisory Council on Historic Preservation, to meet Section 106 responsibilities under the National Historic Preservation Act of 1966, as amended (NHPA). In addition, interested parties and Native Hawaiian organizations including but not limited to the Office of Hawaiian Affairs and the Hui Malama I Na Kupuna O Hawai'i Nei are being consulted for their comments and input into the PA and concurrence if they wish to concur. The draft PA defines procedures that the Army will follow for the identification and treatment of historic properties found to be within the Area of Potential Effect (APE) for the proposed transformation projects and maneuver areas on existing ranges.

Phase I surveys to identify the presence of cultural resources within all the proposed project APE's are nearing completion. We plan for these to be completed by the end of July 2003. Of the proposed APE's, ten of the completed surveys have identified no cultural properties. These ten project APE's are on formerly developed, disturbed, or manipulated landscapes. They are located on Schofield Barracks Military Reservation, or are within pineapple plantations in Helemano, on the Island of Oahu; or are located in the Pohakuloa Training Area on the Island of Hawaii. Enclosed, for your information and review, are brief summaries of the survey findings, including photographs and maps of each of the ten proposed project APE's.

The Army has made a "**no historic properties affected**" determination for these ten project APE's. In compliance with Section 106 of the NHPA, your review and concurrence to this determination is being requested. Should you require additional information about the undertakings, including field trips to any of the ten proposed APE's, the point of contact is Dr. Laurie J. Lucking, Installation Cultural Resource Manager, at telephone number 656-2878, ext 1052.

Sincerely,

A handwritten signature in cursive script that reads "David L. Anderson".

Hawaii Historic Preservation Division
Kakuhihewa Building, Room 555
601 Kamokila Boulevard
Kapolei, Hawaii 96707

Dear Mr. Diamond:

The U.S. Army Hawaii (USARHAW) proposes an undertaking to transform its 2nd Brigade, 25th Infantry Division (Light), to a Stryker Brigade Combat Team (SBCT). Enclosure 1 shows the Army's Notice of Intent as published in the Federal Register announcing the proposed transformation in Hawaii. This transformation, one of six others being planned across the United States, would allow the Army in Hawaii to become more responsive, deployable, agile, versatile, lethal, survivable, and sustainable to meet the challenges of the 21st century. To bring the SBCT to operational capability in Hawaii and to provide realistic field training for it, USARHAW is proposing 28 projects and the introduction of a new vehicle capable of cross-country maneuvering, the Stryker at Army installations on the Islands of Hawaii and Oahu (see Enclosure 2).

The prime purpose of this letter is to officially initiate coordination and consultation with your council for the proposed transformation undertaking in compliance with Section 106 of the National Historic Preservation Act of 1966, as amended, pursuant to implementing regulations 36 CFR 800 (NHPA). The Section 106 coordination and consultation is being carried out concurrently and in conjunction with the National Environment Policy Act (NEPA) process to which the Army's transformation in Hawaii must also adhere. This is being conducted with the preparation of an Environmental Impact Statement (EIS) study. Public scoping for the EIS was completed in April 2002, with the draft EIS expected to be submitted for public review and comment by the end of February 2003. Both Section 106 of NHPA and NEPA mandate that the Army consider the impact of its transformation undertaking on places and sites of traditional cultural importance to Native Americans, including Native Hawaiians. The Army is also very serious in its intent to ensure that its transformation projects do not significantly impinge on the rights of Native Hawaiians to conduct their traditional cultural practices. Therefore, the Army is requesting your council members' assistance in carrying through its mandate to identify and locate persons, groups, and organizations knowledgeable in matters of Native Hawaiian cultural practices, sites (including sacred sites and Native Hawaiian traditional burial sites), and landscapes in the vicinity of the area of potential effect (APE) for each of the transformation projects. The Army would greatly appreciate your council members providing any such assistance before the end of February 2003 in order to assist in the NEPA documentation process.

As listed in Enclosure 3, the 28 proposed transformation projects include: 1) the construction of training ranges, vehicle wash facilities, range control/maintenance facilities, and fixed tactical internet (antennas) on Pohakuloa Training Area (PTA) on Hawaii Island and Schofield Barracks Military

Reservation (SBMR) and Kahuku Training Area on Oahu Island; 2) all-weather vehicle trails from PTA to Kawaihae Harbor and from SBMR to Dillingham MR; 3) construction of ammunition storage areas on PTA, 4) the upgrade of Wheeler Army Airfield (WAAF) on Oahu Island and of Bradshaw AAF on PTA; 5) a multiple deployment facility on WAAF, 6) a road from Schofield to Helemano MR; 7) acquisition of maneuver land on West PTA on Hawaii Island and South Range on Oahu Island; and 8) securing land easements for the Hawaii and Oahu Island trails.

As the 28 projects are projected to be funded beginning fiscal year 2004 and continuing through 2007, the Army considers a programmatic agreement (PA) as the most appropriate vehicle to bring the transformation projects in compliance with Section 106 of the NHPA. The PA will detail stipulations with which the Army will agree to comply as each transformation project comes on board and is funded. Parties to the PA will include your Burial Council, Hui Malama I Na Kapuna O Hawai'i Nei, Office of Hawaiian Affairs, Historic Hawaii Foundation, the State Historic Preservation Office, the Advisory Council on Historic Preservation, and other interested parties in accordance with Section 106 of the NHPA. A draft copy of the PA and its accompanying archival study will be ready for public review in the very near future, anticipated no later than the end of February 2003. The PA and the study will contain more detailed descriptions of each project's APE. The Oahu Island Burial Council will be provided a copy of the PA and the study as soon as these become available.

The Army fully intends to comply with all appropriate federal regulations in its attempt to transform in Hawaii. It will continue with the consultation process with the Oahu Island Burial Council with the submittal of the draft PA, the signing of the PA, submittal of all subsequent documents relating and pertinent to the PA and its stipulations, and until all coordination and consultation is completed satisfactorily and in compliance with Section 106 of the NHPA for each transformation project. The Army contends that the PA, when signed by all parties, will ensure that significant cultural resources will be preserved and protected during the Army's proposed undertaking to transform to an SBCT in Hawaii. The Army appreciates and thanks the members of your Council in advance for their assistance in ensuring the Army continues with its rightful and proper stewardship of the cultural resources under its jurisdiction during this transformation undertaking.

Should you require further information regarding this transformation undertaking, the point of contact is Dr. Laurie J. Lucking, Installation Cultural Resources Manager, at telephone number (808) 656-2878 ext 1052 or at email address luckingl@schofield.army.mil.

Sincerely,

David L. Anderson

APPENDIX J-2

PLACE NAMES AND ORAL HISTORIES

SUMMARY

The cultural significance of the Pōhakuloa area is rooted in: the presence of shrines, burials, and other sacred sites on or near it; the widespread belief that additional such sites remain to be found; its location within the sacred landscape of Mauna Kea; ongoing religious practices in the area; its association with a legendary king; its connection to the Mauna Kea adze quarries, and to traditional hunting and gathering activities; the presence of prehistoric trails and travelers' shelters; and its connection to the post-contact *paniolo* era. More details on specific sites and stories associated with this region can be found in the accompanying tables. Both human-built structures such as heiau and gravesites, and natural features such as *kīpuka* (oases within lava beds), water sources, old-grown forest, and cinder cones, can be considered within Hawaiian tradition to be valuable, and vulnerable, cultural resources.

SITE-SPECIFIC INFORMATION

The tables reflect relevant research conducted through 2002, new leads that were developed in response to requests for supplementary research, and the results of the new research conducted beginning January 2003.

- **Table C-1** summarizes information presented in earlier reports regarding locations with potential traditional meaning that lie in or near SBCT project areas.
- **Table C-2** lists oral histories already collected for this project by a number of different researchers.
- **Table C-3** lists the new sources that were developed after careful consideration of work done to date and resources that could be mined further. The request for new research focused on (a) oral histories recorded in the contemporary era and (b) earlier, written records of Hawaiian traditions of place. With the exception of a very few unpromising and hard-to-locate records, all avenues listed in Table C-3 were pursued.
- **Table C-4** lists the results of that new research.

Table C-1. Summary of place-related traditions recorded in earlier reports.

This table summarizes place-related information already documented in earlier reports, primarily those reporting the results of surveys on Army lands. The fourth column (“report”) credits the report in which the information was found. The fifth column (“original source”) names the document(s) cited by that report. To conserve space, reports and original sources are listed in the table by numbers (document number followed by page numbers), which are keyed to a list of citations at the end.¹

Place	Knowledge of place	Importance	Report	Original source
Ka'ena <i>ahupua'a</i>	<ul style="list-style-type: none"> Additional versions of a story, already given in Table C-1, of the demigod Maui trying to bring Kaua'i closer to O'ahu: Maui threw his hook, which was called manaikalani, into the channel of Ka'ie'ie Waho, but instead of catching Kaua'i he only caught a rock. That rock, known as the Pōhaku o Kaua'i, remains to day in the waters off Ka'ena. The people helping Maui to reel in Kaua'i had been told not to look back, but one person did; this caused the line to break; Kaua'i slipped back into the ocean leaving behind only the fragment now called Pōhaku o Kaua'i. The Pōhaku has been said by various people to be Pele's grandfather or brother. Legend has it that as the demigod Pi'ikoi and his father, Ala-la, traveled from Kaua'i to O'ahu to visit Pi'ikoi's sister, they were attacked by the squid god Kakahe'e. Pi'ikoi killed Kakahe'e near Lae o Ka'ena; in commemoration of the event, the land inshore was called Kakahe'e. Ka'ena Point was known in tradition as the main place on O'ahu from which the souls of the dead left the world of the living. Ka'ena is one of the regions that Hi'iaka, sister of Pele, passed through on her way to Kaua'i to fetch Pele's lover, Lohiau. This very hot, dry area was said to have some hidden water sources that were kept secret by the people of that area, even from Hi'iaka. In front of the current site of the Mokulē‘ia Beach Colony there once existed a traditional fishing shrine or ko‘a called Kōlea; in more recent times, Japanese fishermen built a shrine in the same vicinity. Tradition has it that in Makaleha, east of the DMR project area, sweet potato and taro grew in abundance, as well as ‘awa and banana. In this area the women did the fishing; usually by “torching.” 	Traditional practices: craftsmanship/woodworking, fishing, farming Sacred places: fishing shrine	54:7	
Waialua (<i>Oahunui to Halahape in Waialua</i>)	Mā‘ilikūkahi (the wise chief who was born at Kūkaniloko): had a kulanakauhale or village here.	Association with ruling class	4:12	5:55
Waialua general	This is what the missionary Levi Chamberlain observed in 1826, looking out over Waialua district from the high point where the stream that waters Kawaihāpai originates: “clustering settlements, straggling houses, scattering trees cultivated plants and growing vegetation,” and, near the highest point of the hill, “the ruins of an hut built apparently not long since for the accommodation of sandalwood cutters.”	Settlement pattern 1820s Sandalwood	87:7:8	89:36-37
Waialua general	Missionary John Emerson, who opened a mission station in Waialua in 1832, noted significant conflict between upland ranchers and natives; cattle and horses ruined native gardens and houses and natives had little or no legal recourse. The land now under Dillingham Airfield was all Crown Land, but Hawaiians (with the help/urging of Emerson) were able to by many small lots to the west of that.	Land use Land conflict	87:7:8,9	38:135, 140-141
Waialua general	The missionary Emerson described changes in the 20 years from 1832-1852: “The fields of waving grass and shrubbery... are no longer to be seen. Horses and cattle have reduced the rank pasturage, and where formerly there were only taro, potato and banana patches, there are now fields of cane, wheat, corn, rice and coffee. Twenty years ago wooden or stone houses were rare in our large villages, but now such buildings are quite common and the grass hut is disappearing.”	Changes in land use over specific 20-year period	87:7:9	38:183
Waialua	“Under the guidance of the missionary John	History of Māhele era	54:10	Native Register

	<p>area: “[I]n point of cultivation or fertility, the country did not appear in so flourishing a state.” Vancouver believed the population drop was due to “the constant hostilities that had existed since that period.”</p> <ul style="list-style-type: none"> • In 1833 or 1838, another European observer wrote: “Much taro land now lies waste because the diminished population of the district does not require its cultivation.” • In 1933, archaeologist J. Gilbert McAllister called Kahuku “rather desolate” and found it hard to imagine it supporting a large population. • There seems no evidence of old terraces in the upland along either branch of Kahuku Stream, but in the seaward swampland north and south of Kukio Pond there are such remains. 			
Kahuku area general	<p>In the <i>ahupua’a</i> covered today by the KTA, Hawaiians filing <i>kuleana</i> claims during the Great Māhele described a variety of agricultural and fishing pursuits; individuals often lay claim to a number of small, dispersed land parcels. Among the resources most frequently described in these claims are:</p> <ul style="list-style-type: none"> • taro • sweet potatoes • gourds • <i>wauke</i> • banana • coconut • <i>koa</i> • <i>hala</i> • <i>noni</i> • onions • melons • sugar cane • salt pans • fishponds and ocean fisheries 	Traditional agriculture	87 App. A	113
Kahuku area general	<p>Various legends and sayings suggest that Kahuku had once been a separate island that became attached to O‘ahu:</p> <ul style="list-style-type: none"> • “The natives tell a marvelous story respecting the origin of this district which they say floated in from the sea, and attached itself to the ancient shore of the island, that there was a subterranean communication between the sea and the ancient shore, by which a shark used to pass, and make depredations up on land.” 	Role in legend (that O‘ahu was once two islands)	87:5:8-9 6:67	89:35-36 95:68 90:53 91:144 12b:v4:49-50

Place	Knowledge of place	Importance	Report	Original source
	<ul style="list-style-type: none"> The island of Kahuku, floating, banged against the shore of O‘ahu, creating a lot of noise. Then “the old women guarding Princess Laiekawai ... grappled the island with fishhooks and attached it securely to O‘ahu. Polou Pool on the sea side of the Kahuku Mill is one spot where the hook was fastened. The other end was fastened at Kukio Pond, 300 feet inland at Kahuku Point.” Kahuku, at the point it was still a separate, floating island, was inhabited by menehune. The island did not have fresh water, so the menehune had to collect water from O‘ahu, for which they had to paddle their island up to the O‘ahu shore. Eventually, a man from Kahuku suggested that everyone make whalebone hooks, attach them to <i>olonā</i> rope, and capture the island. The Kahuku people did this and the menehune were unable to free their island. The proverb “Kahuku ‘<i>āina lewa</i>” means “Kahuku, an unstable land”; O‘ahu was once two islands and Kahuku is the part that bridges the gap. “Pōlou, perhaps a shortening of Pōulou (hooked post)” in legend was once two islands ruled by a brother and sister who locked hands to pull the islands together. They did this at a pool called Pōlou” (Pukui). 			
Kahuku area general	<p>Various legends and sayings show the identification of Kahuku with the <i>hala</i>, or pandanus tree.</p> <ul style="list-style-type: none"> Kahuku once had an abundance of <i>hala</i>, as described in the proverb “<i>Nani i ka hala ka ‘ōiwi o Kahuku</i>” or “The body of Kahuku is beautified by <i>hala</i> trees.” In the prayer of Kualii, Kahuku is described as a pandanus. Wearing leis of pandanus fruit and [pretending] to be from Kahuku, a young warrior inspired the marshal of King Kakuhihewa to give him a land grant: “Kalelealuaka was a strong, brave youth who disguised himself and fought many victorious battles for King Kakuhihewa against the forces of Kualii. Before one of these battles Kalelealuaka rushed to Kahuku and decorated himself with wreaths of pandanus fruit and flowers of sugarcane from Kahuku. 	Place in legend (<i>hala</i> tree)	87:5:8-9 87:5:16	<ul style="list-style-type: none"> •91:248 •92:28 •93:100, 105:1

Lā‘ie area general (Waiapuka pool)	<p>The saying “<i>Lā‘ie i ka ‘ēheu o na manu</i>” or “Lā‘ie borne on the wings of birds” refers to one of two legendary twins born at Lā‘ie. They were born at the place now known as Lā‘ie, O‘ahu. Their names were La‘iekawai and La‘ielohelohe.</p> <p>La‘iekawai would represent/ embody the element of water and dwell in sacred pools; La‘ielohelohe was the element of air and took the form of a dragonfly. Their grandmother, Waka, sometimes appeared in the form of a rainbow, protecting them from the air, while</p>	<p>Place in legend (mystical twins)</p> <p>The pool mentioned in this legend is said by Kalākaua to be associated with numerous other legends as well, but he does not name them.</p>	87:5:10-11	91:209 97:455-457 90:52

Place	Knowledge of place	Importance	Report	Original source
	<p>their grandfather—Puihi, the eel god—protected them from the sea.</p> <p>The twins' mother, Malaekahana, was the wife of Kahauokapaka, chief of both Ko'olau districts. Kahauokapaka wanted a son, so he vowed that all girls born to Malaekahana would be put to death; and by the time his wife was pregnant with the twins, he had already killed four daughters.</p> <p>Malaekahana, pregnant for the fifth time, sent her husband away to gather fish for her. In his absence she gave birth to the beautiful twin girls; to save their lives, she sent them away and when Kahauokapaka returned, she told him she had had a stillbirth.</p> <p>La'ielohelohe was sent to be reared by a kahuna named Kapukaihaoa. La'iekawai went to live with her grandmother, Waka; Waka took her to live in a cave that could only be entered by diving into the pool of Waiapuka.</p> <p>In 1885 King David Kalākaua, traveling in the Ko'olau districts, stopped at a pool of water and was told this was the legendary Waiapuka. While legends relating to the pool were being retold "an old native, who had joined the party at Kane'ohe," dove into the pool and found the entrance to the cave.</p> <p>Another legend concerning the beautiful Lā'ie twins says that Hulumananiani, a powerful chief from Kaua'i, took the form of the <i>koa'e</i> bird and visited them and invited them to go for a flight with him. La'iekawai agreed but La'ielohelohe stayed home. After a while La'iekawai realized that she was far from home and called to her relatives for help; they enveloped her into the rainbow.</p> <p><i>(Kalākaua's description of pool and location: They came upon the pool after "entering the district of Koolauloa... and approaching the coast over a broad stretch of grassy meadow but slightly above the level of the ocean." The pool was "of clear water, nearly round, and perhaps a hundred feet in diameter. The surface of the pool was ten or twelve feet below the level of the surrounding plain, and its even banks of solid rock dropped almost perpendicularly into water of unknown depth." It was believed to be spring-fed.)</i></p>			
Lā'ie area general	<p>How the mullet came to Lā'ie:</p> <p>A woman from 'Ewa married and moved to Lā'ie. There she lived very comfortably with</p>	Place in legends. (fish)	87:5:12	93:269-272; 99:48-51

	<p>crowned the plateau ... a magnificent <i>k'oa</i> [tree] spread its protecting branches by the spot chosen by Kokoa for his grass house. <i>Kukui</i> trees furnished their oily nuts for his torches. The <i>ohia</i>, or native apple, and the breadfruit and wild sugarcane gave generously of their wealth to the support of the cannibal band. They easily cultivated taro ... and captured birds and sometimes unwary hunters who penetrated the forest recesses in search of the birds with rare yellow feathers. It was a beautiful den into which, spider-like, he dragged his victims.</p> <p>...</p> <p>"After the grass houses were built for permanent shelter, Kokoa (Ke-alii-ai-Kanaka) caused a great hole to be made. This was the <i>imu</i>, or oven in which the bodies of animals and men were to be baked. ...</p> <p>"After a time Kokoa and his companions took a huge outcropping block of lava and smoothed away the top, making a hollow <i>ipukai</i>, or table dish, or, more literally, a gravy dish, upon which their ghastly repasts were served. This stone table was finally rounded and its sides ornamented by rudely carved figures. The stone was five or six feet in circumference. Not far from it the chief's grass house was built and the ground prepared for the taro which should be their daily food."</p> <ul style="list-style-type: none"> • Ke alii ai kanaka, the cannibal leader, was eventually defeated by Hoahanau, a brother of one of his victims. 			
Helemano	<p>Kalākaua's version of cannibal story: Kokoa, with 200-300 followers, landed on the northern coast of O'ahu at Waialua near the end of the 17th century after leaving Kaua'i. In Waialua people were numerous and unoccupied land was scarce. They eventually found land 8-10 miles from the coast and moved there (known as Helemano). Helemano is described as "a crescent-shaped plateau of two or three hundred acres, completely surrounded by deep and almost precipitous ravines, with the exception of a narrow isthmus, scarcely wide enough for a carriage-way, connecting it with a broad area of timberless table-land stretching downward toward the sea." Kokoa erected a temple in</p>	Association with legend (cannibals)	24	97b:373-376

Place	Knowledge of place	Importance	Report	Original source
	<p>the middle of the plateau, which had walls 200 feet long by 60 feet wide and 20 feet tall. Not far from the temple was the chief's house. Between the chiefs house and the temple was an "excavated oven" which could hold 4-5 human bodies for roasting. Not far from this was the great carving table of Kokoa.</p> <p>Kokoa also "put the place in a condition for defense by cutting the tops of the exposed slopes leading to it into perpendicular declivities, and erecting a strong building covering the width and almost entire length of the narrow back-bone connecting it with the plain below." The plateau could only be reached by "a path zigzagging down the upper side to the timbered gulches beyond, or by the trail passing directly through the building occupying the apex of the isthmus.</p>			
Helemano	Kauikua at Helemano was the place where the young warrior Kalelealuaka was ritually circumcised. The rite was performed by his aumakua (ancestral spirits), after he had taken a purifying bath, while "lightning flashed, thunder sounded, and the earth quaked."	Association with legend (the warrior Kalelealuaka)	57:3-11	93:92
Helemano	Helemano was at one time home to the <i>lō ali'i</i> —chiefs who were considered gods that resembled men. These <i>ali'i</i> guarded their <i>kapu</i> (sacred status) very carefully.	Association with ruling class	4:13	5:40
Helemano	<p>"King Umi, having vanquished the kings of the six divisions of Hawaii, was sacrificing captive in one of these heiaus, when the voice of his god, Kuahilo, was heard from the clouds, demanding more slaughter. Fresh human blood streamed from the altars, but the insatiable demon continued to call for more, till Umi had sacrificed all the captives and all his own men but one, whom he at first refused to give up, as he was a great favorite, but Kuahilo thundered from heaven, till the favorite warrior was slain, and only the king and the sacrificing priest remained."</p> <p>A cruel king, Hooku, is said to have lived here.</p>	Association with legend ('Umi Hooku)	85:97	
Helemano	"It is fifty-four years since the last human sacrifice was exposed on the Waipi'o altars, but there are several old people who must have been at least 30 when Hawaii threw off idolatry for ever." [originally published 1890]	Traditional practice (human sacrifice).	85:97

Kūkaniloko	<ul style="list-style-type: none"> Kūkaniloko is one of two famous <i>ali'i</i> birthing places (the other is Holoholoku on Kaua'i). Thrum's description: "A row of stones was laid down on the right hand and another on the left hand, and the face was to the right side. There stood thirty-six chiefs, eighteen on each side. A hill or mound was made for the back. Kūkaniloko was the stone to be trusted. If any one came in confident trust and lay properly upon the supports the child would be born with honor. It would be called chief divine; a burning fire. "When the child was born, it was quickly taken inside the Waikau [??] of Hoolonopahu. There were forty-eight chiefs to whom belonged the duty of the birth ceremonies, of cutting the naval cord. "The south side of Kūkaniloko was a furlong and a half, and on the western side two furlongs. There the <i>tabu</i> drum of Hawea was sounded, signifying that a chief was born. On such occasions the common people assembled on the east side of the stream—a thousand of them (<i>a mano</i>), on that side of Kuaikua. On the south side were the servants." <i>Kaukonahua Stream or along the nearby Waiakakalaua Stream to the south of Wai'anae Uka")</i>	<p>up their eating habits. His craving for human flesh became uncontrollable.</p> <p>His chiefs and priests begged him to stop attending the cannibal feasts of Aikanaka. Finally he consented, fearing rebellion, and began to eat his meals at home in the company of his chiefs.</p> <p>But his craving eventually got the better of him. One day, O'ahunui said he could hear the surf of Wai'alua and that the fish of Ukoa pond must be ready for harvest. At the time, his brother-in-law Lehuanui was the only adult nearby. Lehuanui agreed to go and harvest the fish, leaving behind his two young sons.</p> <p>While at Wai'alua, Lehuanui's sons appeared to him in a dream and said that the king had cooked and eaten them and hung their skulls from a <i>lehua</i> tree and buried their bones underneath it.</p> <p>When he arrived home he found the dream had come true. He killed O'ahunui—cut off his head with an adze. In this version, there was a surviving younger son. Lehuanui took his son and “chided” his wife for allowing the crime to happen.</p> <p>She tried to follow him as he left, but either he killed her or she fell next to the <i>lehua</i> tree and turned to stone. O'ahunui and his servants also turned to stone. Everyone else fled in fear and disgust.</p> <p>The stone is said to embody chief O'ahunui at the spot where he was killed. In the 1890s, people would ride out from Honolulu to walk around the stone, and it was said you couldn't say you'd been around the island unless you'd been around this stone. (It was shaped like the island of O'ahu.)</p> <p>On the other hand, Thrum quoted in Beckwith saying, “A curse hangs over the place...None has ever dared to live there since.”</p> <p><i>See also: Helemanō for more details on cannibal legends.</i></p>	ruling class	<ul style="list-style-type: none"> • 3:11 • 34:13 	<ul style="list-style-type: none"> • 12:111 • 13:132 • 13:132 • 14:342 (quoting Thrum)

Mauna Kea	<ul style="list-style-type: none"> • The summit above the <i>māmane</i> treeline was sometimes associated with goddess Poli'ahu, who was occasional rival of Pele. • “The Pōhakuloa area has Lilinoe as the female deity of misty rain and heavy fog, while Poli'ahu is the snow deity which adorns the top of Mauna Kea during the winter. These male and female water forms both belong to Mauna Kea area.” • Another version has Lilinoe as the sister of Poli'ahu. • Queen Ka'ahumanu visited Mauna Kea in 1828 in search of the bones of Lilinoe, whose “body was said to have lain for more than a thousand years in a well-preserved condition.” • A story says that Pōhakuloa was a deity who guarded <i>Ka wai kapu a Kane</i> (the sacred water of Kane) at Waiau on Mauna Kea. • A witness who gave testimony before the Boundary Commission stated that on Mauna Kea is “Poli'ahu, a cave where Lilinoe used to live”; however, this has not been located. 	Association with traditional deities—association reinforced by actions of a key Hawaiian figure of the early post-contact era.	<ul style="list-style-type: none"> • 60:88 • 63:10 • 70:1.4 • 70:1.4 • 73:24 • 70:1.15 	<ul style="list-style-type: none"> • 14b:222, 70:?? • -- • -- • 5b:285 • -- • Boundary Comm. Vol.B:28-59
Mauna Kea, upper slopes	The higher regions of the forest (<i>waoma'ūkele</i> and <i>waoakua</i>) contained valuable, large, old hardwoods such as <i>mamane</i> and <i>'ōhia</i> , but these were only harvested on special occasions/for major projects, and required a major sacrifice/human sacrifice in return.	Traditional practices: wood harvesting, conservation	63:14-15	

Place	Knowledge of place	Importance	Report	Original source
Mauna Kea, summit	When Queen Emma and David Kalākaua were vying for the throne, each tried to prove a connection to the senior genealogical line by a symbolic visit to a wahi pana (sacred place). Of the two most sacred islands, Kalākaua went to Kaho‘olawe, and Emma went to bathe in the waters of Waiau at the top of Mauna Kea.	Ritual visit by Queen Emma (an important Hawaiian figure in the mid to late monarchy era) demonstrates area’s importance as a sacred site and as a site validating royal sanctity/power.	• 63:9	
Mauna Kea adze quarry (7.5+ square miles in area, northeast of PTA on the upper slopes of Mauna Kea)	<ul style="list-style-type: none"> • A source of very high quality basalt. • Associated with it are workshops, shelters, shrines, and rock art. • Adze quarrying here died out after metal was introduced but may have lasted as late as 1840s. 	Traditional cultural practices: important basalt quarry for adze-making.	<ul style="list-style-type: none"> • 64:14 • 60:88 	• 70:1.7
Naohuleelua (southeast corner of Ka‘ohe ahupua‘a)	Naohuleelua is said to be the “scene of battle between Hāmākua and Kona birdcatchers, settled with bows.”	Warfare. Traditional cultural practice: bird-catching.	61:D-14	“Map Reg. 1641, 1891” [possibly a State Survey Office map number?]
Papa Hemolele (a flat area mauka of the old trail from Waimea to Humu‘ula, on the south side of Waiki‘i gulch)	There were many altars at this location, where people offered prayers for peace, rain, and various things, and there may also have been human sacrifice offered at certain features in the vicinity.	Sacred sites. Possible human sacrifice altar.	61:D-9	62:130
Pōhakuloa and Mauna Kea	“The Pōhakuloa area has Lilinoe as the female deity of misty rain and heavy fog, while Poli‘ahu is the snow deity which adorns the top of Mauna Kea during the winter. These male and female water forms both belong to Mauna Kea area.”	Gods associated with Pōhakuloa and Mauna Kea	63:10	
Pōhakuloa area general	The high chief ‘Umi a Līloa, who probably lived in the early 1600s, traveled over an upland trail to attack Hilo in one of the earliest battles of his career. According to Kamakau, ‘Umi’s route followed an “ancient trail” that led “by way of the mountain to the trail of Poli‘ahu and Poli‘ahu’s spring at the top of Mauna Kea, and then down toward Hilo.”	Trails Warfare Legendary chiefs Pre-contact political history	43:26	46:191,205 5b:16
Pōhakuloa area general	The literal translation of the name is “long stone.” A story says that Pōhakuloa was a deity who guarded <i>Ka wai kapu a Kane</i> (the sacred water of Kane) at Waiau on Mauna Kea.	Deity associated with Pōhakuloa, Mauna Kea	73:24	
Pōhakuloa area general	Pōhakuloa groves would have played a role in sandalwood trade.	Sandalwood trade (a pivotal event in history and cultural	73:26

Table C-2. Oral histories already collected or referenced for this project.

Numerous oral histories have already been collected in reports concerning areas that are or in the vicinity of the sub-installations that will be affected by the SBCT transformation; others that may be relevant are recorded in other documents cited by those reports. The second column of this table lists the existing reports; the third column indicates the oral histories they contain or refer to.

Place	Existing report	Oral histories
Dillingham	Moblo, Pennie (1991): <i>Literature Review and Archaeological Reconnaissance Survey for Dillingham Airfield Master Plan Area, O'ahu, Hawai'i</i> . Prepared for Edward K. Noda and Associates, Inc., Honolulu. International Archaeological Research Institute, Honolulu.	Handy, E. S. Craighill (1940): <i>The Hawaiian Planter</i> . Bernice P. Bishop Museum, Honolulu. Handy, E. S. Craighill and Elizabeth Green Handy (1972): <i>Native Planters in Old Hawaii: Their Life, Lore, and Environment</i> . Bernice P. Bishop Museum Bulletin, 233. Bernice P. Bishop Museum Press, Honolulu. Rosendahl, Paul (1977) cites [interview with?] Beatrice Krauss in Appendix A of <i>Archaeological Inventory and Evaluation Report for Installation Environmental Impact Statement for U.S. Army Support Command, Hawai'i (USASCH)</i> . Prepared for the Department of the Army, U.S. Army Engineer Division, Pacific Ocean. Bernice P. Bishop Museum, Honolulu.
Pōhakuloa	Langlas, Charles, Thomas R. Wolforth, James Head, and Peter Jensen (1997): <i>Archaeological Inventory Survey and Historic and Traditional Cultural Assessment for the Hawai'i Defense Access Road A-AD-6(1) and Saddle Road (SR 200) Project, Districts of South Kōhala, Hāmākua, North Hilo, and South Hilo, Island of Hawai'i</i> . Paul H. Rosendahl Ph.D., Inc., Hilo, Hawai'i.	Report quotes extensively from Henry Auwae (pages 129-136) regarding traditional Hawaiian sites and summarizes other informants for historic-era information. It does not contain interview transcripts but does list names of those interviewed (pages 173-174).
Pōhakuloa	Maly, Kepā (1999): <i>Mauna Kea Science Reserve and Hale Pōhaku Complex: Oral History and Consultation Study, and Archival Literature Research, Ahupua'a of Ka'ohe (Hāmākua District) and Humu'ula (Hilo District), Island of Hawai'i</i> . Prepared for Group 70 International. Kumu Pono Associates, Hilo, Hawai'i.	Contains transcripts of oral history interviews, and an index to the interviews.

Place	Existing report	Oral histories
Pōhakuloa	Social Research Pacific, Inc. (2002): <i>Planning Level Oral History Survey of Traditional Cultural Properties on U.S. Army Pōhakuloa Training Area Hawai‘i Island, Hawai‘i (Draft Report)</i> . Social Research Pacific, Inc., Kailua, Hawai‘i.	Report contains a number of oral history transcripts as well as a translation of an 1853 article on Ahu-a-‘Umi. It also cites: <ul style="list-style-type: none"> • “The Story of Umi” by Fornander [this is probably a chapter in Elbert (1959): <i>Selections from Fornander</i>; otherwise, it is missing from the references]. • Kumu Pono Associates (1997): <i>Mauna Kea Kuahiwi Ku Ha'o i Ka Maile: A Report on Archival and Historical Documentary Research</i>.
Pōhakuloa	Tomonari-Tuggle, M. J. and C. Kanani Paraso (2002): <i>Cultural Assessment for the Palila Mitigation Project: Ka’ohe and Kalōpā Ahupua‘a, Hāmākua District, Island of Hawai‘i</i> . International Archaeological Research Institute, Inc., Honolulu.	Appendix A contains summaries of two oral history interviews on Mauna Kea. Page 33 cites Maxon, Helen Hitchcock (1987): <i>D. Howard Hitchcock, Islander</i> . Topgallant Publishing Company, Honolulu—re: hunting of feral cattle and pigs for recreation and subsistence.
Schofield	Social Research Pacific, Inc. (2001): <i>Oral Historic Studies for the Determination of Traditional Cultural Places at the U.S. Army Schofield Barracks Military Reservation, Wahiawā, O’ahu Island, Hawai‘i</i> . Prepared for United States Army Engineering District, Honolulu. Social Research Pacific, Inc., Kailua, Hawai‘i.	Report contains a number of oral history transcripts.
Wheeler	Tomonari-Tuggle, M. J. (1994): <i>Archaeology and History on the Central O’ahu Plateau: A Cultural Resources Assessment of Wheeler Army Airfield</i> .	Research integrates information from a number of interviews (individuals listed on page 2) but not in the form of transcripts or lengthy block quotes.

Table C-3. Additional oral histories and traditional accounts.

The following sources, gathered from a review of existing SBCT reports, suggestions by the Army Garrison cultural resource manager, and in the course of new research in Honolulu archives, provided new sources of potential information concerning traditional cultural places and practices on SBCT sub-installations.

Table C-4. New information gathered starting January 2003

This table reflects new information gathered in the course of research starting January 2003, mainly from the sources listed in Table C-3. It also includes additional information from the actual transcripts of interviews for sources listed in Table C-2 (information from these sources in Table C-1 was based only on the text summaries of these documents). For the sake of simplicity, the information is listed as found in the source, not as verified factually accurate (in other words, phrases like “reportedly,” “is said to have,” etc., have been omitted but should be understood).

Place	Knowledge of place	Importance	Source
Places on/near Dillingham Military Reservation			
Dillingham general	In a 1976 interview, Lorna Burger of Hale‘iwa mentions terraces that are said to have been built by <i>menehune</i> trying to drag a shark up a hill, somewhere on the current Nike missile range.	Possible association with sacred site: Kawaihoa Heiau	Ethnic Studies Oral History Project: Waialua and Haleiwa: 174-175 (interview w/Lorna Burger)
Ka‘ena Point	Here, the souls of the dead were believed to begin their journey into the afterlife at Leinaaka‘uhane.	Traditional religion	Becket et al. 1999:89Pukui et al. 1974:131
Kapaeloa	Kāne‘aukai was the older brother of Maikoha. The/a place where he came to shore was Kapaeloa. He asked some fishermen, who had been fishing unsuccessfully, which god they worshipped. They replied, “We are worshipping a god, but we don’t know his name.” Kāne‘aukai told them to use his name in their prayers and he thus became their fish god. Kāne‘aukai replied: “You will now know and worship him. This is the way. When you let down your net again, call out, Here is the food and fish Kāne‘aukai; that is the name of the god.”	Traditional religion (arrival/establishment of fishing god).	Alameida 1993
Kawaihāpai	Additional information about the legend of the drought relieved by prayer, which gave rise to the name of this region: After the two priests had prayed for water, they saw a hog-shaped cloud coming from Kahuku point and soon they heard the rain and saw water pouring from the cliff. The land is called Ka-wai-hāpai (meaning lifted water) “because this water was lifted up and placed above”; because the source was unknown, the water was also called Ka-wai-kumu-ole-i-ka-pali (water without source on the cliff).	Association with legend	Lio KaKelle, H.K. (1911): Haina Nane. Answer to a Riddle.
Waialua	The name Waialua might mean “doubly disgraceful” and derive from a cruel chief whose people eventually drove him off.	Association with legend (cruel ruler)	Becket et al. 1999:88
Waialua	Two well known fishponds in Waialua were Loko‘ea and ‘Uko‘a. ‘Uko‘a is now a wildlife refuge.	Traditional practices (fishponds)	Alameida 1993:82Becket et al. 1999:88
Waialua	Missionary John Emerson wrote that “There is more land owned by the common natives in Waialua than in any	Land issues, population history	Alameida 1993:94

Place	Knowledge of place	Importance	Source
	other district of O‘ahu” and this led to immigration into the district.		
Waialua	Waialua was known during the traditional era as an oracle center and was home to many <i>kāhuna</i> and their schools.	Association with traditional religion	Becket et al. 1999:88
Waialua	<ul style="list-style-type: none"> An 1813 visitor described an area with well developed agriculture and fisheries, including an elaborate fishpond at Uko‘a 	Land use history	Alameida 1993:3
Waialua	<ul style="list-style-type: none"> In the 19th century, the Waialua region provided food to the growing city of Honolulu. 	Land use history	Becket et al. 1999:88
Waialua: Nenelea (somewhere east of Kaena Point)	At this place was a settlement of fishermen.	Land use, population	Alameida 1993:18
Waialua: Puaena Point	At this place some commoners, after death, were left to decompose on the rocks.	Traditional practice	Alameida 1993:12
Places in Kahuku			
Kahuku general	<ul style="list-style-type: none"> Kalaeokahipa is an ancient name for “[t]he brow of the hill that seems to peer right over the round-the-island road.” <p>Nawaiu-o-Lewa (Lewa’s breasts) is a geographical feature northwest of Kaleokahipa; now [1922] only one “breast” remains: “The other was broken off by that supernatural son of Ku and Hina. When that wonder worker passed on, other wonder workers came in and Kahipa’s nose became parched and twisted, the bundles that held the bones of the ancestors were scattered to bits by the giant powder of Mr. Hamana Kalili of Laie.”[No explanation is given for either “Kahipa’s nose” or “Mr. Hamana Kalili.”</p>	Place names; legends of place; possible reference to post-contact land issues; [former] burial sites. [Allusive language, not atypical for this genre, is difficult for uninitiated to interpret yet makes it clear there were issues/traditions associated with area.	Apuakehau 1922
Kahuku general	Between the two features Kalaeokahipa and Nawaiu-o-Lewa is a secret cave that “belonged to Ka-alae-huapi (Red-head-mud-hen) and others in the first Kahuku that was covered by a hala grove. Either the cave or “the first Kahuku” (lang. unclear) belonged to Maui and contained Maui relics or images. This became “the first homestead land” and had frame houses from 1858-1862 “under” (owned by?) Mopika and Kapakini, who raised sheep and cattle.	“Secret cave”; presence at one time of religious relics, mid-19th-century land use (homesteading, ranching)	Apuakehau 1922
Kahuku general	“The natives claimed assuredly that Maui hooked the land fast, for it is indeed strange to see these ponds where Kahuku	Association with legend: folkloric detail on Kahuku as an	Apuakehau 1922

Place	Knowledge of place	Importance	Source
	was made fast and it is a very sure sign that footsteps could be heard resounding a long way off.” The sound of the train coming from Wai‘anae could be heard on the tracks when it was still a long way off, “a very true sign that Kahuku is an unstable land [with] hollow space beneath.”	“unstable” land that was once separate from the rest of O‘ahu.	
Kahuku area general	Per Handy: “In ‘Opana the legend is told that the gods Kane and Kanaloa struck spring water from a rock known as Wai-kane, to give life to this hitherto waterless region around Kawela Bay.”	Association with legend	Handy and Handy 1972:462
Kahuku general	Another version of the kapa anvil story described in Table C-1: The place in Waipahu where the stream re-emerged to the surface and the anvil came out was known as Ka-pukana-wai-o-Kahuku or Outlet-of-water-from-Kahuku. The anvil was found by a woman from Waikele. The Kahuku woman who owned and lost the anvil went searching for it, listening to the sound it made [when it was beaten?], as each anvil had a different sound. She searched in vain at Kaneohe, Wailupe, and Kapalama. At Waipahu, “a gentle Mauunene breeze wafted down from Lihue” and brought the sound of her anvil from Ke-ana-pueo (owl’s cave), where the woman who found it was living. The owner followed the sound until she found her anvil and took it home.	Association with legend	Anonymous 1899
Kahuku general	The missionary John Emerson, who observed conflict between ranchers and native smallholders in Waialua, observed (as described by his son) similar domination by a rancher of Kahuku: “He was so autocratic that the natives could not own a dog, or pasture a cow or horse without his consent. The depredations of his herds and flocks on their small homesteads became unbearable, but they appealed in vain for the protection of their beloved <i>hala</i> tees and patches of vegetables.... With the fading of the forests the people also disappeared and the once populous district of Kahuku became a lonely sheep and cattle ranch.”	Land use/land change/ native loss of control over land	Emerson 1928:134 cited in Becket et al. 1999:113
Kawailoa: Pa‘ala‘a <i>ahupua‘a</i>	There is said to have been a mythical temple called Kapukapukea built by the <i>menehune</i> here. Ma‘ilikukahi, a good chief of ancient royal stock, was said to be installed here	Association with legend	Kirch, Patrick V. and Marshall Sahlins (1992): Anahulu p 21.

Place	Knowledge of place	Importance	Source
	as king of O'ahu.		
Kawela	A fast runner named Keliimalolo was born at Kawela. His grandparents were supernatural beings. The <i>mana</i> (power) of Kahimalolo's grandfather, Kolokini, took him from his parents and he was raised by his grandfather. The child was uncontrollable. He liked to go to Hanakaoe to throw darts with other children. He also liked to fight and beat the other children and so their parents hated him. On his sixth trip to Hanaka'oe he killed a boy there. The boy's father came to kill Keliimalolo but he himself was killed. Keliimalolo remained away from Hanakaoe for 20 days but on the 30th (sic) sailed down the shore of Kawela. He saw some boys playing darts and joined them. They started fighting and he wounded many of the boys and killed two. Keliimalolo kept escaping, however, because he could run so fast.	Association with legend	"Noted Place on the Island of Oahu." Article in Ke Aloha Aina August 29, 1919. HEN Newspapers (folder 15 of 17)
Puna-hoolapa spring/Ponihua stream	In this version of the kapa anvil story, the Hawaiian word for kapa anvil is given— <i>kua</i> . It says the anvil's owner hid it by Puna-hoolapa spring when not using it, and it was washed into Ponihua stream. Her discovery of the anvil in Waipahu was the means by which people discovered the subterranean stream that flowed from Kahuku to Waipahu.	Association with legend (kapa anvil)	Baker n.d.
Puna-manô	There is a spring in Kahuku called Puna-manô; here a shark destroyed a man. A man and women put the shark there when it was small in order to save it. They planted a breadfruit tree at the same time next to the water. The shark killed the brother of the woman because he was stealing breadfruit and the shark was told to guard the tree.	Association with legend	Kuapuu 1861
Waikalai	"There is a big fresh water pond at Kahuku, called Waikalai and an old women sat on its banks beating tapa. When she was through she placed her anvil in the water and while she was somewhere else, the anvil vanished. It was quietly drawn by the water and dragged underneath the land. Because the old lady missed her anvil so much, she went about seeking her possession as she thought it was stolen...when she arrived in Ewa, she heard the sound of her anvil in Wai-pahu...she came to the house of the person who was using it...[The women told her that] one day I went to	Association with legend (kapa anvil)	Anonymous 1868

Place	Knowledge of place	Importance	Source
	bathe where the water is gushing, the water that comes with force out of the rock, and as I bathed my back was touched by the anvil...the source of this water is in Kahuku, a pool called Waikalai. That is where the water of Wai-pahu comes from and it was from there that this anvil was borne hither by the water.”		
Places at Schofield, Wheeler, and Heleman			
Heleman	<p>“[C]ertain people who lived long ago ... were known to roast and eat any person who went there as a stranger. The house site of their chief, whose name was Kale, is pointed out and also a flat, smooth stone called Kale’s meat dish that lies there to this day.... The land is on a high place surrounded by deep valleys and the trail leading to it is steep...There also is a heiau site ten fathoms long and seven fathoms wide. Between the heiau and house site is the imu pit where people were roasted. Below that, about 13 or 14 chains away, lies Kalo’s meat dish...[Kaanokeewe, his strongest servant]...his house stood on the narrowest part of the trail leading to the mountain. The trail went through the house and it was the trail from Koolauloa.”</p>	Association with legend Trails	Anonymous 1861: Some Cannibals
Kamananui	<ul style="list-style-type: none"> • “At Kamananui the lowland fields were watered by means of a ditch some 2 miles long—the longest such waterway in O‘ahu.” • In the early 19th century Kamananui was the ritual and political center of Waialua. • By 1820 the “political center of gravity” had shifted from Kamananui to Kawailoa and corresponded to a change in tabu systems. • Two <i>heiau</i> here of the <i>luakini</i> class (royal class) were probably presided over by the god Kū. 	Traditional practice (agriculture) Early political history/sacred places	Kirch and Sahlins 1992:20-21
Kolekole Pass	<ul style="list-style-type: none"> • Historically, ranchers would drive their cattle through Kolekole Pass on the way to Wai‘anae. The cowboys would overnight at Leilehua. 	historic land use	Wai‘anae Coast Culture and Arts Center and Topgallant Publishing Co., Ltd. 1986: 29
Kolekole Pass	<ul style="list-style-type: none"> • In early historic times, Hawaiians traveled over the mountains through Kolekole Pass and Leilehua to go to the market in Waialua 	historic land use	Wai‘anae Coast Culture and Arts Center and Topgallant Publishing Co., Ltd. 1986: 38
Kolekole Pass	There was a big sacrificial rock up on Kolekole Pass (considered a sacred place)	Sacred place	Social Research Pacific, Inc. 2003: Interview with Kauila Clark, App. D-5.

Place	Knowledge of place	Importance	Source
	that was destroyed during the building of a road. There were also a couple of <i>pōhaku</i> were <i>piko</i> (umbilical cords) were placed.		
Kolekole Pass, Kolekole Stone, and surrounding plains	<p><i>Lua</i> fighting: The god of <i>lua</i> fighting was named Ku‘ialua. This form of fighting involved a number of skills: “first, how to grasp with the hands, second, how to prod with a <i>kaui</i> cane; third, how to whirl the club called the <i>pikoi</i> or <i>ikoi</i> that had one end ... tied with a rope of <i>olona</i> fibers.” In one form of fighting, combatants tried to tie each others’ limbs into knots. Women also practiced <i>lua</i> fighting; the training took from six months to a year. <i>Lua</i> practitioners sometimes looked very mild and harmless until they got ready to fight. A <i>lua</i> warrior’s training ended with a cannibal feast.</p>	Traditional practice (<i>lua</i> fighting)	Anonymous 1923: Na Oihana Lua Kaula 1865
Kūkaniloko	<p>The great chief Mā‘ilikūkahi was known for reorganizing land divisions on O‘ahu in a way that lessened conflict; for protecting the commoners from the chiefs; and for a rule that brought (for the most part) peace and prosperity. Mā‘ilikūkahi, who ruled in the 14th-15th century, is also known for ending the practice of human sacrifice. His reign “ushered in an era of benign rule lasting for several generations.”</p>	<p>Association with legend</p> <p>Association with ruling class</p>	Alameida 1993:25-27 Becket et al. 1999 frontispiece

Mount Ka‘ala	<ul style="list-style-type: none"> A trail on the side of Mount Ka‘ala, “that’s where that shark boy, <i>ali‘i</i>, used to come to meet Ka‘ala... a beautiful, beautiful girl.” The boy—“<i>keia keiki e‘epa</i>” [this mysterious/ strange child] visited his lover several times but after one visit, “on his way back they chopped his head off, make [dead].” Interview switches to Hawaiian language at this point for several sentences; includes the phrase “<i>kanaka e‘epa</i>” [mysterious/strange man] ... “That’s why they killed him on the ridge.” This story was related to Mary Kawena Pukui during a 1960 interview. The storyteller indicated that this was only part of the story, and that the people who knew more chose not to share it. Hi‘iaka’ (the sister of Pele), was returning to Hawaii from Kauai‘i with 	Association with legend	Meyers 1960 Anderson 1928: 274

Place	Knowledge of place	Importance	Source
	Prince Lohiau. On the way they stopped in O‘ahu and Hi‘iaka’ climbed to the top of the Ka‘ala Mountains. From there she could see that her lehua and hala groves, near the beach in Puna on the island of Hawaii, had been destroyed by a lava flow. The flow was caused by her sister Pele’s rage over Hi‘iaka’s long absence and time spent with Lohiau.		
Mount Ka‘ala	Even into late historic times hunting in this area was good. It was lush and there was plenty of fresh water	Environmental description	Wai‘anae Coast Culture and Arts Center and Topgallant Publishing Co., Ltd. 1986: 28
Pa‘ala‘a	Pa‘ala‘a was a place where Ka-‘ihi-kapumahana, one of Lono’s sons, was taken and became the ancestor of the people there.	Association with legend (son of Lono)	Kamakau 1992:54
SBMR general	Most of the sites on SBMR are <i>ahu</i> ’s and are located on the Honolulu side. These sites are in the mountains and deep in the valley and are not located on any maps.	Possibility of undocumented sites within the SBMR area.	Social Research Pacific, Inc. 2001: Interview with Shad Kane, App. D-16.
SBMR West Range (Ogden Site #5392 and #5393)	These two sites consist of a seemingly continuous <i>lo‘i</i> system and follow the streambed and slope of Waikoloa Gulch.. Here, many <i>Lawai</i> plants (used for mats and medicine) are found.	Site showing agricultural practice here.	Social Research Pacific, Inc. 2001: Interview with Kyle Nakanelua, App. D-20.
SBMR West Range (Ogden Site #5448)	Mounds or pits built up from a pile of rocks and called <i>kahikinui</i> structures are found at this site. In the center compost material would have been placed to make <i>huli</i> (growth bedding). Material uses as compost may have been <i>Hapu‘u</i> fern, which is still abundant here, or wet newspaper. Some of the smaller mounds could be ‘ <i>ahu</i> and would have been placed close to the Hale Mua.	Significance and explanation of site	Social Research Pacific, Inc. 2001: Interview with Kyle Nakanelua, App. D-20.
Wahiawâ	A graveyard in Wahiawâ contained a rock that was moved by a Japanese person. The rock came back and so a building was built around it.	Legend associated with place	Social Research Pacific, Inc. 2001: Interview with Kauila Clark, App. D-9.
Wahiawâ	<ul style="list-style-type: none"> You could hear the big waves crashing on the north shore at the peak here. It was very wet here, ideal for growing ‘awa (before Dole was established) 	Traditional land use	Social Research Pacific, Inc. 2001: Interview with Kauila Clark, App. D-9-10.
Wahiawâ	Wahiawâ area is considered by some to be the “most significant lands in all of Hawai‘i.”	Significance of place to native Hawaiians	Social Research Pacific, Inc. 2001: Interview with Tom Lenchanko, App. D-18.
Waikakalaua gulch	You could not bring pork here. After midnight you could not take pork here because that was when the <i>kahuna</i> trained in the area. There were also birthing stones here- which when moved would move right back. The Filipinos (during plantation times) said that between six	Taboos associated with place Legend associated with place	Social Research Pacific, Inc. 2001: Interview with Kauila Clark, App. D-9.

Place	Knowledge of place	Importance	Source
	and seven o'clock at night the stones would talk to each other.		
Places in/near Pōhakuloa			
Halela'au house	Halela'au house was built to house goat runners and the last goat trap is past the Pu'u Anahulu area.	Historic land use	Social Research Pacific, Inc. 2002: Interview with Sonny Keakealani, Appendix E p. 42
Hāmākua district	Hāmākua was called the land of many valleys.	Traditional place name	Ka'ai'ai 1872
Hāmākua	Traditional place song for the districts of Hawai'i Island; each district is characterized by a traditional phrase relating to it: <i>Hilo Hanakahi i ka ua Kanilehua</i> Hilo of Hanakahi in the Lehua Sounding rain <i>Puna paia'ala i ka paia 'ala i ka hala</i> Puna fragrant forest clearing, in the forest clearing fragrant with the pandanus <i>Ka'u i ka makani, i ka makani kuehu lepo</i> Ka'u in the wind, in the dust scattering wind <i>Waimea i ka ua, i ka ua Kipu'upu'u</i> Waimea in the rain, in the goose-pimple raising rain <i>Hāmākua i Ka pali, i ka pali lele koa'e</i> Hāmākua of the cliff, of the cliff where the tropic birds fly	Traditional song associated with place	Charlot 1983: 65
Hāmākua	Chant describing traveling in Hamakua and mountain climbing: Hāmākua: This is Hāmākua of the windward cliff Letting down the rope a little at a time The tooth bites the gourd At Leaping Whale cliff, Arching Water, Bird Water	Activities associated with place	Charlot 1983: 66
Hāmākua	Hamakua was the name of one of Hawai'i Loa's sons. His favorite daughter was called O'ahu and was the mother of the Puna people.	Place name	Kumo Pono Associates 1999: Interview with Alexander Kanani'alika Lancaster and Anita Leilani Lancaster, A-230.
Hawai'i Island general	There was a trail-The King's Trail- that went along the ocean around the whole island of Hawai'i. The whole island was connected by trails. Old trails went across hills because it was easier then going up and down the hillside.	Trails	Social Research Pacific Inc. 2002: Interview with Mel Kalahiki; p 9-11.
Hawai'i Island interior	The interior of the island was the used for hunting, especially for birds (the feathers and the meat). Only certain people were able to hunt birds. The feathers were plucked for the cape of the <i>ali'i</i> . Feathers were plucked from the <i>I'iwi</i> , the <i>'Elepaio</i> and the <i>'Apapane</i> , which were caught by sticky	Traditional land use and hunting practices	Social Research Pacific, Inc. 2002: Interview with Sonny Keakealani, p. 12.

Place	Knowledge of place	Importance	Source
	<i>Olona</i> placed on branches on which the birds would land and become stuck to.		
Ka'ohe <i>ahupua'a</i>	Bird catching: Hawaiian names for bird catcher: <i>kona manu</i> and <i>kia manu</i> . In a method for catching the 'io bird, the hunter made a <i>hapapa</i> (cross-shaped trap) gummed the horizontal arms and tied small (live) birds just below where the sticks crossed. He then hid and imitated the bird's cry. Either his cry or that of the captive birds would lure other birds to try and rescue them. When trapped, the large birds fought back and could be dangerous. The 'io could also be mesmerized by a piece of fluttering cloth tied to a branch, then caught with a gummed stick. Owls were caught by tethering a rat under a net, next to a sharpened stick which would impale the owl when it went after the rat. <i>Uwa'u</i> birds roosted in caves; the hunter would approach the cave and imitate the call of the parent bird, which would stir up the chicks; they would insert into the cave a gummed snare made of 'ie'ie root until it touched the chicks' feathers, then twist it to further entangle the birds. "Bird catchers say that they always leave some behind to grow up," Kepelino reported. There are a number of other methods for catching birds, for example, putting a noose next to a <i>lehua</i> flower and waiting for the bird to alight.	Traditional practice (bird catching)	Kepelino n.d. Nalimu, H. B. n.d.
Ka'ohe	An oral history interviewee tells (without giving a time frame or specific names) of how royalty tried to claim as much of the uplands as possible for their <i>ahupua'a</i> because of the valuable <i>ua'u</i> birds there. The story mentions Ka'ohe but focuses on Keauhou—another Big Island <i>ahupua'a</i> that was "big on top" (rather than narrowing toward the inland end). Runners were sent out to claim as much land as possible. "The <i>ali'i</i> on this side, at Keauhou, sent runners out, to take in the biggest territory he could get for the, where the <i>ua'u</i> nested in the mountains. And so the runner from Keauhou ran up, hit Hualālai, and there was runners coming down from Ka'ohe, from the Mauna Kea side, and they ran up to the top of Mauna Loa and [-?] Hilo people		Paris 1970

Place	Knowledge of place	Importance	Source
	came up. And the runner that ran south, the southern boundary of Keauhou, went up so far, and then he ran along all the little lands of Kona, cutting them all off, cutting off the weaker runners until he [-?-) met the runners coming from Ka'u and they both ran up to the top, so that's how Keauhou is big on top.		
Lake Waiau	The following trails all converged at Wai'au: 'Umikoa-Kuka'iau-Mauna Kea trail, Waipunalei-Laupahoehoe trail, Papaikou-Pauka'a trail and Humu'ula-Mauna Kea trail.	Trails	Kumo Pono Associates 1999: Interview with Hannah Kihalani Springer, A-311.
Lake Waiau	Queen Emma, on a trip to Wai'au, decided that she wanted to swim across the lake, but was unable to complete it alone and was thus carried across the lake.	Legend associated with place	Kumo Pono Associates 1999: Interview with Kepa Maly, A-387.
Mauna Kea	Ahu a 'Umi was not a <i>heiau</i> , but represented the six districts of Hawai'i. In this way the six stone piles each represent a district, each pile brought up one of the piles.	Alternative explanation for Ahu a 'Umi heiau	Kumo Pono Associates 1999: Interview with John Ah San, A-75.
Mauna Kea	Rock shelters in the higher elevations of Mauna Kea have revealed botanical, dietary remains of: yam, possibly sweet potato, taro, banana and breadfruit. It can thus be concluded that people working in the quarries were coming from the rainforest zone (between Hilo and Waimea).	Archeological evidence associated with place	Cordy 1994: 98
Mauna Kea	An unnamed colonel found a feathered cape in a cave on PTA lands.	Artifacts associated with place	Social Research Pacific Inc. 2002: Interview with Mel Kalahiki; p 8
Mauna Kea	Poli'ahu (snow goddess of Mauna Kea) was sled racing with her snow maidens when a stranger appeared and challenged her to a race. This stranger lost the race to Poli'ahu every time and began to grow angry. Soon her eyes were glowing red and thus her identity was revealed- she was Pele. The enraged Pele stamped the ground and molten lava began flowing up from the earth and a wall of fire ignited on the sled track down which Poli'ahu rode. Both goddesses raced though the wall of flames. Poli'ahu waved her golden mantel into the air causing an icy wind to blow and slow the lava river. Pele ordered the lava to swallow Poli'ahu up, but the river split and moved slowly down to the sea to form what is known as "Leaf-of-smooth-lava". Pele never again returned to Mauna Kea.	Association with legend	Thompson 1966: 28

Place	Knowledge of place	Importance	Source
Mauna Kea	Ahu a 'Umi's <i>heiau</i> was so remote and at such a point so that he could look down on everything; so he could see his enemies. 'Umi is considered to be a special ancestor because "most every Hawaiian can trace their lineage to 'Umi.	Association with legendary figure	Social Research Pacific Inc. 2002: Interview with Mel Kalahiki; p 5
Mauna Kea	'Umi spent a lot of time on at Ahu a 'Umi after the great battle. There were plenty of resources including sandalwood (amongst others) to make the <i>mai ole</i> . Water was probably acquired from a source on Mauna Kea, near Ahu a 'Umi.	Association with legendary figure	Social Research Pacific Inc. 2002: Interview with Mel Kalahiki; p 6
Mauna Kea	Hawai'i Loa (the captain of the first ship to arrive in the archipelago) was buried on the east side of Mauna Kea. He and his people were buried facing the east (the way from which they came) and also so as to face his children who remained in the lowlands. Hawai'i Loa and his people were eventually pushed up the mountain by other Polynesian peoples. Then the whole mountain was like a sanctuary and these new people could only come up so far.	Association with legendary figure	Kumo Pono Associates 1999: Interview with Alexander Kanani'alika Lancaster and Anita Leilani Lancaster, A-235, 243.
Mauna Kea	'Umi-a-Liloa built a house on top of Mauna Kea, the foundation of which still remains. There were 6 doors in this house, [named] Kahikipailewa, on for each district	Association with legendary person	Kelsey 1921
Mauna Kea	In the Ka'ohe <i>ahupua'a</i> there are several cinder cones around 7,500 feet elevation. These may have been places of secret burial, so as not to have the bones of the dead used as fishhooks.	Burials	Cordy 1994: 87
Mauna Kea	Burials on flanks and summit of Mauna Kea have been confirmed in a few cases in the form of platforms or pits.	Burials	Cordy 1994: 92
Mauna Kea	The ashes of many people have been taken to the summit of Mauna Kea	Burials	Kumo Pono Associates 1999: A-6.
Mauna Kea	The ashes of Eben Low were scattered around an ' <i>ahu</i> at the summit of Mauna Kea.	Burials	Kumo Pono Associates 1999: Interview with Toshi Imoto, A-27.
Mauna Kea	There were people buried all along the rim of the mountain. These are considered by some as high ranking individuals- ali'i.	Burials	Kumo Pono Associates 1999: Interview with Sonny Alohalani Kaniho and Daniel Kaniho, A-165-170.
Mauna Kea	Wherever you get <i>pu'u</i> , you get burials. The majority of <i>pu'u</i> on the island are burial grounds.	Burials	Kumo Pono Associates 1999: Interview with Alexander Kanani'alika Lancaster and Anita Leilani Lancaster, A-249.
Mauna Kea	Ahu a 'Umi may have been one of four <i>heiau</i> in the Mauna Kea area, one of these may have been Pu'u Ke'eke'e. Another may have been covered by the Ka'u lava	Connections between sacred sites	Social Research Pacific, Inc. 2002: Appendix E p. 48

Place	Knowledge of place	Importance	Source
	flows. And the other two may have been Mauna Halepohaku and Pohakuohanalei.		
Mauna Kea	People would work on the adzes at the quarries because the basalt was less brittle due to the cold.	Construction of tools at place	Kumo Pono Associates 1999: Interview with Theodore Bell, A-130.
Mauna Kea	Ahu a 'Umi was changed by "goat runners" who changed the shape of the <i>heiau</i> into a V in which they would hold the goats. There were openings which they would drive the goats into and then knock them over the head with rocks.	Historic alteration of place	Social Research Pacific, Inc. 2002: Interview with Jean Greenwall, Appendix E p. 41.
Mauna Kea	In early historic times people rarely went up to the summit except on horseback. At Lake Wai'au there was a bottle set on a pile of rocks (possibly a historically constructed type of <i>'ahu</i>) that people would put there names in and the date they visited. This was right near the Humu'ula trail.	Historical tradition associated with place	Kumo Pono Associates 1999: Interview with Theodore Bell, A-127.
Mauna Kea	Mauna Kea windward slopes of the Hamakua District have "been largely unsurveyed archaeologically" [as of this publication-1994]	Need for work in this area	Cordy 1994: 83
Mauna Kea	Hawaiians were said to have been reluctant to guide early European visitors above the forest line.	Possible indication that area considered sacred/off limits. If that is the case, then we can't judge the importance of the region to traditional culture by how often it shows up in visitors' accounts of that culture.	Wentworth 1935
Mauna Kea	Ringling the summit plateau of Mauna Kea are shrines consisting of 1-22 aligned upright stones either of bare rock, along one side of a low platform, or in cairns. These may have been marking the edge "of a spirit zone" or possibly the edge of the normal snow cover extent. In this case they may be associated with deities such as Poli'ahu.	Possible sacred site, possible association with legend	Cordy 1994: 92
Mauna Kea	At Kukuihaele a religious image made of wood was found in a "cliff cave."	Religious significance of place	Buck 1964: 483
Mauna Kea	The priest Paa'o introduced a temple style that was used in Tahiti (the <i>heiau</i>). In all areas except some isolated places, such as the slopes of Mauna Kea; the early temples were destroyed and replaced by <i>heiau</i> .	Sacred site of unusual, early style	Buck 1964: 531
Mauna Kea	<ul style="list-style-type: none"> The waters at Wai'au were considered sacred and were important in rituals of dedication 	Sacredness of place	Kumo Pono Associates 1999: Interview with Alexander Kanani'alika Lancaster and Anita

Place	Knowledge of place	Importance	Source
			Leilani Lancaster, A-230.
Mauna Kea	<ul style="list-style-type: none"> Not just anybody could go up to the summit of Mauna Kea in ancient times, just <i>kahu</i> (caretakers). Other people were considered to defile the place 	Sacredness of place	Kumo Pono Associates 1999: Interview with Alexander Kanani'alika Lancaster and Anita Leilani Lancaster, A-233.
Mauna Kea	Between the Pohakuloa and Pu'u La'au trails, on the upper slopes of Mauna Kea there are several walled enclosures with upright stones. Some caves had <i>lau hala</i> baskets with bones inside. Some of the old people put the bones back if they were exposed.	Sites of Mauna Kea	Kumo Pono Associates 1999: Interview with Hannah Kihalani Springer, A-346.
Mauna Kea	At the summit there was once a small navigational <i>heiau</i> , but it is no longer there.	Sites of Mauna Kea	Kumo Pono Associates 1999: Interview with Hannah Kihalani Springer, A-346.
Mauna Kea	<ul style="list-style-type: none"> The '<i>ohi'a-koa</i> forest zone of the Mauna Kea windward slopes was used for bark gathering, for fish net construction, <i>mamaki</i> for <i>kapa</i> cloth, bird feathers and timber for canoes. In addition, crops such as banana and taro were probably present in lower elevations <i>Ahupua'a</i> borders were very specific in the '<i>ohi'a-koa</i> forest zone of the Mauna Kea windward slopes and resources taken by people living outside of the specific borders could be taken back. 	Traditional land use Traditional land borders	Cordy 1994: 62
Mauna Kea	Trails were also used for bird hunting and the ' <i>ua'u</i> hunters, "the forest men" would come to <i>kalai</i> the trees.	Traditional land use	Social Research Pacific, Inc. 2002: Interview with Hannah Kihalani Springer, Appendix E p. 12
Mauna Kea	Mauna Kea was originally called Pu'u Kukahau'ula but the Hawai'i Loa people. It was changed to Mauna Kea in the 1800's. Kukahau'ula describes the red-glowing sunrise reflecting off the snow.	Traditional place name	Kumo Pono Associates 1999: Interview with Alexander Kanani'alika Lancaster and Anita Leilani Lancaster, A-253.
Mauna Kea	Birds may have been taboo in the 1800's Only certain <i>ali'i</i> could kill birds for their feathers. Otherwise the feathers would be plucked and the birds let go.	Traditional practices (bird catching)	Social Research Pacific, Inc. 2002: Interview with Sonny Keakealani, Appendix E p. 12
Mauna Kea	Dunite and gabbro (apart from the well known adze quarry sites) for use as octopus lure sinkers and hammer stones were quarried on Mauna Kea.	Traditional practices (adze quarrying)	Cordy 1994: 92
Mauna Kea	In a trip to Mauna Kea in 1934, Auntie Coco visited caves in which adze makers stayed. Here, she says that she saw ' <i>opihī</i> (limpet) shells.	Traditional practices (adze quarrying)	Kumo Pono Associates 1999: Interview with Florence La'I-ke-aloha-o-Kamamalu "Coco" Vrendenburg-Hind, A-100.
Mauna Kea	The higher, sub-alpine regions of Ka'ohe were associated mostly with adze quarrying although there were accounts by travelers in the late 1800's who	Traditional practices (adze quarrying); burials	McEldowney 1982 in Cordy 1994: 88

Place	Knowledge of place	Importance	Source
	identified burials in the upper elevations.		
Mauna Kea	The interior plateau of Mauna Kea and the eastern reaches of Ka'ōhe were primarily used for hunting petrels on a seasonal basis. Nene were also probably hunted here.	Traditional practices (bird catching)	Cordy 1994: 105
Mauna Kea	Around 'Umi's <i>heiau</i> there are openings in the <i>pahoehoe</i> that may have surrounded the outposts used by warriors and served as wind breaks or possibly blinds for hunting birds. These also may have been used as nesting areas for the 'ua'u. In this case the Hawaiians were encouraging the nesting of certain bird species.	Traditional practices (bird catching)	Social Research Pacific, Inc. 2002: Interview with Richard Greenwall and Jean Greenwall, Appendix E p. 35
Mauna Kea	A major trail ran on the seaward side of Mauna Kea in the <i>māmane</i> zone (in the Ka'ōhe <i>ahupua'a</i>). It ran parallel to the sea above the 'ohi'a-koa forest. It connected the Kohala-Waimea and Waipi'o Districts to the Hilo District. This may have been "the trail of Poli'ahu" used by 'Umi and his army in the conquest of the Hilo District.	Trails Association with legend	Cordy 1994: 87
Mauna Kea	<ul style="list-style-type: none"> The mountain trail ('Umi's trail to Waimea) connecting Waimea, Kohala and Hāmākua with Kona, passed through the interior plateau of Mauna Kea. Caves near the Ahu a 'Umi <i>heiau</i> and along this trail were used as shelters. One of these caves contained a shrine and another was used to collect water (the ceiling drips were caught in calabashes). A trail (possibly one which Kamehameha's forces used to attack Ka'u and Hilo in the 1780's) enters the inland plateau area of Mauna Kea near the modern Saddle Road Corridor. A trail connecting Ka'u to the Waimea-Kona trail at Ahu a 'Umi <i>heiau</i> ran just south of Hāmākua this trail was also called 'Umi's Road. People were likely coming to the interior plateau region of Mauna Kea on the main trails then departing into the interior areas from there. Campsites are found in caves and in some cases were used only once and are found scattered through the <i>pahoehoe</i> flows, and were likely seasonal camps for petrel and nene hunting. 	Trails Shelters Shrines	Cordy 1994: 107, 116
Mauna Kea	'Umi Trail ran all the way across to Ka'u then to Na'ohule'elua and then to Waimea and right up to Halela'au.	Trails	Social Research Pacific, Inc. 2002: Interview with Sonny Keakealani, Appendix E p. 7-8

Place	Knowledge of place	Importance	Source
Mauna Kea	Trails were used by warriors, [they could see the enemies from the interior] then drop down on the adversaries below.	Trails	Social Research Pacific, Inc. 2002: Interview with Hannah Kihalani Springer, Appendix E p. 12
Mauna Kea	‘Umi’s road to Waimea may have been called Na’ohule’elua Trail.	Trails	Social Research Pacific, Inc. 2002: Appendix E p. 12
Mauna Kea	Pu‘u ‘O‘o trail started at the Pu‘u ‘O‘o ranch house then cut up and hit the present day Mauna Kea Forest Road, then passed Keanakolu, down to Kukaiau Ranch, then down to ‘Umikoa	Trails	Kumo Pono Associates 1999: Interview with Toshi Imoto, A-20.
Mauna Kea	Around 10,000 feet elevation there are small ‘ <i>ahu</i> all around the mountain. These may not have been burial sites but rather, trail markers so as not to lose the trail on the <i>pahoehoe</i> (i.e. They were trail markers in open areas).	Trails	Kumo Pono Associates 1999: Interview with Toshi Imoto, A-32, and in interview with Martin Pence, A-195
Mauna Kea	Pu‘u La‘au trail goes up to Lake Wai‘au from Waiki‘i.	Trails	Kumo Pono Associates 1999: Interview with Theodore Bell, A-127.
Mauna Kea	Pu‘u Kole (the red hill) is the boundary of Humu‘ula and Ka ‘ohe. There were burials all along these boundaries and trails. Most of them have been moved.	Trails, burials	Kumo Pono Associates 1999: Interview with Toshi Imoto, A-23.
Pôhakuloa Gulch	In the Pôhakuloa Gulch at the 8,000-10,000 feet level, hawaiiite (adze quarry material) has been washed down from higher elevations. This is considered a lower elevation for quarrying and is located in the <i>mâmane</i> forest. These areas may have been “tree line base camps”—areas of acclimation and gathering of materials for transport to higher elevations.	Traditional land use	McCoy 1986 in Cordy 1994: 98
PTA area	<ul style="list-style-type: none"> On the lava flats going towards the Pôhakuloa area there are hollows (called <i>lawai‘a manu</i>) used for encouraging nesting of birds. “Blisters” in the lava flows house <i>keiki</i> birds. The eggs and even the adults can be simply pulled out. These are everywhere- all the way from sea level up to the timber line, all over the volcanic areas. There were millions and millions of birds here, including petrels and shearwaters, and at one point flightless birds. 	Traditional practices (bird catching)	Social Research Pacific, Inc. 2002: Interview with Jean Greenwall, Appendix E p. 46 Social Research Pacific, Inc. 2002: Interview with Scott Henderson, Appendix E p. 47
Pu‘u Ho‘olelelupe	Translated place name: The place to fly kites. When it was windy Hawaiians would fly kites here, although it was somewhat superstitious because lots of wind meant that it was dry.	Traditional place name Activities associated with place	Kumo Pono Associates 1999: Interview with Theodore Bell, A-126.
Pu‘ukohola	Pu‘ukohola is a place name meaning the	Traditional place	Social Research Pacific Inc. 2002: Interview with

APPENDIX K-2

IRP SITES

SCHOFIELD BARRACKS

In order to prioritize the investigation and remediation activities at Schofield Barracks, the installation restoration program was developed around four Operable Units (OUs). OU 1 consists of suspected sources of TCE contamination (Figure K-1); OU 2 analyzes the contaminated groundwater system underlying the sub-installation (Figure K-2); OU 3 consists of all other hazardous waste sites identified on the sub-installation (including POLs, as previously stated) (Figure K-3 and K-4); OU 4 consists of the former Schofield Barracks Sanitary Landfill (Figure K-5).

OU 1

The US army has monitored and surveyed eleven locations within OU 1 to determine the source of the TCE contamination. The eleven sites of contamination all have been identified with use or storage of TCE or other solvents at Army Properties through the 1990 study conducted by USATHAMA and include the following:

- Firing range burning areas;
- Area R waste storage area (POL area);
- East Range disposal site;
- Former laundry site;
- Maintenance area (Building T-1029);
- Distribution Warehouse (T-1052);
- Autocraft shop;
- Maintenance area;
- Aircraft fuselage area;
- Aircraft storage bunkers; and
- Engine rebuild area.

The investigation concluded that none of the OU 1 sites were sources of the TCE contamination and did not provide conclusive evidence of the actual source of the contamination. The army is performing long-term monitoring at the eleven OU 1 sites until 2028 (USARHAW 2002e, 18).

OU 2

The OU 2 analysis addressed the impact of Schofield Barracks operations on the groundwater. As previously stated, investigation of groundwater contamination of Schofield Barracks was initiated in 1985 when the levels of TCE above the Safe Drinking Water Act maximum contaminant level of 5 ppb was first detected. Air strippers were installed in September 1996 at the water supply wells on base to remove TCE. Based on the IRP investigations, the TCE plume lies to the east and south of the Schofield Barracks water supply wells.

Figure K-2
Regional Monitoring Well Network – Operable Unit 2

Figure K-3
Site Locations – Main Post

Figure K-4

Site Locations – East Range

Figure K-5

Location Map of Operable Unit 4 – Former Landfill

Under the IRP program, OU 2 involved a well survey of 39 wells within a six-mile radius of the Schofield Barracks water supply wells. The sampling results indicated that TCE is found only in the Schofield supply wells and wells at Kunia on the west side of WAAF. A phase II RI field investigation work plan was submitted to regulatory agencies and was completed in May 1996. A proposed plan to continue treatment at the Schofield Barracks water plant, to monitor wells in the area for any migration of the TCE plume, and to install wellhead treatment at any municipal well that is affected was distributed to the public in May 1996. The resulting Record of Decision was signed by the Army, the Hawai'i Department of Health, and the EPA in September 1996, November 1996, and February 1997, respectively (USARHAW 2002e, 20).

OU 3

Possible sources of soil, surface water, or groundwater contamination not covered by OUs 1 or 4 have been grouped into OU 3, which included motor pools, repair shops, residential areas, golf courses, an automobile service station, and undeveloped parcels. The sites were chosen because of recent or current use and storage of hazardous materials, records of past industrial use, indications of dumping noted in historical aerial photographs, or a combination of the three (USARHAW 2000a, 4-7).

Initial investigations of the OU 3 sites found that several areas contained organic compounds and metals above background levels. Although constituents were identified above background levels, the risk assessment concluded that there was no significant current or potential threat to human health or the environment. As a result of the findings, the Army, Hawai'i DOH, and the EPA distributed a no action plan to the public, and the no action record of decision was signed by November 1996 (USARHAW 2002e, 23 and 24).

OU 4

OU 4 consists of the former Schofield Barracks sanitary landfill, which was operated from 1967 to 1981 and was sited in an area used as an open burn dump site from 1942 until 1967. The site was converted to a sanitary landfill in response to provisions of the CAA. The former landfill was used to dispose of a wide variety of solid wastes from various military installations, primarily consisting of domestic refuse from surrounding base housing; however, wastes were also disposed of from various industrial operations, such as vehicle and equipment maintenance and construction. TAMC reportedly contributed medical waste including pathogenic, infectious, and pharmaceutical waste. Other materials reportedly disposed in the former landfill were organic solvents, sewage sludge, asbestos, pesticide containers, unusable paints, as well as munitions, acids, and solvents. Although the former landfill was not a permitted hazardous waste disposal facility, no provisions were made to exclude hazardous waste. The landfill was closed in 1983 due to concern by the HDOH and City and County of Honolulu Board of Water Supply that the landfill operations would affect the quality of the Schofield Barracks water supply (EDR 2002a). The initial Phase I contamination surveys were performed starting in March 1993. The investigation was designed around EPA guidance and found that the landfill was a source of groundwater contamination, but not a source of TCE contamination (USARHAW 2000a, 7).

The OU 4 feasibility report, finalized in December 1995, recommended an initial maintenance effort consisting of regrading the landfill cap to its original design, installing gas monitoring wells around the landfill perimeter, installing a passive landfill gas venting system, performing cap revegetation, and performing long-term maintenance of the area. Remediation and construction of the new landfill cap was completed in January 1998. On July 21, 1998, the Army, in conjunction with EPA and DOH, conducted a final inspection and determined that the remedial action had been successfully executed (USARHAW 2000a, 7-9).

All four records of decision for the Schofield Barracks National Priorities List site were signed and approved by the Army and EPA Region IX in 1997. Final closeout reports and construction complete reports for all remedial activities were submitted to and approved by EPA in 1998. Schofield Barracks was removed from the National Priorities List in August 2000 (US Army 2002e, 7 and 8).

WHEELER ARMY AIRFIELD

IRP Sites

Initial Phase I environmental investigations at Wheeler Army Airfield were conducted in 1983 by the Air Force. Preliminary investigations identified eight sites for further evaluation. These sites consisted of a potential former landfill, two dump sites, a fire fighting training area, an abandoned oxidation pond, two aircraft parking/wash areas, and the sanitary sewer system (Figure K-6). A federal Phase 2 Facilities Review of the installation was conducted for the EPA in 1991. Phase two investigations resulted in no further response action planned (NFRAP) decision documents covering four of the eight original sites of concern: The two aircraft parking areas, the sanitary system, and the abandoned oxidation ponds (USARHAW 2002c, 7).

The other four sites were subject to a remedial investigation (RI). The preliminary findings for the RI recommended NFRAP decisions for the former landfill site and the fire fighting training area. The Landfill site was closed in 1997 (although the site closure was based on not finding anything to corroborate the existence of the landfill at the site). In November 1997, the HDOH and the US Air Force both signed the final NFRAP documents for the landfill and fire fighting training area sites (USARHAW 2002c, 7).

The final two sites of concern (Kunia Gate Dump and Gulch Runway Dump) were recommended for remedial action. A non-time critical removal action was performed in 1996 at the Kunia Gate Dump and included debris removal, surface grading, and placement of a cap. The Kunia Dump was subsequently closed, and both HDOH and the US Air Force signed a NFRAP document for the site (USARHAW 2002c, 7).

A non-time critical removal action was also conducted at the Gulch Runway Dump in 1996. Excavation and remediation were performed, per cleanup guidelines established by the State of Hawai'i. A draft NFRAP of the site was released on January 5, 2001. The final NFRAP is pending HDOH review (USARHAW 2002c, 7).

Figure K-6

1991 Wheeler Army Airfield Installation Action Plan Installation Restoration Program Sites

Areas of Concern

The initial 1983 records survey performed by the Air Force was not performed in accordance with current regulatory requirements. In response to this, a preliminary assessment/site investigation was initiated in September 1994. Four IRP sites (Figure K-7) and seven areas of concern were investigated during the preliminary assessment. The four IRP sites (originally investigated in the 1983 assessment) were again recommended for NFRAP decisions, and final NFRAP documents were signed by the HDOH and US Air Force in May 2000 (USARHAW 2002c, 7 and 8).

The seven areas of concern identified in the preliminary assessment included a former aircraft revetment area, a vehicle wash rack, a hydraulic lift sump, a UST, an AST, a former POL transfer station drum storage area, and a drum disposal area (Figure K-8). All seven areas of concern contained contaminant concentration levels below action levels (USARHAW 2002c, 8).

UST and AST Sites/Additional Potential IRP Sites

In addition to the aforementioned sites of investigation, the US Army has identified numerous potential sites, including former UST/AST sites and associated pipelines (Figure K-9) and additional potential IRP sites as sources of contamination. The final potential IRP sites include a former firing range, an AST, and an earthen sump at a former gas station (Figure K-10) (USARHAW 2002c, 8).

Appendix K-3 provides a summary of site descriptions, current status of investigation, and future responses for all the aforementioned Wheeler Army Air Force IAP sites.

PTA

PTA was inspected in 1997 as a potential hazardous waste site and was entered into the CERCLA System in July 1992, under the USEPA Identification number HI3214522234. PRC evaluated two landfills, a former pesticide storage area, and a former fire training area as potential hazardous waste sources (Figure K-11).

The results of the analysis were compared with USEPA Region IX PRGs. The laboratory results for VOCs, SVOCs, PCBs, pesticides, and metals were compared to the PRGs for residential soil, with the residential soil PRG being the more conservative measure. The concentrations were found to be less than USEPA PRGs. Metal concentrations at the four source areas, with the exception of arsenic, were all below the PRGs. Arsenic levels exceeded the PRGs but were below the maximum background concentration, indicating that relatively high arsenic concentrations occur naturally and are not elevated due to past facility operations. Contaminant concentrations that exceed PRGs do not necessarily indicate an unacceptable health risk, although exceedences may warrant further evaluation through risk assessment.

The site investigation analytical results also indicated that the subsurface soils were contaminated with low concentrations of petroleum-based substances. Although the

Figure K-11
Potential Contaminant Sources at PTA

1 impact of site contamination on groundwater was not investigated, contaminant migration
2 from source areas to the basal aquifer was unlikely, based on the estimated depth to
3 groundwater at the site, the relatively small area of contaminated soil, and the low levels of
4 detected contaminants. The analysis found that at the time of the analysis, if left undisturbed,
5 the four source areas did not warrant further investigation or remediation. The site
6 investigation data for soils in these areas indicate the presence of some contaminants of
7 concern, but at concentrations that if left in place would pose minimal, if any, threat to
8 receptors (PRC 1997, 102-103).

9 There are no IRP sites located at KTA or DMR.

APPENDIX K-5

PESTICIDE INFORMATION

Pesticides

Table K-5-1 and K-5-2 list the pesticides that are used and maintained on the proposed project installations.

Table K-5-1
Pesticides Stored and Used on SBMR

Product Name	Chemical Name	Formulation	Pesticide Classification	Quantity	Unit
Amdro Fire Ant Bait	Hydramethylnon	Bait - Granule	Insecticide	0.0073	Lb
CB-80 Extra	Pyrethrins - 0.5% Piperonyl Butoxide - 4.0%	Aerosol	Insecticide	0.045	Lb
Certamine	n-alkyl dimethyl benzyl ammonium chloride - 5% n-alkyl dimethyl ethylbenzyl ammonium chloride - 5%	Liquid	Disinfectant	0.1	gal
Demand CS	Lambda-cyhalothrin	Micro- encapsulated	Insecticide	0.838	gal
Demon TC	Cypermethrin	Emulsifiable Concentrate	Insecticide	2	gal
Drax Roach Kil Gel	Boric Acid	Bait - Gel	Insecticide	0.333	Lb
Eaton's Bait Blocks Rodenticide W/ Apple	Diphacinone	Bait - Block	Rodenticide	0.00005	Lb
Eaton's Bait Blocks Rodenticide W/ Molasses	Diphacinone	Bait - Block	Rodenticide	0.00005	Lb
Eaton's Semi-permanent Bait Blocks	Diphacinone	Bait - Block	Rodenticide	0.00005	Lb
Embark 2S	Diethanolamine salt of mefluidide	Liquid	Plant growth regulator	2	gal
Ficam D	Bendiocarb	Dust	Insecticide	0.01	Lb
Fumitoxin	Aluminum Phosphide	Tablets	Fumigant	0.55	Lb
Gentrol IGR Concentrate	Hydroprene	Liquid	Plant growth regulator		
Invader HPX	Baygon	Aerosol	Insecticide	0.01	Lb
Malathion	Malathion	Liquid	Insecticide		
Maxforce FC Ant Bait Station	Fipronil	Bait Station	Insecticide	0.00000033	Ea
Maxforce FC Roach Bait Station	Fipronil	Bait Station	Insecticide	0.00000017	Ea
Mosquito Dunks	BT	Briquette	Insecticide	0.1	Lb
Orthene 75 S Soluable Powder	Acephate	Soluable Powder	Insecticide	0.75	Lb

Oust	Sulfometuron methyl	Dispensible Granules	Herbicide	0.75	Lb
------	---------------------	----------------------	-----------	------	----

Table K-5-1
Pesticides Stored and Used on SBMR (*continued*)

Product Name	Chemical Name	Formulation	Pesticide Classification	Quantity	Unit
Prentox 5 Lb Malathion Spray	Malathion	Liquid	Insecticide	5	Gal

APPENDIX L

ECONOMIC IMPACT FORECAST SYSTEM (EIFS) MODEL AND OUTPUT

Appendix L: Economic Impact Forecast System Model and Output

Socioeconomic Impact Assessment

Socioeconomic impacts are linked through cause-and-effect relationships. Military payrolls and local procurement contribute to the economic base for the region of influence (ROI). In this regard, construction of military training ranges and supporting facilities necessary for transformation at the Schofield Barracks, Kahuku Training Area, and Dillingham Military Range in Honolulu County, and the Pōhakuloa Training Area in Hawai'i County, will have a multiplier effect on the local and regional economy. With the preferred alternative, direct jobs will be created, generating new income and increasing personal spending. This spending generally creates secondary jobs, increases business volume, and increases revenues for schools and other social services.

The Economic Impact Forecast System

The U.S. Army, with the assistance of many academic and professional economists and regional scientists, developed the Economic Impact Forecast System (EIFS) to address the economic impacts of NEPA-requiring actions and to measure their significance. As a result of its designed applicability, and in the interest of uniformity, EIFS should be used in NEPA assessments for RCI. The entire system is designed for the scrutiny of a populace affected by the actions being studied. The algorithms in EIFS are simple and easy to understand, but still have firm, defensible bases in regional economic theory.

EIFS is implemented as an on-line system supported by the U.S. Army Environmental Policy Institute through the Computer Information Science Department of Clark Atlanta University, Georgia. The system is available to anyone with an approved user-id and password. University staff and the staff of the Army Environmental Policy Institute are available to assist with the use of EIFS.

The databases in EIFS are national in scope and cover the approximately 3,700 counties, parishes, and independent cities that are recognized as reporting units by federal agencies. EIFS allows the user to define an economic ROI by identifying the counties, parishes, or cities to be analyzed. Once the ROI is defined, the system aggregates the data, calculates multipliers and other variables used in the various models in EIFS, and prompts the user for forecast input data.

The EIFS Model

The basis of the EIFS analytical capabilities is the calculation of multipliers that are used to estimate the impacts resulting from Army-related changes in local expenditures or employment. In calculating the multipliers, EIFS uses the economic base model approach, which relies on the ratio of total economic activity to basic economic activity. Basic, in this context, is defined as the production or employment engaged to supply goods and services outside the ROI or by federal activities (such as military installations and their employees). According to economic base theory, the ratio of total income to basic income is measurable (as the multiplier) and sufficiently stable so that future changes in economic activity can be forecast. This technique is especially appropriate for estimating aggregate impacts and makes the economic base model ideal for the EIS process.

The multiplier is interpreted as the total impact on the economy of the region resulting from a unit change in its base sector; for example, a dollar increase in local expenditures due to an expansion of its military installation. EIFS estimates its multipliers using a location quotient approach based on the concentration of industries within the region relative to the industrial concentrations for the nation.

The user inputs into the model the data elements which describe the Army action: the change in expenditures, or dollar volume of the construction project(s); change in civilian or military employment; average annual income of affected civilian or military employees; the percent of civilians expected to relocate due to the Army's action; and the percent of military living on-post. Once these are entered into the EIFS model, a projection of changes in the local economy is provided. These are projected changes in sales

volume, income, employment, and population. These four indicator variables are used to measure and evaluate socioeconomic impacts. Sales volume is the direct and indirect change in local business activity and sales (total retail and wholesale trade sales, total selected service receipts, and value-added by manufacturing). Employment is the total change in local employment due to the proposed action, including not only the direct and secondary changes in local employment, but also those personnel who are initially affected by the military action. Income is the total change in local wages and salaries due to the proposed action, which includes the sum of the direct and indirect wages and salaries, plus the income of the civilian and military personnel affected by the proposed action. Population is, of course, the increase or decrease in the local population as a result of the proposed action.

Because the counties in this study (Hawai'i County and Honolulu County) are two separate islands, two separate ROI's were defined and analyzed using EIFS. For Hawai'i County, the cost of construction of the new training ranges and supporting facilities was entered as the change in total expenditures. The total expenditure is the money that would be spent in the ROI study area, as well as outside the study area for goods that would need to be imported into the ROI (e.g., lumber). The expenditures associated with these projects were spread out over a 4-year period since the construction is currently scheduled to take place between 2004 and 2007. There would be no change in troop strength at any of the installations in Hawai'i County as a result of the proposed action.

For Honolulu County, just as for Hawai'i County, the cost of construction of the new training ranges and supporting facilities was entered as the change in total expenditures. The expenditures associated with these projects were spread out over a 5-year period since the construction is currently scheduled to take place between 2004 and 2008. Schofield Barracks in Honolulu County is expected to gain 480 troops. This increase in troop strength was entered as the change in military personnel. The average income of affected military personnel was calculated from the military basic pay scale, effective January 1, 2002.

The Significance of Socioeconomic Impacts

Once model projections are obtained, the Rational Threshold Value (RTV) profile allows the user to evaluate the significance of the impacts. This analytical tool reviews the historical trends for the defined region and develops measures of local historical fluctuations in sales volume, income, employment, and population. These evaluations identify the positive and negative changes within which a project can affect the local economy without creating a significant impact. The greatest historical changes define the boundaries that provide a basis for comparing an action's impact on the historical fluctuation in a particular area. Specifically, EIFS sets the boundaries by multiplying the maximum historical deviation of the following variables:

		<u>Increase</u>	<u>Decrease</u>
Sales Volume	X	100%	75%
Income	X	100%	67%
Employment	X	100%	67%
Population	X	100%	50%

These boundaries determine the amount of change that will affect an area. The percentage allowances are arbitrary, but sensible. The maximum positive historical fluctuation is allowed with expansion because economic growth is beneficial. While cases of damaging economic growth have been cited, and although the zero-growth concept is being accepted by many local planning groups, military base reductions and closures generally are more injurious to local economics than are expansion.

The major strengths of the RTV are its specificity to the region under analysis and its basis on actual historical data for the region. The EIFS impact model, in combination with the RTV, has proven successful in addressing perceived socioeconomic impacts. The EIFS model and the RTV technique for measuring the intensity of impacts have been reviewed by economic experts and have been deemed theoretically sound.

The following are the EIFS inputs and output data for construction and the RTV values for the ROI. These data form the basis for the socioeconomic impact analysis presented in Section 4.13.

Notes: ^A PRG CONCENTRATIONS, Version 8, EPA Region 9, October 2002

^B Ambient or “background” sample for metals.

Values reported in **bold** are sample concentrations above the applicable PRG, indicated in **bold**.

INFORMATION PAPER

SUBJECT: Transformation Training Impact at USARHAW

1. General. In support of the U.S. Army -Hawaii Transformation Environmental Impact Statement (EIS) I was asked to identify the training impact of the current units stationed in Hawaii, estimate the training impact after transformation of the 2nd Brigade, 25th ID (L) to a Stryker Brigade Combat Team (SBCT), and compare the "before and after" results. The Army Training and Testing Area Carrying Capacity (ATTACC) methodology was the tool used to accomplish these tasks, as it had been used previously in support of the U.S. Army - Alaska and Fort Polk Transformation EIS.

2. Discussion.

- a.** A list of reference materials is at Enclosure 1.
- b.** Worksheets and graphs containing unit MIMs calculations and totals are at Enclosure 2.
- c.** The ATTACC Methodology quantifies the impacts of vehicles (Training Impact Factors) and training events (Event Severity Factors) in relation to a standard vehicle (M1A1 Tank) and event (Armor Battalion FTX). The result is a Maneuver Impact Mile (MIM). These factors were developed jointly with observer-controllers (O/C) at both CONUS Combat Training Centers. These factors were then linked to the (HQDA) Battalion Level Training Model (BLTM), which quantifies how many annual miles a specific vehicle in a specific unit will travel in specific training events. As a result, tables in the ATTACC Training Model (ATM) show the number of annual MIMs for almost all Army units.
- d.** Using the ATM tables, I calculated the annual MIMs for current 2nd Brigade,(8700) and the remaining 25 ID (L) units (40,200). Of those 40,200 MIMs, 15,500 belong to the Engineer Battalion (Cbt Hvy). A more thorough analysis of the Engineer Battalion's specific training events and training locations may reduce that number in both current

and future estimates. Additionally, I estimated the training impact for Army National Guard, Army Reserve and Marine Corps units that train in Hawaii. The current estimated total training impact for units training in Hawaii is 51,000 MIMs.

e. I reviewed the standard training records provided by the Range Facility Management Support System v. 3.5 (RFMSS) Training Utilization Reports. I reviewed these reports for the infantry battalions. I also discussed training locations with the Range Operations staff, using their training area maps. This helped identify specific training locations. As a result I allocated the MIMs as follows:

East Range	11,680
Schofield Bks	16,740
Dillingham	1710
Kahuku	7210
Pohakuloa (PTA)	13,660

f. Estimating future MIMs for a Transformed 2nd Brigade required several adjustments to the ATTACC Training Impact Factors, which measure the vehicle portion of the training load. In our previous analyses we gave the Stryker a Vehicle Severity Factor (VSF) of 0.86, equivalent to a M2 Bradley Infantry Fighting Vehicle. After reviewing the Light Armored Vehicle (LAV) Impact Studies (Ayers, et.al.) conducted in Yakima and Schofield Barracks, and discussing it with one of the authors and ATTACC Team member (A. Anderson) we concluded the Stryker vehicle severity more closely resembled that of a M113A3. The M113A3 VSF is 0.65. Not wanting to make a radical change, we adjusted the Stryker VSF to the midpoint, 0.75. We had also previously given the Stryker a Vehicle Off-road Factor (VOF) of 0.9, equivalent to a Bradley and the M113A3. In discussions with the USARPAC and USARHAW staff we concluded that the many limitations to off-road maneuver in Hawaii training areas would reduce the Stryker VOF to 0.6, equivalent to a HMMWV. This reduction in two vehicle impact factors reduced the total Stryker brigade training load (MIMs) by 20%.

g. The Stryker Brigade annual MIMs are 116,900 and the remainder of the 25 ID(L) units are 36,900 MIMs. The majority of the increase in the Stryker Brigade comes from the 3 transformed infantry battalions and the new RSTA Squadron. The total predicted training impact for

transformed units training in Hawaii is 155,900 MIMs. This is a three-fold increase over current training impact.

h. The next step in this process is the distribution of future Transformed training impact over Hawaii training lands. At the request of USARPAC and USARHAW staffs we included as available maneuver area the proposed 23,000 acre land purchase adjacent to PTA. After a discussion with the Transformation Office staff on a very preliminary Stryker Brigade training strategy, I was able to understand where platoon, company and battalion "unopposed" and force-on-force training would occur. Brigade size training will occur at one of the Combat Training Centers. As a result I allocated the MIMs as follows:

East Range	19,145
Schofield Bks	25,855 Note 1.
Dillingham	4335
Kahuku	13,770
Pohakuloa(PTA)	30,931
Keamuku	61,862

Note 1. Schofield Bks includes the proposed South Range land purchase.

3. Conclusions. Through the use of the ATTACC Methodology and the process described in the previous paragraphs, we predict two significant increases in training impact, measured in MIMs, as a result of the Transformation of USARHAW forces. We predict the overall training impact to increase 3 times. We predict the training impact on the island of Hawaii (PTA + the proposed land purchase) to increase 7 times. As Stryker tactical and training doctrines emerge, we may find that a significant portion of the Stryker training is dismounted infantry training, which would reduce the training impact.

APPENDIX N

**SUPPLEMENTAL REGULATION AND RESOURCE
INFORMATION**

APPENDIX N

SUPPLEMENTAL REGULATION AND RESOURCE INFORMATION

N.1 CHAPTER 3 SUPPLEMENTAL REGULATION AND RESOURCE INFORMATION

This appendix serves as a supplemental guide to Chapter 3 discussions and contains the laws, regulations, and programs associated with the various resources discussed in Chapter 3. Also provided in this appendix is additional resource information that may be of interest to some readers, but is not necessarily required in the overall resource discussions.

N.2 LAND USE

N.2.1 Federal Land Use Regulations

Coastal Zone Management Act, 16 U.S.C. 1451 et seq

Federal coastal zone management (CZM) enforcement authority (Public Law 92-583), as amended, has been delegated to the State of Hawai'i (Chapter 205A, Hawai'i Revised Statutes, as amended). Other than the review of federal applicants, federal permits, or federal activities, state CZM review authority has been delegated to the county level through special management area (SMA) controls. Each federal agency activity within or outside the coastal zone that affects any land or water use or natural resource of the coastal zone must be carried out in a manner which is consistent to the maximum extent practicable with the enforceable policies of the Federally approved Hawai'i Coastal Zone Management Program. The CZMA (16 USC 1453(1)) excludes federal lands from the coastal zone and therefore activities which only affect only federal lands are not subject to the above mentioned requirements regarding consistency.

Farmland Protection Policy Act

The Farmland Protection Policy Act (FPPA) (P.L. 97-98, Sec. 1539-1549; 7 U.S.C. 4201, et seq.) is intended to minimize the extent to which Federal activities

contribute to the conversion of farmland to nonagricultural uses. It also stipulates that federal programs be compatible with state, local, and private efforts to protect farmland—for example, Hawaii’s land use law (Act 187) which designates agricultural district lands.

Federal agencies are required to examine the impact of any activity that would convert farmland. Under the FFPA, “farmland” includes all land defined as Prime farmland, Unique farmland, and Other farmland of statewide or local importance. Agencies have the option of determining whether a site contains farmland—and therefore falls under the Act—without input from the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), which is charged with FPPA oversight. Because portions of the South Range Acquisition Area, portions of the West PTA Acquisition Area and PTA Trail easement, as well as segments of the Dillingham Trail and Helemanō Trail easements, may be subject to the requirements of the FPPA, the Army has requested a farmland determination from the NRCS, which evaluates the impacts of converting farmland areas to nonagricultural use. The determination will include an impact rating.

Army Regulation 210-21, Army Ranges and Training Land Program

AR 210-21 assigns responsibilities and prescribes policies, procedures, and guidance for determining training land requirements. Documentation required under this regulation includes Land Use Requirement Studies, to determine whether a training land shortfall exists, and Range and Training Land Program (RTLTP) Development Plans that compile installation range and training land projects.

- The RTLTP Land Use Requirement Study (Nakata Planning Group LLC. 2002b) quantifies the 25th ID(L) and USARHAW training land requirements and surveys the sufficiency of lands currently under Army control and available for training. The study analyzes training land requirements for a light division with two infantry brigades and makes recommendations based on guidance from training circulars, Army regulations, and ARTEP mission training plans. In addition, the study analyzes the impact of transforming one brigade into an Interim Brigade Combat Team, while the remaining brigade transforms as a Legacy Force light infantry brigade.
- The RTLTP Development Plan (Nakata Planning Group LLC. 2002a) provides a view of available assets, identifies the users (customers), and establishes the training requirements based on Army training doctrine and resource guidance. It establishes current requirements and utilization levels for available training assets, providing a near-term and long-term project plan for training, public works, and environmental planners. The projects identified in the RTLTP Development Plan consider the impacts on the 25th ID(L) and

USARHAW's mission, economic resources, environmental stewardship, and potential for productivity enhancements.

Integrated Natural Resources Management Plans

Integrated Natural Resources Management Plans (INRMPs) are comprehensive plans for the management of installation resources, including recreation resources. The following plans were reviewed for the recreation section of the document:

- Integrated Natural Resources Management Plan and Environmental Assessment/Finding of No Significant Impact 2002-2006 O'ahu August 2001a (USARHAW and 25th ID [L] 2001a). This document addresses the following installations: Dillingham Military Reservation, Kahuku Training Area, Kawaihoa Training Area, Makua Military Reservation, Schofield Barracks East Range, and Schofield Barracks Military Reservation.
- Integrated Natural Resources Management Plan and Environmental Assessment/Finding of No Significant Impact 2002-2006 Pōhakuloa Training Area. August 2001b (USARHAW and 25th ID [L] 2001b).

Army Integrated Training Area Management (ITAM) Program

The Army Integrated Training Area Management (ITAM) program provides a decision-making process and an action-oriented land management program to integrate Army training and other mission requirements for land use with sound natural resource principles. The objectives, responsibilities and policies for the ITAM program are set forth in AR 350-4, ITAM. Within the 25th ID (L) and USARHAW, ITAM is under the direct supervision of the G3-Director of Plans, Training and Mobilization (DPTM), Range Division Hawai'i. The ITAM program is used to help balance environmental compliance and natural resources management needs with the installation's mission to provide realistic training lands for active and reserve forces. ITAM is intended to bridge the mission training requirements and the natural and cultural resource compliance and prevention requirements.

N.2.2 State Land Use Regulations

Hawai'i State Plan

In 1978, the state completed a Hawai'i State Plan to improve the planning process, to increase the effectiveness of government and private actions, to improve coordination among agencies and levels of government, to provide for the wise use of Hawai'i's resources, and to guide the future development of the state (HDBEDT 1991).

The legislature adopted the Hawai'i State Planning Act, as Hawai'i Revised Statute Section 226-1. The act consists of a series of broad goals, objectives, and policies that guide future long-term growth and development. The planning act further provides a basis for determining priorities and allocating limited resources, seeks to improve coordination of federal, state, and county plans, policies, programs, projects, and regulatory activities, and establishes a system for plan formulation and program coordination to integrate all major state and county activities.

State Functional Plans

The Hawai'i State Planning Act called for the creation of functional plans to set specific objectives, to establish policies, and to implement actions for a particular field of activity. These functional plans further identified those organizations responsible for carrying out the actions, the implementing timeframe, and the proposed budgets. The most current functional plans that may be relevant to the proposed projects are discussed below.

- The State Agricultural Functional Plan (1991) identified issues vital to the economic growth and success of the agriculture industry. One of the governing policies of the functional plan for agriculture is to develop capabilities to convert Hawai'i-grown crops into potential new value added products for the local, visitor industry, and export markets. The plan encouraged the promotion of effective marketing for Hawai'i's agricultural commodities and the fostering of increased public awareness and understanding of the contribution and benefits of agriculture as a major sector of Hawai'i's economy.
- The State Recreation Functional Plan (1991) focused on six areas: ocean and shoreline recreation; Mauka, urban, and other recreation; public access to the shoreline and upland recreation areas; resource conservation and management; management and recreation programs, facilities; and wetlands protection and management. The plan included a technical reference document referred to as the State Comprehensive Outdoor Recreation Plan, which was updated in 1996.
- The State Conservation Lands Functional Plan (1991) primarily addressed governmental policies and programs directed at the preservation of conservation lands and the judicious use of the State's natural resources.

State Land Use Districts

The Land Use Law under Hawai'i Revised Statutes, Section 205, places all lands in one of four land use districts: Urban, Agriculture, Conservation, or Rural. The State Land Use Commission, an agency of the Department of Business, Economic, Development, and Tourism, administers the land use law and periodically updates the land use district maps. The Land Use Commission also reviews applicant-initiated amendments to the district boundaries, pursuant to Hawai'i Revised

Statute Section 205-4 and the Hawai'i Administrative Rules, Chapter 15-15, Hawai'i Land Use Commission Rules, as amended.

Hawai'i Administrative Rules Title 13 Department of Land and Natural Resources (DLNR)

Under this Hawai'i Administrative Rule, DLNR is charged with regulating land use in the Conservation District for conserving, protecting, and preserving the important natural resources of the state through appropriate management and use to promote their long-term sustainability and the public health, safety, and welfare. Conservation District subzone designations are Protective, Limited, Resource, General, and Special.

Hawai'i Coastal Zone Management Program

Enacted as Chapter 205A, Hawai'i Revised Statute, the Hawai'i CZM Program was established in 1977 in response to the Federal Coastal Zone Management Act of 1972. The CZM Program encompasses the entire state, including all marine waters seaward to the extent of the state's police power and management authority, including the 12-mile US territorial sea.

N.2.3 County Land Use Plans and Policies

City and County of Honolulu General Plan Objectives and Policies

The 1992 General Plan for the City and County of Honolulu is a statement of objectives and policies that set forth the long-range aspirations of O'ahu residents and strategies of action to achieve them. It is the focal point of a comprehensive planning process that addresses various issues affecting the City and County of Honolulu (City and County of Honolulu 1992).

City and County of Honolulu Sustainable Communities Plans

O'ahu is divided into eight geographic planning regions responding to specific conditions and community values of each region. Most of O'ahu's project areas are included in four of the sustainable community plans: Central O'ahu (City and County of Honolulu 2002a), North Shore (City and County of Honolulu 2000a), Wai'anae (City and County of Honolulu 2000b), and Ko'olau Loa (City and County of Honolulu 2002b). These planning regions are envisioned to remain relatively stable. The project area at Hickam AFB is included in the Primary Urban Center, which is composed of communities from Wai'alae-Kahala to Pearl City. It is the most populated part of the state, and is O'ahu's largest employment center.

City and County of Honolulu Land Use Ordinance

The purpose of the ordinance is to regulate land use in a manner that will encourage orderly development in accordance with adopted land use policies, including the O'ahu General Plan and Sustainable Community Plans, and to promote and protect the public health, safety, and welfare.

County of Hawai'i General Plan

The County of Hawai'i General Plan is a policy document for the long-range comprehensive development of the Big Island. It provides direction for the future growth of the county. It brings into focus the relationship between residents and their pursuits and institutions, offering policy statements that embody the expressed goals for present and future generations. As a policy document, the General Plan (County of Hawai'i 1989) provides the legal basis for subdivision, zoning, and related ordinances. It also provides the legal basis for initiating and authorizing all public improvements and projects.

The December 2001 draft of the County of Hawai'i General Plan is under review (County of Hawai'i 2001a).

County of Hawai'i Zoning Code

The zoning code implements the general plan and is the County of Hawai'i's primary land use control. It deals with existing conditions and shorter range needs. The zoning code sets out the various types of zoning districts and the allowable uses for each. Zoning maps, established by ordinance, set out the zoning for the island on a parcel-by-parcel basis.

Special Management Area and Shoreline Setback

The SMA and shoreline setback are designated for more intensive management. The SMA originally encompassed all lands extending not less than 100 yards inland from the shoreline. The shoreline is defined as the upper reaches of the wash of the waves at high tide during the season of the year in which the highest wash of the waves occurs (other than storm or seismic waves). The shoreline is usually evidenced by vegetation growth or by the upper limit of debris left by the wash of waves. In some areas, the SMAs currently extend several miles inland to cover areas in which coastal resources are likely to be directly affected by development activities. The shoreline setback is the area between the shoreline and the shoreline setback line. Currently, most shoreline setback lines are set at 40 feet from the shoreline, although in some places the shoreline setback boundaries extend farther inland.

Actions within the SMA, including construction of Dillingham Trail and PTA trail, may require a SMA Use Permit. On O'ahu, this permit would need to be approved by both the City and County of Honolulu Planning Commission and the Council. On the Island of Hawai'i, this permit would need to be approved by the County of Hawai'i Planning Commission.

N.3 VISUAL RESOURCES

Army Regulation 200-3 Natural Resources - Land, Forest and Wildlife Management - provides for maintenance, protection, and improvement of aesthetic values by "protecting and improving the natural beauty of the landscape" and "improving the appearance of installations and facilities in accordance with an approved landscape master plan and through initiatives of the Army Community

of Excellence and self-help programs,” including the Installation Design Guide (IDG). The IDG provides specific guidelines and information to improve the aesthetics of the installation, including site planning for parking, signs, lighting, and utilities, lists of plants appropriate for planting at specific installation sites, and standards for the planting, maintenance, and protection of trees, shrubs, groundcovers, and turf. All new construction projects are to include provisions for landscaping and aesthetics with appropriate landscape design and funding authorization, including landscaping, buffer zones, screening, parks, and recreational areas, as appropriate.

N.4 AIRSPACE

N.4.1 Airspace Regulations

The Federal Aviation Act of 1958-gives the FAA sole responsibility for the safe and efficient management of all airspace within the continental United States, a responsibility that must be executed in a manner that meets the needs of all airspace users, both civil and military. The FAA's policy on airspace is implemented by FAA Order 1000.1A and is stated in FAA Handbook 7400.2E, Procedures for Handling Airspace Matters.

Part 5 of FAA Handbook 7400.2E contains the policy, procedures, and criteria for the assignment, review, modification, and revocation of special use airspace. Special use airspace, including prohibited areas, restricted areas, military operations areas, alert areas, and controlled firing areas, is airspace of defined dimensions wherein activities must be confined because of their nature, or wherein limitation may be imposed upon aircraft operations that are not a part of those activities, or both (FAA 2001).

DOD Policy On The Management Of Special Use Airspace-is essentially an extension of FAA policy, with additional provisions for planning, coordinating, managing, and controlling those areas set aside for military use. Airspace policy issues or interservice problems that must be addressed at the DOD level are handled by the DOD Policy Board on Federal Aviation, a committee composed of senior representatives from each service. However, airspace action within the DOD is decentralized, with each service having its own central office to set policy and oversee airspace matters.

Executive Order 10854-extends the responsibility of the FAA to the overlying airspace of those areas of land or water outside the jurisdiction of the United States. Under this order, airspace actions must be consistent with the requirements of national defense, must not be in conflict with any international treaties or agreements made by the United States, nor be inconsistent with the successful conduct of the foreign relations of the United States. Accordingly, actions concerning airspace beyond US jurisdiction (12 miles [19 kilometers]) require coordination with the DOD and State Department, both of which have preemptive authority over the FAA (FAA 2001).

Part 5 of FAA Handbook 7400.2E also contains the policy, procedures, and criteria for the assignment, review, modification, and revocation of special use airspace overlying water, namely, warning areas. A warning area is airspace of defined dimensions over international waters containing activity that may be hazardous to nonparticipating aircraft. Because international agreements do not provide for prohibition of flight in international airspace, no restriction of flight is imposed. The term “warning area” is synonymous with the International Civil Aviation Organization term “danger area” (FAA 2001).

Army Regulation 95-2 Air Traffic Control, Airspace, Airfields, Flight Activities, and Navigational Aids covers Army air traffic control general provisions, certification of airfields, airspace, and special military operations requirements, terminal instrument procedures, terminal air navigation, approach facilities, and other matters.

N.5 AIR QUALITY

Clean Air Act, 42 USC 7401

The original 1963 federal Clean Air Act limited federal involvement in air quality programs to research, education, and advisory functions, plus a mediation role for interstate disputes. The federal role was expanded in 1965 with Congressional authorization for uniform federal emission standards for motor vehicles. The 1970 amendments to the Clean Air Act established several regulatory programs, including the following:

- Adoption of emission standards for motor vehicles and other types of mobile sources;
- Adoption of emission standards for major new industrial facilities as new source performance standards;
- Adoption of national emission standards for hazardous air pollutants; and
- Preconstruction review of major new industrial facilities or major modifications to existing facilities as the new source review (NSR) program for nonattainment areas and the prevention of significant deterioration (PSD) program for attainment areas.

The 1977 amendments to the Clean Air Act revised and expanded some of the regulatory programs established by the 1970 amendments. The 1990 amendments to the Clean Air Act made further revisions to the established regulatory programs and added some new regulatory programs, as follows:

- Operating permits for major industrial facilities (Title V permits);
- Additional programs to regulate an extensive list of hazardous air pollutants;

- Emissions allocation programs to regulate sulfur emissions from electrical power generation facilities;
- Programs to reduce emissions of compounds that deplete stratospheric ozone levels; and
- Requirements for federal agencies to demonstrate that actions they undertake are consistent with federally mandated SIPs.

In general, states have assumed primary responsibility for enforcing most industrial source emission standards and industrial source review requirements; the USEPA exercises formal review and oversight. Most states have implemented the NSR, PSD, and Title V requirements as formalized air quality permit programs. Many states have air quality permit programs that extend to emission sources not covered by federal NSR or PSD requirements. State air quality permit requirements generally are integrated with federal NSR and PSD requirements, resulting in a consolidated permit program. Under most consolidated permit programs, basic state permit requirements apply to all sources that are not specifically exempted. Additional NSR and PSD program requirements (including USEPA review of the permit) become applicable if sources exceed various size or emission thresholds.

Primary Pollutants, Secondary Pollutants, and Pollutant Precursors

Air pollutants are often characterized as being primary or secondary. Primary pollutants are those emitted directly into the atmosphere, such as carbon monoxide, sulfur dioxide, lead particulates, and hydrogen sulfide. Secondary pollutants are those formed through chemical reactions in the atmosphere, such as ozone, nitrogen dioxide, and sulfate particles; these chemical reactions usually involve primary pollutants, normal constituents of the atmosphere, and other secondary pollutants.

Those compounds that react to form secondary pollutants are referred to as reactive pollutants, pollutant precursors, or precursor emission products. Some air pollutants (such as many organic gases and suspended particulate matter) are a combination of primary and secondary pollutants.

The distinction between primary and secondary pollutants is more than a matter of semantics; important air quality management implications are also involved. The ambient concentration of primary pollutants depends on the spatial concentration of the emission sources, the rate of pollutant emissions, and the degree to which the emitted pollutants are dispersed or removed from the atmosphere between the emission source and the location of interest. Air quality problems involving primary pollutants (such as carbon monoxide) often can be traced to a single pollutant source or a concentrated group of sources emitting large quantities of the pollutant. Additionally, the responsible emission source will be relatively close to the location of the air quality problem. The distance between the emission source and the location of a ground-level air quality

problem depends largely on the height at which the emissions are released into the atmosphere.

When an air quality problem involves a secondary pollutant (such as ozone), the spatial relationship between emission sources and ambient air quality problems becomes much more complicated. Because secondary pollutants are not emitted directly into the atmosphere, observed ambient concentrations may not show a clear correlation with the spatial distribution of sources emitting the pollutant precursors. The time factor involved in the chemical reactions producing secondary pollutants allows emissions from numerous sources to become dispersed and mixed together. As a result, the observed ambient pollutant concentrations are due as much to the cumulative area-wide emissions of precursors as to the spatial concentration of emission sources.

Aerosols and Particulate Matter

Most people would interpret aerosol to mean some type of liquid droplet or mist sprayed into the air. Similarly, most people would interpret particulate matter to mean a solid particle (such as dust or fly ash). But in the air pollution field, these terms are used interchangeably: both terms can refer to either liquid or solid material suspended in the air.

Ozone Precursor Emissions

Ozone is a major component of photochemical smog. The pollutant emissions generally categorized as ozone precursors fall into two broad groups of chemicals: nitrogen oxides and organic compounds. Many different terms are used to refer to these groups of ozone precursors, but the various terms are seldom used in a rigorous chemical sense.

Nitrogen oxides and oxides of nitrogen are used interchangeably to refer to the combination of nitric oxide (designated by the chemical symbol NO) and nitrogen dioxide (designated by the chemical symbol NO₂). This combination of nitrogen oxides often is designated by the symbol NO_x. Although there are five different oxides of nitrogen, NO_x generally refers only to the combination of NO and NO₂. NO₂ is itself a secondary pollutant formed primarily from nitric oxide.

Organic compound precursors of ozone are routinely described by a number of variations of three terms: hydrocarbons (HC), organic gases (OG), and organic compounds (OC). These terms are often modified by adjectives such as total, reactive, or volatile. The result is a rather confusing array of acronyms: HC, THC (total hydrocarbons), RHC (reactive hydrocarbons), TOG (total organic gases), ROG (reactive organic gases), TOC (total organic compounds), ROC (reactive organic compounds), and VOC (volatile organic compounds). An additional term, NMHC (nonmethane hydrocarbons), is also used on occasion.

To a chemist, most of these terms differ from each other in some significant way. However, in the air pollution control field they are categorized into two groups: non-photochemically reactive in the lower atmosphere (e.g. THC, TOG, TOC, methane or many chlorinated organics) or photochemically reactive in the lower atmosphere (e.g. HC, RHC, ROG, ROC, VOC, and NMHC).

From a purely chemical standpoint, the hydrocarbon terminology (HC, THC, RHC, and NMHC) often is inappropriate; many of the compounds of concern are organic compounds but not hydrocarbons. The reactive organic gases terminology incorrectly implies that compounds that condense into an aerosol droplet cease to play a role in smog photochemistry. The volatile organic compound terminology incorrectly implies that emissions occur only through an evaporation process. "Reactive organic compounds" usually is the most accurate ozone precursor terminology, but the ROC acronym is not in widespread use. Because there already are too many acronyms for ozone precursors, the ROG acronym is the most reasonable one to use and is the one used in this document.

Air Quality Standards

Air quality management programs have evolved using two distinct management approaches:

- Setting ambient air quality standards for acceptable exposure to air pollutants, conducting monitoring programs to identify locations experiencing air quality problems, and then developing programs and regulations designed to reduce or eliminate those problems; and
- Identifying specific chemical substances that are potentially hazardous to human health and then setting emission standards to regulate the amount of those substances that can be released by individual commercial or industrial facilities or by specific types of equipment.

Ambient Air Quality Standards for Criteria Pollutants

Air quality programs based on ambient air quality standards typically address air pollutants that are produced in large quantities by widespread types of emission sources and which are of public health concern because of their toxic properties. The USEPA has established ambient air quality standards for several different pollutants, which often are referred to as criteria pollutants (ozone, nitrogen dioxide, carbon monoxide, sulfur dioxide, suspended particulate matter, and lead). Standards for suspended particulate matter have been set for two size fractions: Inhalable particulate matter (PM₁₀) and fine particulate matter (PM_{2.5}). Federal ambient air quality standards are based primarily on evidence of acute and chronic health effects and apply to outdoor locations to which the general public has access.

Some states have adopted ambient air quality standards that are more stringent than the comparable federal standards or address pollutants that are not covered by federal ambient air quality standards. Most state ambient air quality standards are based primarily on health effects data but can reflect other considerations such as protecting crops and materials or avoiding nuisance conditions, such as objectionable odors. Table N-1 summarizes federal and state ambient air quality standards applicable in Hawai'i.

Air pollutants covered by federal and state ambient air quality standards can be categorized by the nature of their toxic effects, as follows:

- Irritants (such as ozone, particulate matter, nitrogen dioxide, sulfur dioxide, and hydrogen sulfide) that affect the respiratory system, eyes, mucous membranes, or skin;
- Asphyxiants (such as carbon monoxide and nitric oxide) that displace oxygen or interfere with oxygen transfer in the circulatory system, affecting the cardiovascular and central nervous systems;
- Necrotic agents (such as ozone, nitrogen dioxide, and sulfur dioxide) that directly cause cell death; or

Table N-1
Ambient Air Quality Standards Applicable in Hawai'i

Pollutant	Symbol	Averaging Time	Standard as Parts Per Million by Volume		Standard as Micrograms per Cubic Meter		Violation Criteria	
			Hawai'i	National	Hawai'i	National	Hawai'i	National
Ozone	O ₃	8 Hours	0.08	0.08	157	157	If exceeded on more than 1 day per year	If exceeded by the mean of annual 4th highest daily values for a 3-year period
Carbon Monoxide	CO	8 Hours	4.5	9	5,000	10,000	If exceeded on more than 1 day per year	If exceeded on more than 1 day per year
		1 Hour	9	35	10,000	40,000	If exceeded on more than 1 day per year	If exceeded on more than 1 day per year
Inhalable Particulate Matter	PM ₁₀	Annual Arithmetic Mean	---	---	50	50	If exceeded	If exceeded as a 3-year single station average
		24 Hours	---	---	150	150	If exceeded on more than 1 day per year	If exceeded by the mean of annual 99 th percentile values over 3 years

Table N-1
Ambient Air Quality Standards Applicable in Hawai'i (*continued*)

Pollutant	Symbol	Averaging Time	Standard as Parts Per Million by Volume		Standard as Micrograms per Cubic Meter		Violation Criteria	
			Hawai'i	National	Hawai'i	National	Hawai'i	National
Fine Particulate Matter	PM2.5	Annual Arithmetic Mean	---	---	---	15.0	---	If exceeded as a 3-year spatial average of data from designated stations
		24 Hours	---	---	---	65	---	If exceeded by the mean of annual 98 th percentile values over 3 years
Nitrogen Dioxide	NO2	Annual Average	0.037	0.053	70	100	If exceeded	If exceeded
Sulfur Dioxide	SO2	Annual Average	0.03	0.03	80	80	If exceeded	If exceeded
		24 Hours	0.14	0.14	365	365	If exceeded on more than 1 day per year	If exceeded on more than 1 day per year
		3 Hours	0.5	0.5	1,300	1,300	If exceeded on more than 1 day per year	If exceeded on more than 1 day per year

Table N-1
Ambient Air Quality Standards Applicable in Hawai'i (*continued*)

Pollutant	Symbol	Averaging Time	Standard as Parts Per Million by Volume		Standard as Micrograms per Cubic Meter		Violation Criteria

Hydrogen Sulfide	H ₂ S	1 Hour	0.025	---	35	---	If exceeded on more than 1 day per year	---

Sources: 40 CFR Parts 50, 53, and 58; Hawaii Administrative Rules Chapter 11-59 (August 28, 2001)

Notes:

All standards except the national PM₁₀ and PM_{2.5} standards are based on measurements corrected to 25 degrees C and 1 atmosphere pressure.

The national PM₁₀ and PM_{2.5} standards are based on direct flow volume data without correction to standard temperature and pressure.

Decimal places shown for standards reflect the rounding precision used for evaluating compliance.

Gaseous pollutant concentration equivalencies (parts per million by volume versus micrograms per cubic meter) are nominal values accounting for rounding conventions; exact equivalencies may be different.

Except for the 3-hour sulfur dioxide standard, the national standards shown are the primary (health effects) standards.

The national 3-hour sulfur dioxide standard is a secondary (welfare effects) standard.

The national PM₁₀ standards were adopted in 1987; revised violation criteria were adopted for attainment areas in 1997.

The original violation criteria for the national PM₁₀ standards will remain in effect for PM₁₀ nonattainment areas until EPA takes actions required by Section 172(e) of the Clean Air Act or approves emission control programs for the relevant PM₁₀ state implementation plan.

Violation criteria for all standards except the national annual standard for PM_{2.5} are applied to data from individual monitoring sites.

Violation criteria for the national annual standard for PM_{2.5} are applied to a spatial average of data from one or more community-oriented monitoring sites representative of exposures at neighborhood or larger spatial scales (40 CFR Part 58).

The "10" in PM₁₀ and the "2.5" in PM_{2.5} are not particle size limits; these numbers identify the particle size class (aerodynamic equivalent diameters in microns) collected with 50% mass efficiency by certified sampling equipment. The maximum particle size collected by PM₁₀ samplers is about 50 microns aerodynamic equivalent diameter; the maximum particle size collected by PM_{2.5} samplers is about 6 microns aerodynamic equivalent diameter. (40 CFR Part 53).

The "10" in PM₁₀ and the "2.5" in PM_{2.5} are not particle size limits; these numbers identify the particle size class (aerodynamic equivalent diameters in microns) collected with 50% mass efficiency by certified sampling equipment. The maximum particle size collected by PM₁₀ samplers is about 50 microns aerodynamic equivalent diameter; the maximum particle size collected by PM_{2.5} samplers is about 6 microns aerodynamic equivalent diameter. (40 CFR Part 53).

- Systemic poisons (such as lead particles) that affect a range of tissues, organs, and metabolic processes.

Ozone, suspended particulate matter, and carbon monoxide are the air pollutants of greatest concern in most parts of the country. Ozone is a strong oxidizing agent that reacts with a wide range of materials and biological tissues. It is a respiratory irritant that can cause acute and chronic effects on the respiratory system. Recognized effects include reduced pulmonary function, pulmonary inflammation, increased airway reactivity, aggravation of existing respiratory diseases (such as asthma, bronchitis, and emphysema), physical damage to lung tissue, decreased exercise performance, and increased susceptibility to respiratory infections. In addition, ozone is a necrotic agent that causes significant damage to leaf tissues of crops and natural vegetation. Ozone also damages many materials by acting as a chemical oxidizing agent. Because of its chemical activity, indoor ozone levels are usually much lower than outdoor levels.

Suspended particulate matter represents a diverse mixture of solid and liquid material having size, shape, and density characteristics that allow the material to remain suspended in the air for long periods. The physical and chemical composition of suspended particulate matter is highly variable, resulting in a wide range of public health concerns.

Many components of suspended particulate matter are respiratory irritants. Some components (such as crystalline or fibrous minerals) are primarily physical irritants. Other components are chemical irritants (such as sulfates, nitrates, and various organic chemicals). Suspended particulate matter also can contain compounds (such as heavy metals and various organic compounds) that are systemic toxins or necrotic agents. Suspended particulate matter or compounds adsorbed on the surface of particles can also be carcinogenic or mutagenic chemicals.

Public health concerns for suspended particulate matter focus on the particle size ranges likely to reach the lower respiratory tract or the lungs. PM_{10} represents particle size categories that are likely to reach either the lower respiratory tract or the lungs after being inhaled. $PM_{2.5}$ represents particle size categories likely to penetrate to the lungs after being inhaled. The 10 in PM_{10} and the 2.5 in $PM_{2.5}$ are not upper size limits but refer to the particle size range collected with 50 percent mass efficiency by certified sampling devices; larger particles are collected with lower efficiencies, and smaller particles are collected with higher efficiencies.

In addition to public health impacts, suspended particulate matter causes a variety of material damage and nuisance effects: abrasion; corrosion, pitting, and other chemical reactions on material surfaces; soiling; and transportation hazards due to visibility impairment.

Carbon monoxide is a public health concern because it binds to the ferrous heme binding sites on hemoglobin 200 to 250 times more preferentially than oxygen. Therefore, a relatively low concentration of carbon monoxide can affect the amount of oxygen in the bloodstream available to be transported to the body tissues (Bromberg 1999, Gutierrez 1982, Maynard and Waller 1999, McGrath 1982, and USEPA 1990).

Hazardous Air Pollutants

Air quality programs based on regulation of other hazardous substances typically address chemicals used or produced by limited categories of industrial facilities. Programs regulating hazardous air pollutants focus on substances that alter or damage the genes and chromosomes in cells (mutagens), substances that affect cells in ways that can lead to uncontrolled cancerous cell growth (carcinogens), substances that can cause birth defects or other developmental abnormalities (teratogens), substances with serious acute toxicity effects, and substances that undergo radioactive decay processes, resulting in the release of ionizing radiation. Federal air quality management programs for hazardous air pollutants focus on setting emission limits for particular industrial processes, rather than on setting ambient exposure standards. Some states have established ambient exposure guidelines for various hazardous air pollutants and use those guidelines as part of the permit review process for industrial emission sources.

The State of Hawai'i has adopted ambient concentration guidelines for hazardous air pollutants which are used as part of the permit review process for emission sources that require state or federal air quality permits. The Hawai'i ambient exposure guidelines for hazardous air pollutants (Hawai'i Administrative Rules Title 11 Chapter 60.1, Section 179) include the following:

- For noncarcinogenic compounds, an 8-hour average concentration equal to one percent of the corresponding 8-hour threshold level value (TLV) adopted by OSHA;
- For noncarcinogenic compounds, an annual average concentration equal to 1/420 (0.238 percent) of the 8-hour TLV value adopted by OSHA;
- For noncarcinogenic compounds for which there is no OSHA-adopted TLV, the Director of Health is authorized to set ambient air concentration standards case-by-case to avoid unreasonably endangering public health with an adequate margin of safety; and
- For carcinogenic compounds, any ambient air concentration that produces an individual lifetime excess cancer risk of more than 10 in 1 million, assuming continuous exposure for 70 years.

N.6 NOISE

Other frequency weighting schemes are used for specialized purposes. The C-weighted decibel scale (dBC) often is used to characterize low frequency sounds capable of inducing vibrations in buildings or other structures. The C-weighted scale makes only minor reductions to the measured pressure level for low frequency components of a sound, while making slightly greater reductions to high frequency components than does the A-weighted scale.

Unweighted decibel measurements are used for refined analyses that require data on the frequency spectrum of a sound (e.g., when determining the sound absorption or sound transmission properties of materials). Unweighted decibel measurements sometimes are termed flat or linear measurements. The term overall sound pressure level sometimes is used as a technical term to describe unweighted decibel measurements. Unfortunately, the phrase also is used in a generalized sense to refer to composite dBA or dBC measurements (combined measurements across the range of frequency bands being measured). For most noise sources, unweighted dB measurements are less than 1 dB higher than corresponding C-weighted dB measurements. Evaluations of blast noise or sonic booms sometimes use a peak overpressure measurement. The peak overpressure normally is an unweighted decibel measurement for the dominant octave band, or 1/3 octave band component of a sound. In most cases, the specific octave or 1/3 octave band for the peak overpressure measurement is not reported. The peak overpressure level is slightly less than the corresponding composite unweighted decibel measurement.

Varying noise levels often are described in terms of the equivalent constant decibel level. Equivalent noise levels (Leq) are not a simple averaging of decibel values but are based on the cumulative acoustical energy associated with the component decibel values. Leq values sometimes are referred to as energy-averaged noise levels. As a consequence of the calculation procedure, high dB events contribute more to the Leq value than do low dB events.

Leq values are used to develop single-value descriptions of average noise exposure over various periods of time. Such average noise exposure ratings often include additional weighting factors for potential annoyance due to time of day or other considerations. The Leq data used for these average noise exposure descriptors generally are based on A-weighted sound level measurements.

Statistical descriptions (L_x, where x represents the percent of the time when noise levels exceed the specified decibel level) also are used to characterize noise conditions over specified periods. L₁, L₅, and L₁₀ descriptors can be used to characterize peak noise levels, while L₉₀, L₉₅, and L₉₉ descriptors can be used to characterize background noise levels. (Note that the L₅₀ value (the sound level exceeded 50 percent of the time) is seldom the same as the Leq value for the period being analyzed.) The Leq value often is between the L₃₀ and the L₄₀ values for the measurement period.

Noise Descriptors for Discrete Noise Events

Many people are skeptical about using 24-hour average noise descriptors to evaluate the annoyance potential of isolated short-duration noise events. Although this skepticism is often misplaced, other types of noise evaluations can be used. Lightly used rail lines, aircraft at small general aviation airports, emergency generators, pile drivers, and blasting activities sometimes are evaluated using other types of noise descriptors. Peak noise levels, the duration of individual noise events, and the repetition pattern of events often are used to describe intermittent or short duration noise conditions. Statistical descriptions (L_x values) and event-specific L_{eq} values also can be used to characterize discrete noise events.

Impulse sounds usually are defined as noise events producing a significant increase in sound level but lasting less than two seconds (often less than one second). Examples of impulse noise sources include pile driving, punch presses, gunshots, fireworks, sonic booms, and blasting. Impulse noises usually are described using the sound exposure level (SEL) descriptor. In addition to impulse type noise events, the SEL descriptor often is used for a variety of longer duration discrete noise events (such as aircraft flyovers and train passings). The SEL measure represents the cumulative (not average) sound exposure during a particular noise event, integrated with respect to a one-second time frame. The SEL descriptor sometimes is labeled SENEL (single event noise exposure level), LAE, LAX, or LE.

SEL measurements are equivalent to the L_{eq} value of a one-second noise event producing the same cumulative acoustic energy as the actual noise event being analyzed. In effect, an SEL measure spreads or compresses the noise to fit a fixed one-second time interval. If the actual duration of the noise is less than one second, the SEL value will be less than the L_{eq} value. If the duration of the noise exceeds one second, the SEL value will exceed the L_{eq} .

Impulse noises of substantial magnitude (e.g., blasting or sonic booms) often are characterized using unweighted (flat) or C-weighted SEL measures. Annoyance from such sources often involves induced structural vibrations and the loudness of the noise. Unweighted and C-weighted decibel scales have proven more useful than the A-weighted scale for such evaluations. Less intense impulse noises often are characterized using an A-weighted SEL measure.

Most SEL measurements are performed using procedures that restrict the time interval over which actual measurements or subsequent calculations are made. Sometimes this involves defining the noise as the period when sound levels exceed a particular threshold level. In other cases, the calculations are restricted to that duration of the noise when sound levels are within a defined increment (generally 10 to 30 dB) of the peak sound level. The measurement restrictions noted above are done as a practical expediency to minimize manual computations, to accommodate monitoring instruments with a limited measurement range, or to systematically define discrete noise events against fluctuating background noise

conditions. Due to the logarithmic nature of decibel units, these measurement restrictions normally have little effect on the calculated SEL value.

If individual noise events are repeated frequently, it is possible to calculate Ldn or CNEL values based on typical SEL values and the number of occurrence of such noise events during daytime, evening, and nighttime periods. Such computation procedures often are used to estimate noise levels around airports or railway lines.

A slightly modified version of the Ldn and CNEL calculations is used in some computer models that evaluate aircraft noise along low altitude military training routes. An additional penalty factor of up to 11 dB is added to the standard Ldn or CNEL calculation to account for the added disturbance caused by very rapid increases in noise level during flyover events. The resulting “onset rate adjusted” Ldn or CNEL value is often designated as Ldnmr. The magnitude of the added penalty factor depends on flight speed, flight altitude, and aircraft type. The maximum penalty factor (11 dB) is added for conditions in which noise levels increase from background conditions to the peak level in less than one second.

Decibel Values

The nature of dB scales is such that numerical dB ratings for different noise sources cannot be added directly to give the dB rating of the combination of these sources. Decibel values are 10 times the logarithm of a squared pressure ratio, and must be converted back into squared pressure ratio values before being added together or averaged in a time-weighted manner. The resulting composite squared pressure ratio value can then be converted back into a composite decibel rating. For simplicity, the procedure for combining decibel values is often referred to as “energy averaging”.

Time-Weighted Averages

The calculation procedure used for computing average noise levels (Leq values) results in high dB events contributing significantly more to the final Leq value than do background low dB conditions. For example, a single 1-second episode of 90 dBA introduced into a 1-hour constant background noise condition of 45 dBA will result in a 1-hour Leq value of 54.9 dBA. A 5-second episode of 90 dBA in a 1-hour background condition of 45 dBA results in a 1-hour Leq of 61.5 dBA. And a cumulative total of 20 seconds of 90 dBA in a 1-hour background condition of 45 dBA results in a 1-hour Leq of 67.5 dBA.

Cumulative Effect of Multiple Noise Sources

Two noise sources producing equal dB ratings at a given location will produce a composite noise level 3 dB greater than either sound alone. When two noise sources differ by 10 dB, the composite noise level will be only 0.4 dB greater than the louder source alone. Most people have difficulty distinguishing the louder of two noise sources that differ by less than 1.5-2 dB.

Decibel Changes Versus Perceived Loudness

In general, a 10 dB increase in noise level is perceived as a doubling (100% increase) in loudness. A 2 dB increase represents a 15 percent increase in loudness, a 3 dB increase is a 23 percent increase in loudness, and a 5 dB increase is a 41 percent increase in loudness. Conversely, a 2 dB reduction represents a 13% decrease in loudness, a 3 dB reduction represents a 19% decrease in loudness, a 5 dB reduction represents a 29% decrease in loudness, and a 10 dB reduction represents a 50% decrease in loudness.

Sound Attenuation Considerations

When distance is the only factor considered, sound levels from an isolated noise source would be expected to decrease by about 6 dB for every doubling of distance away from the noise source. When the noise source is essentially a continuous line (e.g., vehicle traffic on a highway), noise levels would be expected to decrease by about 3 dB for every doubling of distance, due to the additive effects of a linear array of noise sources.

Sound levels at various locations away from a noise source are influenced by factors other than just distance from the noise source. Ground surface conditions, topographic features, and structural barriers can absorb, reflect, or scatter sound waves, resulting in lower noise levels (increased sound attenuation rates). Atmospheric conditions (wind speed and direction, humidity levels, temperature, and air pressure) and the frequency characteristics of the sound itself also affect sound attenuation rates. The vertical variation in wind, temperature, pressure, and humidity conditions also affects sound attenuation rates.

The atmosphere absorbs some of the energy content of sound waves, thus increasing sound attenuation rates over long distances. Such atmospheric absorption is greatest for high frequency components of a sound, resulting in a lower pitch to the sound at greater distances. Atmospheric absorption is most strongly dependent on temperature and humidity conditions, with a somewhat complex relationship among temperature, humidity, and the frequency components of the sound. Overall, atmospheric absorption is greatest for high frequency sounds under conditions of low relative humidity and moderately cool temperatures. Atmospheric absorption is least for low frequency sounds at high relative humidity and moderate temperatures.

Sound waves reflected by topographic features, buildings, or other structures can result in higher sound levels than expected in front of the reflecting object. The effects of reflected sound waves can be important in urban areas, partially offsetting the shielding effect of buildings and other structures.

Temperature inversions and altitudinal changes in wind conditions can at times diffract and “focus” sound waves to a location at considerable distance from the noise source. In such situations, the vertical changes in atmospheric conditions affect sound waves much the way lenses and prisms can bend and focus light rays.

Decibel Scales Reflecting Annoyance Potential

Average noise exposure over a 24-hour period often is presented as a day-night average sound level (Ldn). Ldn values are calculated from hourly Leq values, with the Leq values for nighttime (10 PM to 7 AM) increased by 10 dB to reflect the greater disturbance potential from nighttime noises. Because of the time period weighting, an Ldn value will be 6.4 dB greater than the corresponding 24-hour Leq value for a constant noise level. For most real noise conditions, the corresponding Ldn and 24-hour Leq values will differ by less than this.

The community noise equivalent level (CNEL) also is used to characterize average noise levels over a 24-hour period, with weighting factors for evening and nighttime noise levels. Leq values for the evening period (7 PM to 10 PM) are increased by 5 dB, while Leq values for the nighttime period are increased by 10 dB. Because of the time period weighting, a CNEL value will be 6.7 dB higher than the corresponding 24-hour Leq value for a constant noise level. For most real noise conditions, the corresponding CNEL and 24-hour Leq values will differ by less than this.

The CNEL value will be slightly higher than (but generally within 1 dB of) the Ldn value for the same set of noise measurements. Only in situations with high evening period noise levels will CNEL values be meaningfully different from Ldn values. Because of the small difference between them, CNEL and Ldn ratings normally are considered interchangeable.

Single-value average noise descriptors (such as Ldn or CNEL values) are applied to variable but relatively frequent sources of noise. Typical urban noise conditions, highway traffic, major rail yards, heavily used rail lines, and major commercial airports are examples where CNEL and Ldn descriptors are most appropriate.

Federal Legislation***The Noise Pollution and Abatement Act of 1970***

This act (Title IV of the Clean Air Act, 42 USC 7627) established an Office of Noise Abatement and Control within the US Environmental Protection Agency (EPA). The USEPA was directed to investigate and identify the effects of noise levels on public health and welfare, including: psychological and physiological effects on humans; effects of sporadic extreme noise as compared with constant noise; effects on wildlife and property; effects of sonic booms on property; and such other matters as may be of interest in the public welfare. Title IV of the Clean Air Act also requires other federal agencies and departments to consult with USEPA regarding methods for abating objectionable or nuisance condition noise impacts that result from activities they carry out or sponsor.

Federal Noise Control Act of 1972 (42 USC 4901 et seq.)

This act established a requirement that all federal agencies must administer their programs in a manner that promotes an environment free from noise that jeopardized public health or welfare. USEPA was given the responsibility for:

providing information to the public regarding identifiable effects of noise on public health or welfare, publishing information on the levels of environmental noise that will protect the public health and welfare with an adequate margin of safety, coordinating federal research and activities related to noise control, and establishing federal noise emission standards for selected products distributed in interstate commerce (construction equipment; transportation equipment; motors and engines; and electrical or electronic equipment). Aircraft, aircraft engines, military weapons, military combat equipment, rockets and other equipment used by the National Aeronautics and Space Administration, and various other items were excluded from the definition of products distributed in commerce. States and political subdivisions thereof retain the right to establish and enforce controls on environmental noise through the licensing, regulation, or restriction of the use, operation, or movement of products or combinations of products. The federal Noise Control Act also directed all federal agencies to comply with federal, state, interstate, and local noise control and abatement requirements to the same extent that any person is subject to such requirements.

Although the USEPA can require other federal agencies to justify their noise regulations with respect to the policy requirements of the federal Noise Control Act, each federal agency retains authority to adopt noise regulations pertaining to agency programs. The Occupational Safety and Health Administration has primary authority for setting workplace noise exposure standards. Due to aviation safety considerations, the Federal Aviation Administration has primary jurisdiction over aircraft noise standards.

Federal Interagency Noise Committees

The Federal Interagency Committee on Urban Noise (FICUN) was formed in 1979 to review various federal agency programs related to noise impacts on land use. The committee included representatives of the Department of Transportation, Department of Housing and Urban Development, Environmental Protection Agency, Department of Defense, and the Veterans Administration. The 1980 report issued by FICUN summarized federal agency noise policies and programs. In addition, it identified the Ldn noise metric as the most appropriate noise descriptor to use for evaluating noise in the context of land use compatibility issues. The 1980 FICUN report also included a chart of compatible and incompatible noise levels for various categories of land use.

The Federal Interagency Committee on Noise (FICON) was formed in 1990 to review federal agency policies concerning the assessment of airport noise issues. Participating agencies included the Department of Transportation, Department of Defense, Department of Justice, Department of Housing and Urban Development, Environmental Protection Agency, Veterans Administration, and the Council on Environmental Quality. The 1992 report prepared by the committee confirmed the use of the Ldn noise metric as the primary basis for assessing land use compatibility issues, but also recognized that supplementary noise descriptors could be useful to further explain noise impacts on a case-by-case

basis. The 1992 FICON report recognized the maximum A-weighted decibel level (Lmax) as useful for evaluating short-term individual aircraft flyover events.

The Federal Interagency Committee on Aviation Noise (FICAN) was established in 1993 to provide an on-going forum for coordination and review of federal agency activities related to aviation noise issues. Agency participation in FICAN includes the Federal Aviation Administration, the Department of Transportation (Office of the Secretary), US Army, US Navy, US Air Force, National Aeronautics and Space Administration, National Park Service, Department of Housing and Urban Development, Environmental Protection Agency, and the Centers for Disease Control and Prevention (National Center for Environmental Health). Periodic reviews conducted by FICAN have continued to support the use of Ldn values as the primary indicator of land use compatibility conditions in terms of aviation noise. FICAN has, however, also supported the use of supplemental noise descriptors (such as Lmax, SEL, or time above a threshold level) to provide information that is not easily communicated by Ldn values (FICAN 2002).

N.7 HYDROLOGY AND GROUNDWATER

N.7.1 Federal Laws and Regulations

Clean Water Act

The federal legislation governing the water quality aspects of the project is the Clean Water Act (CWA), as amended by the Water Quality Act of 1987. The objective of the CWA is “to restore and maintain the chemical, physical, and biological integrity of the Nation’s waters.”

The purpose of the Section 401 of the CWA is to insure compliance with requirements, application procedures and other provisions of the law. No license or permit will be granted until certification has been obtained or waived. Any applicant for a Federal license or permit to conduct any activities which may result in any discharge into the navigable waters will have to provide a permitting agency a certification from the State in which the discharge originates.

The purpose of the Section 402 of the CWA is to control both point and non-point source discharge of pollutants to waters of the United States. Under Section 402, all discharge of any pollutant will meet all applicable requirements under section 1311, 1312, 1316, 1317, 1318, and 1343 under the CWA.

Congress delegated the permitting of fill material under Section 404 of the CWA to the Department of the Army. The Secretary of the Army has further delegated implementation of the permit program to the Army Corps of Engineers. The purpose of the Section 404 program is to insure that the physical, biological, and chemical quality of our nation’s water is protected from unauthorized discharges of dredged or fill material that would alter or destroy its quality, including its

resource functions and values. Persons who proposed to place dredged or fill material in waters of the U.S. must first apply for and obtain a permit from the Corps, subject to a public interest review of the proposed activity. Some examples of activities that require Section 404 permits to place dredged or fill material into waters of the US (jurisdictional waters) include:

- Residential, commercial, recreational or other construction activities;
- Water dependent activities such as the construction of revetments, groins, breakwaters, levees, dams, dikes, and weirs; and
- Road fills and placement of riprap for bank and other stabilization purposes.

Waters of the United States are surface waters including all traditional navigable waters, all interstate waters, all tributaries, impoundments, and adjacent wetlands of these waters, and the territorial seas. Also, agencies shall provide opportunity for early public review of proposals for construction in wetlands, including those projects not requiring an EIS.

Executive Order 11988 of 1977 (Flood Plain Management)

Executive Order 11988 directs all Federal agencies to avoid, if possible, development and other activities in the 100-year base floodplain. Where the base floodplain cannot be avoided, special considerations and studies for new facilities and structures are needed. Design and siting are to be based on scientific, engineering, and architectural studies; consideration of human life, natural processes, and cultural resources; and the planned lifespan of the project. The implementing guidelines are in 40 CFR 6030.

Federal agencies are required to:

- Reduce the risk of flood loss;
- Minimize the impact of floods on human safety, health, and welfare; and
- Restore and preserve the natural and beneficial values served by floodplains in carrying out agency responsibility.

Executive Order 11990 of 1977 (Wetlands)

This order directs all Federal agencies to avoid, if possible, adverse impacts to wetlands and to preserve and enhance the natural and beneficial values of wetlands. Each agency shall avoid undertaking or assisting in construction projects in wetlands unless the head of the agency determines that there is no practicable alternative to such construction and that the proposed action includes measures to minimize harm.

In general, all waters must be free of substances resulting from domestic, industrial, or other controllable sources of pollution. This includes sediments

resulting from erosion caused by construction or agricultural activities, floating or settleable materials, thermal pollutants, pathogens, biocides, excessive nutrients, toxic compounds, and other pollutants. All discharges to state waters are subject to laboratory testing to determine if the discharge meets standards for acute or chronic toxicity. These standards differ depending on whether the receiving water is classified as freshwater (salinity less than 0.5 parts per thousand [ppt]) or saltwater (salinity greater than 0.5 ppt). Two types of tests are used, including tests to determine if concentrations of individual pollutant chemicals are present above numerical standards; and tests that measure the survival of indicator organisms in samples of the water under specific test conditions. These standards are published in HAR Title 11, Chapter 54.

N.7.2 State of Hawai'i Laws, Regulations, and Policies

In Hawai'i, several agencies have responsibility for managing water resources. Management of land-based surface and groundwater supplies (quantity) is the responsibility of the State Water Commission. The Coastal Commission is charged with protecting waters within the Coastal Zone. The State Department of Health is responsible for protecting surface and groundwater quality. Each county prepares a County Water Use and Development Plan.

State Water Code

In 1987 the Hawai'i State Legislature enacted the State Water Code, which is Chapter 174C of the Hawai'i Revised Statutes. The code established the State Commission on Water Resource Management (Water Commission). The division's primary responsibilities are:

- Basic Data Collection and Resource Assessment;
- Water Resource Planning;
- Regulation of Water Development and Use;
- Enforcement and Technical Support Services; and
- Protection of Instream Uses.

The Code also called for the preparation of a Hawai'i Water Plan. The Plan consists of eight parts, including:

- Water Resources Protection Plan;
- Water Quality Plan;
- State Water Projects Plan;
- Agricultural Water Use and Development Plan; and
- Four County Water Use and Development Plans, for Hawai'i, Maui, Honolulu, and Kaua'i Counties.

Under the State Water Code, the Water Commission must establish and administer a state-wide in-stream use protection program. The commission must establish in-stream flow standards on a stream-by-stream basis “whenever necessary to protect the public interest.” To preserve a stream environment in a perennial stream, some level of minimum flow is necessary. In establishing the minimum, flow characteristics need to be identified. As a general rule, in-stream values are significant only for perennial streams (Yuen and Associates 1990). (Perennial streams are streams that contain flowing water at all times during the year).

Surface Water Protection and Water Quality Standards

In 1989, environmental management programs of the Department of Health were organized under the Environmental Management Division, with media-specific branches, including the Clean Air Branch, the Clean Water Branch, the Safe Drinking Water Branch, the Solid and Hazardous Waste Branch, and the Wastewater Branch. The Environmental Planning Office revises the state Water Quality Standards every three years, as required by the federal Clean Water Act. The regulations governing water quality are primarily contained in Title 11, Chapter 54 of the Hawai‘i Administrative Rules (HAR Chapter 11-54). The Clean Water Branch administers and enforces state water pollution laws and regulations.

As part of its three-year review process, the state recently reviewed HAR Chapters 11-54 and 11-55, and proposed many revisions needed to comply with federal and state law. The revisions are currently undergoing public review and comment, and the final rules must be approved by the USEPA. Only the current rules, rather than the proposed rules, are addressed in this report.

All waters are subject to an anti-degradation policy, which states that “Waters whose quality are higher than established water quality standards shall not be lowered in quality unless it has been affirmatively demonstrated to the director [of the Department of Health] that the change is justifiable as a result of important economic or social development and will not interfere with or become injurious to any assigned uses made of, or presently in, those waters.” (HAR Section 11-54-01.1)

In general, all waters must be free substances resulting from domestic, industrial, or other controllable sources of pollution. This includes sediments resulting from erosion caused by construction or agricultural activities, floating or settleable materials, thermal pollutants, pathogens, biocides, excessive nutrients, toxic compounds, and other pollutants. All discharges to state waters are subject to laboratory testing to determine if the discharge meets standards for acute or chronic toxicity. These standards differ depending on whether the receiving water is classified as freshwater (salinity less than 0.5 parts per thousand [ppt]) or saltwater (salinity greater than 0.5 ppt). Two types of tests are used, including tests to determine if concentrations of individual pollutant chemicals are present

above numerical standards; and tests that measure the survival of indicator organisms in samples of the water under specific test conditions. These standards are published in HAR Title 11, Chapter 54.

Surface Water Classification

In addition to these basic criteria, additional water quality criteria have been established based on protection of water uses. The Hawaiian water use classification system is based on land use. All state waters are classified as either inland waters or marine waters. Inland waters may be fresh, brackish, or saline. Fresh waters have salinity of less than 0.5 parts per thousand (ppt). Brackish waters have salinity of greater than 0.5 ppt and less than 32 ppt. Saline waters have salinity greater than 32 ppt. Inland fresh water are further subdivided based on whether they are flowing (in streams, springs or seeps, or ditches and flumes), standing (including natural lakes and reservoirs), or wetlands (including elevated wetlands or low wetlands). Inland brackish and saline waters are further subdivided based on whether they are standing, wetlands, or estuaries.

Inland Waters

Inland waters are classified as Class 1a, Class 1b, or Class 2. The objective of Class 1 waters is to minimize human-caused pollution, and to protect the wilderness character of the waters. Waste discharge into Class 1 waters is prohibited, as is any action that results in a demonstrable increase in levels of contamination. Class 1a waters receive the highest level of protection. Class 1b waters are protected as a drinking water source. Class 2 waters are protected for recreational uses, aquatic life, agricultural and industrial water supplies, and shipping and navigation. Industrial, stormwater, or sanitary wastewater may be discharged to Class 2 waters provided the discharge is treated using the best degree of treatment or control compatible with the criteria established for Class 2 waters, and subject to NPDES point or non-point discharge permit requirements. No new treated sewage discharges are permitted within estuaries. No new industrial discharges to estuaries are permitted, except non-contact thermal and drydock discharges or marine railway discharges to Pearl Harbor.

For most inland waters, except streams, elevated wetlands, and estuaries, only the basic water quality standards apply, and waste discharge into these waters is prohibited. For streams, there are also numerical standards for nutrients (nitrogen and phosphorous), suspended solids, turbidity, pH, dissolved oxygen, temperature, and specific conductance, and there are specific standards for bottom sediments. For elevated wetlands, in addition to the basic water quality standards, there is a pH standard. For estuaries other than the Pearl Harbor Estuary, standards are established for nutrients (nitrogen and phosphorous), ammonia, chlorophyll a, turbidity, pH, dissolved oxygen, temperature, and salinity in the water column, and for oxidation-reduction potential in bottom sediments. The standards for Pearl Harbor Estuary apply to the same parameters, but the allowable limits are higher than for other estuaries.

Marine Waters

Marine waters include embayments, open coastal waters, and oceanic waters. Marine waters are classified as either Class AA or Class A. Class AA waters include specific protected bays or segments of coast, and all embayments in preserves, reserves, sanctuaries, and refuges, or embayments that have been identified as unique or critical habitat for threatened or endangered species. The objective of Class AA waters is that they remain as nearly as possible in their natural pristine state. Mixing zones of wastewater discharges are not allowed within reef areas where the depth is less than 18 meters (59.06 feet), or within 305 meters (1,000 feet) from shore if there is no reef.

Class A marine waters include all marine waters that are not classified as Class AA. The objective of Class A marine waters is to protect recreational and aesthetic uses. As for Class 2 inland waters, only discharges that have received the best degree of treatment or control compatible with the criteria for the waters are allowed. No new industrial discharges are allowed within Class A embayments except for industrial stormwater discharges that meet applicable water quality standards, NPDES-permitted point source discharges, and non-contact thermal and drydock or marine railway discharges to specific water bodies.

Numerical standards established for embayments include standards for nutrients (nitrogen and phosphorous), ammonia, chlorophyll a, turbidity, pH, dissolved oxygen, temperature, and salinity. The standards differ depending on the amount of freshwater inflow. “Wet” criteria apply when freshwater inflow is greater than one percent of the embayment volume per day, and lower “dry” criteria apply at other times.

Standards established for coastal waters and ocean waters address the same parameters as for embayments, except that the standards for coastal waters are more stringent than for embayments, and the standards for ocean waters are more stringent than for coastal waters. Only one area-specific criterion has been established, and that is for the Kona (west) coast of the island of Hawai‘i, excluding some areas such as Kawaihae Harbor.

Finally, two classes of marine bottom ecosystems are provided protective standards. These include water areas associated with these ecosystems. The objective of Class I marine bottom ecosystems is to maintain them as nearly as possible in their natural pristine state with an absolute minimum of pollution from human-induced sources. The objective of Class II marine bottom ecosystems is to protect propagation of fish, shellfish, and wildlife, and recreational uses. For the most part, the standards for marine bottom ecosystems address either sediment deposition or oxidation-reduction potential in the shallow sediment, although the Department of Health may designate other parameters or measures on a site-specific basis. Any action that may permanently alter a Class II marine bottom ecosystem must be approved by the director of the Department of Health.

In addition to the above standards, specific criteria are established for recreational areas. These standards set limits on the quantities of pathogens, such as fecal coliform bacteria allowed in the waters, and prohibit discharge of raw or inadequately treated sewage.

Point Source Discharge Requirements

In November of 1974, the USEPA delegated the administration of the National Pollutant Discharge Elimination System (NPDES) Permit program in Hawai'i to the Hawai'i Department of Health. The NPDES program is the national program for controlling both point and non-point source discharges of pollutants to waters of the State and waters of the United States through uniform permitting procedures. For point sources, the permits establish limits on the concentrations and quantities of waste that can be discharged to waters of the state at an outfall, and monitoring requirements to ensure that the limits are not exceeded. Limits are typically based on evaluation of the degree of dispersion of the effluent within a mixing zone, and the permit establishes the allowable size of the mixing zone. Under the authorization of HRS, Section 342D-53 and HAR, Subsection 11-54-09.1, the State is responsible for giving out certifications to agencies applying for license and permits with the federal government, to conduct activities which would result in discharge, in compliance with Section 401 of the Clean Water Act. The Hawai'i Department of Health has the authority to issue and enforce the NPDES requirements under the HRS, Chapter 342D, HAR, Chapters 11-55 and 11-54.

An NPDES general permit coverage is required for the following activities:

- Storm water associated with industrial activities, as defined in Title 40, Code of Federal Regulations (CFR), Sections 122.26(b)(14)(i) through 122.26(b)(14)(ix) and 122.26(b)(14)(xi)
- Construction activities, including clearing, grading, and excavation, that result in the disturbance of equal to or greater than one (1) acre of total land area. The total land area includes a contiguous area where multiple separate and distinct construction activities may be taking place at different times on different schedules under a larger common plan of development or sale. An NPDES permit is required before the commencement of requirements;
- Discharge of treated effluent from leaking underground storage tank remedial activities;
- Discharge of once through cooling water less than one (1) million gallons per day;
- Discharge of hydrotesting water;
- Discharge of construction dewatering effluent;

- Discharge of treated effluent from petroleum bulk stations and terminals;
- Discharge of treated effluent from well drilling activities;
- Discharges of treated effluent from recycled water distribution systems;
- Discharges of storm water from a small municipal separate storm sewer system; and
- Discharge of circulation water from decorative ponds or tanks.

The CWB requires that a Notice of Intent (NOI) to be covered by a NPDES general permit for any of the above activities be submitted at least 30 days before the commencement of the respective activities. The NOI forms may be picked up at CWB or downloaded from CWB's website at <http://www.state.hi.us/doh/eh/cwb/forms/genl-index.html>.

In November of 1990, Hawai'i's Nonpoint Source Water Pollution Management Plan and Hawai'i's Assessment of Nonpoint Source Pollution Water Quality Problems were completed, and in 1993, a Nonpoint Source Pollution Program was established in the Department of Health.

Impaired Water Bodies

In 1998, in compliance with requirements of Section 303 of the Clean Water Act that require biennial reports identifying impaired water bodies, the State of Hawai'i Department of Health identified 18 impaired water bodies statewide, (Impaired water bodies, or "Water Quality Limited Segments," are defined in Section 303 of the Clean Water Act as water areas where existing water quality does not meet, and will not meet, applicable water quality standards even after effluent limitation requirements on point source discharges are applied. Thus, impaired water bodies are defined in relation to dispersed, or non-point sources of pollution, rather than point sources.)

Of the impaired water bodies identified by the state, only Pearl Harbor and Kaiaka-Waialua Bay on O'ahu, and Hilo Bay on the island of Hawai'i, are downstream of SBCT project areas. Hickam AFB is adjacent to Pearl Harbor; Schofield Barracks lies partly within the upper watersheds of Pearl Harbor; Drum Road-Helemao Trail is in the upper watershed of Kaiaka-Waialua Bay; and the eastern side of Pōhakuloa Training Area is in the upper watershed of Hilo Bay. Pearl Harbor is impaired by nutrients, siltation, turbidity, and organic chemicals; Kaiaka-Waialua Bays are impaired due to turbidity; and Hilo Bay is also impaired because of turbidity.

In 2001, USEPA re-evaluated the 1998 list of impaired waterbodies to identify impaired perennial streams contributing runoff to the impaired waterbodies. Of 57 perennial streams on O'ahu, 31 were identified as impaired; and of 108

perennial streams on the island of Hawai'i, eight were identified as impaired. Under the Clean Water Act, the state must determine current pollutant loads and establish load reductions necessary to bring the impaired water bodies into attainment. The resulting maximum allowable pollutant loadings are known as Total Maximum Daily Loads (TMDLs). The state has not yet determined TMDLs for any of the streams in watersheds containing SBCT project actions.

Watershed Classification

In response to the federal Clean Water Action Plan developed in 1998, the State of Hawai'i assigned priorities for restoration of watersheds. The resulting classification scheme identified four categories of watersheds. Category I watersheds are those in need of restoration because they do not meet, or are close to not meeting, clean water and other natural resource goals. Category II watersheds are those that require preventive action to sustain water quality. Category III watersheds have pristine or sensitive aquatic systems on lands administered by federal, state, or tribal governments. Category IV watersheds are those with insufficient data to make an assessment. To date, the State has only identified Category I watersheds, relying mainly on the 303(d) list of impaired water bodies as the basis for classification.

On the Island of O'ahu, all of the watersheds in the Ko'olaupoko District, on the windward side of the island, were identified as "tier 1" Category I watersheds. The remaining watersheds containing or drained by 303(d) impaired water bodies were identified as "tier 2" watersheds.

On the leeward coast of the Big Island, the watershed of Pelekane Bay, which comprises intermittent streams draining the west side of the Kohala Mountains, was identified as a Category 1 watershed based on sediment erosion problems, partly due to grazing, that had a potential to impact coral reefs in the bay. It was given a high priority ("tier 1") rating because its restoration was considered to have a high probability of success. Seven additional ("tier 2") Category I watersheds were identified based on containing, or draining into, a 303(d) listed impaired water body. All of these watersheds are on the windward side of the island and drain to Hilo Bay. The upper portion of one of the seven listed watersheds - the upper Wailuku watershed - overlies the eastern side of the PTA.

Watershed Protection Act

In 2000, the state legislature passed Act 152, which created a watershed protection board. The Board included representatives of the Department of Land and Natural Resources, Department of Agriculture, water managers from each of the four counties, and a representative of the U.S. military. The Board was charged with development of a watershed master plan. Act 152 sunset on June 30, 2002, at which time the Board was to have prepared the watershed master plan. The Board did not complete the watershed master plan, but instead recommended that the plan be completed in four phases. Phase I is preparation of the framework for the Watershed Protection Program. Phase 2 is watershed assessment and

prioritization in mauka (mountain, or upper watershed) areas. Phase 3 is preparation of a Watershed Master Plan for mauka areas. Phase 4 is preparation of a Watershed Master Plan for mauka and makai (coastal, or lower watershed) areas, based on an ahupua'a approach to watershed management. The legislature has not acted to continue the existing Board or appoint a new Board, or to implement the recommendations of the previous Board.

Coastal Zone Management Program

The Hawai'i Coastal Zone Management Program (HCZMP) was promulgated in 1977 in response to the Federal Coastal Zone Management Act of 1972. The federal law was reauthorized and amended in 1990 in the Coastal Zone Act Reauthorizatoion Amendments (CZARA). The CZM area encompasses the entire state including all marine waters seaward to the extent of the state's police power and management authority, including the 12-mile (4-meter) US territorial sea and all archipelagic waters. The Program includes a permit system to control development within a SMA managed by the Counties and the Office of Planning; a Shoreline Setback Area which serves as a buffer against coastal hazards and erosion, and protects view-planes; and the Marine and Coastal Affairs. The national CZMA requires direct federal activities and development projects to be consistent with approved state coastal programs to the maximum extent practicable. One objective of the HCZMP is to reduce hazard to life and property from tsunami, storm waves, stream flooding, erosion, and subsidence.

The SMA originally encompassed all lands extending not less than 100 yards (91 meters) inland from the shoreline. The shoreline is defined as the upper reaches of the wash of the waves (other than storm or seismic waves) at high tide during the season of the year in which the highest wash of the waves occurs. The shoreline is usually evidenced by vegetation growth, or the upper limit of debris left by the wash of waves. Counties may amend the boundaries of the SMAs to achieve the CZM objectives and policies. No development can occur in the SMA unless the appropriate county (or for developments in the Community Development Districts, the Office of Planning) first issues a permit.

The Shoreline Setback Area is the area between the shoreline and the shoreline setback line. Currently, most shoreline setback lines are set at 40 feet (37 meters) from the shoreline, although in some places the Shoreline Setback boundaries extend further inland. The Counties have the authority to set deeper setbacks. Structures or portions of a structure are not permitted in the shoreline setback area without a variance.

In 1991, the Hawai'i and Marine Resources Council developed the Hawai'i Ocean Resources Management Plan (ORMP) that contains objectives, policies, implementing actions, and recommendations for a comprehensive, integrated ocean policy and management framework. The 1995 enactment of Act 104, Session Laws of Hawai'i integrated the ORMP with the Hawai'i CZM Program to strengthen the state's ability to coordinate marine and coastal policy development

and resources management responsibilities. Act 104 also created the Marine and Coastal Zone Management Advisory Group (MACZMAG) which is charged with, among other things, facilitating the implementation of the ORMP. The boundaries addressed by ORMP are from the coastal zone out to the limit of the 200-mile (183-meter) Exclusive Economic Zone (EEZ).

In compliance with the federal CZARA of 1990, the State of Hawai'i prepared the Hawai'i Coastal Nonpoint Pollution Control Program in 1996, which was approved by NOAA and USEPA in the same year. In July 2000, the state completed an Implementation Plan for Polluted Runoff Control, which establishes long and short-term goals and activities to control nonpoint source pollution as required for the implementation of the Coastal Nonpoint Pollution Control Program. It also establishes 5-year implementation plans to address polluted runoff in six categories: agriculture, forestry, urban, marinas and recreational boating, hydromodification, and wetlands and riparian areas. The non-point source pollution control programs are intended to be consistent with the Native Hawaiian 'ahupua'a approach to resource management.

Traditional Ahupua'a Watershed Management Structure

Water was an important factor in the organization and administration of communities in pre-territorial Hawai'i. The ahupua'a was the basic community land unit in old Hawai'i. An ahupua'a was a parcel of land generally conforming to the valley of a natural watershed and the associated coastal plain. It typically extended from the highest point at the head of the watershed to the outer edge of the reef offshore. The boundaries were marked by a heap ('ahu) of stones surmounted by an image of a pig (pua'a). The ahupua'a was entrusted by the king to a chief (ali'i), who administered it as a self-sufficient community. The development, distribution, and care of water were administered by a water master (konohiki). The ahupua'a was not only a land unit but was also a social, economic, and political unit, and by incorporating the watershed and nearshore fishing waters, it provided most of the resources needed by the community.

In 1848, King Kamehameha III adopted a new system of individual land ownership and subdivided the land in what became known as the Great Mehele (land division). At first, the land was divided among the crown, the government, the ali'i, and the konohiki. Then the Kuleana Act of 1850 enabled commoners to own land and also allowed the government to sell land to foreigners. Over time, thousands of acres were sold or given to foreigners. In 1893 the monarchy was overthrown and the remaining crown lands were confiscated by the government and made part of the public domain.

Ahupua'a have political, legal, cultural, and hydrologic significance. Current Hawaiian water law recognizes Konohiki rights to particular amounts of water assigned to specific land parcels for taro irrigation (Yamauchi and Hudes 1976). The islands are divided into political districts that comprise groups of ahupua'a.

The names, and in some cases, the boundaries of ahupua‘a are shown on current USGS topographic maps.

N.7.3 Local Regulations

At the local level, water resources are regulated by the counties. On O‘ahu, this is the City and County of Honolulu, while on the island of Hawai‘i it is Hawai‘i County. The State Water Code requires the counties to prepare County Water Use and Development Plans to manage their water resources.

City and County of Honolulu

The O‘ahu Integrated Resource Plan (IRP) is a joint project of the Board of Water Supply (BWS), the Department of Planning and Permitting, and the Department of Environmental Services of the City and County of Honolulu, initiated in July 1999. The project is intended to address the water needs of the eight District Planning (DP) areas on O‘ahu. The Board of Water Supply plans to use the IRP process to update the O‘ahu Water Management Plan, which is the name given to the Water Use and Development Plan specified in the Water Code. One of the major new developments proposed in the IRP is to join the now separate water systems on O‘ahu into one combined water system so that in times of excess or shortage, water can be easily transferred from one area to another.

N.8 BIOLOGICAL RESOURCES

Endangered Species Act

The ESA (16 USC §§ 1531-1534) protects plant and animal species (and their habitats) that are listed under the act as threatened or endangered. Endangered species are those in danger of extinction throughout all or a significant portion of their ranges; threatened species are those likely to become endangered within the foreseeable future. The ESA also protects designated critical habitat for listed species. This consists of areas on which are found those physical or biological features essential to the conservation of the species, which may require special management considerations. The ESA requires federal agencies to consult with the USFWS or National Marine Fisheries Service (NMFS), as applicable, before initiating any action that may affect a listed species or critical habitat.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) (16 USC §§ 703-712) is domestic legislation implementing international agreements made among the United States and England, Mexico, the former Soviet Union, and Japan to protect migratory bird populations. It protects species of birds that live, reproduce, or migrate within or across international borders at some point during their life cycles.

Fish and Wildlife Coordination Act and implementing regulations, 16 U.S.C. § 661 – 666c

Any federal agency that proposes to control or modify any body of water must first consult with the USFWS or NMFS, as appropriate, and with the head of the

appropriate state agency exercising administration over the wildlife resources of the affected state. This act is the primary legal authority behind the Birds of Conservation Concern list as identified in the Birds of Conservation Concern 2002 report, issued on December 2002. This conservation list identifies those migratory and non-migratory birds that are not already Federally listed as threatened or endangered, but that require priority concern and action to avoid future listing.

Fish and Wildlife Conservation Act, 16 U.S.C. § 2901 et seq

The purpose of this Act is to foster comprehensive wildlife management by encouraging all Federal departments and agencies to use their statutory authorities to conserve and promote the conservation of non-game fish and wildlife and their habitats, consistent with each agency's statutory mission and responsibilities.

Marine Mammal Protection Act

The Marine Mammal Protection Act (MMPA) (16 USC §§ 1361-1421h) protects and conserves marine mammal species by placing a moratorium on harassing, hunting, capturing, or killing any marine mammal or attempting any of these. If a project proponent determines that an action could incidentally harass marine mammals, the proponent shall consult with either the USFWS or NMFS to determine if a permit to take a marine mammal is required.

Magnuson-Stevens Fishery Conservation and Management Act

The Magnuson-Stevens Fishery Conservation and Management Act (MSA) (amended by the Sustainable Fisheries Act of 1996, Pub. L. 104-267, as codified in scattered sections of 16 USC § 1801 et seq.) applies to fisheries resources and fishing activities in federal waters that extend to 200 miles [322 kilometers] offshore. It addresses conserving and managing US fisheries, developing domestic fisheries, and phasing out foreign fishing activities. It also establishes regional fisheries management councils that set fishing quotas and restrictions in US waters in the form of Fishery Management plans (FMPs). All fish included in a FMP are assigned Essential Fish Habitat (EFH) —those waters and substrate necessary for fish to spawn, breed, feed, or grow to maturity. Federal agencies must consult with the NMFS on proposed actions authorized, funded, or undertaken by the agency that may adversely affect EFH. The act sets forth the enforcement actions that authorized officers may take, including making arrests, boarding, searching, and inspecting fishing vessels and seizing fishing vessels, fish, and other evidence. For more detailed information on FMPs and EFH, refer to Section 3.8.6.

National Environmental Policy Act

NEPA requires federal agencies to evaluate the environmental impacts of proposed projects, programs, and policies that could significantly affect the quality of the human environment.

Marine Protection, Research, and Sanctuaries Act (33 USC 1401-1445)

This act establishes regulatory guidelines for marine protected areas and restrictions and permit process for ocean dumping.

Federal Clean Water Act (33 USC §§ 1251-1387)

The Army Corps of Engineers has primary federal responsibility for administering regulations that concern waters and wetlands. The Corps acts according to the Rivers and Harbors Act (sections 9 and 10), which regulates placement of structures or other work in addition to fill in “navigable waters,” and the Clean Water Act (Section 404), which governs fill in “Waters of the United States,” including wetlands. A Corps permit is required if a project would place structures within navigable waters, of which there are none in the project area, or if it were to alter waters of the US below the ordinary high water mark in nontidal waters. The Corps does not issue these types of permits in cases where it is the lead agency but instead evaluates the project to determine compliance and acceptability. The primary criteria for evaluating the biological impacts of the Corps permit actions in wetlands is provided by the USEPA, but the mandates of other federal agencies apply as well. Those agencies include, but are not limited to, the USFWS and the NMFS.

Additional enforcement of the Clean Water Act is provided by the State Water Quality Resources Control Board, which must certify that a Corps permit action meets state water quality objectives (Section 401, Clean Water Act).

AR 200-3 Natural Resources-Land, Forest and Wildlife Management

This regulation prescribes current Army policies, procedures, and standards for conserving, managing, and restoring land and the renewable natural resources consistent with and in support of the military mission and national policies.

Executive Order 13089: Coral Reef Protection, and Coral Reef & Coastal Marine Conservation Act of 2001 (HR 22720)

Executive Order 13089 was signed by President Clinton in order to direct all agencies to increase their efforts to protect our nation’s coral reef resources. The executive order calls for the establishment of a US Coral Reef Task Force, co-chaired by the Secretaries of the Interior and of Commerce. The Task Force will develop and implement a comprehensive program of inventory, monitoring, and research, to map and identify the major causes and consequences of degradation of coral reef ecosystems.

Executive Order 13112: Invasive Species (February 3, 1999)

Federal agencies whose actions may affect the status of invasive species shall, to the extent practicable and permitted by law, identify such actions (including but not exclusive to); use relevant programs and authorities to: prevent the introduction of invasive species; detect and respond rapidly to and control populations of such species in a cost-effective and environmentally sound manner; monitor invasive species populations accurately and reliably; provide for

restoration of native species and habitat conditions in ecosystems that have been invaded; and not authorize, fund, or carry out actions that it believes are likely to cause or promote the introduction or spread of invasive species in the United States or elsewhere and that all feasible and prudent measures to minimize risk of harm will be taken in conjunction with the actions. Federal agencies shall pursue the duties set forth in this section in consultation with the Invasive Species Council, consistent with the Invasive Species Management Plan and in cooperation with stakeholders, as appropriate, and, as approved by the Department of State, when Federal agencies are working with international organizations and foreign nations.

Executive Order 13158: Marine Protected Areas (May 26, 2000)

Each Federal agency whose authorities provide for the establishment or management of Marine Protected Areas (MPAs) shall take appropriate actions to enhance or expand protection of existing MPAs and establish or recommend, as appropriate, new MPAs. Each Federal agency whose actions affect the natural or cultural resources that are protected by an MPA shall identify such actions. To the extent permitted by law and to the maximum extent practicable, each Federal agency, in taking such actions, shall avoid harm to the natural and cultural resources that are protected by an MPA. Each Federal agency that is required to take actions under this order shall prepare and make public annually a concise description of actions taken by it in the previous year to implement the order, including a description of written comments by any person or organization stating that the agency has not complied with this order and a response to such comments by the agency.

Executive Order 13186: Responsibilities of Federal Agencies To Protect Migratory Birds (January 10, 2001)

Federal agencies taking actions that have, or are likely to have, a measurable negative effect on migratory bird populations is directed to develop and implement, within 2 years, a Memorandum of Understanding (MOU) with the Fish and Wildlife Service (USFWS) that shall promote the conservation of migratory bird populations. The conservation intent of the migratory bird conventions should be supported by federal agencies by the following; integrating bird conservation principles, measures, and practices into agency activities and by avoiding or minimizing, to the extent practicable, adverse impacts on migratory bird resources when conducting agency actions; and restore and enhance the habitat of migratory birds. Environmental analyses of Federal actions required by the NEPA or other established environmental review processes will evaluate the effects of actions and agency plans on migratory birds, with emphasis on species of concern.

EO 11990, Protection of Wetlands

Executive Order 11990 directs all federal agencies to avoid, if possible, adverse effects on wetlands and to preserve and enhance the natural and beneficial values of wetlands. Each agency shall avoid undertaking or assisting in wetland

construction projects unless the head of the agency determines that there is no practicable alternative to such construction and that the Proposed Action includes measures to minimize harm.

EO 13158: Marine Protected Areas (May 26, 2000)

This order helps protect the natural and cultural resources within the marine environment by strengthening the management and protection of existing marine protected areas (MPAs), establishing new MPAs, and directing the federal government to establish a national system of marine protected areas (MPAs). Under this national system, federal agencies are encouraged to develop, coordinate, and use scientific strategies to assess identify, and monitor MPAs; identify threats to MPAs, and formulate methods to protect them. In this EO, NOAA was given primary responsibility (with DOI) for implementation; NOS is the lead NOAA office.

N.9 CULTURAL RESOURCES

National Historic Preservation Act of 1966 as Amended (NHPA) (16 USC §§ 470-470x-6)

Cultural resources on federal lands are protected primarily through the National Historic Preservation Act (NHPA) of 1966 and its implementing regulations (found at 36 CFR 800). Section 106 of the NHPA requires federal agencies to identify and evaluate the effects of their actions on properties listed in or eligible for listing in the National Register of Historic Places (NRHP). Consultation with the State Historic Preservation Officer (SHPO), Native American tribes, native Hawaiian organizations, the Advisory Council for Historic Preservation, and other interested parties is part of the regulatory process. To be protected under the NHPA, a property must meet specific criteria of significance established under the NHPA's regulations at 36 CFR 60.

Archaeological Resources Protection Act of 1979 (16 USC §§ 470aa – 470mm)

This act requires all archaeological excavations on federal land to be undertaken pursuant to permit issued by the federal land manager. This act also imposes criminal penalties for unauthorized excavations.

Archaeological and Historic Data Preservation Act of 1974 (16 U.S.C. 469-469c)

This act applies to federal dam construction and other federal construction projects. It requires federal agencies to provide notice to the Secretary of the Interior if any project would result in the irreparable loss of significant archaeological data, and to recover, protect, and preserve such data as possible. This act also provides that up to 1 percent of project funds may be used for survey, recovery, analysis, and publication of such archaeological data.

Native American Graves Protection and Repatriation Act of 1990, Pub. L. 101-601 (25 USC §§ 3001-3013)

This act requires federal agencies to identify and inventory possible Native American, native Alaskan, or native Hawaiian human remains, burial goods, or cultural items in their collections and to make them available for repatriation to affiliated tribes or lineal descendants. The act also establishes procedures for handling and disposing of such remains, burial goods, or cultural items discovered on federal lands.

American Indian Religious Freedom Act of 1978, Pub. L. 95-341, as amended (42 USC §§ 1996-1996a)

This act extends First Amendment guarantees regarding free exercise of religion to Native Americans, native Alaskans, and native Hawaiians.

Curation of Federally Owned and Administered Archaeological Collections (36 CFR § 79)

This regulation provides guidance for the appropriate care and management of materials relating to or excavated from archaeological sites on federal lands.

Executive Order 13007, Indian Sacred Sites (May 24, 1996)

EO 13007 requires federal land managers to accommodate access to and ceremonial use of Indian sacred sites by Indian religious practitioners, and avoid adversely affecting the physical integrity of such sacred sites. While EO 13007 does not include Native Hawaiian sacred sites in its protections, AR 200-4 extends to Native Hawaiian sacred sites the same level of protection as that granted to Indian sacred sites under the order.

N.10 HAZARDS AND HAZARDOUS MATERIALS AND WASTE

Comprehensive Environmental Response, Compensation, and Liability Act, 42 USC 9601-9675

Requires reporting of releases and cleanup of releases of hazardous substances; also assigns liability for cleanup.

Resource Conservation and Recovery Act of 1976, 42 USC 6901-6992k

Regulates collection, storage, transport, and disposal of hazardous and solid waste and regulates underground storage tanks.

Federal Facility Compliance Act, 42 USC 6901

This act provides a waiver of sovereign immunity with respect to all procedural requirements relating to Resource Conservation and Recovery Act (RCRA) solid and hazardous waste laws and regulations at federal facilities. FFCA gives any state that has an authorized hazardous waste program the authority to inspect any facility that manages hazardous waste, including federal facilities, for the purpose of enforcing the facilities' compliance with the state's program.

US DOT regulations 49 CFR 100-109 address the interstate shipment of hazardous substances. These regulations specify the proper shipping name, hazard class, and identification number to be used for each material shipped. This information is necessary to ensure proper handling by shipping personnel and identification by emergency personnel if an accident involving hazardous materials should occur. In addition, DOT regulations set guidelines specifying containers suitable for the quantity and chemical characteristics of the hazardous materials that are used. Hawai'i incorporates the DOT regulations under its Revised Statute Section 286 Part XI (Motor Carrier Safety Law) and Section 286 Part XII (Transportation of Hazardous Materials, Hazardous Waste, and Etiologic Agents). Public sea shipments in the region of Hawai'i must be in accordance with Hawai'i Revised Statute Harbor & Tariffs Title 19, Subtitle 3, para. 42-133, Loading and Unloading Hazardous Materials.

The Hazardous Materials Transportation Act of 1975 (PL 93-633, 49 USC 1801, et seq.) gives the DOT authority to regulate shipments of hazardous substances by air, sea, highway, or rail. These regulations, found at 49 CFR 171-180, may govern any safety aspect of transporting hazardous materials, including packing, repacking, handling, labeling, marking, placarding, and routing (other than with respect to pipelines).

Army Standard Operating Procedures (SOPs)

The US Army follows strict standard operating procedures for storing and using hazardous materials. All hazardous materials for Oah'u Army installations are stored at the Hazardous Materials Control Center (HMCC) on Schofield Barracks East Range. When an Army unit requests use of a hazardous material, the material is picked up from the HMCC and is transferred to a satellite storage area for immediate use. The HMCC is regulated by an USEPA-approved spill contingency plan (SCP), which contains information about the emergency response procedures in the event of a spill. This is to minimize hazards to human health or the environment from fires, explosions, or any release of hazardous material or its constituents to air, soil, or surface water. The SCP describes actions that site personnel must take to comply with RCRA's emergency procedures, 40 CFR 265, Subparts C and D, Contingency Plan and Emergency Procedures, and 29 CFR 1910.120, Hazardous Waste Site Operations and Emergency Response. A copy of the facility SCP is submitted to all local or federal police departments, fire departments, hospitals, and state and local emergency response teams that may be called on to provide emergency services. All Army facilities that store or use hazardous substances contain a copy of the SCP, and spill kits available for clean up.

Spill Prevention, Control, And Countermeasure (SPCC) Plans And Pollution Prevention (P2) Plans

AR 385-14, Transportation Accident Prevention and Emergency Response Involving Conventional Munitions and Explosives applies to the transportation of DOD conventional munitions and explosives (US Army 1991a, 1). The

regulation establishes policies, prescribes procedures, and assigns responsibilities for transportation accident prevention and for emergency response measures, when a transportation accident involving DOD conventional munitions and explosives occurs. The regulation applies to all commercial modes of transportation (rail, motor vehicle, air, and water) and all military motor vehicles, both administrative and tactical, transporting munitions and explosives on public highways, including shipments by military carrier. All military vehicles and facilities maintain copies of SPCC plans and spill kits available for clean up.

Army Pamphlet 385-64, Ammunition and Explosives Safety Standards-explains the Army's safety criteria and standards for operations involving ammunition and explosives prescribed by AR 385-64, US Army Explosives Safety Program (US Army 1999, i-1). The pamphlet addresses a variety of safety criteria, including, but not limited to, fire prevention, protection, and suppression, explosives quantity-distance, transportation of ammunition and explosives, and electrical hazards, including electromagnetic radiation. These procedures are designed to provide for the safe and proper storage and handling of ammunition and explosives.

The distance between the potential explosion site and the exposed site, the ability of the potential explosion site to suppress blast overpressure, fragments, and debris, and the ability of the exposed site to withstand explosion effects normally determine the damage or injury potential of an explosion (US Army 1999, 33). For the safe storage and transportation of ammunition and explosives, explosive safety quantity-distance requirements are established. These requirements are based on records of actual fires and explosions involving ammunition and explosives. In addition to protecting Army personnel, the requirements also protect nearby communities and private and public property.

AR 385-63, Policies and Procedures for Firing Ammunition for Training, Target Practice, and Combat (and the draft update of this regulation Army Regulation 385-63, Range Safety Program)-prescribe general safety precautions to minimize the possibility of accidents in the firing and other uses of ammunition and explosives by troops in training, target practice, and, as much as possible, combat and range operations, including range clearance (US Army 1983a, i-1; Sato. 1996, 5-8). The regulation addresses a multitude of weapons and safety requirements, such as surface danger zones. For the safe use of ammunition and explosives, surface danger zones are established for training areas. Projectiles or debris caused by firing ammunition or explosives must be contained within the surface danger zone's boundaries (US Army 1983a, 2 and 113-114).

Hazardous Waste Management Program

Wastes are separated into hazardous waste, such as lithium batteries or RCRA chemicals, and non-regulated waste, such as recyclable oil. The hazardous waste is brought to the Hazardous Waste Shop Storage Point (HWSSP), while the recyclable materials are brought to the Recyclable Material Shop Storage Point

(RMSSP) (Akasaki 2002b). The US Army follows strict regulations and standard operating procedures for the temporary storage and disposal of hazardous wastes. For example, the Military Munitions Rule (62 FR 6621, 40 CFR 260, et seq.) identifies when military munitions become a hazardous waste under RCRA and provides safe storage and transport of such waste.

All hazardous wastes generated on Army land are first collected at HWSSPs, which are designated areas at or near the point of waste generation. A generator may accumulate as much as 55 gallons of hazardous waste or one quart of acutely hazardous waste listed in 40 CFR 261.33(e) at a HWSSP for up to one year or 55 gallons, whichever ever comes first. Once hazardous waste is accumulated at a HWSSP point, it is relocated to a Transfer Accumulation Point (TAP) after a TAP manager has inspected it. The TAP is a 90-day, regulated storage area for hazardous wastes.

Before 90 days, hazardous waste stored at the TAP site is managed and transported off-site in accordance with 40 CFR 265 Subparts C and D. The TAP manager will coordinate relocating hazardous waste through the DRMO-HI's on-site pickup service. The DRMO-HI contractor is authorized and certified to transport hazardous waste from the TAP with an USEPA transporter identification number. At Schofield Barracks, the HMCC and the TAP facility is a co-located operation that is operated jointly by the Director of Logistics (who manages the useable HM) and the DPW (who manages hazardous waste).

Typical hazardous wastes that are accumulated on base are as follows:

- Silver bearing photo-developing wastes;
- Used oil, oil filters, and oily rags;
- Used antifreeze, coolants, and solvents;
- Used batteries and fluorescent light bulbs; and
- Miscellaneous corrosive liquids.

A detailed 2002 Hazardous Waste Report is provided in Appendix K-1. The report includes wastes generated for all army installations within the project action. The report identifies specific hazardous wastes that have been managed by the DPW and then disposed of by the DRMO as required under 40 CFR 265.

Hawai'i Hazardous Waste Management Act (HRS Title 19, Health, Chapter 342J)

Under this act, the state hazardous waste management program provides technical assistance to generators of hazardous waste to ensure safe and proper handling. The hazardous waste management program promotes hazardous waste minimization, reduction, recycling, exchange, and treatment as the preferred methods of managing hazardous waste, with disposal used only as a last resort

when all other hazardous waste management methods are ineffective or unavailable. The state program is coordinated with Hawai'i's counties, taking into consideration the unique differences and needs of each county

Federal Insecticide, Fungicide, and Rodenticide Act, 7 USC 121 et seq.

The Act requires that all pesticides used in the US be submitted to the USEPA for registration. They must meet USEPA criteria regarding quantity, quality, impact on the environment, and labeling. Federal agencies must implement integrated pest management activities in a manner that provides for the safety of the public, the persons applying the pesticides, and the environment, and must provide for the training and certification of personnel in proper and safe methods of applying, storing, and disposing of pesticides.

Federal Facilities Compliance Act, 42 USC 6961 et seq.

The Act provides that all Federal departments and agencies engaged in activities that result in the management or disposal of solid or hazardous waste are subject to and must comply with all Federal, State, interstate, and local requirements pertaining to the control and abatement of such waste in the same manner and to the same extent as a private person.

Disposal Of Ordnance Under RCRA

The disposal of ordnance, such as ammunition, is regulated under RCRA. Section 107 of the Federal Facilities Compliance Act of 1992 requires USEPA, in consultation with the DOD and the states, to issue a rule identifying when conventional and chemical military munitions become hazardous waste under RCRA, and to provide for protective storage and transportation of that waste. Basically, this rule explains what is considered a solid waste and the rules for handling that waste (i.e. permitting, labeling, storing, transporting, and disposal). The final rule also amends existing regulations regarding emergency responses involving both military and non-military munitions and explosives (USEPA, 2002d).

This rule establishes the regulatory definition of solid waste as it applies to three specific categories of military munitions:

- Unused munitions;
- Munitions being used for their intended purpose; and
- Used or fired munitions (which can then be termed either “exploded,” EXO, or “unexploded,” UXO, ordnance).

The rule conditionally exempts:

- From RCRA Manifest Requirements and Container Marking Requirements, waste non-chemical military munitions that are shipped from one military-owned or -operated Treatment, Storage,

or Disposal Facility (TSDF) to another in accordance with DOD military munitions shipping controls;

- From RCRA Subtitle C storage regulations, waste non-chemical military munitions subject to the jurisdiction of the DOD Explosives Safety Board storage standards.

Department of the Army Underground Storage Tank Program

The Department of the Army UST Program not only requires compliance with Federal regulations, but with the more stringent of Army, Federal, State, or local requirements. Current Army standards are cited in “Environmental Protection and Enhancement,” Army Regulation 200-1, Chapter 5-7, dated April 23, 1990. Army policy provides for the removal, repair, or replacement of damaged, leaking, or improperly functioning USTs, ASTs, or associated pollution prevention devices. USTs and ASTs must include monitoring devices for leak detection and be fitted with cathodic protection, catch basins, and overfill warning devices.

Asbestos Management Program

This program covers hazardous effects from asbestos and includes an annually updated asbestos management plan. The plan contains the USAG-HI Commander’s Asbestos Policy, which delegates responsibilities for asbestos management and five standard operating procedures for handling ACM. The objective of the plan is to provide information necessary to manage friable and nonfriable ACM in on-post USAG-HI facilities. A further objective is to identify those procedures that will minimize the release of ACM into the air (USARHAW 2001c). The Army environmental department also maintains a database of asbestos surveys and results. The database is updated as surveys are finalized (Song 2002). The most recent version of the asbestos survey database for Schofield Barracks, Wheeler Army Airfield, Kahuku TA, Mākua MR, Pōhakuloa TA, and Dillingham MR is available through the Army DPW.

Radon Reduction Program

The Army follows a Radon Reduction Program under AR 200-1 to reduce radon exposure of military personnel and civilians. The Army Radon Reduction Program policy ensures that all Army installations and civil works facilities will:

- Comply with legal regulations concerning elevated indoor radon levels applicable to Army operations.
- Maintain and update records of radon assessments conducted under the Army Radon Reduction Program (as identified in DA PAM 200-1).
- Ensure occupants of Priority One facilities which contain elevated radon levels are notified in writing of specific test results, planned or executed mitigation, and results of mitigation efforts. Facility managers will distribute assessment results for Priority Two and Three facilities with elevated radon levels.

- Attach radon test results to real property records. Attach complete record when property is transferred.
- Measure radon in newly constructed Army facilities.
- Measure radon in facilities converted to housing and in continuously occupied structures prior to occupancy.
- Identify elevated radon levels to the Installation Medical Officer or the Civil Works District Safety and Occupational Health Officer.
- Follow US Army Center for Public Works guidance on mitigation of elevated radon levels.
- Use USACE design criteria for radon reduction in new construction.
- Designate their facilities as priority 1,2, or 3 in accordance with definitions and parameters in DA PAM 200-1.

Biomedical Program

The Army follows strict guidelines according to AR 200-1 in the handling, use, and disposal of medical, dental, and veterinary supplies. The policy includes:

- Medical, dental, and veterinary supplies or their containers will be disposed of IAW applicable provisions and implementing regulations of the Medical Waste Tracking Act of 1988, state, interstate, and local requirements, and suggested guidelines provided in the Military Item Disposal Instruction (MIDI) System. See DA PAM 200-1 for additional information.
- Medical, dental, and veterinary supplies that are in excess of medical facility requirements will be reported through medical supply channels according to AR 40-61.
- USACHPPM will issue a method of destruction for medical, dental, and veterinary supplies. If the generator does not possess the technical capability or facilities to dispose of the items, the generator will contact the DRMO for disposal.
- Some medical, dental, and veterinary supplies are RCRA listed or characteristic waste. These items must be managed and disposed of as a hazardous waste.
- DRMO disposes of all items in Federal supply classes 6505, 6556, 6600 and 6800. This will include routine destruction/disposal of hazardous material and nonhazardous controlled material. DRMO does not accept regulated medical or radioactive waste.
- Health care facility wastes will be handled, stored, treated, and disposed of, per AR 40-5, AR 40-61 and other applicable regulations.

APPENDIX O

INTEGRATED WILDLAND FIRE MANAGEMENT PLAN OVERVIEW

Executive Summary

Wildfire poses a significant threat to the sensitive ecosystems, cultural sites, and training lands of the U.S. Army, Hawaii (USARHAW). The mission of the 25th Infantry Division (Light) is to fight and win military conflicts. This requires the use of munitions and weapons systems that often increase the chance of wildfire ignition and may damage important resources. This Integrated Wildland Fire Management Plan (IWFMP) presents a comprehensive approach to reduce the frequency of wildfires and the associated costs and damages. USARHAW will implement this plan to comply with all applicable laws and regulations, to fulfill the requirements established by the Army Wildland Fire Policy Guidance dated September 2002, and to reduce the impacts of training related fires.

The IWFMP lays out specific guidance, procedures, and protocols in the prevention and suppression of wildfires on all USARHAW training lands with wildland fuels. Its goal is to convey the methods and protocols necessary to minimize fire frequency, severity, and size. At the same time it will allow military units to maintain a high level of combat readiness. It defines responsibilities of all offices, departments, and agencies involved, and describes fire pre-suppression and suppression actions to be taken on strategic as well as tactical bases. The document is organized around general wildfire management information; installation specific information, requirements, and upgrades; and Standing Operating Procedures (SOPs) for wildfire management actions at each installation.

The Installation Fire and Safety Office (IFSO) is the proponent for this plan. In addition to the IFSO, individual wildland fire managers are the Director of Installation Fire and Safety, as the Command Fire Marshal; the Installation Fire and Safety Office, Wildland Fire Program Manager; the Installation Fire and Emergency Services, Fire Chief; the Pohakuloa Training Area, Deputy Fire Chief; the Installation Fire and Safety Office, PTA Wildland Fire Coordinator; the Federal Fire Department, Fire Chief.

USARHAW will implement improvements to its land and firefighting resources that will enhance the response and capabilities of firefighters. Chief among these is establishment of a ten-person strike team that will serve as the primary initial attack force and will be under the direct control of the IFSO Wildland Fire Program Manager. Range Division, Hawaii will continue as first responders and provide initial attack on small, incipient fires until the IFSO Strike Team is fully functional.

Additionally, the IFSO will explore the possibility of purchasing at least one helicopter and employing the necessary crew to man it. This helicopter will be required to respond to any fire on USARHAW lands on Oahu or, if need be, to provide extended attack support for fires at PTA.

A number of firebreaks, fuelbreaks, and other wildland fire management improvements that will aid firefighters in containing and suppressing fires will be constructed. Some of these will also serve to help keep non-military ignited fires off of Army lands. The IFSO will employ a Pohakuloa Training Area (PTA) Wildland Fire Coordinator to manage the numerous fire related projects and regular maintenance requirements there.

Range Division, Hawaii and specifically Range Control, will implement and strictly enforce a Fire Danger Rating System (FDRS) for each of the installations under its jurisdiction. This system will restrict weapons fire and training depending on weather and vegetation conditions. Range Control will be responsible for retrieving the necessary weather data collected by

weather stations on the various installations, and communicating to training units any restrictions imposed as a result of adverse weather and/or fuel conditions. Range Control will ensure that restrictions are adhered to and that appropriate administrative disciplinary action is taken for non-compliance on the part of individual units and/or Officers in Command.

USARHAW will continue to expand its network of Remote Automated Weather Stations (RAWS) such that at least one weather station is functioning at each installation. Weather data from these stations will continue to be archived to provide a database from which future weather analyses may be possible.

This plan will be reviewed and updated bi-annually to ensure the latest information is consistently incorporated into Army wildfire prevention and suppression procedures. An ad hoc review committee will be convened by the Wildland Fire Program Manager and will consider fire activity, and prevention and response effectiveness. They will conduct an audit of fire expenses and recommend what, if any, changes are necessary to improve the wildfire management program. In addition, this plan is a living document and may be changed as necessary to account for the constantly evolving requirements placed on the Wildland Fire Management Program.

1.1. OVERVIEW.

1.1.1. Existing Conditions. The juxtaposition of military training on locations of high ecologic and historic value in Hawaii presents a situation in which the utmost care must be taken to ensure the continued viability of these unique natural and cultural resources. Wildfire is a threat to these as well as to the ability of military trainers to complete their mission. The realities of military training, the prevalence of flammable wildfire fuel types on U.S. Army Hawaii (USARHAW) installations, the extreme topography, and the year round fire season together represent a nearly unique fire management scenario.

1.1.2. Purpose. In the past, military activities on Army lands have resulted in the loss of native vegetation and threatened the habitat of federally protected species of plants and animals. This Integrated Wildland Fire Management Plan (IWFMP) has been developed to help meet the land stewardship responsibilities of USARHAW and comply with applicable federal and state environmental statutes, while at the same time allowing the 25th ID(L) and other military units to accomplish their mission of maintaining a high level of combat readiness. It lays out specific guidance, procedures, and protocols in the prevention and suppression of wildfires on Army training lands in Hawaii.

1.1.3. Scope. This IWFMP covers all lands administered or leased by USARHAW in the State of Hawaii (Figure 1). USARHAW land is found on the islands of Oahu and Hawaii (the Big Island). Training areas on Oahu are Dillingham Military Reservation (DMR), Kawaihoa Training Area (KLOA), Kahuku Training Area (KTA), Makua Military Reservation (MMR), Schofield Barracks East Range (SBER), and Schofield Barracks Military Reservation (SBMR). Pohakuloa Training Area (PTA) is on the island of Hawaii. This plan also covers lands that may be acquired as part of the Stryker Brigade Combat Training (SBCT) Transformation. These additional lands include the South Range Acquisition Area (SRAA) on Oahu, the Keamuku Parcel on the Big Island, which will be treated as part of PTA, and three military vehicle trails, two on Oahu and one on the Big Island.

1.2. GOALS AND OBJECTIVES.

1.2.1. Goal. Lay out the methods and protocols necessary to control fire frequency, intensity, and size on USARHAW lands in order to comply with federal and state laws and meet USARHAW's land stewardship responsibilities. At the same time, provide for firefighter and public safety and allow continuation of military training necessary for the 25th Infantry Division (Light) (25th ID(L)) and other military units to maintain a high level of combat readiness.

1.2.2. General Objectives.

(a) Provide, first and foremost, for firefighter and public safety. All other objectives are secondary.

(b) Protect all natural and cultural resources, to the extent feasible, through a program of prevention, pre-suppression, and suppression. Support the goals and objectives of existing USARHAW land management plans.

Center for Environmental Management of Military Lands 2003

Legend

Installation Boundary

Roads
Primary

- (c) Base all fire management activities on the best available science.
- (d) Incorporate public health and environmental quality considerations into fire management planning and execution.
- (e) Coordinate and cooperate where possible and beneficial with other federal, state, and local agencies.
- (f) examine and identify resource requirement and availability at each organizational level, to provide needed suppression and support. Establish suppression measures and determine the confine, contain, and control strategies.
- (g) Base fire management activities on the evaluation of economic factors that consider resource and social values.
- (h) Continually evaluate and improve upon fire management policies and procedures with the goal of constantly improving the level of fire protection on USARHAW lands.

1.2.3. Specific Objectives

- (a) Maintain or improve the quality of training lands represented within the installations of USARHAW.
- (b) Allow military training to occur at the tempo required to maintain a high level of combat readiness.
- (c) Prioritize installations and locations within installations for funding and implementation of fire management improvements.
- (d) Establish a series of firebreaks and/or fuelbreaks at high fire risk installations to reduce the probability of a fire moving into high value areas or off installation. Establish monitoring protocols and minimum specifications for these breaks.
- (e) Control the timing of ignitions such that fires that occur do so when conditions are such that there is a high probability of controlling the fire and protecting all valued resources.
- (f) Establish guidelines and implement a prescribed burn program that includes the use of wildland fires for resource benefit in predetermined areas and under predetermined conditions.
- (g) Communicate within the fire management hierarchy to improve practices and policies. Communicate and educate other departments to facilitate a reduction in fire starts.
- (h) Update interagency agreements as necessary to ensure prompt and complete cooperation during wildfire incidents both on USARHAW lands and those of other agreeing agencies.
- (i) Establish fire management qualifications for all firefighters and fire managers and insure all personnel assigned to those positions are trained to a level appropriate for their expected duties.

(j) Fires will be suppressed at minimum cost while still considering firefighter and public safety and resources to be protected.

1.2.4. Policy. All policies in this document are in accordance with the 2001 Federal Wildland Fire Management Policy, to which the Department of Defense is a signature, the Army Wildland Fire Policy Guidance dated September 2003, and the USARHAW Commanding General's Policy Memorandum regarding the Wildfire Management Program. Accomplishment of the goals and objectives of this IWFMP depends on ensuring that policies are actively implemented and enforced. This will be the responsibility of fire managers at all levels. Fuel modification, soldier education, ignition control, and a quick wildfire response by appropriate resources will help to prevent the loss of sensitive habitat and the degradation of training lands.

1.3. WILDLAND FIRE ORGANIZATION AND REVIEW.

1.3.1. Fire Management Areas. The IWFMP is an overarching document based on a strategy linking all six (6) Oahu training areas, Pohakuloa Training Area (PTA) on the Island of Hawaii, and future purchases on both islands. Each installation has its own Wildfire Standing Operating Procedures (SOP) which have been developed specifically for resources, risks, and training that occur there and are published in Appendix 1. Each of these installations is referred to as a Fire management Area (FMA). Each FMA SOP provides specific guidance that delineate the responsibilities of the fire managers, Range Control staff, using training units, fire department personnel, and other agency cooperators in the prevention and suppression of fires.

1.3.2. Wildland Fire Managers. Wildland fire managers within USARHAW are:

- a. Director of Installation Fire and Safety, as the Command Fire Marshal.
- b. Installation Fire and Safety Office, Wildland Fire Program Manager.
- c. Installation Fire and Emergency Services, Fire Chief.
- d. Pohakuloa Training Area, Deputy Fire Chief.
- e. Installation Fire and Safety Office, PTA Wildland Fire Coordinator.
- f. Federal Fire Department, Fire Chief.

1.3.3. IWFMP Review Process. This IWFMP is a living document that allows flexibility to incorporate new data as it develops. This IWFMP will be reviewed biannually from the date of signature to ensure compliance with the standards, policies, and management goals outlined in this plan. The Installation Fire and Safety Office (IFSO) Wildland Fire Program Manager will convene an ad hoc evaluation team to review fire activity during the two years. The review team will analyze fire reports, evaluate the program, and develop a report to determine what, if any, policy or operational changes should be initiated. This review will include an audit of expenditures and an analysis of how well the allocated funding resources meet program management needs. It will also include a Fire Protection Operational Readiness Inspections and Environmental Compliance Assessment Screenings. Until superseded, the IWFMP will remain in effect. If changes are made to this IWFMP, the U.S. Fish & Wildlife Service (USFWS) shall review the amended IWFMP for compliance with the Endangered Species Act of 1973, as amended (ESA).

1.4. ENVIRONMENTAL STEWARDSHIP.

1.4.1. Environmental Issues. USARHAW lands contain many federal and state listed threatened and endangered species of plants and animals. These lands also contain areas that are culturally significant. The federal and State of Hawaii environmental laws and regulations with which USARHAW must comply protect both natural and cultural resources. This document provides USARHAW with a proactive approach to protecting its land resources.

1.4.2. Fire Threats to the Environment. The Hawaiian ecosystem is not resistant to, nor dependent on, fire. In addition to the statewide expansion of towns and suburban communities, military training can pose a threat to the natural habitats found on Army land. Military forces stationed in Hawaii are of the “light” force structure, meaning that the forces are made up of “light”, or dismounted infantry or tactical units. Since light forces only move by foot, light wheeled vehicle, or helicopter, impact to the environment by movement is minimal. Wildfire is the single largest impact made of military activities on the Hawaiian ecosystem. The use of Army lands must include fire avoidance efforts. By following the guidelines in this IWFMP, the Wildland Fire SOPs, and the Range and Training Area SOPs, USARHAW can reduce wildfires and preserve its training assets.

APPENDIX P-1

PUBLIC COMMENTS AND RESPONSES

P.1 INTRODUCTION

The DEIS for Army Transformation in Hawai'i was circulated for public review and comment from October 3, 2003 to January 3, 2004. As summarized in Appendix B, public meetings were held during the review period to provide the public with the opportunity to ask questions about the project and comment on the DEIS. (Transcripts of the public meetings are found in Appendix P-2.) In addition, written comments were accepted throughout the review period.

In accordance with NEPA regulations, the FEIS provides responses to comments on the DEIS. In compliance with those regulations, this Appendix includes a list of agencies, organizations, and individuals commenting on the DEIS, copies of their comments, and responses to the substantive environmental issues raised in the comments. The following pages show all the comments received which relate to the project and the Army's responses to those comments. The Army reviewed and considered all comments and determined whether or not the comments warranted further analysis and documentation. While the Army greatly appreciates the participation of all those who commented, not all comments required further analysis or changes to the Final EIS. The Army noted in the individual responses when further analysis or changes were made.

April 2004

Stryker Brigade Combat Final EIS, Hawai'i

P-9

Comments

- F1-1** 1) Page ES-6, Training/Aircraft Flights and UAVs. The SBMR and Wheeler Army Airfield, DMR and KTA/KLOA columns state "UAV operations in restricted airspace". None of these areas are located within restricted airspace.
- F1-2** 2) Page 4-17. Table 4-3 shows no impact to Special Use Airspace which is true if the restricted area is not expanded to include Qualification Training Range 2 (see page 2-27).
- F1-3** 3) Page 5-50. *New or Modified Special Use Airspace*. This paragraph states "The proposed flights would normally be conducted within the R3109 and R3110 restricted area complex....thus, the UAV flights would use existing special use airspace." Current plans are for the UAVs to launch and recover from the airfield or the gulch adjacent to the airfield. Both are outside restricted airspace which will result in a portion of every flight to be conducted outside restricted airspace. An FAA Certificate of Authorization (COA) must be issued for the portion of the flight to and from the restricted area.
- F1-4** 4) Page 5-50 and 5-51. *Obstructions to Air Navigation*. This paragraph states that proposed FTI antennas "would also be at sufficient distance from the WAAF runway to be well below the military airport imaginary surface thresholds". This statement is not true. Calculations were done on the East Range 2 antenna and it penetrates the Approach-Departure Clearance surface by 37 ft. Calculations were not performed on the remaining antennas.
- F1-5** 1) Page ES-6. Installation will need to submit an FAA Form 7460-1 for apron upgrade. Antennas (Fixed tactical internet) may also require FAA Form 7460-1.
- F1-6** 2) Page ES-8. Ranges created outside of restricted airspace will require a SARSA or CFA
- F1-7** 3) Page 2-26. South Range Acquisition Area (SRAA) will require SARSA, CFA or restricted area if live fire will be conducted.
- F1-8** 4) Page 2-27. Range S10 will require SARSA, CFA or restricted airspace

Responses

F1-1

The reconnaissance training subsection of Section 2.3.4 has been modified to include that statement that most of the UAV launch and recovery sites would be within the existing restricted airspace on O'ahu and Hawai'i Islands. However, launching from WAAF or BAAF may be desired for routine training and maintenance. Before such training and maintenance flights, coordination and approval would be sought from the Federal Aviation Administration (FAA). In addition, UAVs would not be launched, nor recovered, at DMR, KTA, KOLA or West PTA, although they would be flown over KTA and West PTA using visual ground monitoring by qualified observers.

F1-2

There is no proposal to expand or extend the R-3109/3110 restricted area complex. A Controlled Firing Area (CFR) would be installed over QTR2.

F1-3

The reconnaissance training subsection of Section 2.3.4 has been modified to include that statement that most of the UAV launch and recovery sites would be within the existing restricted airspace on O'ahu and Hawai'i Islands. However, launching from WAAF or BAAF may be desired for routine training and maintenance. Both the FAA Honolulu Control Facility and the Hawai'i Department of Transportation, Airports Division have been consulted, and their review comments on the DEIS have been incorporated. The FAA has well-defined procedures for remotely operated aircraft such as UAVs. As stated in Section 5.4.2 in the Aviation Safety subsection, a certificate of authorization would be required at least 60 days prior to the proposed commencement of UAV operations. NEPA does not require EISs to analyze remote and speculative impacts when assessing the risk that an action "might have" an environmental effect, especially when that effect would be caused by an accident. As stated in Section 3.4.2, the Army has an excellent aviation safety record. The precise flight paths of the UAVs have not been determined at this time. They will be identified when the Army submits its plans to the FAA when it applies for the FAA Certificate of Authorization for UAV flights.

F1-4

The text has been changed to reflect the fact that no antennas would penetrate the imaginary surface thresholds.

To: sbct_eis@poh01.usace.army.mil
Subject: STRYKER Draft EIS

Ms. Barger,

Please see the following for Honolulu Control Facility (Air Traffic - FAA) comments regarding the STRYKER Draft EIS. Although the comment period officially ended 1/3/04, I hope that you will accept our comments and find them useful/constructive.

If you have any questions, please contact me at 808-840-6121.

Thank you.

Diane Tom
Support Manager, Honolulu Control Facility

Responses**F1-5**

The Army will comply with all FAA review requirements.

F1-6

A CFA would be established over the QTR2. This is discussed in the EIS.

F1-7

A CFR above SRAA is not being proposed because its already covered by restricted area special use airspace.

F1-8

A CFA would be established over the S10 (QTR2). This is discussed in the EIS.

Comments

Comments have to do with minor inaccuracies to what's written as follows:

F2-1

Volume 1, page 3-15: Talks about general aviation traffic at Ford Island. A statement should be added to say that Ford Island is closed to civil aircraft.

F2-2

Volume 1, page 3-16: Mentions that the US Coast Guard is based at Honolulu International Airport. The US Coast Guard flying operation is really based at Kalaeloa Airport.

F2-3

Volume 1, page 3-17, page 5-49, page 6-30: Air Traffic Control is managed by the Honolulu Control Facility, not Honolulu Air Traffic Control Center.

F2-4

Volume 1, page 3-17 Also on this page, it talks about the Army's aviation safety record over the last 10 years. In Feb 96, an AH1 crashed at Leader Field on Schofield Barracks, killing 2 soldiers. The aircraft was returning to Wheeler AAF on a maintenance test flight.

F2-5

Volume 1, page 5-50: "Restriction of Access to Airports/Airfields" says that the increase in C130 operations at WAAF would not affect the access/use of airports available for public use or affect commercial or private airport arrival and departure flows. This statement is not entirely accurate. IFR traffic into/out of WAAF is limited to one aircraft at a time. Should two C130s require an IFR arrival into WAAF, the second aircraft would have to hold while the first aircraft is on approach. This may affect sequencing into HNL or JRF. Additionally, the Pearl Harbor TFR requires additional coordination should the C130s require the use of the VOR-B approach.

F2-6

Volume 1, page 5-51: "Aviation Safety" talks about increased C130 operations at WAAF and concludes, given the Army's excellent aviation record in Hawaii, that future adverse impacts on public health and safety (is) extremely unlikely. The Army's aviation record over the last 10 years is based primarily on helicopter and small fixed-wing aircraft. C130s are large, 4-engine turbo-props which are less maneuverable and fly faster.

Regarding UAV flights, it will be true that "operations would be conducted in accordance with well-defined FAA procedures for remotely operated aircraft." Presently, we don't know what the procedures are since we haven't agreed to anything yet. What should be a concern are the gliders that operate in or near R3110 with which we don't have any communications.

Comments may be forwarded to Ms Cindy Barger at sbct_eis@poh01.usace.army.mil.

Moses

Responses

F2-1

A note has been added to Table 3-2 that states that Ford Island NAF is closed to civil operations.

F2-2

The text has been changed to reflect this.

F2-3

The text has been changed to reflect this.

F2-4

The text has been modified as follows ... "the second [incident] was the crash of an AH-1Cobra, an attack helicopter, at Leader Field on Schofield Barracks, while returning to WAAF on a maintenance test flight."

F2-5

The text has been modified to add the following ... "IFR traffic into and out of WAAF is limited to one aircraft at a time. Should two C-130s require an IFR arrival into WAAF, the second aircraft would have to hold while the first aircraft is on approach. While this may affect sequencing into Honolulu International or Kalaeloa airports, it would not ultimately restrict access to them." The height of the Pearl Harbor TFR was recently lowered.

F2-6

The text states that the strict procedures in place governing flight operations in both controlled/uncontrolled airspace and special use airspace makes future adverse impacts on public health and safety extremely unlikely. For UAV flights, the need for an FAA Certificate of Authorization (COA) is acknowledged in the Chapter 4 Airspace aviation safety subsections. While the details of the procedures required by the COA have not yet been negotiated, it is sufficient for the EIS to note this requirement just as it does for other permits, licenses and other entitlements that may be required.

Subject: RE: SBCT EIS - Site visit for Kahuku CACTF

Cindy, John, Steve:

I am sending an attachment with general BMP's that we routinely recommend. Please also incorporate them into the record for the proposed CACTF site.

Could one of you follow up and inform us on the question of the NPDES requirement? Because of the extent of the grading at the proposed CACTF site, I'm only comfortable saying we have no concerns *if* there is a NPDES permit for the work. This would be an enforceable mechanism for comprehensive BMP's to be applied during construction, as opposed to "committing" to the BMP's in the ROI for the EIS.

Thanks again for running this by our office early on, we like projects where our concerns are minimal!

F3-1

Gordon

ps The BAX letter should get to you very soon... it was signed yesterday or maybe the day before.

F3-1

Information given on the NPDES Permit is outlined in section 7.10, and discussed in Appendix N.

Subject: Re: SBCT EIS - Site visit for Kahuku CACTF

Cindy:

F3-2

I looked over the maps and site schematic, thanks for sending them. We do not have concerns about the location of the grass training airstrip. I do not think that it warrants a FCWA planning aid letter, as have the Schofield-Dillingham and Schofield-Heleman Roads, which clearly had potential impacts because the roads actually crossed streams. (The Schofield BAX letter that we are working on similarly crossed streams, though are concerns are minimal.)

F3-3

My only comment is that the total amount of land clearing and grading for the proposed CACTF construction is substantial. The potential effects of construction-related impacts should be controlled and minimized through the use of BMP's that reduce runoff and sedimentation to aquatic environments.

Is there a formal mechanism for applying BMP's, such as a county grading permit or HDOH NPDES permit for this project?

Gordon

Responses**F3-2**

Thank you for your comment, it has been considered and will be added to our administrative record.

F3-3

This is discussed in chapter 7.10. Compliance with the NPDES and Clean Water Act are discussed in Appendix N.

Comments**ENCLOSURE****USFWS Recommended Standard Best Management Practices**

The Service recommends that the following measures be incorporated into projects to minimize the degradation of water quality and impacts to fish and wildlife resources:

- a. dredging, filling, or grading in or adjacent to streams and riparian areas should be scheduled to occur during low flow periods;
- b. no project-related materials (fill, revetment rock, pipe etc.) should be stockpiled in the water or riparian areas;
- c. all project-related materials and equipment placed in the water should be free of pollutants;
- d. no contamination (trash or debris disposal, alien species introductions, etc.) of aquatic environments should result from project-related activities;
- e. fueling of project-related vehicles and equipment should take place away from streams and riparian areas and a contingency plan to control petroleum products accidentally spilled during the project should be developed. Absorbent pads and containment booms should be stored on-site to facilitate the clean-up of petroleum spills; and,
- f. turbidity and siltation from project-related work should be minimized and contained to the site through the appropriate use of effective silt containment devices and the curtailment of work during adverse weather conditions.

F3-4**Responses****F3-4**

Section 4.8 has been updated to include these standard Army BMPs as mitigation for potential impacts to surface water quality.

RE: Comments on the Draft Environmental Impact Statement for the Transformation of the 2nd Brigade, 25th Infantry (L) to a Stryker Brigade Combat Team in Hawaii (dated October 2003)

Dear Ms. Barger:

We have reviewed the Draft Environmental Impact Statement (DEIS) for the Transformation of the 2nd Brigade, 25th Infantry (L) to a Stryker Brigade Combat Team in Hawaii (Transformation), dated October 2003, and are pleased to offer comments on the DEIS in this letter.

Given the time frame for comments (i.e., approximately two months), we focused our review on the Biological Impacts sections of the DEIS, as those sections appeared most relevant to the Protected Resources Division. These comments do not represent a complete analysis of the entire DEIS.

Importantly, this review does not constitute a consultation under section 7 of the Endangered Species Act on the Transformation, since the Army already has initiated a consultation on this activity. Specifically, on June 20, 2003, the Army issued a letter to the National Marine Fisheries Service (NOAA Fisheries) stating the Army's determination that the actions associated with the Transformation (as listed in that letter) would not be likely to adversely affect federally listed marine mammals or turtles. On July 29, 2003, we issued a letter concurring with the Army's determination in the June 20, 2003, letter. However, if the activities associated with the Transformation differ from those articulated in the letter, a re-initiation of consultation will be appropriate to address the actual impacts on federally-listed species and critical habitat.

Our comments on the DEIS are presented as follows:

F4-1

1) Discussion of Hawaiian Islands Humpback Whale National Marine Sanctuary (HIHWNMS). The Regions of Influence (ROIs) for Dillingham Military Reservation (DMR) and Pohakuloa Training Area (PTA) overlap with the HIHWNMS. As a result, the HIHWNMS should be discussed as a "Sensitive Habitat" in each of the chapters for which it is relevant. For example, in section 3.10.2 (Resource Overview), which discusses Critical Habitat and Recovery Plans, no mention is made in this section of the HIHWNMS or the requirements associated with the

cont'd

National Marine Sanctuaries Act. Similarly, in section 8.10.1 (addressing PTÀ), under the Sensitive Habitats subsection, no mention is made of the HIHWNMS or the Sanctuaries Act.

F4-2

2) Impacts on Sea Turtles. The discussions of sea turtles in the Affected Environment sections and their associated tables (e.g., sections 6.10.1 and 8.10.1) and in Appendix I-1 do not present a sufficiently comprehensive discussion of the distribution of turtle populations in the SBCT ROI. These sections need to be further fleshed out to discuss the distribution and likely presence/absence of turtle populations in the ROI. In particular:

- Green turtles are federally listed as threatened and are found in inshore waters. The conclusion that individual turtles may occur in the ROI does appear to be correct.
- Hawksbill turtles are known to nest in Hawaii and are found in the nearshore environment in the Hawaiian islands. However, the DEIS does not address the potential for interactions with hawksbills anywhere in the document. In particular, even though section 8.10.1 indicates that hawksbills may nest on the Island of Hawaii, there is no discussion of whether those nesting areas are near or in the marine portion of the ROI.
- Leatherback turtles are federally listed as endangered. Around the Hawaiian islands, these animals occur primarily in the pelagic environment.
- Olive Ridley turtles may be found in the pelagic environment around the Hawaiian islands (as leatherbacks are).
- Loggerhead turtles may be found in the pelagic environment around the Hawaiian islands (as leatherbacks are).

It would appear from the bibliography that the information on Pacific sea turtles was taken from the extremely limited descriptions of the species and their habitat on the NOAA Fisheries Office of Protected Resources website. The authors should contact, at a minimum, Mr. George Balazs at the Pacific Islands Fisheries Science Center for further information to make a more informed determination of the impacts of the Transformation on these species. In addition, the Recovery Plans for all five turtle species should be reviewed for information on potential interactions with these species.

3) Dillingham Military Reservation (DMR)

F4-3

- a) The analysis concludes that, because runoff generated by Transformation activities is within the normal range, no adverse impacts are anticipated (i.e., Page 6-96, No Impacts, last sentence). One of the reasons given for this conclusion is that no in-water or beach activities are anticipated. However, runoff, by definition, originates upland from the beach. As a result, in-water or beach activities, while they may or may not be detrimental to marine wildlife, are not runoff-generating activities. It is not clear why the authors can conclude that the absence of in-water or beach activities will preclude impacts from runoff.

Responses

F4-2

Updated information citing articles with Balazs as a co-author have been included and incorporated into the body of the text in sections 6.10 and 8.10. These articles include those by primary authors Work, Polovina, Zug, and Brill. Recovery plans have been reviewed for sea turtles.

F4-3

Text has been changed to clarify runoff analysis.

Comments

NOAA Fisheries
Comments on October 2003 Draft SBCT EIS
Page 3 of 4

- F4-4** | b) In Figure 3-13, DMR's portion of the SBCT marine ROI is not reflected on this map. It appears to only address the Pohakuloa marine portion of the ROI.
- F4-5** | 4) Kahuku Training Area: The activities taking place in that the KTA include aviation training and troop movements (p. 7-3). To the extent that they are over water or produce runoff, these activities may have noise, visual, and runoff impacts to marine resources similar to those identified in the DMR analysis. KTA extends almost to the ocean, suggesting that such impacts could be feasible. In addition, the marine waters adjacent to KTA are part of the HIHWNMS and known to be frequented by humpback whales and other cetaceans. Despite this potential for impacts, the Region of Influence for KTA appears to be limited to terrestrial areas. The analysis needs an explanation of why the ROI does not include the marine environment given the potential impacts above and, if the ROI is extended to include the marine environment, the extent of such impacts.
- 5) Pohakuloa Training Area
- F4-6** | a) The discussion of activities to be undertaken in the Proposed Action (pp. 8-1 to 8-5) does not include any kind of marine-based activity, despite the fact that marine biological impacts are analyzed in later sections. Subsequent sections (e.g., pp. 8-148 and 8-149) discuss harbor construction and construction of a fixed tactical tower at the harbor. These and other activities with the potential to impact marine resources (e.g., vessel transport) should be discussed explicitly in the section on proposed activities.
- F4-7** | b) P. 8-130, Marine Wildlife, second paragraph: the first sentence should read, "Of these ESA-listed species, the most likely occurrences in the ROI...". Since that sentence discusses turtles as well as mammals, the reference to "marine mammals" should be replaced with "species".
- F4-8** | c) P. 8-148, first full paragraph, last sentence: the fact that animals are habituated to the type of noise produced by logistical support vessels (LSVs) and barges and therefore unaffected is not a valid rationale for presuming that impacts are negligible. The fact of habituation suggests a change to behavior, which is a "take" under the Endangered Species Act and Marine Mammal Protection Act and therefore prohibited without further consideration and consultation.
- F4-9** | d) The discussion of runoff impacts (p. 8-149) is inadequate. Given that harbor construction will take place, there should be a discussion of controlling erosion and reducing turbidity to minimize effects on marine wildlife.
- F4-10** | e) While it is true that monk seals typically have not hauled out in Kawaihae Harbor area, two seals are known to have lived in or visited the North Kohala area in the

Figure has been changed per comment

F4-5

The ROI does not include any marine habitat. While the waters adjacent to KTA are part of the Hawaiian Islands Humpback Whale National Marine Sanctuary (HIHWNMS), no project actions occur in this area nor in the vicinity of the coastline, in the nearshore, or in the offshore marine habitat, or upland from the nearshore marine habitat. This has now been noted in the document.

F4-6

Text has been added to clarify PTA actions and to address the tactical tower construction. Text has also been added to the EIS to state that any harbor construction would be addressed under separate NEPA documentation as it is not part of this project action.

F4-7

The text has been changed.

Subject: Review of Draft Environmental Impact Statement on Transformation of the 2nd Brigade,
25th Infantry Division (Light) to a Stryker Brigade Combat Team in Hawaii

Dear Ms. Barger:

Please disregard the U.S. Department of the Interior's (Department) no comment letter dated December 30, 2003 on the Draft Environmental Impact Statement (DEIS) for the Transformation of the 2nd Brigade, 25th Infantry Division to a Stryker Brigade Combat Team (SBCT) in Hawaii. The Department has comments, which are provided in an attachment to this letter.

The proposed action, as we understand, is to convert personnel and equipment of the existing 25th Infantry Division to a SBCT. This would require use of new types of equipment and new and expanded training facilities. A characteristic feature of the SBCT is the use of 20-ton, eight-wheeled "Stryker" vehicles to transport personnel and equipment.

Army training activities in the SBCT format are anticipated at various locations on the islands of Oahu and Hawaii. Twenty-eight individual projects identified and discussed in the DEIS would provide infrastructure such as dedicated roadways, communications support, and various types of training grounds.

The proposed action is a component of a larger plan to transform the U.S. Army (Army) as a whole. In concept, the nationwide transformation plan is to convert much of the Army to a "medium weight" format that allows troops to be quickly sent to areas of conflict anywhere on the globe and be highly mobile once they are in place.

We presume you are aware that the Fish and Wildlife Service (Service) is also investigating and reporting to the Army under the Fish and Wildlife Coordination Act on potential impacts to fish

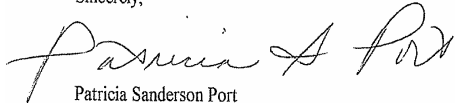

Comments

and wildlife resources for certain Army transformation actions that may impact aquatic resources. In addition, Army consultation with the Service pursuant to section 7 of the Endangered Species Act (ESA) has been completed for routine and SBCT training on Oahu and is nearly complete for routine and SBCT training on the island of Hawaii.

We recognize the critical importance of maintaining a trained, modern national defense force. The Army and the Department have cooperated in numerous mutually beneficial programs to meet military needs while also achieving natural resource protection goals, in Hawaii and across the Nation. We believe mutual success is possible in this effort, and we hope that our comments will help you address our concerns.

Thank you for our opportunity to comment on this document. Questions may be directed to Gina Shultz, Acting Field Supervisor in our Fish and Wildlife Service office in Honolulu, Hawaii, at (808)792-9400.

Sincerely,

Patricia Sanderson Port
Regional Environmental Officer

ATTACHMENT. Comments from Department of the Interior, pertaining to the Draft Environmental Impact Statement for Transformation of the 2nd Brigade, 25th Infantry Division to a Stryker Brigade Combat Team in Hawaii.

General Comments

Level of Detail and Level of Assurances: The proposed action, effects, and mitigation measures are often described in general terms, and without important detail. Although the DEIS anticipates a number of effects would be significant and identifies measures to reduce these effects to less than significant levels, assurances that these measures will be implemented are not always clear. In several cases, mitigation measures are described as being under consideration.

In the case of construction-related soil erosion and surface water quality effects, for example, it appears your control and mitigation measures would be successful in reducing effects to less than significant, and that assurances for implementation will be provided through the permitting and certification procedures of the Clean Water Act and other regulatory mechanisms.

Soil erosion and the resulting water quality effects from non-construction training activities, however, could be significant in geographic extent. Unlike construction impacts which are temporary, erosion from training would be ongoing. Preventing eroded soil from entering and degrading waterways would require a commitment of resources and effort, yet measures described in the DEIS are essentially voluntary. Including greater detail in the Final Environmental Impact Statement (FEIS), as well as formal mechanisms for implementing mitigation measures, would overcome these concerns.

ESA, Critical Habitat: It appears that outdated information was used in the analysis relating to the amount of critical habitat reported for the palila and Oahu elepaio, and we ask that this be rectified in the FEIS. This is also the case for plants, perhaps because critical habitat designations were only recently completed. Critical habitat was designated for 99 plant species on Oahu, on June 17, 2003, and for 41 plant species on the island of Hawaii, on July 7, 2003.

The Army did send out an errata sheet dated October 3, 2003, to indicate that all discussion of plant critical habitat in the DEIS was in error because it was based upon previously "proposed" critical habitat boundaries, rather than upon the final geographic designations.

We are concerned, however, because the errata sheet notes that the majority of Army lands were excluded from the final critical habitat designation. This could lead some to interpret that these lands are less important for recovery of the listed species.

In fact, Army lands were excluded from critical habitat based upon a rationale that recognizes, and even emphasizes, the essential contribution that Army-led natural resource conservation actions play in the recovery of threatened and endangered species. These contributions include ongoing and proposed management actions specified in Integrated Natural Resource Management Plans (INRMPs) and other natural resource conservation programs.

We ask that the FEIS describe how the actions identified in the relevant INRMPs will be used by the Army to make this essential contribution to the recovery of listed species. In addition, there is

F5-1

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

F5-2

We have updated our critical habitat information in the document and on the figures. Additionally, the text was changed to incorporate this response.

Comments

- F5-2 cont'd** plant critical habitat within the Region of Influence (ROI) of the proposed action outside of Army installation boundaries. We ask that the potential effects of the action to plant critical habitat throughout these areas also be described and assessed in the FEIS.
- F5-3** ESA, Section 7 Consultation: As mentioned in our cover letter, the Service completed a Biological Opinion pursuant to section 7 of the ESA, dated October 23, 2003, for routine and transformation training actions at six Oahu Army installations. A second BO assessing routine and transformation training activities at the Pohakuloa Training Area on Hawaii will be completed in December 2003. We ask that information from the BOs be incorporated into the FEIS.
- F5-4** ESA, Recovery Plans: Recovery plans for ESA listed species are available for the relevant species indicated below, and can be obtained by contacting the Service Office in Honolulu, at (808)792-9400. Recovery plans summarize threats to the species, discuss their needs and recovery strategies, and prescribe management actions that should be used when assessing effects to the species in the DEIS.
- Hawaiian Duck, Hawaiian Stilt, Hawaiian Coot, and Hawaiian Common Moorhen - Draft Revised Recovery Plan for Hawaiian Waterbirds, Second Revision. (1999)*
- Oahu Elepaio, Oahu Creeper, Palila, and Akiapolaau - Draft Revised Recovery Plan for Hawaiian Forest Birds. (1983)*
- Dark-rumped Petrel - Hawaiian Dark-rumped Petrel and Newell's Manx Shearwater - Recovery Plan. (2003)*
- F5-5** Discussion of Installations: There may be some advantage to combining the analyses and discussions of potential impacts to Kahuku Training Area (KTA), Kawaihoa Training Area (KLOA,) and Drum Road. However, the presentation of the information pertaining to these facilities is confusing. In some instances, the discussion refers to KTA alone, and elsewhere, it appears KTA, KLOA, and possibly Drum Road are being referenced together.
- Kahuku Training Area and KLOA are geographically, physiographically, and administratively distinct, and analyses of environmental impacts to these areas should reflect their unique characteristics. For clarity, we recommend that discussion of these two installations be completely separated throughout the FEIS.
- With regard to KTA and KLOA, the tables that illustrate transformation alternatives (e.g., Table 2-5), and impacts (e.g., Tables 4-8 and 4-10), are inconsistent and unclear. In some tables, information for KLOA is presented separately, in some tables it is combined with KTA, and in other tables KLOA is omitted entirely. This makes interpretation of the information on KLOA difficult and confusing, and we recommend that tables present information for each installation in separate columns.
- F5-6** Antennas and Migratory Birds: The DEIS states in several sections that "the construction and subsequent presence of fixed tactical Internet (FTI) antennas would not significantly affect migratory birds..." though sufficient information to support this conclusion is not provided.

Responses

F5-3

Biological Opinion information has been incorporated into the EIS as requested.

F5-4

Thank you for your comment. It has been considered and will be added to our administrative record.

F5-5

Because of the scope of the project the document was organized in such a way that community members can focus on issues that would most directly affect them. The tables have been edited to make it clear that this is a summary of KTA and KLOA.

F5-6

Full descriptions of the antennas are given in Appendix D. Impacts to migratory birds are discussed fully in chapter 5.10, 6.10, 7.10, 8.10.

Comments

Responses

April 2004

Stryker Brigade Combat Final EIS, Hawai'i

P-24

**F5-6
cont'd**

In continental North America, the species affected by antennas, towers, and other tall structures, are primarily land birds that migrate at night. In Hawaii, however, the primary species impacted by these structures are seabirds, during their diurnal movements between the sea and nesting areas. These species include wedge-tailed shearwater, dark-rumped petrel, Newell's shearwater, and Laysan albatross. Artificial lighting can attract and disorient seabirds, and they are known to become injured during collisions with antennas, towers, utility lines, and other structures.

The DEIS indicates that 25 new antennas are included as part of the proposed action. Five of these would be located in the State Conservation District, though no information is provided about their proposed locations, height, position relative to surrounding vegetation, or whether they will be guyed or lighted. This information is needed for a full assessment of the potential effects to federally protected migratory birds.

F5-7

Road Descriptions: Three major road-building projects are included as part of this action: the Dillingham Trail, the Schofield-Helemano Trail, and the Pohakuloa Training Area Trail. Taken together, these roads constitute one of the largest transportation infrastructure projects to be proposed in the State of Hawaii in many years. The DEIS describes the roads in terms of total acreage. We ask that the actual footprint (length and width) of the proposed road alignments also be included in descriptive presentations for these road projects. This will assist in understanding the associated effects of the road construction and operation.

F5-8

Definitions of Terms: We ask that technical military terms be defined or replaced with "plain" language. Examples of such terms include: strategic, tactical, strategic mobility, tactical mobility, training throughput, battlespace, increased lethality, etc.

Specific Comments

F5-9

Pg. 2-1, U.S. Army Hawaii Training Complex: The six major training areas are described adequately for this introductory section. Drum Road, however, which extends from Helemano Military Reservation (HMR) to KTA and traverses KLOA, is not thoroughly described. Drum Road is a critical component of the training infrastructure that is undergoing a major upgrade, under a parallel National Environmental Protection Act process.

We recommend that Drum Road be described in this section, and that the relationship between the Drum Road upgrade project and the Army transformation be described, because of the degree to which the outcome of the proposed transformation is contingent upon completion of the Drum Road upgrade.

This information is necessary in order to understand the anticipated direct and cumulative project-related impacts to fish and wildlife resources in the analysis of environmental consequences later in the document.

F5-10

Pg. 2-12, Figure 2-6: We recommend this illustration be revised in the FEIS to reflect changes in the "Stryker" maneuver area as established through the section 7 consultation process for these sites. Also, Puu Nohonaoahae and Puu Papapa are not maneuver areas, as indicated, and we suggest the figure be revised accordingly.

F5-7

Table 2-5 gives the length, width and composition of all roads. In addition Appendix D gives a more detailed description of each road project.

F5-8

Every effort was made to make the EIS reader friendly. Most military terms were replaced with "plain" language. Some are self explanatory. The FEIS has been reviewed to see if further changes in language could be made.

F5-9

Presently Drum Road is used for access to the Kahuku Training Area (KTA) and the Kawaihoa Training Area (KLOA) during current force training activities. The existing road lacks proper drainage and safety measures such as guard-rails, barriers, and warning signs. In order to safely continue using Drum Road for current force training activities, the Army is proposing upgrades to the road, regardless of the final decisions on SBCT in Hawai'i. If the Army decides to transform to SBCT in Hawai'i, the Army would use Drum Road for access to the KTA and KLOA regions, as such the use of Drum Road is discussed in this EIS in Chapter 7. Since the proposed upgrade of Drum Road is a single and complete project separate for the proposed SBCT, the upgrade itself is discussed in Chapter 9 of this document in relation to cumulative impacts.

F5-10

This figure and similar figures for the other project areas were used in the Section 7 consultation process. Pu'u Nahonaoahae and Pu'u Pāpala are not maneuver areas and are shown in Yellow on the map as areas where no off road maneuvers are to occur.

Comments

- F5-11** | Pg. 2-17: The DEIS states that units are currently deployed from Pearl Harbor, Oahu, to Pohakaloa Training Area (PTA) via vessels that dock at Kawaihae Harbor, on the island of Hawaii. The vessels used are barges (4 round-trips per year) and logistic support vessels (LSVs, 60 round-trips per year). The number of LSV round-trips per year is expected to increase to 66. Any possible increases in barge round-trip traffic also needs to be specified.
- The use of barges towed from Pearl Harbor to Kawaihae Harbor has the potential to result in the unintentional spread of alien marine species, which are abundant in Pearl Harbor.
- We recommend that all barge hulls be periodically inspected and cleaned to assure that marine alien species that occur in Pearl Harbor are not transported to Kawaihae Harbor, especially if barge traffic is increased.
- F5-12** | Pg. 2-35, Mounted Maneuver Training: The DEIS includes the following statement: "Doctrine provides that the area of operations for which the SBCT could be responsible in combat is normally 31 miles by 31 miles." We recommend the policy document or other official statements that establish this geographic requirement be referenced.
- This is important because all subsequent justification for land acquisition dedicated to SBCT training appears to be justified by this doctrine.
- F5-13** | Pg. 2-42, Implement an Environmental Management System (EMS): The description of an EMS to change environmental management practices under Army transformation is described in general terms. Without more detail, it is not clear what is meant by "systematic integration of environmental management into all missions, activities, and functions," in terms of the Army's four categories of environmental management (i.e., prevention, compliance, restoration, and conservation). We recommend that a more complete description of the proposed EMS integration be provided.
- F5-14** | Pg. 3-7, Drum Road: Drum Road is described as a dirt and gravel road. The current 'Improvements to Drum Road Upgrade Project' which proposes to substantially widen and pave the entire Drum Road alignment in a two-lane configuration, is not included in this description. The improvements achieved through this road upgrade affect and are directly related to the Army's ability to train the proposed SBCT.
- As mentioned above, the relationship between the Drum Road Upgrade Project and the Army transformation should be described, particularly the degree to which they are interrelated and interdependent. This will facilitate a discussion in the Environmental Consequences Chapter on the direct and cumulative impacts of SBCT use of Drum Road.
- F5-15** | Pg. 3-60, Biological Resources, bullet 2: For consistency, we recommend listing the numbers of non-flowering plants and the evolutionary founders from which they are derived, as a separate bullet.
- F5-16** | Pg. 3-62, Figure 3-13: This figure illustrates ocean regions, but not inland aquatic habitats such as streams and wetlands. We recommend that an overview illustration that depicts all inland waters

Responses

F5-11

There will be no change in the number of barge trips under SBCT. There will be no change in the number of barge trips so no increase in the transport of alien species is anticipated. All vessels are periodically inspected and cleaned at the present time and no change is anticipated.

The total number of barge trips will increase by only six. All vessels are periodically inspected and cleaned at the present time and no change is anticipated. The spread of alien marine species is not expected to be significant. Section 8-10 Biological Resources describes impacts from spread of alien species. Significant but mitigable impacts are the result of vegetative species.

F5-12

The following reference has been added, (Nakata 2002b), Final Submittal Range and Training Land Program Development Plan.

F5-13

The EMS is being developed. While this will likely improve the conditions on Army lands, whether Transformation takes place or not, it was not considered as a mitigation measure for SBCT for that very reason. It is noted here as a program that will be implemented in the future.

F5-14

Page 3-7 is simply a discussion of existing facilities not proposed construction activities. The Drum Road improvements are not part of the Transformation project. The improvements are required for the current forces and as such a separate NEPA document has been prepared. However, the use of Drum Road by SBCT forces and the impacts of that use are described in the Transformation EIS. A discussion of the Drum Road Upgrade project can be found in Chapter 9 – Cumulative Impacts as Project 19 and is described as required for current mission requirements of the 2nd Brigade, 25th ID(L) and would be needed regardless of SBCT implementation.

Comments

- F5-16 cont'd** of the ROI be developed, either as an addition to the marine waters shown on this figure, or with an additional map.
- F5-17** Pg. 3-63, paragraph 2: The DEIS characterizes the ROI as being “largely made up of disturbed areas, with minimal natural communities,” and states “the vast majority of species inhabiting these areas are non-native.” It is true that portions of the ROI are very disturbed and support mostly non-native species. Other portions of the ROI, however, contain some of the least disturbed natural communities left in Hawaii and are home to a large number of unique and imperiled native species and the ecosystems that support them.
- We recommend biological resources present in all portions of the ROI be described to allow assessment of potential effects to these resources.
- F5-18** Pg. 3-65, paragraph 2: The stated extent of Oahu elepaio critical habitat in the ROI (1,147 acres) is not accurate. There are 1,913 acres of critical habitat at Schofield Barracks Military Reservation (SBMR); 2,266 acres at Schofield Barracks East Range (SBER); and 4,349 acres at KLOA. In Figure 3-13, which shows critical habitat in the ROI on Oahu, the area indicated as critical habitat for the Oahu elepaio is the current range of the Oahu elepaio, not actual designated critical habitat for the species.
- We ask that this be corrected and that potential effects on elepaio designated critical habitats be assessed, taking this information into account.
- F5-19** Pg. 3-65, paragraph 2: Critical Habitat, Fig. 3-15: Designated critical habitat for palila on the island of Hawaii is actually greater than what is shown in this figure. This causes us to question whether the area of palila critical habitat within the ROI is also inaccurate, and if not accurate, whether the full effects are accurately assessed. We ask that you ensure that the correct palila designated critical habitat information be used and also in the full environmental effects analysis.
- F5-20** Pg. 4-7, Conversion of Agricultural Land to Training Land: The DEIS states that “the estimated 535 acres of pineapple land [which will be lost] is approximately 0.005 percent of the U.S. Department of Agriculture (USDA) designated agricultural land on Oahu...”
- This statement cannot be correct because it would mean that there are 10,700,000 acres of USDA designated agricultural land on Oahu, an island that is only 388,000 acres in size. This statement should be corrected.
- F5-21** Pg. 4-40, paragraph 1: The descriptions of roads crossed by the proposed Helemano Trail is not accurate. The text appears to be an inadvertent duplicate of pg. 4-40, paragraph 2.
- We recommend inclusion of revised text indicating that the proposed Helemano Trail would cross Kaukonahua Road, Kamehameha Highway, and possibly Wilikina Drive (see pg. 4-40, paragraph 2).
- F5-22** Pg. 4-46, Surface Water Quality; and pg. 4-52, Geology, Soils and Seismicity: Based upon the information provided in these two sections, it is difficult to understand the conclusion that impacts to surface water quality will be mitigated to less than significant levels. Section 4.9 (Geology,

The corrections were made to this figure and these changes were evaluated in the impact analysis.
- F5-20**
Text revised to read, “The estimated 535 acres (219 hectares) of cultivated pineapple land is approximately 0.67 percent of the total USDA designated agricultural land on O‘ahu and 2.8 percent of the total area in pineapple production in the state (Statistics of Hawai‘i Agriculture 2004). Similar text on page 5-31 (last paragraph) will also be revised. Similar text on page 5-33, under the Reduced Land Acquisition Alternative revised to read, “ The estimated 98 acres of cultivated pineapple land is 0.1 percent of the total USDA designated agricultural land on O‘ahu and is 0.5 percent of the total area in pineapple production in the State (Statistics of Hawai‘i Agriculture 2004).”
- F5-21**
In the Final EIS, these sections has been revised with the correct crossings as noted.
- F5-22**
Erosion would not necessarily result in significant surface water impacts for several reasons. First, although we have concluded that the ITAM program may not be entirely successful in preventing significant erosion in the maneuver areas, it will nevertheless direct resources to reducing soil erosion, and it is expected to be successful in reducing the amount of erosion. The problem, as explained in the EIS, is lack of available land area to enable maneuver training to be moved to another range while the damaged land is allowed time to recover. Thus, erosion will continue and over time, the erosion damage will accumulate. However, this does not mean that the rate of erosion will be so high that it will result in significant impacts to water quality. Second, the erosion would occur in upland areas some distance from major stream channels, which provides space for implementing measures to slow runoff and precipitate sediment. Thus, although maneuvers are likely to

Stryker Brigade Combat Final EIS, Hawai'i

P-27

F5-22

Soils and Seismicity) describes expected soil erosion due to training activities and concludes that erosion will be significant under the proposed action and may not be mitigable. This is due to increased intensity of use within limited maneuver areas, and due to an increase in the total amount of land subject to increased erosion-causing activities, particularly at SBMR, Dillingham Military Reservation (DMR), KTA, and KLOA.

Appendix M-2 depicts the Army Training and Testing Area Carrying Capacity (ATTACC) model output, which provides quantitative estimates of Maneuver Impact Miles (MIMs) resulting from training on Army lands. A basic goal of the transformation is to increase mobility of military personnel and equipment and it follows that training activities, as measured in these "impact mile" units would increase substantially.

Impact miles are anticipated to approximately double at DMR and KTA and undergo a sevenfold increase at PTA. Overall, model results indicate that MIMs will increase by a factor of three as a result of the training regimes anticipated under the proposed action.

Despite the recognition that soil erosion will not be mitigable at any of the installations under the proposed action, the resulting impacts to water quality are described as mitigable through ongoing activities of the Integrated Training Areas Management (ITAM) program. The administrative and regulatory mitigation under ITAM appears to consist primarily of monitoring surface waters and possibly implementing unspecified mitigation measures in the event that sedimentation is found to be significantly elevated above background levels.

The DEIS describes this approach only for the case of a low precipitation, low run-off time period. The greater concern, and the more probable scenario with the anticipated increased soil disturbance under the proposed action, is that unpredictable but regular storm-associated run-off will be increasingly laden with sediment due to SBCT training activities. It is generally recognized that these occasional, large runoff events have a significant effect on environmental conditions in freshwater and marine environments and are a major influence of ambient surface water quality conditions.

Storm flows that carry large amounts of sediments would be expected to occur at all of the Oahu installations, even at DMR where there are no perennial streams but where intermittent drainages flow a very short distance to the sea. The marine waters adjacent to DMR are particularly vulnerable to impacts from erosion-derived sediments because of the presence of extensive areas of coral reef habitat.

Additionally, numerous perennial and intermittent streams originate in KTA and KLOA and flow across narrow coastal plains toward sensitive coastal receiving waters. Based upon the information provided in section 4.8 (and subsequent sections for each Oahu installation), it does not appear likely that impacts to surface water quality can be mitigated to less than significant levels so long as soil erosion is anticipated to be significant as described in section 4.9 (and subsequent sections for each Oahu installation).

Therefore, we recommend that the effect of anticipated levels of training-related erosion on surface water quality and impacts to aquatic and marine resources be re-assessed in the FEIS and that these impacts be considered significant unless specific, effective and enforceable mechanisms

disturb soils and remove vegetation, which will result in erosion, engineering controls can be placed outside of the maneuver areas to slow runoff and trap sediment within the installation boundary before it reaches the major stream channels. Third, an increase in erosion during periods of high rainfall would not necessarily translate to a significant impact on water quality because background concentrations of suspended sediment are high at these times. While we consider the erosion impacts to be mitigable to less than significant levels, the discussion of these impacts has been revised to provide the reader with a better understanding of the uncertainties involved and the rationales for considering the impacts to be mitigable. In addition, we have added further discussion of specific, effective and enforceable sediment control mechanisms to support these conclusions, as suggested in the comment.

Comments

- F5-22 cont'd** | to control these impacts can be described and proposed for implementation with a high degree of certainty.
- F5-23** | Pg. 4-60, paragraph 2: Please provide a citation and reference, and/or rationale for the use of an indirect impact analysis approach that uses a 60-meter radius to determine the extent of indirect effects to species and habitats.
- F5-24** | Pg. 4-62, Regulatory and Administrative Mitigation 1: For clarity, we suggest changing the first sentence to read: "The effects of SBCT actions on listed species in the ROIs have been evaluated in the section 7 consultation with USFWS. The Army will implement their project description, conservation measures, and terms and conditions as described in this consultation." This section also states that "Wildland Fire Management Plans (WFMPs) are being developed to minimize the probability of fire," and that "WFMPs and their mitigation value are described in section 4.12.3," but the treatment of WFMPs in section 4.12.3 provides only a brief description of fire management actions, and is not clear.
- It is, therefore, difficult to assess whether the WFMPs will effectively minimize the impact of fires without more information about them and the actions they prescribe. It is our understanding that the WFMPs have been completed. If so, we recommend that their relevant aspects be presented and discussed in the DEIS so the anticipated potential impact of fire on fish and wildlife resources can be accurately assessed.
- F5-25** | Pg. 4-63, Regulatory and Administrative Mitigation 2: The DEIS states that "The Army is in Section 7 Consultations with the USFWS to ensure that the proposed action would not jeopardize the continued existence of federally listed species or adversely modify critical habitat." However, on pg. 4-63 (paragraph 1) the DEIS states that "it is not within the Army's ability to prevent and contain all fires."
- The BO written by the Service as part of formal ESA section 7 consultation with the Army, indicates the risk of fire will be reduced outside of the intended impact area in order to minimize loss of elepaio and its habitat at SBMR. In addition, the efficacy of the WFMPs are to be formally reassessed after a period of five years.
- We recommend the FEIS state that if it proves impossible to completely contain fires within the intended impact area, the Army will address this anticipated impact on critical habitat through the restoration of native forest suitable for elepaio.
- F5-26** | Pg. 4-64, Additional Mitigation 3: We suggest changing the first bullet to read "weed-free clothes and to maintain weed-free vehicles." Also, the section on spread of non-native species does not mention the brown tree snake, which is a serious threat to birds and the environment throughout Hawaii and the Pacific. We recommend that specific measures for preventing the introduction of the brown tree snake into Hawaii via military aircraft and ships from the Mariana Islands be identified in this section.
- F5-27** | Pg. 4-65, Threat to Migratory Birds: The DEIS states that "the construction and subsequent presence of FTI antennas would not significantly affect migratory birds species known to occur in the SBMR ROI," but no information is provided about the location, height, structural features and

Responses

F5-23

In the Final EIS the text was changed to incorporate this response. The 60-meter buffer applies only to the activities that take place on the vehicle trails.

F5-24

The discussions and mitigation measures in Section 4.10 have been revised to better address the impacts to biological resources from wildland fire. In addition, since publication of the Draft EIS, the Army has updated the IWFMP and has received biological opinions from USFWS of "no jeopardy" for the proposed action on the islands of O'ahu and Hawai'i. The Army has determined that the impacts to biological resources from wildland fires is significant. The mitigation measures including the implementation of the Biological Opinions and the updated IWFMP will substantially reduce the severity the impact but not to less than significant levels.

F5-25

All mitigation will be considered.

F5-26

The text was changed to incorporate this response.

F5-27

Full descriptions of the antennas are given in Appendix D. Impacts to migratory birds are discussed fully in chapter 5.10, 6.10, 7.10, 8.10. A brief discussion was incorporated into the text as requested.

Comments

Responses

- F5-27 cont'd** | position of such antennas. We recommend the inclusion of this information because without it, the potential impact of the proposed antennae on migratory birds cannot be assessed.
- F5-28** | Pg. 5-138, Main Post: In addition to the sources for biological information cited in the text, we recommend the following sentence be included: "In addition, the Army's environmental division conducts routine monitoring and surveys for rare and listed plant species."
- F5-29** | Pg. 5-140, East Range: The description of the training area did not include the James Campbell National Wildlife Refuge as a bordering neighbor. We recommend the first sentence be changed to read "...Kahana Valley to the east, KLOA to the north, the Service's James Campbell National Wildlife Refuge and private agricultural..."
- F5-30** | Pg. 8-142, Pohakuloa Training Area (PTA): The DEIS notes that there will be construction needed to upgrade facilities to accommodate the SBCT. This construction is expected to bring equipment into Hawaii from foreign ports as well as other islands or subinstallations within Hawaii. There is no explanation of whether this equipment will arrive by aircraft or if ocean-going vessels would transport the equipment via Kawaihae Harbor.
- Any increase in marine vessel traffic, especially barge traffic, will result in an increased likelihood that marine alien species would be introduced into Kawaihae Harbor. We recommend a description of transport procedures be added to the FEIS. Using this information, we also ask that you describe the effects of alien species introductions that could occur, as well as any offsetting measures or mitigation that will be employed.
- F5-31** | Pg. 5-145, Invertebrates: The DEIS describes native invertebrate species located on the main post area of the SBMR installation. Two additional species currently proposed for Federal listing as endangered (*Drosophila aglaia* and *Drosophila obatai*) are not included. We recommend the FEIS include the following information on these two picture-wing fly species:
- *Drosophila aglaia* was first collected in 1946 on Mount Kaala on the island of Oahu, and described by Elmo Hardy in 1965. *Drosophila aglaia* is known only from six localities in the Waianae Mountains of Oahu. It has been recorded on land owned by the State of Hawaii Department of Land and Natural Resources at Makaleha Valley, Peacock Flats Trail, and Puu Kaua. Additionally, this species is known from private land holdings at Palikea Ridge, Puu Kaua, and Kaluaa gulch, and is also found on Federal land owned by the Army at Puu Pane. The occurrence of *Drosophila aglaia* is restricted to the patchy distribution of its host plant, *Urera glabra*, a small endemic tree. The larvae of *Drosophila aglaia* develop in the bark and stem of *Urera glabra*. This tree does not form large stands, but is scattered throughout slopes and valley bottoms in mesic and wet forest habitat on all the main islands. In the Waianae Mountains on Oahu, this tree occurs infrequently in mesic forest. Because *Drosophila aglaia* is reliant on an infrequently occurring host plant, it is difficult to estimate the size of the land area on which this species occurs. Each site is probably less than several acres. The major threats to *Drosophila aglaia* are predation by ants and habitat degradation from feral ungulates, alien plants, and fire.
 - *Drosophila obatai* was described by Elmo Hardy and Kenneth Kaneshiro in 1972, from specimens collected in the Waianae Mountains of Oahu. *Drosophila obatai* is restricted to

F5-31
cont'd

the island of Oahu where it is known from State of Hawaii DLNR-owned land at Makaleha Valley in the Mokuleia Forest Reserve in the Waianae Mountains, and Wailupe Gulch located in the Honolulu Watershed Forest Reserve in the southern Koolau Mountains. This species is also known from Federal land owned by the Army at Puu Pane, and from city and county of Honolulu and private holdings at Waialae Nui. *Drosophila obatai* use *Pleomele forbesii* as a host plant (Montgomery 1975). This host plant, growing on slopes in dry forest and diverse mesic forest, occurs singly or in small clusters and does not form large stands of many individuals (Wagner *et al.* 1990). Threats to this Hawaiian picture-wing include habitat degradation from feral ungulates, alien weeds, and fire, and predation by ants and alien wasps.

These species are at risk of extinction due to natural and human-caused factors. These species are declining and are currently limited in their distribution to very small and isolated patches of habitat. The reasons for the picture-wing flies' decline, like many Hawaiian insects, are habitat degradation through the action of introduced ungulates, particularly feral pigs and goats; predation and parasitism by introduced wasps and ants; reduction of adequate food resources through the action of both feral ungulates and introduced weed species; and competition with introduced flies.

Due to this decline, the species are now more at-risk of extinction due to catastrophic events such as fire and hurricanes. All of the picture-wing flies have specialized breeding sites and require specific endemic host plants. A third of the flies' host plants are already listed as endangered and many others are already proposed or considered candidates for listing. Preservation of host plants in natural ecosystems is necessary for recovery of these flies.

We recommend that the FEIS describe that negative impacts to the flies' host plants and their habitat are a possible result of the proposed action and describe the means by which these impacts will be avoided or minimized.

F5-32

Pg. 5-145, Invertebrates: We request the FEIS include an increased commitment to conservation measures to minimize anticipated effects to rare Hawaiian tree snails at SBMR (and similarly at KLOA/KTA). Because the geographical extent of habitat occupied by these tree snails has declined substantially in the last several decades, we recommend that future surveys for the Oahu tree snails be exclusively focused on locating new occurrences of snails rather than be conducted as an add-on activity during other surveys.

Combining tree snail surveys with other objectives does not allow the time and intensity needed to adequately search and locate tree snails. In addition, field biologists familiar with tree snails and appropriate quantitative survey methodologies should be included with Army natural resource staff during field surveys. As mitigation for the potential effects of the proposed action, and loss of genetic diversity, we ask that the Army establish and support two or more captive populations for each known tree snail species found within the ROI, with oversight from tree snail experts that have successfully carried out captive propagation.

F5-32

All mitigation measures will be considered. Finalized mitigation will be set forth in the ROD.

April 2004

Stryker Brigade Combat Final EIS, Hawai'i

P-31

F5-33

Pg. 5-149, Table 5-23: Two species within the ROI were not included in the Oahu section 7 consultation. We recommend that the Army determine the status and actual locations of *Lobelia niitahuensis* and *Nototrichium humile* and determine whether or not they need to reinitiate section 7 consultation.

Pg. 5-158, paragraph 4: The BO for Routine and Transformation-related Training on Oahu outlines minimization measures to offset military training impacts to 37 listed plant species. For plant species that have less than three known populations in existence, or more than 50 percent of known individuals within one or more of the Oahu action area, the Army will "stabilize" that species. Stabilization measures include the following elements: 1) out-planting, 2) enhancing existing populations, and 3) reduction of threats to the species (e.g., feral ungulate removal, rodent control, and eradication of invasive plant species).

Out of the 37 listed plant species on Oahu installations, it was determined that 31 would be stabilized.

Although the BO concluded these effects would not jeopardize the continued existence of these plants, the effects are potentially significant. We recommend, therefore, that the FEIS incorporate an increased level of commitment and incorporate a similar suite of conservation actions for the remaining six plant species.

These efforts would need to be incorporated into ongoing management efforts in order to reduce anticipated impacts to these species resulting from training activities. Additional conservation measures could include increased rodent and invasive plant control, protection of endangered species from foot traffic and habitat restoration post wildfire event.

F5-34

In addition, we recommend the basic biological needs of these endangered plant species be studied in order to more effectively conserve and manage the species (i.e., sexual reproduction requirements, pollination and seed dispersal mechanisms; soil, light, and nutrient requirements; and seed storage and germination requirements) because many of these basic biological requirements are unknown.

We recommend that the Army use a phased approach to implementing training throughout the ROI. The Department encourages the Army to perform additional conservation measures to reduce impacts to plants to less than significant levels. For example, we recommend training begin only after some of the species-specific conservation actions are in place for the species most vulnerable to fire.

We suggest the Army not use highly incendiary munitions that have a medium to high likelihood of starting fires until species most vulnerable to fire have some conservation actions in place, particularly for those species that occur both in Makua and Oahu installations; or until the WFMP is fully implemented and Range Control has fully implemented the new Standard Operating Procedures established by this plan.

In addition, we encourage the Army to incorporate species of concern and other rare species and important habitat types within the ROI into these conservation efforts.

F5-33

The text was changed to incorporate this request. Impacts to individuals and populations of sensitive species and habitats are outlined in chapters 5.10, 6.10, 7.10 and 8.10

F5-34

Stryker Brigade Combat Final EIS, Hawai'i

P-32

**F5-34
cont'd**

Although critical habitat for plants was not designated on Army lands, critical habitat has been designated for species that occur within the ROI. We recommend that this critical habitat be monitored for impacts as a result of training activities, and, if detected, actions be taken to mitigate for them. For example, trails that are located in or adjacent to a critical habitat should be monitored for weed ingress and erosion.

We recommend that actions be implemented to manage lands in or adjacent to critical habitat, including invasive weed control, feral ungulate control, and planting associated native species. Critical habitat that occurs in lowland areas is at greater risk of impact from fires due to more xeric conditions (very dry), and higher non-native fuel load.

To minimize the threat of habitat loss due to fire in these areas, we recommend enhancing or establishing native habitats in the vicinity of listed species or critical habitat. This action will create natural buffers that will slow wildfires and help protect these sensitive areas.

F5-35

Pg. 5-161, paragraph 1: The DEIS states that "firing and mortar points are located to ensure the maximum range of the weapon would not overshoot the impact area." However, the maximum range of many weapons used at SBMR is greater than the maximum distance within the intended impact area, and numerous rounds could land outside the intended impact area. These rounds regularly ignite fires outside the intended impact area, and the percussions from high-explosive rounds may kill listed species and negatively affect other biological resources.

Natural resource management activities outside the intended impact area require an unexploded ordnance expert escort because of the presence of unexploded ordnance. We understand the firing points and maximum range of weapons used at SBMR do not preclude rounds landing outside the intended impact area, and that this occurs regularly. This is a significant impact, and no mitigation measures are proposed to minimize this impact.

We recommend that the risk of rounds landing outside the intended impact area be reduced by moving targets as far away as possible from the borders of potential listed species habitats, or by reducing propellant charge in weapons used for training at this location.

F5-36

Pg. 5-161, paragraph 3: The DEIS states that "there is no assurance that fires or other threats associated with the proposed action would not reach or otherwise threaten populations of listed species within the SBMR ROI." The DEIS states later, however, on page 5-162, bullet 5, that "section 7 consultation and regulatory and administrative mitigations...would help reduce the impact to a less than significant level."

As described in our comments above, it is not possible to assess whether the WFMP or other mitigation actions will be effective or sufficient without more information about the nature of those actions. If fires continue to affect Oahu elepaio at SBMR, the long-term persistence of the elepaio population is threatened.

We recommend the FEIS more fully describe the measures derived from the consultation process and other means that will be implemented to reduce impacts to less than significant levels.

F5-37

Pg. 5-162, Regulatory and Administrative Mitigation 1: We recommend these standards and

F5-35

While it is true that the maximum range of many weapons may exceed the impact area on some ranges, the charges for the munitions used on those ranges are reduced to avoid rounds landing outside the impact areas. Therefore the chances of a round landing outside the impact area are very small. All ranges have a designated safety zone as well. The safety zone are set so that the odds of a round landing outside this zone are, statistically, one in a million. This has been determined to be a less than significant impact so no mitigation is necessary.

F5-36

Text was changed to incorporate this request.

Comments

- F5-37** | measures need to be checked to reflect the most current language in the final BO.
cont'd |
- F5-38** | Pg. 5-162, Additional Mitigation 1, second bullet: We recommend changing the text to read "Replanting any area that is damaged by fires with appropriate native plants (if native plants are not available, plants known to be invasive or noxious will not be used)."
- F5-39** | Pg. 5-163, paragraph 1: The DEIS states that "twenty elepaos have been identified within the SBMR ROI." The actual number of elepaio estimated to occur within the SBMR ROI is 340 (VanderWerf et al. 2001), indicating that the potential Transformation-related impact to elepaio is much greater than what is described in the DEIS. We recommend that the impact analysis be based on the estimate of 340 elepaos.
- F5-40** | Pg. 5-163 paragraph 4: In the third line from the end of the paragraph, it is indicated that cars are the only vector for non-native invasive species. Because this is not the case, we recommend that the word "cars" be changed to "equipment" in order to be more accurate.
- F5-41** | Pg. 5-164, last paragraph: We recommend that "as a result of Transformation activities" be added to the end of the second sentence to read as follows: "However, note that no new impact areas would be created in conjunction with the proposed action, and the population of feral ungulates and other alien mammals is not expected to increase as a result of transformation activities."
- F5-42** | Pg. 5-166, Additional Mitigation 3: We recommend this section be changed to reflect the most current language in the BO.
- F5-43** | Pg. 5-167, paragraph 3: For consistency, we recommend this paragraph be edited to read: "All sensitive plant species are at risk from trampling, particularly *Delissia subcordata*, aupaka (*Isodendron longifolium*), and ulihi (*Phyllostegia hirsuta*) (Gomez 2003), though this risk is low."
- F5-44** | Pg. 5-168, paragraph 3: We recommend the following species be added to the list of special status species: *Cyanea calcynia*, *Cyrtandra viridiflora*, *Doodia lyonii*, *Lobelia hypoleuca*, and *Platydesma cornuta* var. *cornuta*.
- F5-45** | Pg. 5-174, Loss and Degradation of Sensitive Species and Habitat, third sentence: We recommend inserting the word "special" to read "species of special concern."
- F5-46** | Pg. 6-69, Recovery Plan: There are no current occurrences of listed plant species at DMR, and the reference to unspecified listed plant species should be removed. We recommend the paragraph be changed to read: "Two animal species with recovery plans are known to occur within the DMR ROI." These species are listed in Appendix I-1a of the DEIS.
- F5-47** | Pg. 6-84, paragraph 2: This paragraph does not reflect the same final action that was agreed upon between the Army and the Service, and described in the final BOs for Routine and Transformation-related training. We assume the completed BOs will be referenced to incorporate the geographical extent of the finalized action areas for the purpose of finalizing the ROIs in the

Responses

- F5-38**
The impacts to sensitive species was changed to significant after further evaluation. The ITAM program, which will continue to be used under the proposed action includes a goal of planting native plants where possible. However, because success of the planting depends on location, soil condition and water, survival cannot be guaranteed. While this and other measure will significantly reduce the impacts they will not be reduced to less than significant.

FEIS.

- F5-48** | Pg. 6-87, Significant but Mitigable to Less than Significant Impacts, Impact 1: Impacts from fires on sensitive species and habitat: We recommend pyrotechnics and non-live fire training be identified as potential sources of ignition, and than you describe the associated mitigation.
- F5-49** | Pg. 6-89, bullet 1: We recommend the date of completion of the WFMP be included in this section.
- F5-50** | Pg. 7-82, paragraph 1: The DEIS states in the Sensitive Wildlife Species section that "the latest USFWS and survey information on sensitive species and habitat in the SBCT ROI has been incorporated into this evaluation of biological resources."
This is not the case in several instances in the description of the current status of sensitive species and habitat in the DEIS. For example, the DEIS under-represents the population size of Oahu elepaio and the amount of elepaio designated critical habitat within the SBCT ROI. We recommend that the latest information from the Service be used in the analysis.
- F5-51** | Pg. 7-88, Critical Habitat: The DEIS correctly states that "there is no federally designated or proposed critical habitat for wildlife within the KTA ROI," though the DEIS does not mention that 4,449 acres within the KLOA ROI are designated as critical habitat for the Oahu elepaio. In chapter 7 of the DEIS, numerous sections discuss resources and impacts in the KTA ROI, but similar discussion of the KLOA ROI is absent, or are confusing.

We recommend incorporation of this important information into a discussion relevant to the KLOA ROI.
- F5-52** | Pg. 7-94, paragraph 2: We recommend non-live-fire training and the use of pyrotechnics be identified as potential sources of ignition, and the inclusion of these sources in the analysis of impacts.
- F5-53** | Pg. 7-99, paragraph 1: We recommend the use of pyrotechnics and non-live-fire training be addressed in the analysis of impacts.
- F5-54** | Pg. 8-118, paragraph 2: We recommend this discussion reference the State's noxious weed list (<http://www.hawaiiag.org/hdoa/adminrules/AR-68.pdf>) and note which weeds occur at PTA. Also, please note that Russian thistle is listed as a State noxious weed and is, therefore, regulated under State laws.
- F5-55** | Pg. 8-118, paragraph 3 and 4: Although the DEIS recognizes the presence of feral ungulates, rats, and mice at the site, we recommend that a discussion of proposed methods to control these animals be incorporated into these descriptions.
- F5-56** | Pg. 8-118, Terrestrial Mammals: The DEIS states that "the Hawaiian hoary bat could occur on PTA." Surveys have shown that the Hawaiian hoary bat is known to occur on PTA (Jacobs

F5-56 cont'd	1994). We recommend that the status of the bat be corrected.	
F5-57	<u>Pg. 8-118, Birds</u> : This section of the DEIS does not mention the federally endangered dark-rumped petrel (<i>Pterodroma phaeopygia sandwichensis</i>), which is known to occur at PTA. The petrel is included in other portions of Chapter 8 of the DEIS and we recommend identification and incorporation of this species into the analysis of impacts.	F5-57 The text was changed to incorporate this request.
F5-58	<u>Pg. 8-119, Invertebrates</u> : We recommend relocating the sentence regarding three endemic caterpillar species, to avoid confusion. We also recommend dividing this section into two paragraphs that describe native and introduced species separately.	F5-58 The text was changed to incorporate this request.
F5-59	<u>Pg. 8-134, Figure 8-30</u> : We recommend including a discussion of why Army properties were excluded from critical habitat designation (i.e., the INRMPs for Army installations on the islands of Oahu and Hawaii complement and support recovery goals, thereby providing conservation benefits to listed species).	F5-59 The text was changed to incorporate this request.
F5-60	<u>Pg. 8-140, bullet 3: Additional Mitigation 1</u> . "Replanting any area damaged by fires with plants similar to those destroyed," should be changed to "Replanting any area damaged by fire with appropriate native plants" to be more consistent with <i>Additional Mitigation 3</i> , bullet 2 on page 4-64 and <i>Additional Mitigation 4</i> , bullet 1 and bullet 3 on page 4-65.	F5-60 The text was changed to incorporate this request.
F5-61	<u>Pg. 8-141, paragraph 2</u> : This paragraph understates the extent of detrimental impact of the proposed action on listed plants. Battle Area Complex construction, for example, will destroy the easternmost population of <i>Haplostachys haplostachya</i> , significantly reducing the distribution of this species. We recommend incorporating that information into this discussion.	F5-61 The text was changed to incorporate this request.
F5-62	<u>Pg. 8-142, Pohakuloa Training Area</u> : The DEIS notes that there will be construction needed to upgrade facilities to accommodate the SBCT. This construction is expected to bring equipment into Hawaii from foreign ports as well as other islands or subinstallations within Hawaii. There is no explanation of whether this equipment will arrive by aircraft or if ocean-going vessels would transport the equipment via Kawaihae Harbor. Any increase in marine vessel traffic, especially barge traffic, will result in an increased likelihood that marine alien species would be introduced into Kawaihae Harbor.	F5-62 There is no significant increase in vessel traffic. Only 6 additional trips will occur per year. Therefore, this increase is not considered significant and additional risk of invasive species is negligible.
	This is particularly true if the vessel is originating from Pearl Harbor. We recommend a description of transport procedures be added to the FEIS. Using this information, we also ask that you describe the potential for alien species introductions to occur, as well as any offsetting measures or mitigation that will be employed.	
F5-63	<u>Pg. 8-147, Threat to Migratory Birds</u> : The DEIS states that the construction and subsequent presence of FTI antennas would not significantly affect migratory bird species known to occur in the SBMR ROI, though the DEIS does not mention the potential effect of antennas on the endangered dark-rumped petrel at PTA. We recommend the potential impact to the petrel from antennas and towers that will be constructed at PTA, as well as other installations involved in this action, be assessed and reported.	F5-63 The text was changed to incorporate this request. A full description of the antennas is located in Appendix D, however, in general they are no taller than 10 feet and will be mounted on already existing structures where available.

Comments

- F5-64** | Pg. 9-2, Critical Habitat: Final critical habitat has been identified, though an analysis of transformation-related actions in areas of critical habitat is not included in the DEIS. We recommend this section include an analysis of cumulative effects to critical habitat as designated for plants and bird species.
- F5-65** | Pg. 9-31, Water Resources, paragraph 1 and 2: This description recognizes the potential cumulative impacts to surface water quality both within the project area due to training activities and throughout adjacent watersheds. However, the discussion does not present a thorough description of how these impacts will be mitigated to less than significant levels as described in Table 9-3. The discussion recognizes that some watersheds adjacent to the ROI are undergoing development of Total Maximum Daily Load-related water quality improvement requirements, because they are already demonstrably impaired as indicated by their consistently exceeding State water quality standards.
- We recommend that cumulative impacts be considered significant unless soil erosion, as predicted by ATTACC modeling and/or other analysis methods, can be directed away from surface waters with well-defined and enforceable erosion control measures.
- F5-66** | Appendix I-1, pg. I-1-2: The Service recently released a Draft Revised Recovery Plan for Hawaiian Forest Birds (August 2003), which includes the Oahu elepaio, a species found at SBMR on Oahu; and the palila and akiapolaau, which are found at PTA. We recommend the appendix specifically reference the recovery plan.
- F5-67** | Appendix I-1, pg. I-1-23 *Chasiempis sandwichensis ibidis*: The information about the status of elepaio at SBMR is not accurate. As stated previously, approximately 340 elepaio are known from SBMR (VanderWerf et al. 2001), or 15% of the total population, a value not mentioned in the DEIS. Also, SBMR is not in the southern Waianae area, Puu Hapapa is not in SBER, and elepaio are not currently known from the Schofield-Waikane Trail. We ask that you reassess the potential impacts to the elepaio, and that the results be incorporated into the FEIS.
- Additional Comments**
- The following comments address typographical errors, table formatting and content, and other less substantive items. Although repetitive, we also include corrections to many of the references to plant critical habitat throughout the document.
- F5-68** | Pg. 3-63, Resource Overview: The numbers of listed species should read “381 listed species, including 88 animals and 293 plants.”
- F5-69** | Pg. 3-65, paragraph 2: Critical habitat boundaries for listed Hawaiian plants are now in their final form. We recommend the final geographical data sets be used in the analysis. This comment applies to all references in the DEIS to “proposed” plant critical habitats. The FEIS should analyze impacts from transformation-related training based on final plant critical habitat.
- F5-70** | Pg. 3-66, Figure 3-14: The figure title should read “Overview of Federally Designated Critical

Responses

- F5-64**
- Information on the designation on final critical habitat has been included in the document and was considered in the Army's analysis of impacts on biological resources. Please see Sections 4.10, 5.10, 6.10, 7.10, and 8.10 for a discussion of impact on Biological Resources.
- F5-65**
- After further analysis the Army has changed the impact analysis on soil loss to significant. Although the mitigation measure described in Section 4.9 will reduce the impacts considerably they will not reduce them to less than significant. However, as discussed most of this soil loss will be from dust erosion the measures to be implemented (described below) will reduce soil erosion from other causes to less than significant and would minimize erosion into surface waters. Therefore the impact to surface water quality due to soil erosion is still considered less than significant. The mitigation measures that will be put in place include: The Army will develop and implement a Dust and Soils Management and Monitoring Plan (DuSMMoP) for the training area. The plan will address measures such as, but not limited to, restrictions on the timing or type of training during high risk conditions, vegetation monitoring, soil monitoring, and buffer zones to minimize dust emissions in populated areas. The plan will determine how training will occur in order to keep fugitive dust emissions below CAA standards for PM10 and soil erosion and compaction to a minimum. The Army will monitor the impacts of training activities to ensure that emissions stay within the acceptable ranges as predicted and environmental problems do not result from excessive soil erosion or compaction. The plan will also define contingency measures to mitigate the impacts of training activities which exceed the acceptable ranges for dust emissions or soil compaction.
- The Army will implement land management practices and procedures described in the ITAM annual work plan to reduce erosion impacts (US Army Hawai'i 2001a). Currently these measures include: implementation of a training requirement integration (TRI) program; implementation of an Integrated Training Area Management (ITAM) program; Sustainable Range Awareness (SRA) program; development and enforcement of range regulations; implementation of an Erosion and Sediment Control Management Plan; coordinating with other participants in the Ko'olau Mountains Watershed Partnership (KMWP); and continued implementation of land rehabilitation projects, as needed, within the Land Rehabilitation and Maintenance (LRAM) program. Examples of current LRAM activities at

Comments

- F5-70 cont'd** | Habitat on Oahu." In addition, we recommend that the figure legend be updated to indicate 55,040 acres of final plant critical habitat.
- F5-71** | Pg. 4-61, Significant Impacts, Impact 1: The last sentence should be changed to include SBER and read: "The combined impacts of fire at PTA, SBMR, and KTA (where live-fire is proposed) and KLOA, SBER, and DMR (where non-live-fire training is proposed)..."
- F5-72** | Pg. 4-61, Significant Impacts, Impact 1: The last sentence should be changed to include SBER and read: "The combined impacts of fire at PTA, SBMR, and KTA (where live-fire is proposed) and KLOA, SBER, and DMR (where non-live-fire training is proposed)..."
- F5-73** | Pg. 5-148, Sensitive Habitats, Critical Habitat: As described above, the acreage given in the DEIS as critical habitat for the Oahu elepaio is not accurate. In Figure 5-37 the area marked as elepaio critical habitat represents the current range of the elepaio. The designated critical habitat area for elepaio is considerably larger in size and we recommend that it be clearly identified. As mentioned previously, Oahu plant critical habitat has been established in its final form. We recommend that the incorrect figure of 4,554 acres be corrected to 180 acres for 12 plants.
- F5-74** | Pg. 5-148, Sensitive Plant Species: We recommend that the number of sensitive plant species identified in the DEIS be changed from 59 to 57 to reflect the most current information. Also, the second sentence should be changed to read: "The USFWS has also designated critical habitat for areas within the SBMR ROI."
- F5-75** | Pg. 5-149, Table 5-23: We offer the following recommendations for this table:
- Remove the words "or Potentially Occurring" from the title; all occurrences have been confirmed.
 - A notation of critical habitat should be indicated for the following species: *Abutilon sandwicense*, *Delissea subcordata*, *Flueggea neowawraea*, *Hesperomannia arborescens*, *Isodendron longifolium*, *Nototrichium humile*, and *Phyllostegia kaalaensis*.
 - The "dates last observed" for *Abutilon sandwicense* and *Alsinidendron trinerve* should be changed from unknown to 2003, and the U should be changed to C (see Army database);
 - The Federal status of *Bobea sandwicensis* should be changed from "-" to SOC;
 - *C. calcamia*: this line appears to be a typographic error and should be removed;
 - *C. lanceolata* ssp. *calcynia* should be inserted after *C. koolauensis* with the common name Haha, Federal status C, state/global status -/G1, date last observed 1999, and likelihood of occurrence C;
 - *Cyanea membranacea* should be inserted after *C. lanceolata* ssp. *calcynia* with the common name Haha, Federal status SOC, state/global status -/G2, date last observed 1992, and likelihood of occurrence C;
 - *Dissochondrus biflorus* likelihood of occurrence should be changed from P to C;
 - *Doodia lyonii* should be inserted after *Dissochondrus biflorus* with the common name NCN, Federal status SOC, state/global status -/G1, date last observed 1993 and likelihood of occurrence C;
 - *Dubautia sherffiana* likelihood of occurrence P should be changed to C;

Responses

projects involving site preparation, liming, fertilization, seeding or hydroseeding, planting trees, irrigation, and mulching; a combat trail maintenance program (CTP); coordination through the Troop Construction Coordination Committee (TCCC) on road maintenance projects; and development of mapping and GIS tools for identifying and tracking progress of mitigation measures.

cont'd

- *Exocarpos gaudichaudii* likelihood of occurrence P should be changed to C;
- *Hesperomammia arborescens* likelihood of occurrence P should be changed to C;
- *Joinvillea ascendens* ssp. *ascendens* should be inserted after *Isodendron longifolium* with the common name Ohe, Federal status C, state/global status -/G5, date last observed 1999 and likelihood of occurrence C;
- *Labordia kaalae* likelihood of occurrence P should be changed to C;
- *Lipochaeta lobata* var. *leptophylla* should be removed entirely as it does not occur within the ROI;
- *Lipochaeta tenuis* likelihood of occurrence P should be changed to C;
- *Lobelia oahuensis* should be removed entirely as it does not occur within the ROI;
- *Lobelia hypoleuca* Federal status should be changed from “-“ to SOC;
- *Lobelia yuccoies* should be inserted after *Lobelia hypoleuca* with the common name Panaunau/-, Federal status SOC, date last observed 1995 and likelihood of occurrence C;
- *Melicope christophersonii* should be inserted after *Lobelia yuccoies* with the common name Alani/-, Federal status C, date last observed 1997, and likelihood of occurrence C;
- *Melicope cinera* likelihood of occurrence P should be changed to C;
- *Melicope sandwicensis* should be inserted after *Melicope christophersonii* with the common name Alani/-, Federal status SOC, date last observed 1993, and likelihood of occurrence C;
- *Neraudia angulata* var. *angulata* and *Nothocestrum latifolium* should be removed entirely this species does not occur within the ROI;
- *Nototrichium humile* should be inserted after *Neraudia melastomatifolia* with the common name Kului/-, Federal status E, date last observed 2000, and likelihood of occurrence C;
- *Platydesma cornuta* var. *decurrens* should be inserted after *Platydesma cornuta* var. *cornuta* with the common name pilo kea /-, Federal status C, date last observed 1999, and likelihood of occurrence C;
- *Pritchardia kaalae* should be removed entirely as it does not occur within the ROI;
- *Schiedea kaalae* should be inserted after *Schiedea hookeri* with the common name Maolioli, /-, Federal status E, state/global status -/G1, date last observed 1999, and likelihood of occurrence C;
- *Schiedea nuttallii* should be removed entirely, this species does not occur in the ROI;
- *Schiedea pentandra* should be inserted after *Schiedea linguistrina* with the common name Maolioli /-, Federal status SOC, state/global status -/G2, date last observed 1994, and likelihood of occurrence C; and,
- *Zanthoxylum oahuense* should be removed entirely, this species does not occur within the ROI.

F5-76

Pg. 5-150, Table 5-23: The common name of *Nothocestrum latifolium* is listed as kulu'i. The correct common name is 'aiea.

F5-77

Pg. 5-151, Figure 5-34: We recommend changes to this table as follows: *Alectryon macroccus macroccus* should be removed; it is misspelled and listed twice. The following species should be removed from the list: *Lipochaeta lobata leptophylla*, *Lobelia* sp., *Neraudia angulata angulata*, *Schiedea mannii*, *Schiedea pubescens purpureascens*, *Tetramoloptium lepidotum lepidotum* *Urera kaalae* and *Wollastonia tenuis*. The following should be added to the list with corresponding data points on the map: *Alsiniidendron trinerve*, *Bobea sandwicensis*, *Lobelia*

F5-76

It was determined that this species likely does not occur in the ROI and it has been removed from the table.

F5-77

The GIS points for these species were added to the figure. However, when cropping the image to fit inside the ROI, only 14 of the 17 additional species were shown to occur. Our GIS info came from HINHP.

F5-77 cont'd	<i>niihauensis</i> , <i>Cyrtandra subumbellata</i> , <i>Cyrtandra viridiflora</i> , <i>Lobelia hypoleuca</i> , <i>Melicope sandwicensis</i> , <i>Melicope christophersonii</i> , <i>Nototrichium humile</i> , <i>Panicum beechyi</i> , <i>Phlegmariarum nutans</i> , <i>Phyllostegia mollis</i> , <i>Plantago princeps</i> var. <i>princeps</i> , <i>Platydesma cormuta</i> var. <i>cormuta</i> , <i>Sanicula purpurea</i> , <i>Schiedea kaalae</i> , and <i>Schiedea pentandra</i> .	
F5-78	Pg. 5-155, Figure 5-36: Final plant critical habitat adjacent to SBMR has been identified though it is not reflected in the DEIS. We recommend the figure caption be changed from "proposed" to "final" and that the map be updated to reflect the final critical habitat designations.	F5-78 The figure was changed to incorporate this response.
F5-79	Pg. 5-161, paragraph 4: Insert "(<i>Alectryon macrococcus</i> var. <i>macrococcus</i>)" after "mahoe;" insert "(<i>Lepidium arbuscula</i>)" after "anaunau;" and insert "(<i>Viola chamissoniana</i> ssp. <i>chamissoniana</i>)" after "olopu."	F5-79 The text was changed to incorporate this request.
F5-80	Pg. 5-162 to 163, Impact 2: Revise to recognize final designation of critical habitat for plants in the SBMR ROI. We recommend removal of "or proposed" in the title of the section. We also recommend the following: changing <i>C. grimesiana</i> ssp. <i>grimesiana</i> to <i>C. grimesiana</i> ssp. <i>obatae</i> ; remove <i>L. kaalae</i> , <i>Lipochaeta lobata</i> var. <i>leptophylla</i> , <i>L. tenuis</i> , <i>L. hypoleuca</i> ; transpose <i>P. kaalensis</i> and <i>P. mollis</i> ; remove <i>Platydesma cormuta</i> var. <i>decurrens</i> , <i>P. cormuta</i> var. <i>cormuta</i> , <i>Pleomele forbesii</i> , <i>Pritchardia kaalae</i> , <i>Pteralyxia macrocarpa</i> ; insert <i>S. kaalae</i> ; and remove <i>S. nuttallii</i> , <i>Solanum sandwicense</i> , <i>Strongylodon ruber</i> , <i>Tetramolopium lepidotum</i> spp. <i>lepidotum</i> , and <i>Urera kaalae</i> .	F5-80 The text was changed to incorporate this request.
F5-81	Pg. 5-163 paragraph 3: We recommend this paragraph be changed to recognize the final designation of critical habitat for plants in the SBMR ROI. The reference to proposed plant critical habitat should be removed from the second line to read "It is also near the Oahu elepaio's federally designated critical habitat." The extent of critical habitat reported for plants is not accurate: 4,554 acres should be changed to 180 acres.	F5-81 The text was changed to incorporate this response however, our calculations indicate 910 acres of plant critical habitat within the ROI.
F5-82	Pg. 5-163 paragraph 4: We recommend this paragraph be changed to recognize the final designation of critical habitat for plants in the SBMR ROI.	F5-82 The text was changed to incorporate this response.
F5-83	Pg. 5-163, Regulatory and Administrative Mitigation 2: We recommend this paragraph be changed to recognize the final designation of critical habitat for plants in the SBMR ROI. We recommend removing the line "The USARHAW would consult about the proposed plant critical habitat when it receives its federal designation."	F5-83 The text was changed to incorporate this response.
F5-84	Pg. 5-165, Table 5-27: We recommend revisions to this table as follows: <ul style="list-style-type: none"> to maintain consistency, insert "ssp." between <i>grimseana</i> and <i>obatae</i> for <i>Cyanea grimseana</i> ssp. <i>obate</i>; insert the common name, Palapalai lau lili, and surround <i>Diellia falcata</i> with parentheses; insert the common name, Kamakahala, and surround <i>Labordia cyrtandrae</i> with parentheses; insert the common name, Lanaunau, and surround <i>Lepidium arbuscula</i> with parentheses; insert the common name, Ulihi, and surround <i>Phyllostegia mollis</i> with parentheses; insert "var. <i>princeps</i>" after <i>Plantago princeps</i>; and 	F5-84 The text was changed to incorporate this request.

Comments

- F5-84** | • insert the common name, Maolioli and surround *Schiedea hookeri* with parentheses.
cont'd
- F5-85** | Pg. 5-167, Impact 4, first paragraph: The number of special status plant species is not accurate. We recommend that the number "59" be changed to "57."
- F5-86** | Pg. 5-173, Impacts on Federally listed species and their federally designated or proposed critical habitat: To be consistent with other clarifications made to the DEIS, we recommend removal of "or proposed" from the title of the section. In the second paragraph, we recommend removal of the line "It would consult about proposed plant habitat for its designation," and removal of "or proposed" from the fifth line of the paragraph.
- F5-87** | Pg. 6-71, paragraph 1: We recommend removal of the last sentence, which refers to unspecified listed plant species at DMR.
- F5-88** | Pg. 6-71, Disturbed Habitat, paragraph 2: The last sentence is not accurate because the native habitat is accessible to pigs. We recommend this sentence be removed.
- F5-89** | Pg. 6-80, Table 6-19: There are no sensitive plant species found within the DMR ROI. We recommend this table be removed.
- F5-90** | Pg. 6-84, Critical Habitat: We recommend this paragraph be edited to read: "Three and three-tenths acres of plant critical habitat have been designated for *Hibiscus brackenridgei* ssp. *mokuleianus* and *Schiedea kealiae* within the DMR ROI. The listed plants for which critical habitat is designated are identified in Appendix I-1d. There is no federally designated or proposed critical habitat for other wildlife within the DMR ROI."
- F5-91** | Pg. 6-85, Figure 6-17: We recommend removal of the word "proposed" and inclusion of appropriate edits to reflect the designation of final plant critical habitat.
- F5-92** | Pg. 6-89, Impact 2: There are no listed species within the DMR ROI and, therefore, listed species would not be impacted by training at that installation. Since critical habitat has been designated, we recommend this section be changed to recognize final designation of critical habitat for Oahu plants.
- F5-93** | Pg. 6-90, paragraph 1, last sentence: We recommend this section be changed to recognize final designation of critical habitat for Oahu plants.
- F5-94** | Pg. 6-90, Regulatory and Administrative Mitigation 2: We recommend this section be changed to recognize final designation of critical habitat for Oahu plants. We also recommend removing the sentence "The USARHAW would consult about the proposed plant critical habitat when it receives its federal designation."
- F5-95** | Pg. 6-90, paragraph 2: DMR does not currently contain listed plant species, therefore, we recommend that the last sentence be removed.

Comments

- F5-96** | Pg. 7-73, Recovery Plan: The number of plant species is not accurate and should be changed from "11" to "36."
- F5-97** | Pg. 7-76, paragraph 3: The last sentence refers to the wet cliff habitat as providing effective protection from wild pigs. This statement is not accurate because wild pigs can access many cliff habitats. We recommend removing this sentence.
- F5-98** | Pg. 7-76, paragraph 4: We recommend removal of the sentence beginning with "Rare plants listed within this community..." because most of the plants are incorrectly identified.
- F5-99** | Pg. 7-76, paragraph 5: To maintain consistency, we recommend the following: insert "(*Melicope* spp.)" after alani; insert haiwale before *Cyrtandra viridifolia*; insert parentheses around *Cyrtandra viridifolia*; delete "*Lycopodium*" and replace it with "(*Phlegmariarius*)," insert "wawaeiole" before *Phlegmariarius*; and insert "heae" before (*Zanthoxylum oahuense*).
- F5-100** | Pg. 7-77, paragraph 1: Again, for consistency, we recommend the following: add "spp." to (*Myrsine*); insert "nanu" before *Gardenia mamii*; and surround *Gardenia mamii* with parenthesis.
- F5-101** | Pg. 7-77, paragraph 2: For consistency, we recommend the following: insert "olapa" before *Cheirodendron*; insert "spp." after *Cheirodendron* and surround *Cheirodendron* spp. with parenthesis; insert "amau" before *Cibotium* and surround *Cibotium* spp. with parenthesis; insert "(*Dubautia* spp.)" after naenae; insert "nanu" before *Gardenia mamii*; and surround *Gardenia mamii* with parenthesis.
- F5-102** | Pg. 7-77, paragraph 3: For consistency, we recommend the following: insert "uluhe" before *Dicranopteris linearis* and place *Dicranopteris linearis* in parenthesis.
- F5-103** | Pg. 7-77, paragraph 4: For consistency, we recommend that "(*Psychotria* spp.)" be inserted after kopiko.
- F5-104** | Pg. 7-79, paragraph 1: Because more than one species of *Pritchardia* occur in the Koolau mountains, we recommend removal of the name *Pritchardia kaalae* and the insertion of "*Pritchardia* spp" in its place.
- F5-105** | Pg. 7-82, paragraph 1: We recommend the following changes: replace "twenty four" with "20," "four" with "six," and "eight" with "ten;" remove "(a federally recognized species of concern);" and add the following species to the paragraph: *Chamaesyce rockii*, *Cyanea acuminata*, *C. crista*, *C. humboldtiana*, *C. koolauensis*, *C. lanceolata*, *C. st.-johnii*, *Cyrtandra dentata*, *C. viridiflora*, *Doodia lyonii*, *Eugenia koolauensis*, *Exocarpus gaudichaudii*, *Hedyotis fluviatilis*, *Hesperomannia arborescens*, *Hibiscus kokio* ssp. *kokio*, *Joinvillea ascendens* ssp. *ascendens*, *Lobelia gaudichaudii* ssp. *koolauensis*, *Lobelia hypoleuca*, *Melicope hiiaekae*, *M. lydgatei*, *Myrsine fosbergii*, *Nesoluma polynesianum*, *Phlegmariarius nutans*, *Phyllostegia hirsuta*, *Platydesma cornuta* var. *cornuta*, *Psychotria hexandra* ssp. *oahuensis*, *Pteris lidgatei*, *Sanicula purpurea*, *Stenogyne kaakae* ssp. *sherfii*, *Tetraplasandra gymnocarpa*, and *Thelypteris boydiae*.

- F5-105 cont'd** Also, remove “(federally recognized endangered species)” and add KLOA to the ROI title.
- F5-106** Pg. 7-83, Table 7-20: We recommend the following:
- remove *Bobea timonioides*, *Lobelia gaudichaudii* ssp. *gaudichaudii*, and *Viola kauaensis* as they do not occur with the ROI;
 - insert *Doodia lyonii* after *C. viridiflora* with a common name NCN, Federal Status SOC, State/Global Status -/G1 and Likelihood of Occurrence C;
 - insert *Hibiscus kokio* ssp. *kokio* after *Hesperomammia arborescens* with a common name kokio ula, Federal Status SOC, and Likelihood of Occurrence C;
 - insert *Joinvillea ascendens* ssp. *ascendens* after *Hibiscus kokio* ssp. *kokio* with a common name Ohe, Federal Status C, State/Global Status -/G5 and Likelihood of Occurrence C;
 - insert *Lobelia gaudichaudii* ssp. *koolauensis* after *Joinvillea ascendens* ssp. *ascendens* with a common name NCN, Federal Status E, State/Global Status -/ and Likelihood of Occurrence C;
 - insert *Lobelia hypoleuca* after *Lobelia gaudichaudii* ssp. *koolauensis*, common name NCN, Federal Status SOC, State/Global Status -/G3 and Likelihood of Occurrence C;
 - change the Likelihood of Occurrence of P for *Myrsine fosbergii* to C;
 - insert *Myrsine juddii* after *Myrsine fosbergii* with a common name kolea, Federal Status E, State/Global Status -/G1 and Likelihood of Occurrence C;
 - change the Likelihood of Occurrence of P for *Pteralyxia macrocarpa* to C and the Federal Status from NCN to C;
 - correct the spp. in *Stenogyne kaakae* spp. *Sherfii* to ssp., lower case *sherfii*, and change the Federal Status from E to SOC;
 - change the common name for *V. oahuensis* to olopu; and,
 - change the common name for *Zanthoxylum oahuense* to ae.
- F5-107** Pg. 7-90, Figure 7-22: We recommend replacement of “proposed” with “final” and revision of the map to reflect the final designation for plants.
- F5-108** Pg. 7-92, paragraph 3: The number of threatened or endangered plant species withing KTA is not accurate. We recommend replacement of “twelve” with “five” and revision of the list of species to reflect this correction by removal of “*Labordia cyrtandrae*,” “*Phyllostegia parviflora* var. *parviflora*” and “*Platanthera holochila*.” The name of the genus, *Lycopodium*, has changed and should be corrected to read “*Phlegmariarus*.”
- F5-109** Pg. 7-94, last paragraph: The list of plant species that occur in particular community types is incomplete, we recommend revising the list to read: “*Chamaesyce rockii*, *Cyanea acuminata*, *C. crispa*, *C. humboldtiana*, *C. koolauensis*, *C. lanceolata*, *C. st.-johnii*, *Cyrtandra dentata*, *C. viridiflora*, *Doodia lyonii*, *Eugenia koolauensis*, *Exocarpus gaudichaudii*, *Gardenia mannii*, *Hedyotis fluvialis*, *Hesperomammia arborescens*, *Hibiscus kokio* ssp. *kokio*, *Joinvillea ascendens* ssp. *ascendens*, *Lobelia gaudichaudii* ssp. *koolauensis*, *Lobelia hypoleuca*, *Melicope hiiakae*, *M. lydgatei*, *Myrsine fosbergii*, *Myrsine juddii*, *Nesoluma polynesicum*, *Phlegmariarus mutans*, *Phyllostegia hirsuta*, *Platodesma cornuta* var. *cornuta*, *Psychotria hexandra* ssp. *oahuensis*, *Pteralyxia macrocarpa*, *Pteris lidgatei*, *Sanicula purpurea*, *Stenogyne kaakae* ssp. *sherfii*, *Tetraplasandra gymnocarpa*, *Thelypteris boydiae*, *V. oahuensis*, and *Zanthoxylum oahuense*.”

Location if Known, Status Key: We recommend removal of “Federally” from “Federally listed as a species of concern.” There is no official Federal list for this category.

The following species descriptions should be removed from this section: *B. timonioides*, *Cyperus trachysanthos*, *Diplazium molokaiense*, *H. parvula*, both paragraphs for *Hibiscus brackenridgei* ssp. *mokuleianus*, *I. laurifolium*, *L. bidentatum* var. *o-waihiense*, *Lipochaeta lobata* var. *leptophylla*, *L. remyi*, *Lobelia gaudichaudii* ssp. *gaudichaudii*, *L. oahuensis*, *Pritchardia kaalae*, *S. nuttallii*, *S. kealiae*, *S. sandwicense*, *S. kanehoena*, *S. sherfii*, *T. lepidoptum* spp. *lepidoptum*, *Urera kaalae*, and *Viola kauaensis*.

Descriptions for the following species should be added to this section: *C. crispa*, *C. grimseana* ssp. *obatae*, *C. humboldtiana*, *C. lanceolata* ssp. *calcynia*, *C. membranacea*, *Doodia lyonii*, *Hedyotis fluvialis*, *Lobelia hypoleuca*, *Melicope sandwicensis*, *Myrsine juddii*, *Meraudia melastomatifolia*, *Mesohuma polynesicum*, *Panicum beechyi*, *Phyllostegia kaalensis*, *Portulaca villosa*, *Schiedea linguistrina*, *Schiedea kaalae*, *Schiedea pentandra*, *Stenogyne kaakae* ssp. *sherfii*, and *Strongylodon ruber*.

F5-122

Pg. I-1-4, I-1B: The information in the species paragraphs is not accurate, and the accurate information may be obtained from the BO for Routine and Transformation-related training. We ask that you incorporate this information into the FEIS.

F5-123

Appendix I-3, Special Status Species confirmed or with the Potential to Occur in Each ROI: We recommend incorporating the following changes to this table:

- remove the following species because they do not occur within the ROIs: *Bobea timonioides*, *C. waiolani*, *Lipochaeta lobata* var. *leptophylla*, *Lobelia gaudichaudii* ssp. *gaudichaudii*, *Nerandia angulata* var. *angulata*, *Nothocestrum latifolium*, *Schiedea nuttallii* var. *nuttallii*, *T. lepidotum* spp. *lepidotum*, *Urera kaalae*, and *V. kauaiensis*;
- add “NCN” to *Abutilon sandwicense*;
- replace the *A.* of *A. trinerve* with “*Alsinidendrion*” and add “NCN” for the common name;
- replace the Federal status of *Bobea sandwicensis* with “SOC” and remove its presence from DMR;
- change the subspecies of *C. lanceolata* spp. *Calcynia* to “ssp. *calcynia*”;
- replace the Federal status of *Doodia lyonii* with “SOC” and add a X under KTA/KLOA;
- switch the order of *Diellia falcata* and *Delissea subcordata*;
- insert *Hibiscus kokio* ssp. *kokio*, common name kokio ula, after *Hesperomannia arborescens*, Federal status SOC, KLOA;
- change the “spp.” in *Joinvillea* to “ssp.” and correct the spelling of the genus;
- replace the Federal status of *L. hypoleuca* with “SOC”;
- insert *L. yuccoides*, common name NCN, after *L. niuhauensis*, Federal status SOC, SBMR;
- insert *Melicope christophersenii*, common name alani, after *L. yuccoides*, Federal status C, SBMR;
- replace the Federal status of *Melicope cinera* with SOC;
- insert *Melicope sandwicensis*, common name alani, after *Melicope cinera*, Federal status SOC, SBMR;
- replace the Federal status for *Portulaca villosa* with SOC;

Subject: Draft Environmental Impact Statement Comments
Transformation of the 2nd Brigade

Dear Ms. Barger:

The Federal Highway Administration – Central Federal Lands Highway Division (CFLHD) in cooperation with the Hawaii Department of Transportation (HDOT), are proposing to improve Saddle Road, State Route (SR) 200, in the County of Hawaii. As the lead agency for the Saddle Road improvement project, we offer the following comments on the subject document.

General:

F6-1

The proposed Saddle Road improvements will extend from mile marker 6 in Kaumana to Mamalahoa Highway, SR 190. The westerly 12 miles of the Saddle Road improvement project (referred to as W-3) will be realigned southwesterly of its current location. The new alignment passes through the lower portion of the proposed land acquisition and expansion of the Pohakuloa Training Area (PTA). Consideration should be given to limiting the proposed acquisition to north of the proposed W-3 alignment, or if necessary, to conducting additional environmental studies to address any desired alignment shifts of the W-3 alignment to avoid conflicts between military training and public traffic on the new Saddle Road.

Page 4-40: Less than Significant Impacts:

F6-2

Intersection Operations. The reference in the first paragraph to several public crossings of the Helemano Trail between SBMR and HMR is apparently erroneous. The cited crossings (Queen Ka'ahumanu Highway, Kawaihae Road, and Mamalahoa Highway) are with roads in the County of Hawaii, not on Oahu.

F6-3

In the second paragraph, the trail between PTA and Kawaihae Harbor is noted as crossing the Mamalahoa Highway (SR 190) south of Saddle Road. On page 8-78 under Less than Significant

Responses

F6-1

The new Saddle Road alignment is proposed through the southern portion of the West PTA Acquisition Area. The U.S. Department of Transportation, Federal Highway Administration (FHA), could not provide a firm construction date at this time for this section of the new Saddle Road. If the Army decides to implement the proposed action, the Army will coordinate all road crossings with the FHA to minimize impacts to traffic along the new Saddle Road. Phase III of the Saddle Road realignment (which is from PTA West) has not yet been designed. Upon a favorable Record of Decision (ROD), the Army would purchase the Ke'āmuku and own the land bordering both sides of this section to Saddle Road. The Army would request that the road design be conducive to training needs, which would include a possible road crossing with traffic control devices and an appropriate number of troop underpasses (which has not been determined yet). Proper use of these two means of crossing the public road would not seriously hamper military training, as many realistic scenarios found in real world situations involve consideration of public roadways.

F6-2

Section 4.7.3 has been revised to correct the information.

F6-3

Section 4.7.3 has been revised to correct the information.

Comments

F6-3 cont'd | Impacts, this crossing is reported to be north of Saddle Road. This location inconsistency should be corrected here as well as in any other sections of the document that refers to the trail crossing of SR 190.

Page 9-17: *Saddle Road Realignment – Island Of Hawai'i (Project 5)*:

F6-4 | The second sentence indicates that approximately 250 miles (402 kilometers) of Saddle Road will be modernized to AASHTO standards. The actual improvements to Saddle Road will be approximately 50 miles in length.

Page 9-29: Traffic - Proposed Action:

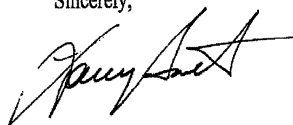

F6-5 | The subject document states that the cumulative impacts of various anticipated highway projects and the vehicle trail crossings would have to be addressed by the environmental assessment of the specific highway project. If there will be any trail crossings with the Saddle Road improvement project, the cumulative impacts should be addressed by the proposed trail project. The Saddle Road Environmental Impact Statement was completed in late 1999.

Page 9-30: Traffic - Proposed Action:

F6-6 | The first sentence of the first paragraph states that the (Saddle Road) project will have no impact on the proposed military trail element because the trail will not cross the Saddle Road. Although it is conceivable that the trail will not necessarily have to cross the new Saddle Road alignment (W-3) in the proposed land acquisition, it seems probable that it will. If true, it may be possible to avoid an 'at-grade' trail crossing by constructing a roadway bridge to separate the military and public traffic.

Thank you for the opportunity to comment of the draft Transformation Environmental Impact Statement. Should the land acquisition portion of the Transformation proposal move forward, we recommend scheduling a meeting to coordinate the common elements of this important effort with those of the proposed Saddle Road improvement project. If you have any questions, please contact Mr. Dave Gedeon at 303-716-2131.

Sincerely,

Larry C. Smith, P.E.
Division Engineer

Responses

F6-4

Section 9 corrected.

F6-5

The new Saddle Road alignment is proposed through the southwestern portion of the West PTA Acquisition Area. The U.S. Department of Transportation, Federal Highway Administration (FHA), confirmed that there are no scheduled funds and no scheduled construction date at this time for this section of the new Saddle Road. If the Army decides to implement the proposed action, the Army would coordinate with FHA to reduce the number of crossings of the new Saddle Road and where practicable have crossing go under the road versus across grade, thereby minimizing any impact to traffic along the new Saddle Road. If the Army decides to implement the proposed action, the Army would coordinate with FHA to limit training activities likely to disturb traffic in proximity to Saddle Road during high traffic periods. WPAA acquisition is part of the project description and impacts caused by this project component are discussed under the appropriate resource categories in Chapter 8.

F6-6

The new Saddle Road alignment is proposed through the southern portion of the West PTA Acquisition Area. The U.S. Department of Transportation, Federal Highway Administration (FHA), could not provide a firm construction date at this time for this section of the new Saddle Road. If the Army decides to implement the proposed action, the Army will coordinate all road crossings with the FHA to minimize impacts to traffic along the new Saddle Road. Phase III of the Saddle Road realignment (which is from PTA West) has not yet been designed. Upon a favorable Record of Decision (ROD), the Army would purchase the Ke'amuku and own the land bordering both sides of this section to Saddle Road. The Army would request that the road design be conducive to training needs which would include a possible road crossing with traffic control devices and an appropriate number of troop underpasses (which has not been determined yet). Proper use of these two means of crossing the public road would not seriously hamper military training, as many realistic scenarios found in real world situations involve consideration of public roadways.

Subject: Draft Environmental Impact Statement, Transformation of 2nd Brigade, 25th
Infantry Division to Stryker Brigade Combat Team, Hawaii (CEQ #030442)

Dear Ms. Barger:

The U.S. Environmental Protection Agency (EPA) has reviewed the Draft Environmental Impact Statement (DEIS) for the above-referenced project. Our comments are provided under the National Environmental Policy Act (NEPA), the Council on Environmental Quality's NEPA Implementing Regulations (40 CFR Parts 1500-1508), and Section 309 of the Clean Air Act. Our detailed comments are enclosed.

Three alternatives are fully evaluated: No Action, a Reduced Land Acquisition Alternative, and the Proposed Action. We rate the DEIS and Proposed Action as EC-2, Environmental Concerns - Insufficient Information. Please see the enclosed "Summary of Rating Definitions" for a detailed explanation of EPA's rating system.

EPA has environmental concerns due to a stated "likelihood" that the Proposed Action potentially exceeds the National Ambient Air Quality Standard (NAAQS) for particulate matter less than 10 microns in diameter (PM10) at Schofield Barracks Military Reservation (SBMR), Dillingham Military Reservation, Kahuku Training Area, and Pohakuloa Training Area. Increased PM10 emissions are projected under the Proposed Action, including a doubling of PM10 emissions (to 1,640 tons per year) at SBMR (Vol. 1, p. 5-55). Although the DEIS presents mitigation to reduce PM10 emissions, it does not quantify reductions, nor commit to implement mitigation to ensure that the PM10 NAAQS is not exceeded. Should the Army determine that emissions exceed the NAAQS, mitigation should be incorporated into the Proposed Action to ensure compliance with the Clean Air Act. Additionally, EPA recommends that the Army evaluate the feasibility of PM10 monitoring at all sites where the NAAQS would likely be exceeded, and implementing an adaptive management program for additional controls if the PM10 NAAQS is approached or exceeded.

Appendix P. Comments and Responses

Comments

We are also concerned that the DEIS does not address if increased emissions may have a disproportionately high, adverse effect on neighboring communities. The FEIS should address the extent to which PM10 mitigation will reduce or avoid potentially adverse air quality effects on such communities, and the extent to which they are involved in developing this project's mitigation.

We appreciate the opportunity to comment. Please send two copies of the FEIS when available. If you have any questions, please contact my staff reviewer for this project, David Tomsovic, at 415-972-3858 or <tomsovic.david@epa.gov>.

Sincerely,

Lisa B. Hanf, Manager
Federal Activities Office

SUMMARY OF EPA RATING DEFINITIONS

This rating system was developed as a means to summarize EPA's level of concern with a proposed action. The ratings are a combination of alphabetical categories for evaluation of the environmental impacts of the proposal and numerical categories for evaluation of the adequacy of the EIS.

ENVIRONMENTAL IMPACT OF THE ACTION

"LO" (Lack of Objections)

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

"EC" (Environmental Concerns)

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

"EO" (Environmental Objections)

The EPA review has identified significant environmental impacts that must be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

"EU" (Environmentally Unsatisfactory)

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potentially unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the CEQ.

ADEQUACY OF THE IMPACT STATEMENT

Category 1" (Adequate)

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

"Category 2" (Insufficient Information)

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analysed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

"Category 3" (Inadequate)

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analysed in the draft EIS, which should be analysed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

*From EPA Manual 1640, "Policy and Procedures for the Review of Federal Actions Impacting the Environment."

Comments

U.S. ENVIRONMENTAL PROTECTION AGENCY (EPA) DETAILED COMMENTS ON DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS) - TRANSFORMATION OF 2ND BRIGADE, 25TH INFANTRY DIVISION (L) TO STRYKER BRIGADE COMBAT TEAM - HAWAII - JANUARY 2, 2004

Air Quality

Fugitive Dust Emissions and Operational Training

EPA is concerned about a stated "likelihood" that the Proposed Action potentially exceeds the Federal 24-hour air quality standard for particulate matter less than 10 microns in diameter (PM10) at Schofield Barracks Military Reservation (SBMR) (Vol. 1, p. 5-55); Dillingham Military Reservation (DMR) (Vol. 1, p. 6-33); Kahuku Training Area (KTA) (Vol. 2, p. 7-34); and Pohakuloa Training Area (PTA) (Vol. 2, p. 8-51). The DEIS is unclear if the Proposed Action exceeds the National Ambient Air Quality Standard (NAAQS) at any training sites and, if so, whether proposed mitigation ensures that the PM10 NAAQS is not exceeded at any facility. The DEIS presents the following mitigation measures to reduce PM10 emissions from operational training on unpaved roads and off-road vehicle maneuver areas:

F7-1

- applying gravel cover on dirt roads and exposed areas;
- paving dirt roads and exposed areas;
- using periodic water spray applications to reduce fugitive dust;
- using synthetic dust control chemicals;
- rotating use among available areas to allow revegetation; and,
- implementing a reseeding program to enable revegetation between training periods (see, for example, Vol. 1, pp. 5-55 and 5-56 for SBMR; and Vol. 2, pp. 8-52 and 8-53 for PTA).

The DEIS discusses the anticipated effectiveness of two controls: a program of regular water spraying reduces PM10 emissions by 75 to 90 percent, and synthetic dust control chemicals achieve reductions exceeding 50 percent (Vol. 1, p. 5-56). However, the DEIS does not quantify the anticipated reductions that could be achieved using these strategies, nor what steps the Army intends to take if the Federal PM10 standard is exceeded. Because the DEIS does not have a specific commitment to mitigate PM10 emissions, it is unclear if the identified mitigation successfully eliminates the likelihood of exceeding the NAAQS at the facilities evaluated.

Recommendations: The Final EIS (FEIS) should quantify the anticipated PM10 reductions at each training site that would be achieved with mitigation. The FEIS should address what mitigation would be implemented at each facility to ensure that the Federal PM10 standard is not exceeded. The FEIS should address specific actions the Army would take if the Federal PM10 standard is approached or exceeded at any sites.

Responses

F7-1

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/ or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

Comments

Mitigation to Avoid Exceedances of the Federal PM10 Standard

Addressing fugitive dust from military vehicles on unpaved roads and off-road areas, the DEIS states, "The impact from fugitive dust emissions could be reduced through mitigation, but it is unlikely that the impact could be reduced to a less than significant level" (Vol. 1, p. 5-53). This conclusion is not substantiated. Although 88 percent of the net PM10 increase is due to vehicle use on unpaved roads, the DEIS does not specifically evaluate the emissions reduction that could be achieved by paving the most-traveled operational corridors and applying dust suppressants to less-traveled corridors and off-road vehicle maneuver areas. It also does not address the feasibility of reducing the overall area available for off-road vehicle maneuvers, especially at training sites where the Federal PM10 standard would likely be exceeded.

F7-2 Although not evaluated or quantified, additional controls may incrementally contribute to PM10 reductions as well. The DEIS does not address the feasibility of installing nets, tarp or other protective cover at locations where off-road maneuvers generally do not occur, but which are still susceptible to erosion and fugitive dust (e.g., areas of steep terrain). It does not address the feasibility of reducing the speed of vehicles on highly-eroded areas.

Since it is unclear if the mitigation presented in the DEIS is sufficient to ensure that the Federal PM10 standard is not exceeded, additional mitigation may be warranted. We attach for your reference a fugitive dust control plan prepared for the Naval Air Weapons Station, China Lake, California (1994). The Navy's plan may be useful in finalizing a fugitive dust mitigation program for the FEIS and Record of Decision. The Hawaii Department of Health may have additional recommendations as well.

Recommendations: If mitigation presented in the DEIS is insufficient to avoid likely exceedances of the Federal PM10 standard, the FEIS should address the feasibility of implementing additional controls, which may include those identified above. The Hawaii Department of Health should be consulted on such measures.

Air Quality Monitoring and Adaptive Management

F7-3 Volume 1 (p. 3-24) indicates that nine ambient air quality monitoring stations are maintained on the Island of Oahu, and five on the Island of Hawaii. No monitoring stations are sited at or near Army training facilities on the two islands. The DEIS does not address the feasibility of a PM10 monitoring program at training sites where the Federal PM10 standard would likely be exceeded. It does not address applicable Federal requirements for collecting representative monitoring data such as Section 2.3 (Data Requirements) of 40 CFR Part 50, Appendix K (Interpretation of the National Ambient Air Quality Standards for Particulate Matter). The DEIS does not evaluate the feasibility of implementing an adaptive management program that, as needed, strengthens and complements PM10 mitigation should the Federal standard be exceeded at any training site. The DEIS does not address the feasibility of additional controls that could be implemented if exceedances are confirmed by monitoring.

Responses

F7-2

The discussion of fugitive dust issues has been expanded in the Final EIS to include results of dispersion modeling to estimate PM10 concentrations from vehicle activity on unpaved roads and in off-road maneuver areas. As a mitigation measure, the Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/ or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. There are no indications that wind erosion is a significant problem at locations on USARHAW installations where there is no disturbance by vehicle maneuver traffic. The installation of nets, tarps, or other protective covers in barren areas where there is no vehicle use might help reduce general precipitation-related soil erosion, but such actions would have little effect in addressing fugitive dust issues.

F7-3

Applicable federal requirements for air quality surveillance programs apply to the State of Hawai'i, not to the Army. In addition, it should be noted that EPA reviews and approves the state air quality monitoring program. The existing distribution of monitoring stations has been approved by EPA as meeting Clean Air Act requirements. As noted in the Final EIS, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

Responses

F7-4

Normal dust control measures, such as those required by state regulations, would be incorporated into construction contracts. The emission estimates for fugitive dust from construction activities assumed implementation of normal dust control measures in a manner sufficient to provide 50% control of fugitive dust. Therefore, no additional dust control measures were discussed in the EIS. The DEIS includes emission estimates for all criteria pollutants generated by construction equipment engine operation. Since nitrogen oxide emissions are clearly the predominant pollutant of concern from diesel engine equipment, the text discussion focused on those emissions. Annual construction activity emissions for all criteria pollutants are illustrated in Figure 5-11 (Schofield Barracks), Figure 6-7 (DMR), Figure 7-9 (KTA), and Figure 8-10 (PTA). Appendix G2 presents annual construction activity emission estimates for individual construction projects at each installation. Because Hawai'i is an attainment area for all criteria pollutants, the implementation of special mitigation measures for reducing engine emissions from construction equipment was not considered necessary.

Comments

F7-3
cont'd

Recommendations: The FEIS should address the feasibility of air quality monitoring at training sites where exceedances of the Federal PM10 standard are likely, and an adaptive management program if controls currently proposed are insufficient to prevent exceedances of the Federal PM10 standard. An adaptive management program would be available for implementation if monitoring shows that the Federal PM10 standard is exceeded. An air quality monitoring program should be referenced in the Army's Record of Decision for this project [see 40 CFR Part 1505.2(c)].

Potential Mitigation for Construction Emissions

The DEIS indicates that construction emissions are not significant (e.g., Vol. 1, p. 5-57; and Vol. 2, p. 8-54). No mitigation is proposed to reduce construction emissions (Vol. 1, Table ES-21). However, the DEIS addresses a single air pollutant, oxides of nitrogen (NOx). It does not evaluate PM10 and other air pollutants generated by construction, including diesel particulate matter (DPM). To the extent that construction emissions potentially affect downwind communities, mitigation may be feasible to reduce such emissions, including:

- using particle traps and other appropriate controls to reduce emissions of DPM and other air pollutants. Traps control approximately 80 percent of DPM, and specialized catalytic converters (oxidation catalysts) control approximately 20 percent of DPM, 40 percent of carbon monoxide emissions, and 50 percent of hydrocarbon emissions;
- using diesel fuel having a sulfur content of 15 parts per million or less, or other suitable alternative diesel fuel, substantially reducing DPM emissions;
- reducing construction-related trips of workers and equipment, including trucks and heavy equipment;
- leasing or buying newer, cleaner equipment (1996 or newer model);
- employing periodic, unscheduled inspections to ensure that construction equipment is properly maintained at all times and does not unnecessarily idle, is tuned to manufacturer's specifications, and is not modified to increase horsepower except in accord with established specifications;
- working with the Hawaii Department of Health to identify feasible mitigation to reduce construction emissions; and
- developing and adopting a "*Construction Emissions Mitigation Plan*."

Two agencies recently identified a program of mitigation to reduce construction emissions. The National Aeronautics and Space Administration (NASA) included measures in its Record of Decision for *NASA Ames Development Plan*. The Federal Aviation Administration and the City of Los Angeles included a construction emissions mitigation program in a Supplemental DEIS for *Los Angeles International Airport Master Plan Improvements*.

Recommendation: The FEIS should evaluate the feasibility of measures to reduce construction emissions, referencing any which are adopted in the Record of Decision. Any determination of significance for construction emissions should evaluate DPM, PM10, and other air pollutants, as well as NOx.

Responses

F7-5

Comments noted. Mitigative measures regarding fugitive dust issues are currently being developed by the military in consultation with the EPA. Please refer to Section 4.11 of the EIS for discussions regarding mitigative measures taken to reduce the effects on resources of cultural importance to Native Hawaiian residents. Please refer to Section 4.13 of the EIS for discussions regarding socioeconomic and environmental justice issues. The DEIS has been revised to include a discussion of fugitive dust EJ issues. In general, the communities living nearest and downwind of SBMR are the only areas that would be subjected to significant dust emissions. These communities, Mililani and especially Wahiawa, are mainly middle and upper income communities that are not prevalently minority.

Comments

Environmental Justice

The DEIS identifies two potential environmental justice impacts (noise and military traffic) at SBMR (Vol. 1, pp. 5-230 and 5-231), DMR (Vol. 1, p. 6-122), and KTA (Vol. 2, p. 7-136). The DEIS does not identify environmental justice as an issue of concern at PTA since it is “relatively isolated” (see Vol. 2, p. 8-208). The overview of environmental and socioeconomic consequences (Vol. 1, p. 4-96) does not identify elevated air pollutant levels on adjacent communities as a potential environmental justice impact.

The DEIS acknowledges that increased PM10 emissions and transport to adjacent communities are expected environmental consequences of the Proposed Action. The DEIS indicates that the Proposed Action is expected to have adverse air quality effects on adjacent communities, potentially affecting the residents’ quality of life. The DEIS also notes that it is “unlikely” that projected increases in fugitive dust can be reduced to less than significant levels (see Vol. 1, p. 5-55; Vol. 2, p. 8-49). We are concerned that the DEIS does not address if the Proposed Action contributes to disproportionately high, adverse health and environmental effects on downwind populations from increased PM10 levels. To the extent that air pollutants can be transported downwind and offsite to sensitive receptors, this is a potential environmental justice impact.

F7-5

The DEIS does not address if potential air quality impacts to low-income or minority populations are disproportionately high and adverse compared to the general population or comparison group that was evaluated (i.e., Volume 1, pp. 5-230 and 5-231). The DEIS also does not address if there are cumulative impacts associated with air quality to nearby communities.

Because of likely PM10 violations, environmental justice is an important consideration when assessing and mitigating such impacts, especially if transported to downwind communities. The minority composition in the Regions of Influence for this project is substantial. The minority population of the Wahiawa Census County Division (within which SBMR is located) is 68 percent (Vol. 1, p. 5-225). The percentage of minority residents in the four census county divisions within which PTA is located ranges from 52.9 percent (North Kona) to 71.9 percent (North Hilo), while the census county division within which PTA is primarily located (Pa’auhau-Pa’auilo) is 67.5 percent minority.

Guidance issued by the Council on Environmental Quality (CEQ), “*Environmental Justice Under the National Environmental Policy Act*,” may be useful as the Proposed Action is refined. CEQ’s guidance provides that mitigation in impact statements “should reflect the needs and preferences of affected low-income populations (and) minority populations to the extent practicable.” The DEIS does not address if the air mitigation was developed in consultation with potentially affected communities on the two islands. An effective air quality mitigation program constitutes “pollution prevention” as defined by CEQ (“*Pollution Prevention and the National Environmental Policy Act*,” CEQ, January 1993). Pollution prevention opportunities, including air quality mitigation, can be an important component in reducing potentially disproportionate, adverse effects on environmental justice communities (see June 2003 report to EPA, “*Advancing*

F7-5
cont'd

Environmental Justice Through Pollution Prevention - A Report Developed from the National Environmental Justice Advisory Council Meeting of December 9-13, 2002," at <www.epa.gov/compliance/resources/publications/ej/pollution-prevention-recom-report.html>).

Draft guidance issued by EPA regarding Title VI of the Civil Rights Act may be a useful reference, including development of a methodology to make a determination on disproportionately high, adverse effects on low-income or minority populations (see Federal Register, June 27, 2000, pp. 39650-39701, "Draft Title VI Guidance for EPA Assistance Recipients Administering Environmental Permitting Programs and Draft Revised Guidance for Investigating Title VI Administrative Complaints Challenging Permits.").

Recommendations: The FEIS should address if increased PM10 levels under the Proposed Action contribute to a disproportionately high, adverse effect on low-income or minority populations, compared to the general population or comparison group that was evaluated, consistent with Executive Order 12898. The FEIS should address the extent to which PM10 mitigation and other pollution prevention efforts reduce potential effects on low-income or minority communities. The FEIS should address if the proposed air mitigation was developed in consultation with potentially affected low-income or minority populations. To the extent other impacts present a disproportionately high, adverse effect on low-income or minority populations, the FEIS should address how proposed mitigation reflects their needs and preferences. This could include the concerns of Native Hawaiians to avoid, reduce or mitigate adverse effects on resources of cultural importance to Native Hawaiian residents.

Water Quality

The DEIS addresses synthetic dust control chemicals to reduce fugitive dust. Volume 1 (p. 5-56) states that Army testing found calcium chloride solutions to be more effective than synthetic polymers or calcium lignosulfonate. However, the DEIS does not address potential effects on the quality of surface water or ground water from using such chemicals, nor identify mitigation to reduce potential adverse effects. The DEIS does not specifically address potential effects on aquatic species or other species (e.g., birds) that use ponded or standing water, where such chemicals may concentrate. We enclose a useful reference, "BMPs [Best Management Practices] for Dust Abatement Practices on Unpaved County Roads in Oregon," presenting information on water quality and toxicity from dust control chemicals.

F7-6

Recommendations: The FEIS should evaluate potential effects on the quality of surface water and ground water from using synthetic dust control chemicals. The FEIS should evaluate potential effects on aquatic species and species that may use ponded or standing water. The FEIS should present appropriate mitigation to avoid or reduce potential effects when using such chemicals, including appropriate commitments in the Record of Decision.

Pollution Prevention and Waste Minimization

The Proposed Action involves demolition and construction activities. The DEIS does not address reusing or recycling demolition waste (concrete, bricks, tile, metal, asphalt, wood, glass, sheetrock, plastics, and wiring) as fully as possible. The DEIS does not address if recovered materials would be used to construct new facilities, nor provide a commitment for procuring construction materials composed of the highest percentage of recovered materials practicable (see Section 6002 of the Resource Conservation and Recovery Act).

F7-7

Recommendations: The FEIS should include commitments to reuse and recycle the project's demolition waste to the fullest extent, and to procure construction materials composed of the highest percentage of recovered materials. This should be reflected in the Record of Decision. It would affirm the Army's continuing commitment to pollution prevention, waste minimization, and environmental stewardship.

F7-6

Thank you for pointing this out. The issue is now addressed in the water resources and biological resources sections of the FEIS. Based on the Oregon BMP report cited in the comment, it does not appear that impacts on water quality are likely if the palliatives are applied according industry standard practices. The Parametrix/OACES Dust Abatement Practices document has been added to the literature cited.

F7-7

The EIS has determined that there is no significant impact to public services by the implementation of the proposed action. The Army designs all of its projects, including those in this proposed action, in accordance with Executive Order 13123 "Greening the Government through Efficient Energy Management" (June 2001), Executive Order 13101 "Greening the Government through Waste Prevention, Recycling, and Federal Acquisition" (September 1998), and Department of the Army Engineering Technical Letter 1110-3-491 "Sustainable Design for Military Facilities" (May 2001) and the U.S. Army Corps of Engineers Sustainable Project Rating Tool (SPiRiT). These documents and tools provide design guidelines and standards for sustainable development - addressing water resources, energy and atmospheric resources, indoor environmental quality, material and other resources.

FUGITIVE DUST CONTROL PLAN
FOR THE
NAVAL AIR WEAPONS STATION
CHINA LAKE, CALIFORNIA

Submitted to
Kern County Air Pollution Control District

1 September 1994

Comments

1.0 INTRODUCTION

The Searles Valley Planning Area (SVPA) was designated a "moderate" non-attainment area for fine particulate matter (PM10) by operation of law with passage of the Clean Air Act Amendments of 1990. This area includes portions of Kern, Inyo, and San Bernardino Counties. It also includes a significant portion of the Naval Air Weapons Station (NAWS) China Lake.

The three affected counties jointly developed and submitted a State Implementation Plan (SIP), representing a comprehensive regional strategy for addressing the PM10 problem. However, the control measures within the plan were tailored to the differing problems found within the three jurisdictions.

The Kern County Air Pollution Control District strategy for attaining the PM10 ambient air quality standard is largely based on its Fugitive Dust Rule (Rule 402) which was adopted on November 29, 1993. This Fugitive Dust Emissions Control Plan for the Naval Air Weapons Station (NAWS), China Lake has been prepared pursuant to paragraph V(D)(3) of that rule. The purpose of this plan is to identify applicable sources of fugitive dust within NAWS, China Lake's boundaries and describe the Reasonably Available Control Measures (RACM) which will be utilized for each of those sources.

2.0 APPLICABILITY AND POTENTIAL SOURCES

The first step in the development of this Plan was to survey potential sources of fugitive dust within the affected area, and then to determine which of those areas are subject to the provisions of Rule 402. This survey was conducted in several steps by surveying available data to identify potential sources of fugitive dust.

2.1 Unpaved Roads *

All unpaved roads within the affected area were identified using comprehensive maps of the Station. Roads less than 75 feet in length were eliminated from the analysis, as they are exempt from the provisions of Rule 402 (para IV (A)(6)(a)). Traffic counts were then conducted on the remaining roads. These traffic counts resulted in the elimination of all but one of the unpaved roads, since they do not have motor vehicle traffic of 25 vehicle-trips per day or more (Rule 402 para IV(A)(6)(b)). Please see Appendix A for unpaved road locations and lengths. The one road subject to Rule 402 is the access road to Hangar 4, identified as "Area 1" in Table 1.

* Maps of potential sources available upon request.

Responses

2.2 Disturbed Areas

Potentially disturbed areas were identified using aerial photographs taken of the Station in August 1989. A field survey was then conducted to determine the current condition of each area. The following is a summary of the field survey results.

- (a) Public Works Compound: This compound, identified as "Area 8" in Table 1, covers nearly 107 acres in two separate areas. The smallest of the two areas is 5.38 acres and the larger area is approximately 102 acres. This compound contains 44 buildings and several trailers which are categorized as administrative, shops (trades), transportation, and supply and storage/issue. A similar area exists just east of Knox Road, occupied by Construction Shop #1, identified as "Area 9". Unpaved portions of both areas are used for housing cargo containers (used for storage) and for the storage of equipment and materials.
- (b) Building 25007 (SNORT) and vicinity: Open storage and general traffic take place between widely spaced buildings and trailers. This includes the magazine areas to the southwest and west. Portions of this area are actively traveled on a daily basis. This potential source is identified as Areas 2 and 3 in Table 1.
- (c) Chlorination Facility South of the Waste Water Treatment Plant: This facility, identified as Area 6, is used for chlorinating treated water from the waste water treatment plant. It consists of three small buildings, a chlorine contact chamber, and various irrigation pumping apparatus. This water is then used to irrigate the Golf Course. Unpaved areas around and between buildings are disturbed by vehicles on a daily basis.
- (d) China Lake Gun Club: Identified as Area 10, the China Lake Gun Club site is located north of the SNORT Access Road, south of Armitage Field. Disturbed areas include unpaved areas around and between buildings, as well as unvegetated berms behind and within target areas. Due to safety considerations Gun Club activities at this site are limited to trap and skeet shooting. The western berm area is no longer in use, and has already revegetated to a considerable degree. The eastern berm area is still used on occasion, and remains unvegetated.
- (e) Ordnance Impact Areas: "Area 11" on Table 1 consists of a variety of ordnance impact areas located on the testing ranges. As the name implies, these areas are used as target zones for certain types of tests using both live and inert ordnance, and generally have only sparse vegetation. The ground within these areas contains an unknown amount of unexploded ordnance, and is considered "off-limits" to vehicular traffic, except under very unusual circumstances.

Comments

- (f) Drainage Berms near Hangars 4 and 5: Identified as Area 12, these berms comprise a portion of China Lake's storm drainage system, and are intended to divert flood waters away from the two new hangars. Since they were constructed within the last two years, these areas are not yet heavily revegetated. However, natural revegetation is slowly taking place, and these areas are no longer actively disturbed.
- (g) Hangars 4 and 5: Area 13 includes all unvegetated areas near Hangars 4 and 5, between the aprons and the surrounding fence. For security purposes, vegetation in these areas must be kept to a bare minimum. However, vegetation is removed by use of herbicides to minimize the amount of ground disturbance.
- (h) Overrun Areas at Armitage Field: For safety purposes, overrun areas (identified as Area 15) have been provided at the end of each runway at Armitage Field. These areas are not actively disturbed, but all vegetation has been removed by use of a herbicide.
- (i) Vicinity of Old Roundhouse: Area 14 consists of areas in the vicinity of the Old Roundhouse, which is currently out of service along with the rest of the China Lake railroad spur. The Roundhouse proper is used by the Public Works Department for storage of electrical transformers, fused cut-outs, pipe insulation, and similar material. This area is infrequently traveled.
- (j) Miscellaneous unpaved parking areas: Various unpaved parking areas can be found at China Lake, usually near buildings that are remote and/or have very few employees. These areas are located in various locations at China Lake, and are not individually identified.
- (k) Berms around industrial waste water ponds: These berms (identified as Area 5) receive limited maintenance and have begun to naturally revegetate.

2.3 Construction and Demolition Activities:

Much of the large facility construction work at China Lake is performed by contractors; however, an increasing amount of construction and/or demolition at the Station is performed in-house by the Public Works Department. The actual location(s) of this work vary with time, and are not individually identified.

2.4 Earth Moving/Open Storage Piles:

- (a) Borrow Pit off of Sandquist Road: Identified as Area 4 in Table 1, this is the borrow pit currently in use for construction activities at China Lake. It is approximately 20 acres in size, and provides a wide range of materials, from fine sand to coarse gravel. Active operations occur at the center of the pit. The edges of the pit are normally

Responses

Comments

vegetated. This site is accessed on average about once a week for material. There may be weeks when there is no activity, and there are short periods, sometimes for a week or two, when the area receives intensive activity.

(b) Old Borrow Pit east of the Golf Course: Identified as Area 7 in Table 1, this borrow pit has been out of use for over 5 years and has begun to revegetate naturally.

(c) Open Storage Piles: Various miscellaneous storage piles may be found at China Lake at any given time. These are often, but not always, associated with construction or demolition projects (see above). Sand or gravel are usually the material being stored, although piles are often used for storage of asphalt millings and other materials suitable for re-use.

3.0 PROPOSED CONTROL MEASURES:

3.1 Unpaved Roads:

China Lake has only one unpaved road within the affected area that meets the applicability requirements of this rule. This is the section of road between Talon and Lauritsen Roads. As part of the planned construction of a new Aircraft Ready Fuel Facility, Lauritsen Road will be realigned. It will then connect with this currently unpaved access road to Hangar 4, which will also be realigned, and which will be paved along with the realigned portion of Lauritsen. This work is currently planned for the coming fiscal year (1 Oct 94 - 30 Sep 95). Since application of chemical stabilizers may hinder the natural revegetation process, the unpaved road will be controlled by watering at the beginning of each business day until the realignment has been completed, at which time active disturbance of the old roadway will cease. The area will then be left alone to revegetate naturally.

3.2 Disturbed Areas

(a) Public Works Compound: This area receives moderate vehicle traffic on a daily basis by Public Works personnel. There are two distinct areas within the compound. The smaller of the two areas consists of approximately 5 1/2 acres and is 50% covered with buildings, concrete slabs, landscaped areas, and deteriorated paving. The other 50% of the space is devoted to open storage of equipment, rubble piles, gravel piles, and similar public works related items. Proposed stabilization of traffic areas not currently paved will utilized recycled asphalt or concrete, spreading and compaction of decomposed granite, or application of chemical dust stabilizers.

The main area of the Public Works compound is approximately 44% covered with improvements with a remainder of 57 acres which are open and subject to fugitive dust emissions. Treatment will consist of a combination of stabilization processes as

Responses

Comments

Responses

determined by the open usage and will encompass one or more of the processes used in the smaller compound area (see above).

(b) Building 25007 (SNORT) and vicinity: This area receives limited vehicle traffic on a daily basis. Stabilization of unpaved traffic areas will consist of utilizing recycled asphalt or concrete, spreading and compacting of decomposed granite, or application of chemical dust stabilizers. Non-traffic areas will be allowed to revegetate naturally.

(c) Chlorination Facility South of Waste Water Treatment Facility: Maintenance personnel perform daily routine maintenance and inspection of the apparatus at this location. Therefore, this area receives limited vehicle traffic on a daily basis. If soil stabilization is required in unpaved traffic areas it will consist of utilizing recycled asphalt or concrete, spreading and compacting of decomposed granite, or application of petrochemical dust stabilizers.

(d) China Lake Gun Club: The western berm has already begun to revegetate. The eastern berm is still used on occasion, but is not actively disturbed by vehicles (only by the impact of small arms fire). We propose leaving both berms alone so that they may revegetate naturally. The areas around and between buildings are occasionally disturbed by vehicles when the gun club is in use. Since this occurs only occasionally, we propose treating the area with water prior to any functions taking place at the facility.

(e) Ordinance Impact Areas: These areas are occasionally impacted by test items, but are very rarely disturbed by vehicles as the areas are generally considered "off limits". We propose leaving these areas alone. Treatment of an active high explosive impact area is impractical due to safety considerations.

(f) Drainage Berms near Hangars 4 and 5: Vegetation in these areas was removed during construction of the berms in 1992. However, no further active disturbance of these areas has taken place or is planned. The soil in these areas has already formed its natural protective crust, and vegetation is slowly reestablishing itself. We propose leaving these areas alone to revegetate naturally, as application of chemical stabilizers may only hinder this process.

(g) Hangars 4 and 5: The areas between the aprons and the fences must be kept unvegetated due to security considerations. However, no active disturbance of these areas takes place, and vehicle access to the entire hangar area is tightly controlled. We propose continuing de-vegetation by application of herbicides by licensed technicians (rather than by mechanical means) in order to minimize soil disturbance. Since the areas are otherwise completely undisturbed, and vehicle access to each hangar area is tightly controlled, we propose applying no other RACM to this area unless the area is to be disturbed for some unforeseen reason.

Comments

Responses

(h) Overrun Areas at Armitage Field: These areas at the end of each runway must be kept clear of vegetation due to safety considerations. However, no active disturbance of these areas takes place. We propose continuing de-vegetation by application of herbicides by licensed technicians (rather than by mechanical means) to minimize soil disturbance. Since the areas are otherwise completely undisturbed, we propose applying no other RACM to this area unless the area is to be disturbed for some unforeseen reason.

(i) Vicinity of Old Roundhouse: This area received little vehicular traffic. Only when material is to be recovered or stored in the Roundhouse does this area receive vehicular traffic. Because of the light traffic in and around this area, it is recommended to leave it as it is. If a control measure is required for those areas not currently paved, stabilization will be achieved by utilizing recycled asphalt or concrete, spreading and compaction of decomposed granite, or application of chemical dust stabilizers. Non-traffic areas will be allowed to revegetate naturally.

(j) Unpaved Parking Areas: The parking areas around facilities which are not paved will be identified. Those areas requiring parking and traffic aisles will receive the necessary improvements. Stabilization of trafficked areas not currently paved will consist of utilizing recycled asphalt or concrete, spreading and compaction of decomposed granite, or application of chemical dust stabilizers.

(k) Berms around industrial waste water ponds: These areas have not been disturbed for over five years, allowing the soil to form its natural protective crust. These areas are not actively disturbed and are fenced to prevent access by unauthorized personnel. We propose taking no further action, so that the area may revegetate naturally.

3.3 Construction/Demolition Activities

A list of standard dust abatement measures has been developed by NAWS China Lake personnel, which must be implemented for both contractor and in-house projects. These measures will be included as conditions of approval during environmental review of each proposed project under the National Environmental Policy Act. For projects performed under contract, the list will also be incorporated into the construction/demolition contract to ensure compliance by contract personnel. The list of dust abatement measures is provided as Appendix B.

3.4 Earth Moving/Open Storage Piles

(a) Borrow Pit off of Sandquist Road: This area is "actively disturbed" about once a week, when the site is accessed for materials. Since only a small portion of the borrow

Comments

pit is disturbed at any given time, we propose application of water to the areas to be disturbed prior to (and after) accessing the pit to excavate. We propose leaving undisturbed portions of the pit alone.

(b) Old Borrow Pit east of the Golf Course: This area has not been "actively disturbed" for over 5 years. The soil has already formed its own natural protective crust. We propose leaving this site alone, to allow it to revegetate naturally.

(c) Open Storage Piles: All open storage piles of materials that may be potential sources of fugitive dust will be covered by a tarp or other suitable material. The storage pile(s) in the smaller area of the Public Works Compound could be controlled with area sprinklers to keep a protective crust over the material in the pile(s).

4.0 COMPLIANCE SCHEDULE:

Funds for application of Reasonably Available Control Measures (RACM) to sources as described in the above section have been allocated in China Lake's budget for Fiscal Year (FY) 1995 (1 Oct 94 - 30 Sep 95). Application of RACM will take place on the following schedule:

Road to Hangars 4 & 5: Begin application of water immediately after 1 Oct. Construction of new paved road will commence during FY95 and will be completed during FY96.

Application of chemical dust palliatives, cape seal, or other applicable methods to areas identified in the plan will be accomplished by 31 December 94.

Application of water: effective immediately after 1 October, to be applied as proposed in section 3.

Construction Demolition: List of Dust Control Practices (Appendix B) is already being incorporated into all new contracts and site approvals for all construction/demolition projects performed either by contractors or by in-house personnel.

Open Storage Piles: Covered or watered as appropriate, effective immediately, and as existing piles are located.

All areas proposed to be left as is are to be made "off-limits" to vehicular traffic effectively immediately, or access restricted as proposed in section 3.

APPENDIX B

Requirements for Dust Control at Construction and Demolition Sites

The contractor shall take reasonable precautions to prevent visible particulate matter from being airborne from the construction site, under normal wind conditions. Reasonable precautions include, but are not limited to:

1. The contractor shall have available a minimum of one watering truck to apply water to the haul roads and construction areas. Water will be applied to these areas at least twice a day. Additional watering will be required if the soil dries to the point that the site becomes a source of fugitive dust.
2. The contractor shall post and observe a speed limit of 25 mph at the project site. During normal daily activity the speed limit will be strictly enforced by the contractor.
3. If wind conditions are such that the contractor cannot control dust, the contractor shall shut down all construction operations except for equipment used for dust control at the project site.
4. Water or other dust suppressants shall be used to prevent particulate matter from becoming airborne in handling dusty materials to open stockpiles and mobile equipment. All stockpiles of topsoil, sand, and other like materials shall be covered to prevent airborne fugitive dust.
5. The contractor shall be responsible for removing materials tracked onto paved roadways from dirt roadways by construction vehicles associated with the project.
6. All bulk materials being hauled on paved roadways shall be covered during transit.
7. The natural topography shall be maintained to the extent possible during grading and other earth movement.

1. Introduction

The Dust Abatement Appendix is part of the County Road Maintenance Submittal Template to NMFS for Coverage under Limit 10 of the 4(d) Rules for Salmon and Steelhead. This template was developed to meet the specific requirements outlined by the National Marine Fisheries Service (NMFS) in Limit 10 of the 4(d) rules for the protection of salmon and steelhead. Dust abatement is included as a section in Limit 10; this appendix is meant to provide Oregon counties with an analysis that can be included with the Road Maintenance submittal for Limit 10 protection.

The Limit 10 template for road maintenance relies on the ODOT road maintenance manual and requires each county to follow the approved BMPs outlined in the manual or practices that are substantially similar. Each county is required to provide baseline environmental information as well as evidence of monitoring and training programs that accompany the maintenance program. The Dust Abatement Appendix provides BMPs for the application of dust suppressants as well as an effects analysis that demonstrates that the application of these materials will not cause significant impacts to water bodies that provide habitat for listed salmonids.

If a county wishes to include dust abatement as part of its routine road maintenance submittal for protection under Limit 10 of the 4(d) rules, the Dust Abatement Appendix must be submitted to NMFS in its entirety along with the template submittal for routine road maintenance. The document has been informally reviewed by NMFS so that each submittal will be uniform, allowing for a facilitated review process.

2. Description

Dust abatement practices help to stabilize gravel roads to reduce damage and maintenance costs. Depending on the type of road treated, application of dust palliatives creates a hard, compact surface that resists potholing, rutting and loss of aggregate.

In addition control of road surface soils reduces the short term, localized air quality hazards associated with unpaved roads. For people living along dirt roads, dust can cause inconveniences from dust settling on their property. While, not all county gravel roads require dust abatement applications, there are situations where dust control is either requested or required.

Dust suppression involves the application of a dust palliative to non-paved road surfaces to temporarily stabilize surface soils, leading to a reduction of dust. Counties provide dust abatement with their own funding in only a few circumstances. In some cases, Counties apply palliatives when excessive truck traffic utilizes a non-paved gravel road such as a quarry or construction site. This practice is for the purpose of the reduction of dust as well as road stabilization. In other instances, private contractors apply dust palliatives to county roads for residents living along county roads to reduce the amount of dust produced by passing vehicles.

Application of dust palliatives often occurs at the beginning of the summer and depending on the road surface and grade, two "light" applications may be made to avoid run off of the palliative from the road surface. In preparation for palliative application, roads are graded and "roughed up" to allow for greater penetration of the palliative. Application normally consists of 0.5 gallons of material per square yard of road and is applied using an applicator truck. Descriptions of the Best Management Practices (BMPs) to be followed for the application of dust palliatives are in Section 4.

Comments

3. Palliatives

The following materials are proposed for use in county road dust abatement practices on unpaved roads. They have been selected because of their effectiveness in controlling fugitive dust, as well as minimizing potential environmental impacts.

Lignosulfonates

Lignin is a polymer in the secondary cell wall of woody plant cells that helps to strengthen and stiffen the wall. During the various pulping processes, lignin by-products are produced. Lignosulfonate is a byproduct of the sulfite method for manufacturing paper from wood pulp. Sometimes it is called sulfonated lignin. Lignosulfonate is a complex mixture of small- to moderate-sized polymeric compounds with sulfonate groups attached to the molecule.

Lignosulfonates have a long history of use on roads as a method for dust control and surface stabilization. Lignosulfonates have a natural adhesive property when moist. When applied to gravel roads, the lignosulfonate solution coats individual road particles with a thin adhesive-like film that binds the particles together. The lignosulfonate acts as a dispersant. By attaching to the particle surface, it keeps the particle from being attracted to other particles and reduces the amount of water needed to use the product effectively. This allows the particles to pack closer together for a stronger surface. Consequently, water uptake by the roadbed surface is greatly reduced and the binder is less likely to be washed away by rain.

Lignosulfonates used for road applications are usually shipped in a concentrated solution and diluted with water on the job site to about a 25 percent solid content. Road conditions and climate can affect the application rate. However, as a general rule for dust control, a diluted solution of lignosulfonate is applied at a rate of one-half gallon per square yard.

Magnesium Chloride

Magnesium chloride is a naturally occurring element and is extracted from salt-water solutions such as those found in seawater. To extract the magnesium chloride brine, water is removed from the salt water by solar evaporation, other energy, and a simple refinement process until other chemicals have been extracted resulting in magnesium chloride brine. This brine can then be further dehydrated to produce magnesium chloride solids.

Magnesium chloride can be adapted and designed to provide highest efficiency depending on prevailing dust conditions, anticipated traffic, and type of soil. Dilution can also be varied to obtain the greatest possible economy and minimize environmental impact. Some soil types may be best treated with a one-time heavy application of

Responses

Comments

product, whereas others may require several light applications. As a general rule, the rate of penetration of magnesium chloride is rapid in sandy soil, moderately fast in silty soil and slow in clay.

4. Effects Analysis

Water Quality

A literature search was conducted to determine the possible effects of lignosulfonates and magnesium chloride on water quality. Though there has been increased interest in this subject recently, there remains little scientific data that fully explores the potential effects of these materials when used as dust palliatives. Both lignosulfonate and magnesium chloride have been tested to determine their potential impacts on water quality, fish and wildlife when introduced directly into surface waters. However, we found no studies that evaluated the effects of these materials when their movement is controlled through application BMPs. Therefore, this appendix will make the assumption that these materials will be applied in a way that reduces their ability to move, thereby limiting the concentrations that reach surface waters, and reducing the likelihood of detrimental effects on receiving water bodies. These BMP recommendations are based on recommendations from County Road Masters who have worked with these materials for many years.

Research does confirm that these materials have limited ability to move (Martin, 1989 and IIT Rayonier, Inc., 1973). They are bonding agents that adhere to material in dry conditions. The BMPs being implemented are meant to further reduce their ability to move and in the unlikely event that these materials were to reach a water body, it would be at very low concentrations that are unlikely to negatively impact the receiving water body.

This analysis was conducted in accordance with the NMFS document "Making Endangered Species Act Determinations of Effect Guidance". The Pathways and Indicators are a Section 7 mechanism that provides a convenient tool for this analysis. The matrix from the report was used to determine the potential for effects to listed salmon and steelhead. The water quality elements that have the potential to be impacted by dust abatement practices were the primary focus. This analysis will provide the scientific background for the BMP recommendations contained in the Oregon County Road Maintenance submittals for coverage under the 4(d) rules for Salmon and Steelhead.

Magnesium Chloride

When magnesium chloride is introduced into the environment as a deicer or as a dust palliative, it is highly soluble in water and has the potential to move through the soil with

Responses

Comments

water. The movement is dependent on the rate and frequency of rainfall, the drainage characteristics, and soil type. Application of magnesium chloride as a dust palliative is less likely to be carried by water runoff than when it is used as a deicer since it is applied as a palliative during dry periods to reduce dust.

Because of magnesium chloride's ability to dissolve in water, lateral movement can occur. If high volumes of rainfall occur, magnesium chloride can move as either surface runoff or as soil leachate. Under these conditions, it is principally the constituted ions Mg_2^{+} and Cl^{-} that migrate through the environment. These disassociated ions migrate rather than the hydrated magnesium chloride. Because of the widespread occurrence in rocks and soils, and its ready solubility, magnesium is present in nearly all waters. The addition of magnesium from dust palliatives would be insignificant when compared to that already found in the environment (Heffner, 1992).

The usual application of magnesium chloride will be 0.5 gallons per square yard; this is equivalent to 18 tons per mile. The 18 tons per mile includes the weight of the water that is used to dilute the brine solution. This results in an application rate for magnesium chloride of 7.5 to 9 tons per mile.

The typical weight of sodium chloride as a road deicer is 20 tons per mile. With the melted snow and ice and applications on paved roads, the chloride concentrations rise to above 250 ppm. The concentrations of magnesium chloride used for dust abatement are considerably less than those observed for calcium chloride used as a deicer. (Singer et al. 1982) Therefore it is unlikely that receiving waters could have concentrations high enough to cause growth or survival problems for fish.

The Colorado Department of Transportation (CDOT, 1998) conducted extensive research on the environmental impacts of magnesium chloride as a deicer on state roads. While this research focuses on a different activity than dust abatement, the results in terms of the chemicals environmental impact are relevant.

Chloride concentration from two separate sources, magnesium chloride and sand with chloride, increased background chloride concentrations by 50 to 100 mg/L during winter application. These concentrations are described as being below levels considered potentially harmful to the most sensitive aquatic organisms. (CDOT, 1998)

Magnesium chloride application as a dust palliative will occur in the summer months. As described above, the ability of magnesium chloride to move to the rivers will be drastically lower than in the Colorado tests because of the minimal rainfall during the summer months when palliatives are commonly applied. The application BMPs include additional measure to limit movement

Responses

Comments

The conclusions of the CDOT report stated that magnesium chloride is "highly unlikely to cause or contribute to environmental damage at distances greater than 20 yards. Even very close to the roadway, the potential for magnesium chloride to cause environmental damage is probably much smaller than other factors related to road maintenance."

Results

Water Temperature

With the proper and safe application of magnesium chloride according to the Minimization and Avoidance BMPs, the function of existing habitat will be maintained in areas where it is applied. No research was found that would indicate the application of magnesium chloride would have any significant negative impacts to water temperature.

Sediment

Because of its use to reduce fugitive dust, in some cases the use of magnesium chloride may act to restore areas that are limited by sediment deposition in a stream. Magnesium chloride may be effective in reducing the amount of fines that are recruited into a system.

Chemical Contaminants/Nutrients

Proper application of magnesium chloride will reduce the chance that any of the material will reach surface waters or migrate through ground water. For this reason, all research indicates that magnesium chloride will not negatively influence chemical contamination and nutrients in streams with listed salmonids and will likely maintain current conditions.

Ligninsulfonates

Ligninsulfonates encompasses a complex group of high-molecular-weight polymers. As a group lignins are second only to cellulose in abundance as natural polymers. Since very few biological agents can degrade the lignin molecule, it is extremely environmentally stable. In fact the Food and Drug Administration (FDA) currently allows for the use of ammonium-, calcium-, magnesium-, and sodium-lignosulfonates in animal feeds. They are commonly used in pelleted feeds for fish at a level of 2 to 2.5 percent, to increase water stability.

There can be issues associated with increased oxygen demand in a stream when lignosulfonates are introduced directly into a stream from pulping plants. Receiving water near pulping plants experiences an increased oxygen demand and the water takes on a yellowish-brown tint (Schwenderman, 1981). Effluent from pulping plants is often up to 55% lignosulfonates so it is at a much higher concentration than would be achieved from its application as a dust palliative. There has not been any research that shows significant impacts to water quality as a result of lignosulfonates applied as a dust palliative.

Responses

Comments

Results

Temperature

No research that was found indicated that an application of lignosulfonates anywhere near a fish bearing stream would have any impact on temperature.

Sediment

The application of lignosulfonates may restore the functioning condition of a stream that is impacted by sediments that originate on gravel roads in the watershed. By limiting the fines that reach streams, sediment will be reduced and existing conditions would be improved.

Chemical Contaminants/Nutrients

Chemical contaminant and nutrient addition to a stream will be maintained/avoided with the proper application of dust abatement palliatives.

Toxicity (LC50)

The LC50 test measures the lethal concentration (LC) of a product expressed in parts per million (ppm) that will produce a fifty percent mortality rate in the test group in 96 hours (4 days). When looking at the results of a LC50 test, the larger the concentration the less toxic the material. Typically less than 100ppm is considered toxic, and 1,000ppm is considered practically nontoxic.

Table 1 shows the results from tests on rainbow trout (*onchorynchus mykiss*) conducted by the British Columbia Ministry of Environment looking at a wide range of materials. The palliatives under consideration for use by Oregon counties were in the range of practically nontoxic (>1000ppm to >10,000ppm).

Magnesium Chloride

Impacts of chloride have been documented mostly in the Northeast. In these cases large amounts of chloride are applied to roads and highways for de-icing purposes. There are environmental impacts associated with chloride but most have been seen at the higher application rates. Worst case scenarios for runoff from magnesium chloride applications as a deicer are less than 70 ppm within 5-30 ft of the application (Martin, 1989). 70 ppm is the concentration of chloride for irrigation water and is considered safe for most plants.

Kunkle studied the impacts of road salt on a fresh water stream in Vermont, USA. Here the application of pure salt to paved roads adjacent to the stream resulted in salt concentrations that did not exceed 100ppm, with the mean levels below 50. (1972) Although the addition of magnesium and chloride in streams can cause hardness in water, no regulation exists which limits the concentrations found in drinking water. (Schwendeman, 1981)

Responses

Comments

Responses

Lignosulfonates

Lignosulfonates have been studied at high-level concentrations when discharged from pulping plants directly to a water body. These discharges have been shown to increase biological oxygen demand and produce a yellowish-brown tint to the water (Schwendeman, 1981). No research was found that evaluates the rate at which lignosulfonates move in the soil or how concentrated it would be reaching surface water. The LC50 concentration for lignosulfonates was calculated to be between 5,200ppm and 6,400ppm, classifying them as practically non-toxic.

Table 1: Rainbow trout 96-hour LC50 Dust Suppressant Results

Substance	ppm
35% Calcium Chloride	45,000
35% Magnesium Chloride	9,000
Sodium Lignosulfonate	6,400
Calcium Lignosulfonate	5,200
Emulsion Oil	200
Laundry Detergent	10

5. Minimization and Avoidance:

Road maintenance employees and anyone applying dust palliatives on county roads will use the following BMPs to prevent palliatives from reaching water bodies thereby mitigating any possible water quality impacts:

- During preparation for application of dust palliatives, gravel roads will be tight bladed or processed (cut 2" and watered, then laid gravel back to grade and roll) to bring fines to the surface.
- Dust palliatives, when applied, will remain on the road surface and will not go over the road edge. The use of berms at the road shoulder or applying palliatives at a low rate are two methods to achieve ensure material remains on the road surface.
- All private contractors that apply palliatives to county right of ways must first obtain a dust control permit for each section of road that will receive an application. (See attached example of dust control permit.)
- Application shall follow the conditions of a dust abatement permit outlining the Minimization and Avoidance methods described here and assure materials are applied in a manner that is not detrimental to either water or vegetation.
- A 1-foot buffer zone on the edge of gravel will be used if the road width allows.
- The machinery used to apply palliatives will carry adequate spill protection equipment during application.
- Dust palliatives will not be applied while raining. (Where practicable, a 3-day forecast of clear weather should follow any application of dust palliatives).
- Environmentally-sensitive cleaning agents will be used on trucks and equipment used for palliative application at the designated areas with the county for truck maintenance and cleaning.

(Counties must include a map or addresses of designated cleaning and maintenance areas for application equipment.)

- Excess materials will be disposed of at designated and approved locations for receiving such materials.

(Counties must include a map or addresses of designated disposal sites for excess material.)

Comments

6. Example Dust Control Permit

This permit allows the applicant or his contractor to treat sectors of Secondary Roads with chemicals to control dust. It is granted subject to the following:

- Two materials are approved for use: Magnesium Chloride and Lignin Sulfonate.
- All contractors receiving a Dust Control Permit are bound to follow BMPs for Dust Abatement approved by the National Marine Fisheries Service to prevent or minimize harm to water quality and the take of salmonids listed under the Endangered Species Act.
- Each applicant will fill out and turn in a Dust Control Permit to the County Public Works Department.
- The applicant or contractor must coordinate application of material with the County Public Works Department at (xxx) xxx-xxxx at least two (2) working days prior to application of the material.
- The applicator will provide adequate notification in the area prior to application of the dust palliatives.
- This permit is valid until October 1 of the year issued, after which the County reserves the right, regardless of actual conditions, to re-blade treated areas in order to prepare the road for winter.
- The permit applicant understands that by signing this permit they assume full responsibility for any and all liability resulting from this treatment of a public highway.

In signing and accepting this permit for dust control, I agree to abide by all of the conditions of the permit as listed above.

Dust Suppressant		Attributes	Limitations	Application	Origin	Environmental Impact
Lignin Sulfonate		Binds surface particles because of adhesive properties.	Corrosive to aluminum alloys due to acidity (CaCO ₃ added ingredient, can neutralize acidity).	Generally ½ gallon per square yard of road surface.	By-product of softwood pulping and the sulfite pulping process.	Lignin products have a high BOD (biological oxygen demand) in aquatic systems. Spills or runoff into surface or groundwater may create low dissolved oxygen conditions resulting in fish kills or increases in groundwater concentrations of iron, sulfur compounds, and other pollutants.
		Greatly increases dry strength of material under dry conditions. Retains effectiveness during long dry periods with low humidity. With high amounts of clay, it tends to remain slightly plastic permitting reshaping and additional traffic compaction.	Proper aggregate mix (4 - 8% fines) important to performance. Becomes slippery when wet, brittle when dry.	Can vary based on soil condition and application method. Spread by spreader trucks.		
Magnesium Chloride		Increases compacted density of road material and the effectiveness is retained after bleeding.	Solubility results in leaching during heavy rain.	Generally ½ gallon per square yard of road surface.	Produced from natural salt brine and a by-product of polash production. Results from a reaction between hydroxide and hydrochloric acid.	From <i>Studies of Environmental Effects of Magnesium Chloride Deicer in Colorado</i> . (CDO, 1999) Unlikely to cause environmental damage if safely applied at distances greater than 20 feet from water body. Study was done evaluating it as a deicer. Dilution of magnesium chloride by melting snow and ice was a factor
		Lower freezing level of water to -27 degrees F, minimizing frost heaves and reducing freeze-thaw cycles.		Can vary based on soil condition and application method. Spread by spreader trucks.

Dear Ms. Barger:

Subject: Draft Environmental Impact Statement (EIS) for the Army Transformation of the 2nd Brigade, 25th Infantry Division (Light), to a Stryker Brigade Combat Team in Hawaii

This is in response to your request for comments dated October 3, 2003, on the Draft EIS for the proposed transformation to a Stryker Brigade Combat Team in Hawaii. The proposal includes construction of 28 projects and proposed land acquisition on the islands of Oahu and Hawaii.

S1-1

In accordance with the Coastal Zone Management Act of 1972, Section 307(c), and the Code of Federal Regulations (15 CFR 930) regarding federal consistency requirements, we respectfully request a federal consistency determination to be submitted to our office for the proposed project.

Should you have any questions or require additional information, please contact Debra Tom of our CZM Program at 587-2840.

Sincerely,

Mary Lou Kobayashi
Planning Program Administrator

Ms. Cindy S. Barger
SBCT EIS Project Manager
U.S. Army Corps of Engineers
Honolulu District
Building 230, Room 306 ATTN: CEPOH-PP-E
Fort Shafter, Hawai'i 96858-5440

Dear Ms. Barger:

SUBJECT: Draft Environmental Impact Statement on the
Transformation of the 2nd Brigade, 25th Infantry Division to a
Stryker Brigade Combat Team

The Department of Education (DOE) has reviewed the Executive Summary of the Draft Environmental Impact Statement (DEIS) on the transformation of the 2nd Brigade, 25th Infantry Division into a Stryker Brigade Combat Team.

The Executive Summary acknowledges a series of "significant" to "significant but mitigable" impacts on the public school students who will be living and attending school on Schofield Barracks.

The DOE would like to suggest the following list of mitigations that should reduce the impacts identified by the DEIS:

1. Classroom needs. If the student population increases by 760 students, a 19.5 percent increase, there will be a need for approximately 35 temporary classrooms. Classrooms would be provided where and when they are needed in the form of permanent classroom buildings and/or temporary facilities. We request meeting with the appropriate individuals as early as possible to determine how the army can assist in providing these facilities and the timetable that they will be needed.

S2-1

Responses

S2-1

The Residential Communities Initiative (RCI) Office, as the lead department for planning Army Family Housing, closely coordinates future student requirements with the State Department of Education. To this end, Keith Nishioka, RCI Project Manager, has been working with DOE District Superintendents Gary Griffiths and Betty Mow. On behalf of the Army, he works with Keith Kameoka from the DOE, to generate School Enrollment Projections with as much accuracy as possible. The Development Partnership plans its demolition/reconstruction/renovation/reallocations years in advance, coordinating with the DOE. In turn, the DOE understands that the Army communities must be advised one year in advance of any changes in school districting. Furthermore, the RCI also works with Heidi Meeker from the DOE's Planning Branch.

Comments

Ms. Cindy S. Barger
Page 2
December 26, 2003

S2-2

2. Insulation and cooling systems for classrooms at Solomon and Hale Kula Elementary Schools that will remain exposed to Zone II noise and might be exposed to Zone III.

S2-3

3. Increased army efforts to protect the safety of children, including increased fencing at Hale Kula Elementary, Solomon Elementary, Wheeler Elementary, and Wheeler Intermediate schools, increased limitations on access to certain areas and the provision of more adult supervision.

S2-4

4. Early notification to the DOE of the projected increase in student enrollment. Notification to be a minimum of two-and-a half years prior to students entering the schools.

Thank you for the opportunity to review and comment on the DEIS summary.

Should you have any questions, please call me at 586-3444 or Heidi Meeker of the Facilities and Support Services Branch at 733-4860.

Sincerely yours,

for Rae M. Loui
Assistant Superintendent

CAS/Central District

Responses

S2-2

Noise impacts on these schools are not directly attributable to SBCT, but to pre-existing conditions. Therefore the Army cannot commit to mitigation for these conditions under this project.

S2-3

Impacts on students are addressed in Sections 4.13 and 5.13. Health and safety impacts are discussed in Sections 4.12, 5.12, 6.12, 7.12, and 8.12. No health and safety impacts have been identified which would affect students at the listed schools, with the exception of noise impacts discussed in sections 4.13 and 5.13.

S2-4

The Army would consult with local and state schools officials on these issues if the proposed action is implemented.

Bldg 230, Rm. 306, ATTN: CEPOH-PP-E
Fort Shafter, Hawaii 96858-5440

Dear Ms. Barger:

SUBJECT: Draft Environmental Impact Statement, U.S. Army Transformation to
Stryker Brigade, Various Locations on Oahu and Hawaii

This letter is to transmit the following comments on the subject application:

Construction/Demolition Involving Asbestos:

S3-1

Since the proposed project would entail renovation/demolition activities which may involve asbestos, the applicant should contact the Asbestos Abatement Office in the Noise, Radiation and Indoor Air Quality Branch at 586-5800.

Control of Fugitive Dust:

S3-1

A significant potential for fugitive dust emissions exists during all phases of construction. Proposed construction activities will occur in proximity to public areas and thoroughfares, thereby exacerbating potential dust problems. It is recommended that a dust control management plan be developed which identifies and addresses all activities that have a potential to generate fugitive dust. Implementation of adequate dust control measures during all phases of development and construction activities is warranted.

Construction activities must comply with the provisions of Hawaii Administrative Rules, §11-60.1-33 on Fugitive Dust.

The contractor should provide adequate measures to control dust from the road areas and during the various phases of construction. These measures include, but are not limited to, the following:

Responses

S3-1

A discussion of renovation/demolition activities with asbestos associated with this project can be found in section 3.12.3 and Appendix N of the EIS. Any construction projects will meet Federal, State, and local guidelines and regulation.

S3-2

The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. Hygroscopic salt solutions (such as calcium chloride and/or magnesium chloride) appear to be the most logical choice for application to unpaved roads and military vehicle trails at USARHAW installations. Monitoring road surface moisture conditions and dust generation levels would be important components of an adaptive management program that seeks to optimize the proper timing of dust suppressant applications. To the extent possible, planned dust suppressant applications should be scheduled to immediately precede periods of significant convoy traffic. As noted in the Final EIS, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. Dust control measures for construction projects would be incorporated into construction contracts as required procedures.

S3-2
cont'd

- a) Plan the different phases of construction, focusing on minimizing the amount of dust-generating materials and activities, centralizing on-site vehicular traffic routes, and locating potential dust-generating equipment in areas of the least impact;
- b) Provide an adequate water source at the site prior to start-up of construction activities;
- c) Landscape and provide rapid covering of bare areas, including slopes, starting from the initial grading phase;
- d) Minimize dust from shoulders and access roads;
- e) Provide adequate dust control measures during weekends, after hours, and prior to daily start-up of construction activities; and
- f) Control dust from debris being hauled away from the project site.

If you have any questions, please contact Mr. Barry Ching of my staff at 586-4200.

Sincerely,

for WILFRED K. NAGAMINE
Manager, Clean Air Branch

U.S. Army Engineer District, Honolulu
Department of the Army
Building 230, Rm. 306 ATTN:CEPOH-PP-E
Fort Shafter, Hawaii 96858-5440

Dear Ms. Barger:

Subject: Draft Environmental Impact Statement (DEIS) for the 2nd Brigade, 25th Infantry Division (Light) to a Stryker Brigade Combat Team (SBCT) in Hawaii

The Department of Health (Department), Clean Water Branch (CWB), acknowledges receipt of a copy of the "Executive Summary" for the subject DEIS. The project includes the proposed construction of 28 projects and proposed land acquisition on the islands of Oahu and Hawaii. The following are our general comments based on limited information contained in the executive summary and the DEIS:

S4-1

1. The Regulatory Branch of the Honolulu Engineer District (HED), U.S. Army Corps of Engineers (COE), should be contacted at (808) 438-9258 to identify whether a Federal license or permit (including a Department of Army permit) is required for any of the proposed construction activities involved in this project. Pursuant to Section 401(a)(1) of the Federal Water Pollution Act (commonly known as the "Clean Water Act (CWA)"), a Section 401 Water Quality Certification is required for "[a]ny applicant for Federal license or permit to conduct any activity including, but not limited to, the construction or operation of facilities, which may result in any discharge into the navigable waters...."

S4-2

2. A National Pollutant Discharge Elimination System (NPDES) general permit coverage is required for the following activities:
 - a. Storm water associated with industrial activities, as defined in Title 40, Code of Federal Regulations (CFR), Sections 122.26(b)(14)(i) through 122.26(b)(14)(ix) and 122.26(b)(14)(xi);
 - b. Construction activities, including clearing, grading, and excavation, that result in the disturbance of equal to or greater than one (1) acre of total land area. The total land area

Responses

S4-1

Sections 4.10, 5.10, 6.10, 7.10, and 8.10 have been revised to address this issue.

S4-2

This information is included in Appendix N.

Page 2

includes a contiguous area where multiple separate and distinct construction activities may be taking place at different times on different schedules under a larger common plan of development or sale. **An NPDES permit is required before the commencement of any proposed construction activities.** Please contact the CWB for detailed requirements;

- c. Discharge of treated effluent from leaking underground storage tank remedial activities;
- d. Discharge of once through cooling water less than one (1) million gallons per day;
- e. Discharge of hydrotesting water;
- f. Discharge of construction dewatering effluent;
- g. Discharge of treated effluent from petroleum bulk stations and terminals;
- h. Discharge of treated effluent from well drilling activities;
- i. Discharges of treated effluent from recycled water distribution systems;
- j. Discharges of storm water from a small municipal separate storm sewer system; and
- k. Discharge of circulation water from decorative ponds or tanks.

The CWB requires that a Notice of Intent (NOI) to be covered by a NPDES general permit for any of the above activities be submitted at least 30 days before the commencement of the respective activities. The NOI forms may be picked up at CWB or downloaded from CWB's website at <http://www.state.hi.us/doh/eh/cwb/forms/genl-index.html>.

S4-2
cont'd

S4-3

3. The U.S. Army, Hawaii may be required to apply for an individual NPDES permit if there is any type of activity in which wastewater, such as the effluent from the tactical vehicle washing facilities, is discharged into State waters and/or coverage of the discharge(s) under the NPDES general permit(s) is not permissible. An application for the NPDES permit is to be submitted at least 180 days before the commencement of the respective activities. The NPDES application forms may also be picked up at our office or downloaded from our website at <http://www.state.hi.us/doh/eh/cwb/forms/indiv-index.html>. The U.S. Army, Hawaii, is encouraged to contact the CWB for detailed NPDES permitting requirements. The U.S. Army, Hawaii shall also contact the Department's Safe Drinking Water Branch (SDWB) if effluent discharges into injection well(s) is anticipated.

S4-4

4. Hawaii Administrative Rules (HAR), Section 11-55-38, also requires the owner of the construction project to either submit a copy of the new NOI or NPDES permit application to the State Department of Land and Natural Resources (DLNR), State Historic Preservation Division (SHPD) or demonstrate to the satisfaction of the Department that the project,

- S4-4**
cont'd | activity, or site covered by the NOI or NPDES permit application has been or is being reviewed by SHPD.
- S4-5** | 5. Wetlands located in the Dillingham Training Field shall be properly delineated and protected. Although, the Regulatory Branch of the HED/COE does not claim permitting jurisdiction under CWA, Section 404, this wetland is State waters. Any discharges, either directly or indirectly, into this wetlands shall comply with Chapter 342-D of Hawaii Revised Statutes (HRS), and HAR, Chapters 11-54 and 11-55 requirements.
- S4-6** | 6. Sanitary waste treatment and disposal issues associated with the personnel increasing (increase of 810 soldiers, with 502 spouses and 1,053 children) in the Schofield Barracks were not properly addressed. The U.S. Army, Hawaii shall ensure that the operation of the SBCT will not violate any conditions of the NPDES permit (File No. HI 0110141) issued to the Schofield Barracks by the Department.
7. Comments on Section N.7 of the Appendix N:
- a. Subsection N.7.1 Clean Water Act
- S4-7** | (1) In conjunction with the CWA, Section 404 permitting requirements, subsection N.7.1 shall also discuss the Federal Water Quality Certification (WQC) requirements as specified in CWA, Section 401. You may discuss the detailed Section 401 WQC application and processing requirements in subsection N.7.2 (State of Hawaii Laws, Regulations, and Policies) since the Department, as the authorized State agency, has the responsibility of processing the application for a Section 401 WQC under the authorization of HRS, Section 342D-53 and HAR, Subsection 11-54-09.1.
- (2) CWA, Section 402 NPDES permitting requirements shall also be discussed in subsection N.7.1. even if the U.S. Environmental Protection Agency (EPA) has delegated the NPDES permitting program to the Department. You may discuss the detailed NPDES permitting & processing requirements in subsection N.7.2 (State of Hawaii Laws, Regulations, and Policies) since the Department is the authorized State agency that issues and enforces the NPDES requirements under the authorization of HRS, Chapter 342D, HAR, Chapters 11-55 and 11-54.
- b. Subsection N.7.2 State of Hawaii Laws, Regulations, and Policies
- S4-8** | (1) In compliance with HRS, Section 342D-55 and HAR, Section 11-54-10, all discharges to State waters are subject to monitoring, not only the toxicity tests.
- (2) Please using the terms defined in the HAR, Chapter 11-54, instead of creating any new terms, such as using the term "threshold concentrations" as it should be the term "numerical standards" or using the term "general standards" as it should be the term "basic criteria."

Responses

S4-5

This wetland was incorrectly identified as jurisdictional.

S4-6

In section 4.14 of the EIS the Army evaluated the existing public services and has determined adequate capacity and no significant impacts.

S4-7

At this time the Army is not proposing any fill in waters of the U.S. and therefore a Section 404 CWA permit is not required. Please see Section 4.8 for further information.

S4-8

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

Comments

- (3) Subsection N.7.2 shall detail HRS, Chapter 342D, HAR, Chapter 11-55, and NPDES permitting requirements.
- (4) Not all NPDES permits are granted with or qualified for a "zone of mixing." The accuracy of the statement "[F]or point sources, the permits establishes limits on the concentrations and . . . Limits are typically based on evaluation of the degree of dispersion of the effluent within a mixing zone, and the permit establishes the allowable size of the mixing zone" needs to be re-evaluated.

Please include the following certification statement in any future correspondence or inquiry regarding this project:

S4-9

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

Should you have any questions, please contact Mr. Edward Chen of the Engineering Section, CWB, at (808) 586-4309.

Sincerely,

DENIS R. LAU, P.E., CHIEF
Clean Water Branch

c: Chief, DEHP/Hawaii

Dear Ms. Barger:

Subject: Draft Environmental Impact Statement (EIS)
Army Transformation in Hawaii
Oahu and the Big Island, Hawaii
TMK: various

S6-1

After reviewing the DEIS and the various locations that will be affected, it appears that each location has addressed domestic wastewater generation, treatment, and disposal. Therefore, as wastewater will be treated and disposed of by means of connecting to existing County/federal sewer service systems or existing individual wastewater system (IWS), we have no objections to the proposed actions.

S6-2

When the Final EIS becomes available on-line, we will submit additional comments if there seems to be a need. All wastewater plans must conform to applicable provisions of the Department of Health's Administrative Rules, Chapter 11-62, "Wastewater Systems." We do reserve the right to review the detailed wastewater plans for conformance to applicable rules. Should you have any questions, please contact the Planning & Design Section of the Wastewater Branch at 586-4294.

Sincerely,

HAROLD K. YEE, P.E., CHIEF
Wastewater Branch

LNK:erm

Responses

S6-1

We thank you for your comment and participation in this public process. Your comment has been noted and has been included as part of the administrative record for this process.

S6-2

The EIS has determined that there is no significant change to wastewater and wastewater treatment if the proposed action is implemented. The Army abides by all appropriate federal laws and regulations in the design and management of its wastewater facilities. State regulations and guidelines do not apply to federal actions.

Attention: Cindy S. Barger

Dear Project Manager:

Subject: Army Transformation
Draft Environmental Impact Statement (DEIS), Volume I

Our comments are as follows:

1. The Draft EIS does not recognize that a Defense Access Road, Project HI-A-AD-6 (1), State Route 200 – Saddle Road, is currently being constructed and runs through the proposed P7 West Pohakuloa Training Area (PTA) Acquisition Area. Attached is a map of the Defense Access Road Project (DARP) with an overlay showing the location of the PTA Acquisition Area. The Final EIS should address the impact of and identify mitigation measures applicable to the DARP – Saddle Road project particularly the portion within the PTA.

Currently a construction contract is being awarded for Phase I - Section II of the DARP for the grading and installing of the drainage system. Phase 2 - Section II of the DARP should be going out for advertising in 2004 to complete the grading and drainage system. Phase 3 - Section II of the DARP for installing the pavement will follow. Portions of the DARP east of Section II are currently being designed by the Central Federal Lands Highway Division of the Federal Highway Administration, U.S. Department of Transportation. The portion of the DARP west of Section II is still to be designed. This is the portion of the DARP that runs through the PTA Acquisition Area. Any realignment of the PTA to Kawaihae Harbor Trail in the vicinity of Saddle Road should be closely coordinated with the DARP - Saddle Road project.

Please contact Mr. Glenn Yasui, Administrator of our Highways Division of the State Department of Transportation at (808) 587-2220 for further discussion on this matter.

2. While the Draft EIS discloses that the initiation of the Stryker Brigade Combat Team will not have a significant impact on traffic in the islands by 2005, we are concerned how the Army will address any traffic impacts beyond the initial transformation if additional

Chapter 9 discusses the cumulative impacts of the new Saddle Road in relation to the proposed action.

S12-2

Any significant future changes in force, equipments, training, or construction will be subject to NEPA and the appropriate NEPA documentation will be prepared. This would address impacts to traffic as well as all other resource areas. The Department of Transportation would be invited to comment on any future projects.

contingents, units or vehicles are added to the brigade or added as part of the transformation. The number of personnel and their housing on base or off-base will be a factor. We understand the initiation of this Interim Force will serve as a "working model" to be refined over the next 30 years. If material or substantive changes occur during this future period to the number and placement of personnel and equipment housed or operating in Hawaii, we should be consulted on the changes, especially if our transportation facilities may be affected.

S12-3

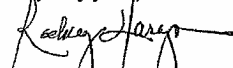

3. The Draft EIS recognizes that fugitive dust from military vehicle use and wind erosion from areas disturbed by military vehicle use within Kawaihae Harbor, Island of Hawaii, are classified as having a significant impact under both proposed action and reduced land acquisition alternatives. The Final EIS should identify required mitigation measures to address these issues.

S12-4

4. The following errors in the text should be corrected:
- a. On page 3-36, paragraph 2, the numbers represent miles of State roads, not lane miles.
 - b. On page 3-37, paragraph 3, Waikoloa Road is under county, not State jurisdiction.
 - c. On page 3-39, paragraph 6, "Countrywide" should be changed to "Countywide".
 - d. On page 4-40, paragraph 1, the "Helemano Trail", between SBMR and HMR, is on Oahu and does not cross Kawaihae Road, and Mamalahoa Highway, which are State highways on the island of Hawaii.
 - e. On page 8-21, the road labeled Akoni Pule Highway should be changed to Queen Kaahumanu Highway.
 - f. On page 8-76, a) replace "County Road Zoo" with "Route 200", b) replace "Kuhio Village" with "Mamalahoa Highway", c) label "Kohala Mountain Road" as SR 250, d) correct the spelling of "Kaahuhanu" to "Kaahumanu", and "Maaluhua" to "Mamalahoa".
 - g. On page 8-80, delete "320" and replace "Mamalakoa" with "Mamalahoa".

We appreciate the opportunity to provide comments. Should you have any questions, please contact David Shimokawa of our Statewide Transportation Planning Office at 587-2356.

Very truly yours,

RODNEY K. HARAGA
Director of Transportation

Attach.

Responses

S12-3

The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. Hygroscopic salt solutions (such as calcium chloride and/or magnesium chloride) appear to be the most logical choice for application to unpaved roads and military vehicle trails at USARHAW installations. Monitoring road surface moisture conditions and dust generation levels would be important components of an adaptive management program that seeks to optimize the proper timing of dust suppressant applications. To the extent possible, planned dust suppressant applications should be scheduled to immediately precede periods of significant convoy traffic. As noted in the Final EIS, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

S12-4

Changes made, except page 8-76. Kuhio Village is indicating a place name not a road name.

STATE OF HAWAII
STATE CAPITOL
HONOLULU, HAWAII 96813

November 17, 2003

Letter
S13

Ms. Cindy Barger
US Army Corps of Engineers, Honolulu District
Bldg. 230, CEPOH-PP-E
Fort Shafter, Hawaii 96858-5440

Dear Ms. Barger:

S13-1

This letter serves as my public comments in support of the Draft Environmental Impact Statement "Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawaii" and the transformation itself. While the transformation of this combat team, the training that coincides with such a transformation, and the construction or renovation of facilities may negatively impact the environment, the protection of the environment has to be weighed against other policy considerations as well. In these times of uncertainty and ever increasing hostility directed to the United States, the establishment and maintenance of military installations on the State is vital to the preparedness and mission of the armed forces of the United States and national defense.

Our island state is over 2,000 miles from its closest neighboring state, and 2,000 miles closer to the Asian continent than any other state in the union save Alaska. With increasing hostility directed to the United States, a Stryker Brigade Combat team would help to realize the defensive needs of this State and, if needed, offensive strategic needs of the nation.

S13-2

We also cannot ignore the fact that the presence and maintenance of the military installations in this State are an important component of the State's economy as well as an area of critical state concern. Besides the obvious tax dollars that flow into our State, the military provides other services to our community that many people may not realize, such as emergency aeromedical services for the island of Oahu and assistance with water drops on large brush fires. Our quality of life is diminished when we work to diminish our working partner. By working together in partnership with the military, we can strike a balance between the numerous important policy considerations.

S13-3

To that end, I am working on introducing several pieces of legislation that will help to facilitate the military presence in Hawaii as well as attempting to strike a proper balance with protecting the environment. Some of these measures include the recognition

S13-2

We thank you for your comment and participation in this public process. Your comment has been noted and has been included as part of the administrative record for this process

S13-3

The EIS has determined that there is no significant impact to public services by the implementation of the proposed action. The Army designs all of its projects, including those in this proposed action, in accordance with Executive Order 13123 "Greening the Government through Efficient Energy Management" (June 2001), Executive Order 13101 "Greening the Government through Waste Prevention, Recycling, and Federal Acquisition" (September 1998), and Department of the Army Engineering Technical Letter 1110-3-491 "Sustainable Design for Military Facilities" (May 2001) and the U.S. Army Corps of Engineers Sustainable Project Rating Tool (SPiRiT). These documents and tools provide design guidelines and standards for sustainable development - addressing water resources, energy and atmospheric resources, indoor environmental quality, material and other resources.

of military installations and activities as areas of "critical state concern" and establishing state policy to support such facilities; requiring county planning departments to notify military commanders of zoning change applications which may affect land uses within three thousand feet of military land; requiring environmental documents to disclose if reclassification of land within three thousand feet of a military installation would impact the installation's training mission; requiring land classification proceedings before the Land Use Commission to include analysis of potential impact on military installations; and authorizing Hawaii military bases that develop their own renewable energy sources to feed excess energy into existing utility company grids without going through the Public Utility Commission process.

In supporting both the draft environmental impact statement and the decision to transform the brigade into a Stryker brigade, it is my hope that we all recognize that through a continuous process of comprehensive, long-term, and strategic planning, we can meet the needs of all of Hawaii's people.

Sincerely,

Representative Cynthia Thielen
Assistant Minority Floor Leader
50th District, Kaneohe Bay - Kailua

Request for Extension of Public Comment Period on Draft Environmental Impact Statement: Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawai'i

Dear Cindy Barger:

The Office of Hawaiian Affairs (OHA) requests that you extend the period for public comment on the *Draft Environmental Impact Statement: Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawai'i* (Draft EIS). The comment period is currently scheduled to end on November 19, 2003. An extension of this period to a total of 120 days is required for several important reasons.

OHA has substantive obligations to protect the cultural and natural resources of Hawai'i for its beneficiaries, the people of this land. As such, OHA will be commenting extensively on the Draft EIS and requires that its beneficiaries, among others, have the opportunity to be effective elements of the review of this important document.

The National Environmental Policy Act (NEPA) does not simply require public participation; it requires adequate public participation. This includes public scoping meetings prior to the drafting of the EIS, public hearings (in commonly accessible, public places), and time for the public to review the material in the Draft EIS in order to make informed, critical and evaluative responses to that material. Otherwise the Congressional policy behind NEPA, that it be used "to identify and assess the reasonable alternatives to

S14-1

The public comment period was extended to 90 days and ended on January 3, 2004. According to NEPA regulations, the main text of a Final EIS should normally be no longer than 300 pages for proposals of unusual scope or complexity (40 CFR 1502.7). In practice, this recommended page limit is typically exceeded. The main text of this SBCT document is well over the suggested 300 pages in length, but the scope of the proposal, involving twenty-eight projects, acquisition of over 24,000 acres of land on two Hawaiian islands, and the comprehensive and complex evaluation of a multitude of resource impacts on the affected environment on O'ahu and Hawai'i necessitates an impact statement of this magnitude. For reviewers not electing to read the entire main text, an Executive Summary provides a comprehensive impact evaluation overview, including a mitigation matrix. This is a large, comprehensive document requiring considerable time to thoroughly review. In view of this, the 45-day minimum comment period for draft environmental impact statements required by NEPA was extended to 90 days. Three months was considered an adequate period of time to review the document and provide written comments.

Comments

proposed actions that will avoid or minimize adverse effects of these actions upon the quality of the human environment," is erased.

Because the Draft EIS is approximately 1,500 pages long, and a dense 1,500 pages at that, 45 days is not enough time for adequate perusal, absorption and criticism of the information contained in those pages. Because this Draft EIS is at least three times the average length of a Draft or Final EIS, OHA requests an extension to 120 days (just under three times the required time for public comment) for public input.

The Army's regulation AR 200-2 implements NEPA for the Army, and is based entirely on the Code of Federal Regulations (40 C.F.R. 1500-1508) that implements NEPA for the Federal Government. AR 200-2 does not provide a maximum time for public input, but does include a minimum time (which is exactly met by the current stipulated 45 days). It also includes a suggested maximum page length for complicated issues: 300 pages (per 40 C.F.R. 1502.7 "Page Limits. The text of final environmental impact statements . . . shall normally be less than 150 pages and for proposals of unusual scope or complexity shall normally be less than 300 pages."). Because this Draft EIS is five times that length, the Army should allow adequate time for the public to review all 1,500 pages.

S14-1 cont'd

Public review of the Draft EIS is supposed to create a better document in the form of the Final EIS. The public needs more time to provide the Army with such informed input, because this document requires much improvement.

AR 200-2 allows for time limits to be changed (Ch. 2-6(b)(3)(d)) and in so doing requests consideration of the factors in 40 C.F.R. 1501.8(b)(1), which include:

- Potential for environmental harm;
- Size of the proposed action;
- Number of persons and agencies affected;
- Degree to which relevant information is known and if not known the time required for obtaining it; and
- Degree to which the action is controversial.

The size and extent of the transformation project described in this Draft EIS include enormous potential for environmental harm; affect the entire State of Hawai'i; require much more extensive research into alternative proposals, mitigating measures, and the cumulative cultural and environmental impacts on O'ahu and Hawai'i Island; and is growing increasingly controversial as more people become aware of the content and extent of the proposed actions. The further good faith research and reporting required of the Army before a Final EIS could be found to be adequate will be significant enough to require supplemental EISs, according to 40 C.F.R. 1502.9(a).

S14-2

The current Draft EIS does not include adequate consideration of a suitable number of alternatives, and the mitigations proposed have not yet reached the level of those that "can reasonably be accomplished as part of a proposed alternative." (AR 200-2, Ch. 2-7(a)) The alternatives presented in an EIS are "the heart of the environmental impact

Responses

S14-2

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

Comments

S14-2
cont'd

statement" (40 C.F.R. 1502.14, see also 42 U.S.C. 4332(C)), and "inadequate range of alternatives presented" is one of three major sources of successful litigation against EISs. Congress designed the requisite alternatives section to provide a clear choice among options to the public and the decision-makers. Only three alternatives, one being the Army's preferred alternative, the other being the required "no action" alternative, and the third being only the lack of land acquisition on O'ahu, with all of the Army's proposed transformation activities maintained and moved to the Big Island, is not an adequate representation of a possible range of alternatives, according to the U.S. Supreme Court and various federal courts.

S14-3

The Army must not presume that its preferred alternative will be the chosen alternative. It cannot commit funds to that alternative until the Record of Decision (ROD) has been approved. And it cannot stack the deck against any other possible alternatives. The NEPA process is a decision-making process, not a decision-made process. (40 C.F.R. § 1501.2(e), (f), (g))

S14-4

The Draft EIS lists a number of "possible" mitigations. The Army should know by now what it will be able to do. Army regulations state that the EIS should include "planned" mitigation measures, not possible ones. (AR 200-2, Ch. 6-5(e)(1)) Otherwise, the public will not be a true part of the decision-making process, as mandated by Congress, because the public may not be commenting upon actual plans. The current wording implies that the Army expects to incorporate whatever mitigation measures, if any, it wishes in its ROD. This is not the purpose of the NEPA process, which anticipates that by the time a ROD is published, "The proponent must ensure such mitigation measures become a project line item in the proposal budget." (AR 200-2, Ch. 2-7(b))

S14-5

OHA, because of the inadequacy of the Draft EIS, the length and density of the Draft EIS, the extent of impact of the proposed Army Transformation process, the level of controversy and concern arising from this proposal, and the Congressional intent of the NEPA process itself, therefore requests that the public comment period be extended to at least 120 days. The extension would be a good faith effort on the part of the Army to support the public's efforts to provide quality, useful input to the Department of the Army's decision-making process on the Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawai'i. As the November 19, 2003, deadline rapidly approaches, we request your immediate attention to this urgent matter.

Thank you for the opportunity to comment. If you have further questions, please contact Lance Foster, Director, Nationhood and Native Rights, at 594-1888.

Sincerely,

Clyde Namu'o
Administrator,
Office of Hawaiian Affairs

Responses

S14-3

No presumption has been made as to the alternative to be selected. The Army has not, and will not, irretrievably commit resources which would prejudice the selection of alternatives until a final decision has been made.

S14-4

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

S14-5

The public comment period was extended to 90 days and ended on January 3, 2004. Regarding time for EIS review, this is a large, comprehensive document requiring considerable time to thoroughly review. In view of this, the 45-day minimum comment period for draft environmental impact statements required by NEPA was extended to 90 days. Three months was considered an adequate period of time to review the document and provide written comments.

Fort Shafter, HI 96858-5440**Comments on Draft Environmental Impact Statement: Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawai'i**

Dear Ms. Cindy Barger:

The Office of Hawaiian Affairs (OHA) is in receipt of your October 2003 request for comment on the above Draft Environmental Impact Statement (Draft EIS). We offer the following comments.

OHA has substantive obligations to protect the cultural and natural resources of Hawai'i for its beneficiaries, the people of this land. The Hawaii Revised Statutes mandate that OHA "[s]erve as the principal public agency in the State of Hawaii responsible for the performance, development, and coordination of programs and activities relating to native Hawaiians and Hawaiians; . . . and [t]o assess the policies and practices of other agencies impacting on native Hawaiians and Hawaiians, and conducting advocacy efforts for native Hawaiians and Hawaiians." (HRS § 10-3) Keeping these responsibilities in mind, OHA has a series of general concerns and specific problems with the Draft EIS which will be addressed below.

Throughout this process, it is important to remember the Congressional policy behind the National Environmental Policy Act (NEPA): that it be used "to identify and assess the reasonable alternatives to proposed actions that will avoid or minimize adverse effects of these actions upon the quality of the human environment." (40 C.F.R. §1500.2(e)) A Federal agency is further required to "[s]tudy, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources." (42 U.S.C. 4332(2)(E))

Responses

Comments

While the Army's regulation AR 200-2 implements NEPA for the Army, it is based entirely on the Code of Federal Regulations (40 C.F.R. 1500-1508) that implements NEPA for the Federal Government. Cites used throughout this letter relate to both statutes, as relevant to the Department of the Army.

S15-1

A major theme to this letter will be the request for a revised and/or supplemental Draft EIS, as required by the aforementioned relevant statutes. "The draft statement must fulfill and satisfy to the fullest extent possible the requirements established for final statements in section 102(2)(C) of the Act. If a draft statement is so inadequate as to preclude meaningful analysis, the agency shall prepare and circulate a revised draft of the appropriate portion. . . ." (40 C.F.R. 1502.9(a)) The agency's duties are qualified by the phrase "to the fullest extent possible," but these words do not "provide an escape hatch for footdragging agencies; it does not make NEPA's procedural requirements somehow 'discretionary.'" (*Calvert Cliffs Coordinating Committee v. United States Atomic Energy Commission*, 449 F.2d 1109 (D.C. Cir. 1972)) These duties are not excused by time or monetary constraints. This is because public review of the Draft EIS is supposed to create a better document in the form of the Final EIS. This document requires much improvement. Several holes are found in this Draft EIS which must be filled by revisions and/or supplements.

Alternatives

For example, the current Draft EIS does not include adequate consideration of a suitable number of alternatives, and the "considered" and "possible" mitigations proposed have not yet reached the level of those that "can reasonably be accomplished as part of a proposed alternative." (AR 200-2, Ch. 2-7(a)) NEPA requires "a detailed statement by the responsible official on . . . alternatives to the proposed action." (42 U.S.C. §4332(C)) The alternatives presented in an EIS are "the heart of the environmental impact statement" (40 C.F.R. 1502.14, see also 42 U.S.C. 4332(C)), and an "inadequate range of alternatives presented" is one of three major sources of successful litigation against agencies' EISs.

S15-2

Congress designed the requisite alternatives section to provide a clear choice among options to the public and the decision-makers. Only three alternatives are presented in this Draft EIS: one being the Army's preferred alternative, another being the required "no action" alternative, and the third being only the lack of land acquisition on O'ahu, with all of the Army's proposed transformation activities maintained and moved to the Big Island. This is not an adequate representation of a possible range of alternatives, according to the U.S. Supreme Court and various federal courts.

One federal appellate court found that even eleven alternatives did not provide an "adequate range" of diverse possibilities. (*California v. Block*, 690 F.2d 753 (9th Cir. 1982)) The court noted that possible alternatives could be infinite, and that an agency only had to consider an array of alternatives that represented the range of possibilities. Even this has not been accomplished here. Some alternatives are alluded to in the mitigation descriptions, but negotiations and consultations with other federal agencies are

Responses

S15-1

The Army has reviewed the public comments and has expanded discussions to address comments submitted. As discussed in Chapter 2, the Army has determined that a supplemental Draft EIS is not necessary.

S15-2

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

Comments

- S15-2 cont'd** | not yet completed, so changes may be made (e.g., Section 7 consultations with the U.S. Fish and Wildlife Service, and Section 106 consultations under NHPA). Such reasonably foreseeable alternatives requiring interagency cooperation should be described in an EIS. (*Natural Res. Def. Council, Inc. v. Morton*, 458 F.2d 827 (D.C. Cir. 1972))
- S15-3** | The Army must not presume that its preferred alternative will be the chosen alternative, as it seems to do in the Draft EIS. It cannot commit funds to that alternative until the Record of Decision (ROD) has been approved. And it cannot stack the deck against any other possible alternatives. The NEPA process is a decision-making process, not a decision-made process. (40 C.F.R. § 1501.2(e), (f), (g))
- S15-4** | Congress and the Pentagon have seemingly made a mockery of the NEPA process and the above requirement, however. News reports state that Congress has already set aside more than \$100 million for the infrastructure to support the brigade, and Secretary of Defense Donald Rumsfeld approved the Stryker Brigade Combat Team for Hawai'i. (*Stryker approved for Hawai'i*, Honolulu Advertiser, Tues. Dec. 16, 2003, B1) Despite this, the Army is required to fulfill NEPA requirements and provide legitimate alternatives to the public and decisionmakers. Equally, if the news reports are accurate, and new lightweight 155mm howitzers and Comanche helicopters are to be included in the brigade's transformation, a revision of the Draft EIS, or at least a supplemental Draft EIS, must be provided for those and any other additions and enhancements to the transformation project before it can go forward. Both of the above items, and other listed aviation and infrastructure enhancements, would have distinctly new and greater impacts on the environment, and new mitigation measures will have to be examined and reported.
- Mitigation*
- S15-6** | The Draft EIS lists a number of "possible" mitigations. The Army should know by now what it will and will not be able to do. Army regulations state that the EIS should include "planned" mitigation measures, not possible ones. (AR 200-2, Ch. 6-5(e)(1)) Otherwise, the public will not be a true part of the decision-making process, as mandated by Congress, because the public may not be commenting upon actual plans. The current wording implies that the Army expects to incorporate whatever mitigation measures, if any, it wishes in its ROD. This is not the purpose of the NEPA process, which anticipates that by the time a ROD is published, "The proponent must ensure such mitigation measures become a project line item in the proposal budget." (AR 200-2, Ch. 2-7(b))
- S15-7** | Because these transformation plans alter and destroy lands with traditional and cultural significance to Native Hawaiians, mitigation is an important element to planning, and something distinctly missing from the Draft EIS. No prescribed methodology for managing these areas of concern exists in the Draft EIS. The Army should provide for the specific protection of Native Hawaiian cultural, historical and archaeological sites.
- S15-8** | Native Hawaiians must also be guaranteed access to areas of traditional and cultural significance, including religious, customary and gathering rights in a manner that is agreeable and appropriate for the intended purpose of access, as is described in the State

Responses

S15-3

No presumption has been made as to the alternative to be selected. The Army has not, and will not, irretrievably commit resources which would prejudice the selection of alternatives until a final decision has been made.

S15-4

Although the Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2nd Brigade 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decision necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2nd Brigade, 25th ID(L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law.

S15-5

After the publication of the Draft EIS, the Army announced plans for an enhancement package for SBCTs. The enhancements include an aviation task force, an increase from twelve to eighteen 155mm howitzers in the direct support artillery battalion, and improvements to command, control, communications, computer, and intelligence (C4I) assets. The announcements indicated that the aviation task force would include Comanche helicopters when the aircraft were ready for fielding. In February 2004, the Army determined that no further testing or fielding of Comanches would occur and canceled the Comanche program. The SBCT aviation task force will come from existing 25th ID(L) aviation brigade assets and will result in minor changes to training, primarily some increased aviation training over WPAA in support of units training in that area. The FEIS has analyzed the impacts of the increased aviation training over WPAA and those impacts are minimal. The Draft EIS analyzed the impacts of twelve 155mm howitzers, a change from the eighteen 105mm howitzers currently in the direct support artillery battalion for 2nd brigade. The addition of another six 155mm howitzers was analyzed in the FEIS and resulted in minimal changes to noise impacts and no change in the overall determination of effect. The C4I improvements are not expected to have any impacts on the environment. Overall, the Army has determined that the enhancements are within the original scope of the proposed action as described in the Draft EIS, are minor in nature, and do not

Comments

- S15-8 cont'd** Constitution and various Hawaii Supreme Court decisions. To that effect, the Final EIS must address managed access to historic Hawaiian trails that cross Army lands in the proposed project areas.
- S15-9** The Army should also provide for the removal of unexploded ordnance (UXO) and for the environmental restoration of our `aina. The Army should establish a legally binding agreement with Native Hawaiians to return the `aina to its pre-military, environmentally safe state, with the requisite federal funding in place to insure proper remediation. The military does not have a good remediation track record in Hawai'i, and Native Hawaiians are rightly concerned about the legacy of the heritage of their land. From Kaho`olawe to Waikane Valley, the military has bombed and contaminated lands to virtually useless status, even for themselves (Waikane Valley recently was found to be too dangerous for the Marines to use for jungle training.).
- S15-9** Both of the above locations are examples of over-use by the military, and a lack of foresight toward future remediation, which the military has found to be excessively expensive in both cases. The Marines are resorting to fencing off Waikane Valley, which cannot be allowed to be a viable option to the military lest these islands become a patchwork of pockmarked, unusable lands, stitched together by security fencing. Before seeking new lands for training and subsequent destruction, lands currently and previously used should be remediated. The Draft EIS speaks of remediation occurring on the lands involved in the Stryker transformation only after the Army is through with them, and that investigations about methods of remediation will not happen until that time. NEPA requires that mitigation methods be studied and explained prior to the actions being allowed, and that those methods be properly funded.
- S15-10** While Army Regulations only require mitigation measures that can actually be accomplished be listed, and state that "complete development or testing of the exact means of performing the action may not have occurred," they also require that mitigation be considered throughout the NEPA process and that mitigation measures be included in the ultimate proposal's budget. Indeed, "[w]hen an EIS or EIS Supplement is prepared, the ROD will state *specific* mitigation measures taken to reduce or avoid the selected action's adverse environmental effects." (emphasis added; AR 200-2(a) and (b), based on 40 CFR 1502.2(c))
- Cumulative Impacts*
- The Ninth Circuit, which includes Hawai'i, has held an EIS to be inadequate because there was not enough information about cumulative impacts on old growth forest habitats, effects on the home ranges of pileated woodpeckers, and mitigation efforts to limit the impacts of increased sedimentation on redband trout. (*Neighbors of Cuddy Mountain v. United States Forest Serv.*, 137 F.3d 1372, 1378-81 (9th Cir. 1998)) The same court found an EIS incomplete because it did not take into account the cumulative impacts of multiple timber sales from old growth forests (*City of Tenakee Springs v. Clough*, 915 F.2d 1308 (9th Cir. 1990)), much like the cumulative impacts of continued damage to military lands that have yet to be remediated from decades of military training,
- S15-11**

Responses

require a supplemental Draft EIS.

S15-6

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

S15-7

The cultural resource sections have been expanded to better address issues raised by the public. In addition, the Army has changed the determination of effect in some cases to "significant". The EIS process is a planning process since actions will not occur until the process is complete. Specific mitigation measures will be developed according to the Final PA developed in compliance with Section 106 of the NHPA (See Appendix J).

S15-8

As discussed in Section 4.11, the Army proposes to continue work with Native Hawaiian communities on access to areas of traditional importance. In addition, an installation wide access protocol is being developed for all Army training lands in Hawai'i.

S15-9

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closer (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations,

such as those lands involved in the proposed SBCT transformation. Equally, an EIS has been found to be inadequate for not considering cumulative and synergistic impacts of simultaneous offshore oil and gas developments in Alaska and the Pacific (*Natural Res. Def. Council, Inc. v. Hodel*, 865 F.2d 288 (D.C. Cir. 1988)), much like the cumulative and synergistic impacts of developments on Mauna Kea, in extending runways for C-17 access and in Kawaihae Harbor.

Specific recommendations

OHA recommends specific changes to the following pages of the Draft EIS:

S15-12

2—43-45 Reduced Land Acquisition Alternative: *The description of this, the only real alternative provided by the Draft EIS, is such that it basically disregards this alternative as well. Therefore, this is not a legitimate alternative, which must be a reasonable choice provided to the public and the decision-maker.*

S15-13

2-45 Alternatives Considered but not Studied in Detail

"First, any alternative must meet the purpose of and need for the action by assisting to bring the Army's Interim Force to operational capability and by providing realistic field training in Hawai'i while providing the nation with capabilities that meet current and evolving national defense requirements." *These prerogatives further limit the possibility of any viable alternative, even though AR 200-2, D-5(a) provides that alternatives go beyond DA jurisdiction. Thus even though a DA directive may seem to compel the location of the training and stationing of an SBCT in Hawai'i, other alternatives must be thoroughly examined.*

S15-14

2-46 2.6.3 Transformation in Hawai'i with Maneuver Live-Fire and Nonlive-Fire Training on the Continental U.S. Instead of on Hawai'i

2-51 Among the reasons given why the above alternative won't work is that "The Hawai'i-based SBCT could not meet its training requirements using facilities at Forts Irwin, Hood, Riley, and Carson due to the lack of specialized facilities required to train an SBCT, and at present there are no plans to construct them." *Plans can be made, and it must not be presumed that just because there are plans to construct such facilities here, that they will be so constructed. The purpose of this NEPA process must be remembered throughout the Draft EIS.*

S15-15

3-3 *The ceded lands definition should be replaced with language from the Apology Bill (U.S. Pub. L. 103-150 (Nov. 23, 1993)), including the following:*

[T]he Republic of Hawaii also ceded 1,800,000 acres of crown, government and public lands of the Kingdom of Hawaii, without the consent of or compensation to the Native Hawaiian people of Hawaii or their sovereign government;" "the indigenous Hawaiian

including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

S15-10

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

S15-11

Chapter 9 discusses projects such as Kawaihae Harbor, C-17 improvements and developments on Mauna Kea that are not part of the Proposed Action. the use of C-17s is analyzed as part of this project and impacts are discussed throughout the document. The C-17 beddown and other C-17 activities are proposed by the US Air Force and are undergoing separate NEPA analysis. Chapter 9 has been expanded to better evaluate the Proposed Action in relation to other existing or proposed projects on the islands of O'ahu and Hawai'i to determine the cumulative impact to resources.

S15-12

The Reduced Land Acquisition Alternative is a legitimate alternative. This alternative was not disregarded in the EIS as a full analysis of this alternative was included. This alternative, while not preferred, is a feasible alternative.

S15-13

As discussed in section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including

people never directly relinquished their claims to their inherent sovereignty as a people or over their national lands to the United States, either through their monarchy or through a plebiscite or referendum;" "the health and well-being of the Native Hawaiian people is intrinsically tied to their deep feelings and attachment to the land;" "the Native Hawaiian people are determined to preserve, develop and transmit to future generations their ancestral territory, and their cultural identity in accordance with their own spiritual and traditional beliefs, customs, practices, language, and social institutions;" and "The Congress . . . (4) expresses its commitment to acknowledge the ramifications of the overthrow of the Kingdom of Hawaii, in order to provide a proper foundation for reconciliation between the United States and the Native Hawaiian people. . . .

S15-16

3-64 "One important component of Army resource management is the ITAM [Integrated Training Area Management] program. ITAM management in Hawai'i is focused on training lands and is the formal strategy that the Army uses on all installations to achieve sustainable use of these lands. The ITAM program incorporates the land condition trend analysis (LCTA), land rehabilitation and maintenance (LRAM), training requirements integration (TRI), and sustainable range awareness (SRA) components. ITAM incorporation began in Hawai'i in 1989 in PTA and has increased ever since. . . . A more detailed discussion of ITAM can be found in Section 2.1.5." *No such section exists. OHA would like more detail.*

S15-17

3-70 Cultural Resources
Through oral histories, religious practice, and the very presence of the land, sea and sky, the cultural landscape presents a principle of culture and reminds Native Hawaiians of their history and origin, and of the gods and ancestors who dwell there. A sense of place for Native Hawaiians equals a genealogical link to Hawai'i and a bond to lessons retold when a district, geological feature, site, structure, burial or name is encountered. Incorporating correct Hawaiian place names in the EIS document would help infuse the culture in the process, and providing more than a cursory overview of the concept of cultural landscape for each ROI would also improve the process.

S15-18

3-81 "The only weapons used in live-fire training that can produce UXO are grenades, mortars, and artillery; all other ammunition is inert." *What about the new lightweight 155mm howitzers? These must be incorporated into a revised Draft EIS.* "UXO is an obvious threat to Army personnel working on the range areas, as well as civilians living in the area. The environment is also at risk by the presence of UXO and ammunition, as chemicals such as lead and explosives propellant could leach into the soils and groundwater." *There is also the concern of runoff carrying contaminants to nearshore ocean waters, which has not been*

S15-19

Responses

several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

S15-14

The decision to transform in Hawai'i was analyzed in the Final Programmatic EIS completed on March 8, 2002. The Record of Decision for this EIS was signed on April 11, 2002. All the factors considered for transforming in Hawai'i are included in that Final Programmatic EIS. The discussion regarding why transformation is to take place in Hawai'i can be found in Chapter 1 – Purpose, Need, and Scope of this EIS. However, options of transforming in Hawai'i and training elsewhere are discussed in the EIS. Please see Section 2.6 in the EIS.

S15-15

We thank you for your comment and your comment has been noted and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

S15-16

The correct reference is Section 2.2.4. This has been corrected in the Final EIS.

S15-17

Section 8.11 and Appendix J have been updated to include more information on oral histories, religious practices and areas of traditional importance. In addition, the Army has determined that the proposed action will significantly

Comments

S15-19 cont'd	<i>addressed in this Draft EIS. It should be addressed for each ROI impacting a coastal environment.</i>
S15-20	3-91 The Army uses "the long-term liquid concentrate fire retardant LCA-R, which consists of ammonium, attapulgite clay thickener, a corrosion inhibitor, and a coloring agent diluted with water." It is approved by the US Forest Service and is not hazardous to people. <i>How does LCA-R interact with native flora and fauna?</i>
S15-21	4-5 Summary of Impacts <i>PASH interests should be included in this section. For example, what about Kawaihae Harbor? There is no mention of it, yet it is an area of regular recreational and cultural uses. Fishers, gatherers and canoe paddlers have expressed their concerns about being locked out of certain traditional areas. This should be addressed, and mitigated.</i>
S15-22	4—21-22 Fugitive dust from military vehicles would increase by 57% under the Proposed Action. <i>In the list of "potential mitigation measures" is a periodic application of "synthetic dust control treatments." This option is used in each ROI where fugitive dust is a significant impact. In each case, what are the impacts on the flora and fauna environment, runoff and air quality?</i>
S15-23	4-44 Water Resources <i>Among the listings of regulatory standards used in evaluating impacts, there is no mention of Native Hawaiian water uses, which the Hawai'i Supreme Court has said are to be assessed before other water uses can be itemized. PASH concerns apply here as well.</i>
S15-24	4-53 Soil erosion is modeled to be so extensive and severe that "soil loss at SBMR, the East Range, DMR, KTA, and PTA may be only partially mitigable. Also soil loss would increase significantly in spite of land management measures under the ITAM program." <i>No further mitigation ideas are offered, and they should be because the loss of soil to the hardpan has severe ecological and cultural implications. The loss of the soil is the loss of the skin of the 'aina and, as seen on Kaho'olawe, is extremely difficult to remediate.</i>
S15-25	4—54-55 Soil compaction: by tracked or wheeled vehicles, which can preclude future growth of vegetation and moisture retention (<i>as happened on Kaho'olawe</i>), and runoff could follow those tracks, furthering erosion. <i>The mitigation offered is vague and should be clarified and improved upon: "The ITAM Program would be used to identify specific areas subject to this type of impact and to identify land management measures that might reduce the impact. The impacts could be partially or fully mitigable by requiring motorists to avoid affected off-road areas if impacts are observed (thereby spreading the problem) and by revegetating and recontouring affected areas."</i>

Responses

impact areas of traditional importance. Mitigation measures are identified such as the implementation of the Final PA that will reduce the severity of the impact but not to less than significant levels.

S15-18

As discussed in Chapter 2, the howitzer artillery analysis has been updated to reflect the current proposal for 18 155 mm howitzers versus the 12 155 mm howitzers analyzed in the Draft EIS. This change in the number of howitzers had a minimal effect on noise as discussed in Section 4.6. The determination of effect for noise has not changed.

S15-19

As discussed in Section 4.8, 4.10, and 4.12, the soil analysis conducted showed that there did not appear to be a significant offsite migration of explosives or other toxic contaminants from the ranges.

S15-20

The following text was inserted into Section 3.12: The corrosion inhibitor used is biodegradable in water and soil into carbon and nitrogen, however the ammonium component of the retardant could potentially harm fish and other aquatic animals if accidentally dropped into a watercourse.

S15-21

Chapter 9 discusses projects such as Kawaihae Harbor that are not part of the Proposed Action. Chapter 9 has been expanded to better evaluate the Proposed Action in relation to other existing or proposed projects on the islands of O'ahu and Hawai'i to determine the cumulative impact to resources.

S15-22

Impacts to the biological resources from dust are discussed in Chapter 8.10.

S15-23

As discussed in Section 4.8, the Army has concluded that no significant conflicts would occur as a result of the Proposed Action on water rights or water supply.

S15-24

Section 4.9 has been expanded to include more detailed discussions of impacts from soil erosion along with additional mitigation measures. The Army has

Comments

- S15-26** 4-61 Fire impacts may be mitigable on a place-by-place basis, but not project wide. *This is a concern, considering how fires in Makua were handled this year. More mitigation efforts are necessary.*
- S15-27** 4-62 "The effects of SBCT actions on listed species in the ROIs are being evaluated in the Section 7 consultation with USFWS. The Army would carry out all reasonable and prudent measures determined during this consultation. These measures would help avoid effects and would compensate for impacts of fire on listed species that would result directly and indirectly from implementing the Proposed Action." *This mitigation formula is used again and again in the Draft EIS, but the public does not know what is being negotiated in these Section 7 consultations, so cannot comment on proposed mitigation plans. This is a good example of a reasonably foreseeable alternative requiring interagency cooperation, which should be described in an EIS.*
- S15-28** 4-68 Cultural Resources
PASH rights should be one of the factors considered for impact analysis.
- S15-29** 4-69 "Specifically for SBCT, the Army is proposing to comply with its responsibilities under the NHPA by executing a PA with the SHPO, the ACHP and other interested parties and Native Hawaiian organizations." *Much of the mitigation descriptions in this section, and in other ROIs with cultural impacts, rely on the use of the PA. OHA is concerned that this PA states that a complete identification and evaluation of historic properties will be finished prior to the implementation of SBCT undertakings, but they have not yet been completed. Therefore, the Army's reliance on the PA as a source of mitigation information in the cultural resources impacts sections of the EIS is invalid. The Draft EIS states that there will be "no significant and unmitigable impacts on cultural resources under the Proposed Action," but according to the PA, not all of the historic properties in the areas for the proposed actions have even been identified, so saying that all impacts will be mitigable is premature.*
- Of further concern is that the identification and evaluation of these areas should already be complete. Although the NHPA statute allows for a phased identification and evaluation of projects with "corridors or large land areas," that is only when there are still legitimate alternatives under consideration. No alternatives are mentioned in the draft PA, and as previously stated in this letter, no real alternatives have been given in the Draft EIS. The identification of historic properties is supposed to be done using a "reasonable and good faith effort," taking into account "the magnitude and nature of the undertaking and the degree of Federal involvement, the nature and extent of potential effects on historic properties, and the likely nature and location of historic properties within the area of potential effects" all of which, in this case, are extensive and warranting immediate identification and evaluation before this project proceeds. (36 C.F.R. §800.4(b)).*

Responses

determined that the proposed action would have a significant impact on soil loss from training and the mitigation measures identified will substantially reduce the severity of the impact but not to less than significant levels.

S15-25

Thank you for your comment. It will be entered into our administrative record. For discussions on mitigation for soil compaction which are specific to each site, please refer to section 9 of Chapters 5-8.

S15-26

The discussions in Sections 4.10, 4.12, 8.10 and 8.12 have been expanded in the Final EIS to better discuss the potential impacts of wildland fires. The impact to biological resources from wildland fires has been changed to significant. The mitigation measures proposed, including the updated IWFMP, will substantially reduce the severity of the impact on biological resources but not to less than significant levels.

S15-27

Since the publication of the Draft EIS, the USFWS issued Biological Opinions for current force and proposed SBCT training on the islands of O'ahu and Hawai'i. The terms and conditions have been included in the Final EIS by reference. The Biological Opinions are available upon request.

S15-28

Section 4.11 has been expanded to better discuss the impacts to cultural resources. In addition, the Army is working with the OHA to address these issues for all Army actions in Hawai'i.

S15-29

As discussed in Section 4.11, all areas that could be impacted by the Proposed Action have been surveyed for presence/absence of cultural resources. The survey results have been included in the Final EIS. In addition, the cultural resource analysis has been expanded and in some cases the determination has been changed to significant. The Final PA has been signed by the Army, SHPO, ACHP, and OHA. It is included in Appendix J.

S15-29
cont'd

Another grave concern is that Congress has already committed funds to this project, before the NHPA process is complete. This makes a mockery of another federal statute, because if the transformation process is already approved, the degradation of cultural and historical sites is a foregone conclusion that may or may not be properly mitigated. Consultation with Native Hawaiian organizations and other members of the public becomes moot, with only the possibility of a court-ordered injunction to halt the project, pending objective review.

S15-30

4-77-78 Human Health and Safety Hazards

The Draft EIS says that there are no significant and unmitigable impacts in this arena from the Proposed Action. *This is hard to believe considering the military's history in Hawai'i. That the impact of ammunition on the land is considered to be mitigable is also unbelievable, particularly because no planned mitigation or remediation is described. Instead, the only mitigation information given, for any ROI that will be impacted by ammunition, reads: "Additional risk based investigations would be undertaken as appropriate in the event any active range is closed and transferred out of DoD control. All remediation necessary to mitigate an imminent threat to human health and the environment would be undertaken at such time." Therefore, mitigation is not being considered because no one sees, at this time, the possibility that this land will be returned to the Hawaiian people. This is not a good presumption to make. Instead of continuously adding to the environmental damage already impacting the Federal lands under the Army's control, and then spreading the damage over newly acquired land, some sort of mitigation and remediation plan must be in place. Not only would that land become ceded lands should the Federal government relinquish control, with the land having to be decontaminated at that time, but as seen in Waikane, the military can make its lands too dangerous even for itself. And the constant addition of new and further impacts on the 'aina will have cumulative impacts that must be addressed, and not simply postponed. Any impacts that are a threat to human health and the environment must be addressed during the NEPA process – before the threat occurs.*

S15-31

The Hawaii Supreme Court astutely noted in Ka Pa'akai O Ka'aina v. Land Use Commission, 94 Haw. 31, 52 7 P.3d 1068, 1089 (2000): "The power and responsibility to determine the effects on customary and traditional native Hawaiian practices and the means to protect such practices may not validly be delegated by the LUC [Land Use Commission] to a private petitioner who, unlike a public body, is not subject to public accountability. Allowing a petitioner to make such after-the-fact determinations may leave practitioners of customary and traditional uses unprotected from possible arbitrary and self-serving actions on the petitioner's part. After all, once a project begins, the pre-project cultural resources and practices become a thing of the past."

The above is what NEPA tries to prevent. The petitioner must convince the public and the decisionmakers that the Proposed Action is the best action and that the mitigations offered will bring any impacts to the environment to level of no

S15-30

As a mitigation measure for safety, prior to initiation of any construction activities, USARHAW will employ qualified professionals to perform UXO clearance of the proposed construction area, remove all UXO encountered to ensure the safety of the site, and document UXO surveys and removal actions in full accordance with applicable laws, regulations, and guidance. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program. The EIS evaluates the total impact of the project over the life of the project in Chapters 5-8. Cumulative impacts are discussed in Chapter 9.

S15-31

The discussions in the cultural resource sections have been expanded to better address the impacts of the Proposed Action and the benefits of proposed mitigation. As discussed in Section 4.11, the Army has determined that some of the impacts to cultural resources are significant. The mitigation measures proposed will reduce the severity of the impact but not to less than significant levels.

S15-31
cont'd

significance. It must do so before the project begins; in fact, to get permission to begin the project, the decision-maker must be so convinced. Saying that the Army will take care of any problem later, should it arise, by methods not yet determined, is not a good faith rendering of the issues. The same theory is tried unsuccessfully on page 4-81 about UXO.

S15-32

5-102 *Special concern is noted for groundwater contamination that may impact the SRAA, because no current surface water quality data are available for Waikele Stream, where it flows through the SRAA. Such data should be obtained for a baseline to compare against future monitoring efforts.*

5-109 *"The Proposed Action could affect surface water quality through an increase in nonpoint source pollutants delivered to streams." This should be monitored, a prudent method provided to the Army by AR 200-2, 6-1(m), to assure that its decisions and mitigations are carried out. More monitoring of its mitigation measures should be provided by the Army on all lands impacted by this Proposed Action.*

S15-33

5-113 *It is important that a baseline study be done of current migrations of contaminants from Army lands, and continued monitoring of any runoff. Instead of saying that future mitigation "could" include controlling soil erosion and the remediation of hotspots, the language should read "would."*

5-131 *A significant increase in soil erosion is anticipated in the SRAA and SBER, to a non-mitigable level. This is of great concern, considering that the Honouliuli Forest Reserve is south of the SRAA, meaning that more contamination from runoff can be anticipated, something which this Draft EIS already does not completely mitigate.*

S15-34

5-138 *"This EIS is being developed concurrently with consultation conducted in compliance with Section 7 of the ESA. The biological resource section will be updated as necessary to reflect any additional information or analysis that develops as part of Section 7 consultation. These updates will be included in the FEIS." This information should be placed in a supplemental Draft EIS so that the public can comment upon it. Otherwise, no mitigation alternative is provided in any instance where the ESA is applicable in this Draft EIS.*

S15-35

5-162 *Completion of the WFMP is estimated to be in August 2003. This should be included in the FEIS as it is a major element of mitigation. It is unclear if the document in Appendix O is this document.*

S15-36

5-163 *"Ongoing programs that would lessen the impact on listed species and their designated or proposed critical habitat include the ecosystem management plan, endangered species management plan, and INRMP. Land acquired as part of the SRAA would be incorporated into the ITAM and ecosystem management plan to protect any sensitive resources on or around this area. This would minimize soil*

S15-32

As discussed in Section 5.8 and 5.12, there does not appear to be a significant impact to groundwater contamination from the proposed action based on soil sampling. In addition, the Army has been coordinating with EPA on the proposed acquisition of SRAA. If the Army decides to acquire SRAA, the Army will work with EPA to ensure that no actions on SRAA would interfere with cleanup measures at the Kunia Village Superfund site.

S15-33

As discussed in Section 5.9, the surface soil data suggest that contaminant concentrations are relatively low, and there are no data to suggest that the current soil contaminant levels impact surface water quality.

S15-34

Since the publication of the Draft EIS, the USFWS issued Biological Opinions for current force and proposed SBCT training on the islands of O'ahu and Hawai'i. The terms and conditions have been included in the Final EIS by reference. The Biological Opinions are available upon request. As discussed in Chapter 2, the Army has determined that the changes between the Draft EIS and the Final EIS are in scope and a supplemental Draft EIS is not necessary.

S15-35

The IWFMP was updated in October 2003. The IWFMP has been included by reference and the overview in Appendix O has been updated. The plan is available upon request.

S15-36

Section 5.9 (Geology) and Section 5.10 (Biological Resources) have been expanded and updated. Additional mitigation measures are proposed in both sections. The Army has changed the determination of effect in some cases for these sections.

Comments

Responses

S15-36 cont'd	erosion and loss to natural habitats that would otherwise occur as the result of mounted and dismounted maneuvers." <i>Again, more information is needed.</i>
5-166	<i>While admitting the dangers of the spread of nonnative species, the mitigation measures proposed are again lacking in definitive statements:</i>
S15-37	"USARHAW would follow HQDA guidance developed in consultation with the Invasive Species Council and compliance with Executive Order 13112, which determines federal agency duties in regard to preventing and compensating for invasive species impacts. USARHAW would agree to all feasible and prudent measures recommended by the Invasive Species Council that would be taken in conjunction with SBCT action to minimize the risk of harm. Implementing an environmental management system would further improve the identification and reduction of environmental risks inherent in mission activities." <i>This is another example of a reasonably foreseeable alternative requiring interagency cooperation that should be included by more than name in an EIS.</i>
S15-38	5-177 A "limited archaeological survey" of Wheeler Army Airfield is not enough to determine the existence of cultural resources.
S15-39	"Access to cultural sites on Army land is now restricted, but the Army, in accordance with policy, provides access for legitimate reasons to traditional places. Such access is provided within the limitations imposed by mission requirements and public safety concerns. No formal policy governs access at SBMR, and access requests are handled on a case-by-case basis in coordination with Range Control. <i>A formal policy should be instated.</i>
S15-40	5-188 "The SRAA is considered an area of potential for unknown resources, depending upon previous land uses of particular locations. Prior use of much of the area for commercial agricultural development would reduce the likelihood of discovering preserved archaeological sites." <i>This does not preclude investigation.</i>
S15-41	5-211 "The Del Monte Corporation site overlying the proposed SRAA and Helemano Trail lands is a Superfund site due to a historical release of pesticides. . . . The US EPA is reviewing ongoing investigations as to whether these sites continue to present a threat to human health and the environment. Until delisted from the National Priorities List, this site is considered a significant impact. The Army would work with USEPA, Del Monte, and Campbell Estates regarding liability and responsibility for cleanup and would conduct any cleanup required by law." <i>This cleanup should be completed before planning more impacts on the 'aina.</i>
S15-42	5-214 Of the 25% increase, only 1.3% of that increase would be from UXO-producing munitions. "UXO is cleared after the range is closed." <i>In the meantime, chemical contaminants and UXO that drain to island coastlines affect nearshore waters. Cleanup should be continuous.</i>

S15-37

Section 5.10 has been expanded to better discuss the impacts from the spread of non-native species. Mitigation measures are discussed in each biological resources section 4.10, 5.10, 6.10,7.10,and 8.10.

S15-38

As discussed in Section 4.11, all areas that could be impacted by the Proposed Action have been surveyed for presence/absence of cultural resources. The text for Section 5.11 has been corrected.

S15-39

As discussed in Section 4.11, the Army proposes to continue work with Native Hawaiian communities on access to areas of traditional importance. In addition, an installation wide access protocol is being developed for all Army training lands in Hawai'i.

S15-40

Section 5.11 has been updated with the most current survey results. The SRAA paragraph has been updated to reflect survey results. Ongoing work stated on Section 5.11 has also been completed and the text has been changed.

S15-41

Section 5.12 has been updated as investigations have been completed by Del Monte and EPA. EPA signed a ROD establishing remedial measures for the area south of SBMR and de-listing the Puomoho area from the Superfund site. The site is not considered a threat to implementation of the proposed action and the proposed action would not interfere with Del Monte's remedial action

S15-42

The analysis of contamination and migration off of the ranges is included in Chapters 5.9, 6.9, 7.9, and 8.9 and was determined to be less than significant and SBMR, KTA, and PTA and would have no impacts at DMR.

Comments

S15-43	6-84 "The Army and USFWS have not yet agreed on a final ROI. Changes to the present ROI . . . could alter the qualitative and quantitative analyses within this environmental consequences section." <i>Again, this information should be in a supplemental Draft EIS so the public can comment and the decision-maker can have all the information before him or her.</i>
S15-44	7-21 <i>Significant impacts associated with KTA and Drum Road are appropriately listed in the Draft EIS, but no mention is made of a potential mitigating alternative that the Army is considering: acquiring the 1,100-acre Pupukea Paumalu Homestead property from the current owner, who is a willing seller. The Army is considering using this property as an Army Compatible Use Buffer to protect both training capability and natural resources. If the Army considers such a buffer to be needed to make the installations compatible with surrounding lands, it should be mentioned in the EIS.</i>
S15-45	7—59-60 <i>While mention is made of the Proposed Action severely degrading land conditions in KTA, not enough consideration is given to severe flooding problems in Kahuku. Considerable land erosion in the KTA and along Drum Road will only exacerbate this problem, and the Army needs to find a way to mitigate such impacts to a non-significant level for a variety of reasons. Flooding holds contaminants from nonpoint source pollution in solution over lands for extended periods of time, and allows those contaminants to seep into the soil where they can have a profoundly negative effect on the human environment, agriculture, and native vegetation and wildlife that relies on that area, particularly protected shorebirds and snails. Flooding is also a huge expense for those who live and work in Kahuku, which brings up environmental justice and human health and infrastructure concerns.</i>
S15-46	7-96 <i>Again, readers are left waiting for the result of the Section 7 consultation with USFWS, and "No additional mitigations have been identified."</i>
S15-47	8-16 "Proposed management objectives for outdoor recreation at PTA include the following: <ul style="list-style-type: none"> Continue current public access policies and procedures from 2002 to 2006, unless more effective or efficient systems become available." <i>While 5-year periods of review are standard for the INRMP process, they do not follow cultural views of time, which are boundless.</i>
S15-48	8-19 <i>Impacts to land use at Kawaihae Harbor should be addressed. Shoreline access concerns have been brought up by Native Hawaiian cultural gatherers, outrigger canoe paddlers, fishers, and recreational and subsistence users of the area. It has been reported that the Department of Transportation has plans to fence off access to this area, which results in Native Hawaiian PASH and public access concerns.</i>
S15-49	8-29 <i>It becomes even more noticeable in the PTA section that the "alternatives" are not really alternatives, when the Reduced Land Acquisition Alternative repeatedly</i>

Responses

S15-43

Section 6.10 has been expanded to better discuss the impacts to biological resources. The ROIs have been updated based on the final Biological Opinion issued by USFWS in October 2003. The ROI for proposed SBCT activities at Dillingham did not change.

S15-44

The Army is considering ACUBs as mitigation for other proposed actions and has met with the commenter. For the Proposed Action, ACUBs were also considered but more feasible mitigation measures were proposed. The mitigation measures proposed are listed in the Executive Summary.

S15-45

We agree that these are important issues, and they are addressed in the EIS. The project would not increase flooding potential. Degradation of the land would be mitigated with measures implemented through the ITAM program. While existing flooding potential would not be mitigated under the project, new facilities would be designed to offset any of the potential effects from increased impervious surface area by slowing runoff. Watersheds in Koolau Mountains have very short retention times for runoff. The ground tends to be near saturation and there is very little water storage capacity in soils. As a result, most of the incident rainfall becomes runoff rather than percolating to recharge groundwater. Except for retention by vegetation and topography, rainfall runs off rapidly to streams. One of the problems is that development in downstream areas has resulted in filling and encroachment on flat lands that are prone to flooding, and in straightening and narrowing of stream channels, and loss of wetlands. These conditions are not the result of Army actions, but of urban development on low lands that are historically prone to flooding. The Transformation project is not expected to increase flooding problems already inherent in these low-lying areas.

S15-46

Since the publication of the Draft EIS, the USFWS issued Biological Opinions for current force and proposed SBCT training on the islands of O'ahu and Hawai'i. The terms and conditions have been included in the Final EIS by reference. The Biological Opinions are available upon request. As discussed in Chapter 2, the Army has determined that the changes between the Draft EIS and the Final EIS are in scope and a supplemental Draft EIS is not necessary.

Comments

- S15-49 cont'd** | reports that "Impacts from ... would be the same as for the Proposed Action," and the No Action Alternative reports that there would be "No Impacts."
- S15-50** | 8-50 *Fugitive Dust from Military Vehicle Use is a huge issue here because of the dry conditions, the amount of vehicle use, and the proximity to residential areas.*
- S15-51** | 8-51 "The 429 tons per year increase in fugitive PM₁₀ emissions generated by military vehicle[s] at PTA, the likelihood of exceeding the federal 24-hour standard, and the potential impacts to quality of life to Waikī'i Ranch residents and users of Kilohana Girl Scout Camp combined may result in a significant air quality impact at PTA under the Proposed Action." *There is a high incidence of asthma in Hawai'i, particularly among Native Hawaiians, so this is a major concern that should be mitigated as much as possible.*
- S15-52** | 8-70 "As part of the ENMP, the Army would consider establishing a 500-foot noise buffer around the Waikī'i Ranch property and the Kilohana Girl Scout Camp property, and minimizing nighttime vehicle maneuver activities within 1,000 feet of those properties." *This is a good idea and should be implemented.*
- S15-53** | "The Proposed Action would not result in any meaningful changes in helicopter flight operations at PTA." *This is no longer necessarily true, according to the Pentagon, and is just one example of why this Draft EIS must be updated or supplemented.*
- S15-54** | 8-113 *PTA has the highest concentration of endangered species of any Army installation in the world, including the best remaining dryland ecosystems in Hawai'i, which are in the western third of PTA that holds the MPRC (Multi-Purpose Range Complex). Botanist Lani Stemmermann sued in 1989 because of the lack of proper environmental studies done for a \$30 million firing range. The Army has reportedly not yet lived up to the 1990 settlement agreement over the MPRC, so concerns continue about whether adequate environmental studies and responses will be made in this transformation process.*
- S15-55** | 8-157 *These trails should be named and documented, put on maps, and cultural access to them should be provided.*
- S15-56** | 8-169 "Seventeen sites have been found in the proposed area for the BAX, including excavated pit complexes, rock shelters, modified outcrops, rock mounds, a cairn, a lava tube, a lithic scatter, and an enclosure. One site, a complex of lava tubes, trails, enclosures, and a shrine had been identified prior to archaeological survey for the Proposed Action." *The Army should assure the public that it will manage its activities and maneuver zones so as to avoid lava tubes and blisters.*
- S15-57** | 8-179 Mitigation through construction of a natural and cultural resources visitor center: *It should be remembered that while education is a valid and respectful act, it does*

Responses

S15-47

As discussed in Section 8.2, if the Army decides to implement the Proposed Action, the Army will work with the community to coordinate public access in consideration of Army mission requirements and public safety. The Army will work with the State of Hawai'i to set up additional hunter checkin stations at PTA. For more information on current public access programs at PTA, please contact the PTA Public Affairs Office.

S15-48

As discussed in Section 8.2, the Proposed Action will not significantly impact land use at Kawaihae Harbor. Section 8.11 has been expanded to better address the potential impacts of the Proposed Action on Areas of Traditional Importance. The Army has changed the determination of effect to significant. Mitigation measures are proposed, such as working with Native Hawaiians to provide access to these areas. These measures will substantially reduce the severity of the impact but not to less than significant levels.

S15-49

As discussed in Chapter 2 and Chapter 8, while many of the impacts are the same there are differences between the alternatives. For example the impacts to land use at SBMR are significant for the proposed action while they are less than significant for the Reduced Land Acquisition alternative

S15-50

Based on public and agency comment, the Army has conducted more detailed air quality modeling and has identified additional mitigation measures. As discussed in Section 8.5, the Army has determined that based on more detailed analysis and the implementation of mitigation measured identified, the impact from fugitive dust emissions will be significant but mitigable to less than significant levels. Mitigation measures include the use of environmentally friendly dust control measures on vehicle trails and the implementation of a Dust and Soils Management and Monitoring Plan (DuSMMoP) for all training areas.

S15-51

Based on public and agency comment, the Army has conducted more detailed air quality modeling and has identified additional mitigation measures. As discussed in Section 8.5, the Army has determined that based on more detailed analysis and the implementation of mitigation measured identified, the impact

Comments

- S15-57 cont'd** | *not equate to access or preservation, which are of extreme importance to Native Hawaiians.*
- S15-58** | 8-190 "The PTA FMA, once completed, will address wildfire issues at the installation. Also, PTA wildland fire SOPs, once completed, will contain specific methods for handling fires." *Again, these should be completed and included in a supplemental or updated Draft EIS.*
- S15-59** | 9-10 "The Army is likely to also conduct controlled burns at DMR, MMR and PTA." *This is a concern after the controlled burns that got out of control in Makua this year.*
- S15-60** | 9-11 *It should be noted that the Marines are no longer planning jungle warfare training in Waikane Valley, and why this is so.*
- S15-61** | 9-12 Land Transfer-Dillingham Military Reservation: *When the state leases this land back to the Army for continued training operations, the pro rata share that belongs to OHA must be included in the lease, for these are ceded lands.*
- S15-62** | 9-13 Projects on Hawai'i: *Included in this list should be NASA's plans on Mauna Kea and the C-17 plans, as they meet the definition supplied in AR 200-2, 7-1(b) for "cumulative actions": "when viewed with other proposed actions, [they] have cumulatively significant impacts and should be discussed in the same impact statement."*
- S15-63** | 9-21 *The Cumulative Impacts by Resource Category are too vague and broad.*

Thank you for the opportunity to comment. OHA hopes that the comments elicited from the public about the current Draft EIS – and supplemental or updated versions of this Draft EIS – which is a springboard for public comment, will be fully considered before the publication of the Final EIS. If you have further questions or require more information regarding OHA's comments, please contact Heidi Guth by phone at (808) 594-1962 or by e-mail at heidig@oha.org.

Sincerely,

Clyde W. Namu'o
Administrator

Responses

from fugitive dust emissions will be significant but mitigable to less than significant levels. Mitigation measures include the use of environmentally friendly dust control measures on vehicle trails and the implementation of a Dust and Soils Management and Monitoring Plan (DuSMMoP) for all training areas.

S15-52

Section 8.6 has been expanded and mitigation measures to address noise impacts have been identified. The Army proposes a 1,000-foot daytime noise buffer and a 2,000 foot nighttime noise buffer for training activities at WPAA.

S15-53

As discussed in Chapter 2 and Chapter 8, there would be a change in helicopter activity over WPAA but not over PTA. Based on noise modeling discussed in Section 8.6, the noise levels from helicopter use will not be significant. However, the Army proposes to establish a 1,000 foot daytime noise buffer and a 2,000 foot nighttime noise buffer for training activities at WPAA including helicopter training activities.

S15-54

Section 8.11 has been expanded to better discuss the impacts to cultural resources. The Army is renaming the trails on the maps and access protocol will be developed.

S15-55

Section 8.11 has been expanded to better discuss the impacts to cultural resources. The Army is renaming the trails on the maps and access protocol will be developed.

S15-56

As discussed in Section 8.11, the Army will implement the Final PA between the Army, SHPO, ACHP and concurring parties in compliance with Section 106 of the NHPA. As discussed in the PA, the Army's first priority with cultural resources is to avoid the resource to the full extent practicable. If the Army is unable to avoid the resource, the Army will consult in accordance with the Final PA (See Appendix J).

Comments**Responses****S15-57**

As discussed in the Executive Summary mitigation measures that are already in existence or unlikely to occur, as part of the NHPA Section 106 consultation, a cultural resource education center is being proposed with the PTA master plan. Since this is addressed through another project, the visitor's center is no longer proposed as mitigation for this action. Additional mitigation measures are discussed in Sections 4.10 and 4.11 for biological and cultural resources.

S15-58

As discussed in Section 8.10 and 8.12, the IWFMP was updated in October 2003 and will be implemented as mitigation to reduce the risk of wildland fires. The plan is available upon request.

S15-59

The Wildfires subsection under the Human Health and Safety Hazards section of Chapter 9 discusses the burn programs at DMR, SBMR and PTA. The Integrated Wildfire Management Plan was approved after the DEIS in October 2003 (project #25). The WFMP is available upon request or at www.sbcteis.com.

S15-60

Changes have been made to the FEIS reflecting cancellation of the project in Waikane.. For more information, please contact the U.S. Marine Corps.

S15-61

The proposed land transfer - DMR (O'ahu project #34) is not part of the proposed action but is included in Chapter 9 as other projects proposed by the Army or other entities on the island of O'ahu. Your comments on this land transfer may be submitted directly to the state of Hawai'i or to the US Army Garrison Hawai'i - Department of Public Works.

S15-62

The use of C-17s is analyzed as part of this project and impacts are discussed throughout the document. The C-17 beddown and other C-17 activities proposed by the US Air Force are considered in Chapter 9 (project #33). The EIS has been revised to include project information on NASA's plans Mauna Kea.

S15-63

Resource categories are standard for NEPA documents and reflect suggested resources in CEQ regulations for implementing NEPA (40 CFR 1500).

COMMENTS:

This is a formal request for the military's
assistance in clearing boulders, koae trees,
and shrubs from the Dept. of Ed. land
between Waiānae Sarceline Con. Hall and
Waiānae Intermediate School. Principal John Vanatta
is very concerned about students' use of a trail in that
area. Because of the heavy brush, the area lacks security
and there have been numerous assaults - police reports as a result.

S16-1

Please contact Principal
John Vanatta or myself
regarding this request.
Thank you very much for
your on-going support of
community causes, eg,
clean-ups.

S16-1

The Army has reviewed the public comments and has expanded discussions to address comments submitted. As discussed in Chapter 2, the Army has determined that a supplemental Draft EIS is not necessary.

ATTN: CEPOH-PP-E
Fort Shafter, Hawaii 96858-5440

Dear Ms. Barger:

SUBJECT: Comments on Stryker Brigade Combat Team (SBCT) Draft Environmental Impact Statement (DEIS)

The following comments are submitted in response to the U.S. Army, Hawai'i's request for comments on its recently released, October 3, 2003, Draft Environmental Impact State (DEIS), which details the impact of the Army's Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawai'i. The comments are submitted by the Hawai'i Department of Health (DOH) Solid and Hazardous Waste Branch (SHWB), Hazardous Waste Section (HWS), and focus on the hazardous waste impact of the proposed project alternatives. *Inter alia*, the comments below include concerns regarding proposed project impacts (i.e., direct, indirect and cumulative), which may affect other environmental media, which may lie under the primary jurisdiction of other state and federal agencies, e.g., Air Quality, Clean Water, etc.

Department of Health's comments on the SBCT DEIS are as follows:

1. Generally, the DEIS states that the Proposed Action (PA) and Reduced Land Acquisition proposed project (RLA) would have "significant but mitigable" impacts with regards to "Human Health & Safety Hazards." PA and RLA impacts to human health and safety hazards would be similar to the impacts imposed in the No Action Alternative, i.e., continuing Legacy Force infrastructure and training needs, except that, human health and safety hazard impacts from implementation of the PA and RLA would increase because of the concomitant requirement for facility construction, personnel, equipment, vehicles, and training activities. According to the DEIS, these additional

Page 2

project-related needs would result in an increased need for hazardous materials management; hazardous waste management; increased ammunition, and therefore lead exposure; lead paint exposure (during facility construction); unexploded ordinance (UXO) exposure; exposure to asbestos containing material (also during facility construction); exposure to PCBs (within the Kahuku Training Area (KTA)); electromagnetic fields exposure; petroleum, oils and lubricants exposure; pesticides and herbicide use and, therefore, exposure; exposure to increased biomedical waste generation; and increased probability of wildfires. The SBCT DEIS Mitigation Matrices indicate that, with the use of current Army Hawaii procedures and practices, which currently address the human health and safety concerns above, any and all significant impacts resulting from the PA and RLA are mitigable to less than significant. For example, the expected increase in lead exposure resulting from greater quantities of spent ammunition (as a result of the PA and RLA requirement for increased live-fire training) would be addressed and mitigated by current Army practices of collection and disposal. Similarly the PA and RLA projected increase in UXO is predicted to be mitigated by currently administered Army detection, collection and disposal procedures following additional live-fire training events. Increased petroleum, oils and lubricant use (due to the PA and RLA mandated increase in vehicles (e.g., Army Stryker vehicles, etc.), vehicle trips over increased terrain, an additional motor pool and vehicle wash facility (within the South Range Acquisition Area (SRAA)) planned to be located adjacent to the Schofield Barracks Military Reservation (SBMR)), are predicted to be regulated, albeit in an expanded capacity, via currently implemented Spill Prevention Control and Prevention Plans as well as wastewater discharge treatment facilities, e.g., oil/water separators, etc.

COMMENT: In light of the above, the DEIS should detail the bases for Army Hawaii's determination that current procedures and practices would mitigate, to less than significant, the expected PA and RLA impacts to human health and safety hazards, which were delineated above. Further, the DEIS should describe and address any and all indirect and/or cumulative impacts, e.g., continued live-fire impacts (resulting in long-term, gradual increases in lead concentration to soils), etc., resulting from the human health and safety hazard impacts, which would result from implementation of the PA or RLA.

2. See Table ES-21 (SBCT EIS Mitigation Matrix), page ES-52; Air Quality, Item 11. The DEIS Mitigation Matrix, in the above referenced item, states that "measures to mitigate impacts on air quality, as a result of PA or RLA required training, include conducting periodic application of synthetic dust control chemicals to control fugitive dust from unpaved roads and tank trails at other military installations."

Responses

S17-1

The Army regulations and procedures that ensure mitigation of the impacts of the alternatives are currently in place. In general, Army policy is to meet or exceed the requirements of all federal, state, and local laws and regulations. Federal and state agencies authorized to implement federal regulations would continue to have enforcement authority. The regulations and policies that define the Army's responsibilities for managing hazardous materials, remediating releases, and reporting, generally have the purpose and objective of achieving conditions protective of human health and safety and environmental health. These laws and regulations are identified in the DEIS. As a result, if the Army properly implements these procedures and meets or exceeds the existing federal, state, local, and DoD regulatory requirements, significant impacts on human health and the environment will be avoided. Cumulative impacts are addressed in Chapter 9 of the EIS. The issue of potential for lead, explosives residues, and other contaminants related to use of munitions on ranges to impact environmental media overlaps and extends beyond the scope of the hazardous materials discussion because it involves considerations of background concentrations, fate and transport of contaminants, and migration pathways. Therefore, the long-term effects of gradual increases in chemical residues in soils and surface water, are discussed in the Water Resources sections of the report including in Chapter 9.

Comments

Ms. Cindy S. Barger
October 29, 2003
Page 3

- S17-2** COMMENT: The DEIS should identify and provide additional information (e.g., provide the Material Safety Data Sheet (MSDS), etc.) for these synthetic dust control chemicals, to facilitate DOH/HW evaluation.
3. Table ES-21 (SBCT EIS Mitigation Matrix), page ED-53; Water Resources, item 15. The DEIS Mitigation Matrix, in the above referenced item, states that "measures considered to mitigate impacts to water resources from erosion of explosives residues, include the voluntary implementation of a monitoring program, similar to what is typically required for storm water pollution prevention programs at construction and industrial sites to determine the need for runoff controls and the effectiveness of controls."
- S17-3** COMMENT: Although this concern is most probably within state and federal Clean Water Act jurisdiction, it would appear that the explosives residue erosion and contamination of surface water would require additional controls (possibly chemical in nature) in addition to utilization of controls primarily effective for soil erosion and sediment loading. The DEIS should identify and explain the design of any planned explosives residues erosion control system and its perceived effectiveness during PA and RLA implementation.
4. Table ES-1 (Proposed Action, Reduced Land Acquisition, and No Action Alternatives Overview), Construction/Demolition, Tactical Vehicle Wash, page ES-6. Under both the PA and RLA, a new tactical vehicle wash facility would be constructed. Based on information presented in the DEIS, the additional vehicle wash will probably utilize an oil/water separator to prevent the introduction of oil-based contaminants into the public water system and, subsequently, to the aquatic environment. The DEIS does not explain any required testing and monitoring of the sump materials, i.e., solid materials found at and removed from bottom of most oil/water separators.
- S17-4** COMMENT: The DEIS should address the testing, monitoring and disposal of oil/water separator sump bottom sediments (this explanation may be provided within the context of the requirement to obtain necessary waste water discharge approvals/permits).
5. SBCT Draft EIS, Hawai'i (July 2003, page 5-217), under Human Health and Safety Hazards. The DEIS states that a new chemical would used in conjunction with the proposed Stryker training as part of the Joint Biological Point Detection Program (JBPD). This chemical, a sodium azide (NaN₃) solution, would be used to preserve suspected biological agent samples discovered during combat measures. Further, the DEIS states that, although

Responses

S17-2

The issue of use of chemical additives for dust suppression was raised by the State in regards to the potential effects of these chemicals on surface water quality and biota. Therefore, a discussion of the types of chemicals that might be used, as well as literature citations, is presented in the applicable water resources sections of the report Chapters 4.8 and 5.8.

S17-3

No erosion control measures are currently proposed, and there is no evidence that they are needed. Erosion control measures would be developed within the Army's ITAM program, if necessary, as discussed in the Soils and Geology section of the EIS. The proposal referred to in the Mitigation Matrix is to monitor runoff water quality. Currently there is no evidence that water quality is impacted by chemical residues. A detailed monitoring plan would be developed.

S17-4

As indicated in the comment, monitoring, testing, and waste management requirements would be defined in the permit for the wastewater treatment system. The EIS describes Army policy to comply with all applicable, relevant and appropriate federal, state, and local laws and regulatory requirements, as well as with DoD regulations. Rather than specify in detail all of the permitting requirements that may apply to individual construction projects or to components of these projects, we have referred to compliance with existing laws and regulations generally as mitigation for potential impacts.

Comments

Ms. Cindy S. Barger

Page 4

sodium azide is considered toxic in its pure form, the sodium azide solution to be used would be 0.5 percent sodium azide and 95.5% water.

S17-5

COMMENT: Unless this information is classified, the DEIS should provide additional detailed information on the sodium azide solution to be utilized (e.g., provide a product MSDS if available, etc.).

Should you have any questions, please contact Karl Motoyama of the Hazardous Waste Section at (808) 586-4226.

Sincerely,

STEVEN Y.K. CHANG, P.E., CHIEF
Solid and Hazardous Waste Branch

Responses

S17-5

The information is not classified. However, the EIS is intended to distill and summarize information needed to describe and evaluate project impacts, and is not a detailed technical document. Therefore, it would not be appropriate to include copies of MSDSs in the EIS. It should be noted that a large number of chemicals are stored and routinely used on the installations, and that OSHA regulations require that MSDSs be maintained and made available to personnel using the chemicals. In addition, personnel who may be exposed to chemical hazards are trained in their use. MSDSs are readily available for this and many other generic chemicals from a variety of publicly available sources, including on the internet. To provide MSDS information in the Final EIS for all possible chemicals that are or could be used as part of Army operations would require a substantial addition to the document and is not warranted.

Dear Ms. Barger:

SUBJECT: Draft Environmental Impact Statement
Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade
Combat Team in Hawaii

Thank you for the opportunity to review and provide comments on this document. The Solid Waste Program offers the following comments:

S18-1

1. The OSWM recommends the development of a solid waste management plan that encompasses all construction and demolition activity associated with this proposal. Specific examples of elements that the plan should address include:
 - The recycling of greenwaste during clear and grub activities;
 - Recycling construction and demolition wastes, when appropriate;
 - The use of recycled content building materials.

S18-2

2. The developer shall ensure that all solid waste generated during project construction is directed to Department of Health permitted solid waste disposal or recycling facilities.

Please contact the Solid Waste Program (808) 586-4226 with any questions regarding these comments.

Sincerely,

STEVEN Y.K. CHANG, P.E., CHIEF
Solid and Hazardous Waste Branch

Responses

S18-1

The EIS has determined that there is no significant impact to public services by the implementation of the proposed action. The Army designs all of its projects, including those in this proposed action, in accordance with Executive Order 13123 "Greening the Government through Efficient Energy Management" (June 2001), Executive Order 13101 "Greening the Government through Waste Prevention, Recycling, and Federal Acquisition" (September 1998), and Department of the Army Engineering Technical Letter 1110-3-491 "Sustainable Design for Military Facilities" (May 2001) and the U.S. Army Corps of Engineers Sustainable Project Rating Tool (SPiRiT). These documents and tools provide design guidelines and standards for sustainable development - addressing water resources, energy and atmospheric resources, indoor environmental quality, material and other resources.

S18-2

All solid wastes generated as a result of construction or operations of the proposed project will be disposed of at approved solid waste disposal or recycling facilities as is the case for current operations.

RE: Department of Land and Natural Resources Division of Forestry and Wildlife comments on the Draft Environmental Impact Statement on the Transformation of the 2nd Brigade of the 25th Infantry Division (Light) to a Stryker Brigade Combat Team

Dear Ms. Barger:

Thank you for the opportunity to review the Draft Environmental Impact Statement on the Transformation of the 2nd Brigade of the 25th Infantry Division (Light) to a Stryker Brigade Combat Team ("Transformation DEIS"). The following are comments from our Division of Forestry and Wildlife (DOFAW).

DOFAW is responsible for managing over 800,000 acres of State public trust lands. Additionally, DOFAW is authorized by State Law to ensure that these public trust lands are managed appropriately for watershed protection and management, native resources protection and management, outdoor recreation resources and development, forest products development, public information and stewardship, planning and administrative support. On O'ahu and Hawai'i, DOFAW jointly manages over 550,000 acres. These lands are managed through an integrated system of forest and natural area reserves, plant and wildlife sanctuaries, public hunting areas and game management areas.

We share many natural resource management functions and goals with the Conservation Restoration Branch of the U. S. Army's Directorate of Public Works. However, our obligation for managing public trust lands is much broader than the military lands and serves a wider community base for multiple-use of State forest lands. These include endangered species protection, watershed protection, wildland fire protection, invasive species removal, public trails and access, and game management programs. It is within this multi-use context that we provide recommendations to the actions proposed in the Transformation DEIS.

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-135

Our understanding of the purpose of the Stryker Transformation is to assist in bringing the Army's Interim force to operational capability and to provide realistic training in Hawai'i. Under the Proposed Action, the 2nd Brigade would be converted to an SBCT and, as such, would operate as part of the Army's Interim Force. Implementing the Proposed Action would require taking several distinct and coordinated actions and activities directly associated with transforming the 2nd Brigade, including fielding Stryker systems and SBCT-specific weapons, building new facilities, acquiring new land for maneuvers (up to 24,300 acres), additional right-of-way easements, and conducting SBCT-specific training. The Army anticipates that training activities will be at a larger scale than those currently conducted by light infantry brigades stationed on and training on O'ahu and the island of Hawai'i, with the number of soldiers expected to increase by 810, the number of rounds to be fired by 25 percent, and an increased site of operations.

S19-1

The Transformation DEIS considers the SBCT "region of influence" for biological resources will include the area where SBCT actions are proposed, and surrounding areas that would likely be affected by these actions. DLNR believes that the region of influence or potential impacts to the area will be much larger than what is being proposed in the DEIS. For instance, we anticipate that the area will extend further in the Waianae and Koolau mountains on O'ahu, including: Mt. Kaala Natural Area Reserve, Waianae Kai Forest Reserve, Makua-Keaau Forest Reserve, Mokuleia Forest Reserve, Pahole Natural Area Reserve, Ewa Forest Reserve, and Pupukeya-Paumalu Forest Reserve. On the island of Hawaii, it will probably extend to parts of the Mauna Kea and Mauna Loa Forest Reserves.

Notably, the Transformation DEIS recognizes that the proposed action is likely to have a significant impact on biological resources because of fire, and the potential impacts will "not be mitigated to less than significant level when considered project-wide" (p. 4-61). In addition, the DEIS concludes that the spread of nonnative species and the loss and degradation of sensitive species and their habitat resulting from the construction and training activities may have a significant impact on the biological resources, but contends that these impacts may be mitigated to a less than significant level.

Based on a review of the DEIS and past experiences working with the military in Hawai'i, DLNR believes that the implementation of the Stryker Brigade Combat Team will have the following impacts:

- S19-2 | • Increased threat to public safety through higher potential for fire;
- S19-3 | • Increased risk of harm to native ecosystems and forest health (invasive species, fire, restricted access);
- S19-4 | • Threat to threatened and endangered species and to critical habitat (invasive species, fire, restricted access);
- S19-5 | • Potential impairment of crucial watersheds (spread of invasive species, fire, restricted access, increased use of water);
- S19-6 | • Reduced effectiveness of resource management (restricted access);
- S19-6 | • Diminished recreational opportunities (restricted access).

The impact of fire, invasive species, and restricted access is discussed further:

Fire

S19-7

DLNR is very concerned about the threat of fire that can cause irrevocable loss of habitat for wildlife and other natural resources on O'ahu and Hawai'i. We agree with the DEIS account that fire caused by military training activities is one of the many threats to the endangered plant

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-136

S19-7
cont'd

species and important native habitat located in the area. However, the DEIS does not adequately cover specific measurable actions that will improve the Army's fire management obligations and capabilities, proportionate to the perceived threat. Furthermore, fire history at Hawaii's military training areas has confirmed our belief that standard fire behavior planning, including the collection of current weather information, have not precluded fire ignition. The risk and the possibility of a wildfire escaping beyond military boundaries remain high despite all precautions and fire pre-suppression measures.

S19-8

It is our position that the proximity of threatened and endangered species and critical habitat located on State land is adjacent to the proposed Stryker action corridor and it warrants the immediate action of the military to provide additional fire protection to these areas. To address this concern, we recommend that the Army improve and expand their fire response management program at PTA and at Schofield and that the Army strengthen their wildland fire capabilities by expanding the existing fire stations with additional resources and manpower. The Army could also assist Hawaii County in strengthening their Waikii volunteer fire station with added resources. Already burdened by a limited budget for fire suppression, it would be difficult for the State to provide fire protection for threatened, endangered, and rare species on State lands. Therefore, it would be in the best interest of the Army to increase their fire prevention, pre-suppression and suppression budget and expand their fire program to reflect the additional fire risks that are being created by the Transformation of the 2nd Brigade, 25th Infantry Division (Light) to a Stryker Brigade Combat Team.

S19-9

Invasive Species

One of the greatest long-term threats posed by the addition of another vehicle based combat team in Hawai'i is the introduction and spread of invasive species. Each military base throughout the Pacific is exposed to a unique set of introduced pest species that have caused harm to human health, agriculture and the native ecosystems of the host island or country. The transportation of materials between these bases has led to the establishment of such high-impact species such as the Brown Tree Snake on Guam and the toxic Fire Weed that has been transported from the Big Island to O'ahu (*Senecio madagascariensis* on Schofield Barracks) by Army equipment or personnel. Since invasive pests have the potential for devastating impacts in Hawai'i, it is imperative that the military bases adopt procedures to restrict their introductions, apply preventive measures for monitoring and detection, and catch species before they enter the islands and become widespread here. For transcontinental shipments between the mainland and Hawai'i, the risk of importing the invasive fire ants, killer bees, snakes or other predators is increased significantly if ammunition boxes or other military equipment go unchecked prior to their arrival at Hawai'i's bases. In addition, many of the invasive pests found on other islands have the potential of compromising Army training on that island. These include flammable grasses such as fountain grass (*Pennisetum setaceum*) and beard grass (*Schizachyrium condensatum*) that are currently found on the Big Island. The Army should also consider funding research programs for the biological control of these grasses and to prevent its spread.

For O'ahu, DLNR is concerned that access improvements of Drum Road and Dillingham Trail, combined with increased use of these roadways by military vehicles for training and other purposes, will encourage the spread of invasive species on adjacent State lands. These areas containing sensitive biological resources include: Mt. Kaala and Pahole Natural Area Reserves, Mokuleia Forest Reserve, Makua-Keaau Forest Reserve, Waianae Kai Forest Reserve, Ewa Forest Reserve, Pupukeya-Paumalu Forest Reserve.

Comments

Responses

May 2004

Stryker Brigade Combat Team Final EIS, Hawai'i

P-137

**S19-9
cont'd**

It will be difficult for the State or the Island Invasive Species Committees to monitor and address the potential impacts of invasive species on State lands without the proper funding support from the Army. In addition, the Army should develop the following protocol for their invasive species control program. To start, the Army shall develop a decontamination procedure for all mechanical, industrial equipment, and personal protective gear when traveling on island as well as inter-island within the State. The Army shall develop an early detection program with DLNR and other State and Federal agencies to monitor and detect incipient invasive pest introductions on military lands.

Restricted Access

S19-10

DLNR is particularly concerned that use of Dillingham Trail on O'ahu will interfere with DOFAW access to Pahole and Mt. Kaala Natural Area Reserves, sensitive biological areas containing rare native plants, snails, and birds. The Natural Area Reserves system was established to protect and preserve Hawai'i's unique flora and fauna for the benefit and enjoyment of future generations, and these areas require active management to reduce threats to the natural elements contained within them. In addition, DLNR is concerned that the Stryker Transformation could restrict or limit public access to State lands for hunting and other recreational purposes. Reduced hunting opportunities would result in exploding feral animal populations, ultimately harming the natural resources contained in the Forest Reserves and adjacent Natural Areas. Similarly, reduced recreational opportunities exacerbate an already limited public inventory for such enjoyable pursuits. Easement agreements or alternate access routes should be established to ensure that there is no loss in management capacity and that access to public Forest Reserves, Natural Area Reserves, Public Hunting Areas, and Game Management Areas for recreation, hunting or other permitted activities is not restricted.

S19-11

In addition, DLNR is concerned about public access on existing trails potentially impacted by the Stryker Transformation and continuing military operations. We would like to negotiate with the Army to provide regulated and permitted public access to the Poamoho and Schofield Waikane trails. Presently, the Army issues permits for public access of the Schofield Waikane trail. In addition, the DEIS does not clearly indicate that a portion of the Kawaihoa training area including the Ewa Forest Reserve is leased to the Army from the State. DLNR and the Army are currently negotiating for the regulated and permitted public access through the Army's Helemano subdivision, and Dole Food Corporation, Hawai'i to the Ewa Forest Reserve.

S19-12

The DEIS describes numerous trails that were used for transportation and classified as "prehistoric" at PTA, island of Hawai'i. Yet, the DEIS map of the PTA area does not identify the location of these prehistoric features. As a result, DLNR staff researched these features through officially registered maps that were done in 1852 and 1902, and our findings indicate the presence of old government roads and trails that meander through the Kawaihae, Waikoloa and PTA areas. There is no evidence to show whether these trails reported in the DEIS are the same ones found in the registered maps. If these trails identified in the DEIS are indeed, "prehistoric" they may be claimed by the State in fee simple pursuant to the Highways Act of 1892. We would appreciate working with the Army to identify and inventory all historic trails at PTA in order to protect these significant cultural and historic sites.

S19-13

In addition, the Army should establish a point of contact with PTA to comply with the State Water Lease S3853 (US Lease, contract no. DA-94-626-ENG-81) and State General Lease S3849 (US Lease, contract no. DA-94-626-ENG-80) issued to the Army from DLNR. Historically, when a change of command occurs, the new command staff is unaware of these leases. DLNR must work with PTA and with the cyclic Army's command staff whenever management assistance is needed at PTA i.e. water use for fire suppression, game

S19-10

Section 4.2 - Land Use/Recreation in the final EIS summarizes the impacts of the proposed project on various land use activities. Though there would be some increase in restricted access, the Army has determined that there would be no significant impacts to recreation land use activities except for restricted access at the CACTF at KTA which would significantly restrict recreation access to that particular facility.

S19-11

The Schofield Waikane trails are not part of this project and their use will not change. If you'd like to discuss this issue with the Army please contact Public Affairs Office at (808) 655-1079.

S19-12

Specific locations of historic and cultural features are purposefully omitted from the final EIS to protect them. For specific information please call the Army's Cultural Resource Manager Dr. Laurie Lucking at 656-2878.

S19-13

For information on specific lease questions please call Mr. Joel Godfry at the Army's Directorate of Public Works at 656-2878.

Comments

management etc. It will help the Army fulfill their obligations for the two general leases with DLNR.

S19-14

There are several ways to address these impacts. DLNR proposes that: 1) the U.S. Army and DLNR actively investigate and negotiate increased public use of military lands under the provisions of the Sikes Act, 2) the U.S. Army develop a consolidated and coordinated resource enhancement and protection plan for the Stryker Brigade training areas, i.e. an Implementation Plan for Endangered Species, Integrated Natural Resources Management Plan, and Wildland Fire Management Program for Oahu and Hawaii training areas, and 3) the U.S. Army establish a Stryker Environmental Mitigation Fund.

The Sikes Act authorizes cooperation between federal and state agencies to plan, develop, and maintain fish and wildlife resources on military reservations. The consolidated plan can identify and reinforce the military's responsibilities to enhance and protect natural resources on military and adjoining State and private lands. The proposed mitigation fund would be used to support proactive actions and reduce the possibility of harm to the natural resources on State lands due to wildfire, the spread of invasive species, the inadvertent destruction of threatened and endangered species or their habitat, or restrictions on public access associated with the Transformation. For budget purposes, DLNR requests that the U.S. Army earmark approximately \$2,000,000 (\$2 million) per year to fund environmental projects on State lands. The priority for funding projects on an annual basis will be determined by consultation between the U.S. Army and a DLNR management team designated by the Chairperson of DLNR.

S19-15

DLNR believes that this amount reflects the potential risks and harm that the Transformation will have on the public's natural resources. As stated previously, DLNR does not have sufficient funding to fully implement resource programs mandated by State law. The additional measures needed to protect the natural resources on State land from Transformation-related threats would significantly burden us financially with added personnel and infrastructure expansions. While the U.S. Army has taken significant corrective measures to protect the natural environment on military bases, Hawaii's military record shows that despite these precautions, impacts to our natural resources do occur.

DLNR provides a brief description of the kind of projects that the Environmental Mitigation fund could support on State lands impacted by the Transformation:

- fire prevention, pre-suppression and suppression measures, including construction of fire barriers in key areas and treatment of fuels around populations of target plant species;
- monitoring of existing rare, threatened, and endangered plant, bird, and snail populations, to facilitate identification of and mitigation of impacts resulting from the Transformation on rare species ;
- monitoring of native ecosystems and forest health, including surveys for invasive species, to facilitate identification of and mitigation of impacts resulting from the Transformation on overall forest health;
- watershed protection efforts coordinated by the Koolau Watershed Partnership and the newly formed Waianae-Kai Community Forest Project Alliance;
- habitat protection efforts to mitigate the resource impacts of the Transformation;
- out planting rare, threatened or endangered species at risk by the Transformation (due to fire, invasive species, increased feral animal populations as well as due to direct harm) in new locations outside the area of risk, but within their historic ranges;

Responses

S19-14

The Army currently funds ongoing stewardship programs like ITAM, LCTA, and the INRMP to manage the natural resources of their lands. Any new lands or activity will be incorporated into these programs. These programs are outlined in Section 2.5.5 - Institutional Programs in the final EIS. There were 58 proposed mitigation measures outlined in Table ES-21 of the Executive Summary. These proposed mitigation measure were included for public comment and based on public comments and a cost benefit analysis those likely to be implemented are described in the FEIS. Costs include not just monetary costs, but cost in manpower and training. The ROD will indicate which mitigation measures will actually be implemented. The Army will seek funds for all mitigation measures identified in the ROD.

S19-15

The Army will seek funds for all mitigation measures identified in the ROD. The Army cannot request funds for future unknown mitigation measures. However, any future new actions will require compliance with NEPA and separate mitigation measure may be identified with those actions and additional funds can be requested for those mitigation measures. many of the projects/actions described in here are included as part of current ongoing Army programs such as ITAM, LCTA, and the INRMP. If you would like to meet concerning these and other programs please contact Mr. Joel Godfry and the number above.

- seed collection, storage, and propagation for rare, threatened or endangered species at risk by the Transformation to prevent their extinction by 'accident';
- access provisions (e.g. easement purchases, fenced corridors) if existing access are restricted, to ensure continued access to State lands for management, recreation, and public hunting.

Finally, DLNR suggests that our agencies meet to discuss the many recommendations provided by this correspondence. We propose upon your concurrence that we also discuss the possibility of entering into a MOU (Memorandum of Understanding) to establish a working relationship that would allow us to collaborate as necessary and to respond to situations or issues that were inadvertently left out of the commenting period.

DLNR thanks you for the opportunity to comment on the Stryker Brigade DEIS. We support the efforts of the U.S. Army to continue your presence in Hawai'i and your ability to train troops here. At the same time, DLNR has an obligation as managers of public trust land to protect these areas. We urge the U.S. Army to carefully consider the comments listed and the recommendations provided here. We look forward to continued discussions and negotiations to ensure that Transformation of the 2nd Brigade of the 25th Infantry Division (Light) into a Stryker Brigade Combat Team is done in a manner that protects the natural resources of the State of Hawai'i. If you have any questions, please contact my Division Head, Michael G. Buck, Administrator, DLNR, Division of Forestry and Wildlife at 587-0166.

Sincerely,

PETER T. YOUNG

Dear Ms. Barger:

This is in response to your request for comments on the Draft Environmental Impact Statement detailing the impacts of Army Transformation in Hawaii.

The selection of Hawaii as one of six locations for an interim force based on the Stryker vehicle, called a Stryker Brigade Combat Team (SBCT), is not expected to have an environmental impact on the operations of City and County of Honolulu governmental facilities.

L1-1

U.S. Army training activities on Oahu, particularly in the Schofield Barracks area, have been an accepted part of the scene for the last 100 years. It does not appear that the conversion to SBCT, particularly in the remote training areas, will significantly alter the existing operation of public facilities.

Should you have any questions, please contact Don Griffin of the Facilities Division, at 527-6324.

Very truly yours,

TIMOTHY E. STEINBERGER, P.E.
 Director

Dear Ms. Barger:

Subject: Draft Environmental Impact Statement
Transformation of the 2nd Brigade,
25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawai'i

We received your letter dated October 3, 2003, requesting our comments on the above-mentioned project.

L3-1 |

The Honolulu Fire Department has no comments, as we do not have any jurisdiction on federal property.

Should you have any questions, please call Battalion Chief Lloyd Rogers of our Fire Prevention Bureau at 831-7778.

Sincerely,

ATTILIO K. LEONARDI
Fire Chief

**DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS)
TRANSFORMATION OF THE 2ND BRIGADE, 25TH INFANTRY DIVISION TO A STRYKER
BRIGADE COMBAT TEAM (SBCT)**

This is in response to your call for comments on the subject DEIS.

From Figure 8-9, it appears that the roadway corridor for the Stryker Brigade passes through our well field and reservoir facilities in Lalamilo, which is our sole water source for Kawaihae, Puakō, and the high-end resorts in South Kohala. Because of this, we have serious concerns as follows:

- L4-1** 1. Although this roadway would be restricted to military use only, it does not ensure unauthorized use by the public or other undesirable elements. Specifically, with the heightened threat of worldwide terrorism, this raises serious vulnerability concerns for our facilities.
- L4-2** 2. More importantly, with the anticipated vehicular traffic that may be transporting hazardous or petrochemical material along this roadway, there is a heightened potential for a spill that could seriously impair our groundwater aquifer.

- L4-3** In conclusion, with serious vulnerability and wellhead protection concerns, this Department hereby requests, if not requires, that the proposed road be relocated as far away as possible from our well fields and reservoirs. A more palatable alternative would be to upgrade and maintain the existing trail that is presently being used. This trail is far enough away that it would probably not raise vulnerability or water quality issues.

We appreciate the opportunity to comment on this DEIS and request you seriously consider our concerns. If you have any questions, please contact Mr. Glenn Ahuna, Engineering Division Head, at (808) 961-8070, extension 238.

Sincerely yours,

Milton D. Pavao, P.E.
Manager

Responses

L4-1

The EIS has determined that there would be no significant impact from vandalism to other facilities by the implementation of the proposed action. If the Army decides to implement the proposed action, gates on the PTA trail will be coordinated with the property owner to prevent unauthorized use, reducing the risk of vandalism to other facilities in the area.

L4-2

The general issue of spills and spill mitigation was briefly discussed under impact 1b. There are numerous potential locations where spills could occur, now and under the project, and our focus was on the fact that there are regulations in place to protect the environment, and that by complying with those requirements, the Army's actions would be protective of the environment. We point out that the potential for spills and accidents cannot be entirely eliminated, but that the Army would respond to spills with trained personnel and using standard procedures that are already in place to address spills. In the particular case of the PTA trail, however, we have added additional text to point out that the project would heighten the potential for spills along this route, while reducing the potential for spills elsewhere.

L4-3

Based on public comment, the Army confirmed the locations of existing wellheads and aquifers in relation to the proposed Kawaihae to PTA military vehicle trail. Based on site investigations, there is no need to relocate the proposed alignment for this trail. In order to mitigate for any potential damage to the wellheads by vehicles breaking down and inadvertently going off the trail, the Army will construct protection devices around the well heads in consultation with the Water Company and land owners. In addition, the EIS analysis has shown that the potential for inadvertent spills from vehicles or vehicle accidents to impact the aquifers is less than significant. However, the Army has a Spill Prevention and Response Plan for all vehicles and vehicle travel. If the Army decides to acquire and construct these trails, this plan will be implemented for these areas as well. If the Army decides to implement the proposed action, the Army will coordinate with the property owners over the location of the proposed alignment. If the coordination results in a change in alignment which results in environmental impacts not analyzed in the EIS, the Army will conduct all appropriate NEPA, ESA and NHPA consultations prior to a final decision on a new alignment.

Building 230, Room 306 CEPOH-PP-E
Fort Shafter, Hawaii 96858-4812

Dear Ms. Barger:

Subject: Draft Environmental Impact Statement (DEIS) Comments
Project: Army Transformation of the 2nd Brigade, 25th Infantry Division (I) to a
Stryker Brigade Combat Team in Hawaii
Location: Pohakuloa Training Area (PTA)
Kaohe, Waikalua, Puuanahulu, Hamakua, South Kohala,
North Kona, Island and County of Hawaii

This is in response to your request for comments, dated October 3, 2003, on the DEIS for the proposed project. The proposal includes the construction of new facilities, the renovation and/or replacement of existing facilities, land altering activities, and additional land acquisition at various locations on the islands of Oahu and Hawaii. Comments from this office shall be limited to the proposed uses and activities on the island of Hawaii and their environmental impacts on the County of Hawaii.

The PTA consists of several Tax Map Key (TMK) parcels and is situated in the State Land Use (SLU) Conservation district. As such, the existing PTA is not subject to any overlying zoning designations by Hawaii County. The proposed West PTA Acquisition Area (WPAA), containing between 15,000 and 23,000 acres of TMK parcel (3) 6-7-001:003 lies west (makai) of the adjacent PTA and is situated in the SLU Agricultural district. The WPAA is zoned Agricultural (A-40) by Hawaii County. The Land Use Pattern Allocation Guide (LUPAG) of County of Hawaii General Plan (GP) designates all of the lands situated within the existing PTA for Conservation. The LUPAG designation for the WPAA area is for Extensive Agriculture and Intensive Agriculture.

Comments

1. Distribution List

The Distribution List provided in Chapter 13 of the DEIS is not organized so as to facilitate the identification of agencies, departments and organizations. It should be organized to list the notified affiliations and organizations alphabetically. Implementation of the project is likely to have a significant impact on the following agencies, departments, and organizations that are notably absent from the Distribution List.

- a) County of Hawaii, Department of Public Works (DPW)
- b) County of Hawaii, Department of Parks and Recreation (P&R)
- c) County of Hawaii, Department of Water Supply (DWS)
- d) County of Hawaii, Department of Environmental Management (DEM previously under DPW)
- e) County of Hawaii, Police Department
- f) County of Hawaii, Fire Department
- g) County of Hawaii, Department of Civil Defense
- h) University of Hawaii at Hilo, Institute for Astronomy

2. Land Use

- a) The discussion should provide support for the assertion (pg. 8-27) that *"general military training within the proposed acquisition area is not expected to affect off-post land use."* The *"impact issues"* (Table 8-8 and pages 8-27 through 8-30) should include the following:
 - i. The potential impacts to off-post land use and possible future development in the areas proposed for a change in LUPAG designation that is situated to the north of Waikoloa Village and makai (west) of the proposed PTA Trail (Fig. 8-4).
 - ii. The potential impacts to off-post land use and possible future development in the areas proposed for a change of LUPAG designation by the proposed revision to the GP (Fig. 8-6).
- b) The discussion (pg. 8-27) regarding the conversion of the 23,000-acre WPAA from agricultural use to military training use is not adequate to support the conclusion that

Responses

L5-1

The Distribution list is organized by type of recipient. There are headings for local, state, and federal agencies as well as private organizations and individuals. Within each group the recipients are listed alphabetically. These agencies have been added to our mailing list.

L5-2

These types of impacts are too speculative to be addressed in the EIS, if they are only proposed. They will be mentioned in the cumulative section but a full analysis cannot be completed until these changes to the General Plan are complete.

L5-3

The Army's evaluation considered conversion of farmland. The farmland conversion rating was completed and coordinated with DLNR and NRCS and was used in the Army's evaluation. The Farmland Conversion forms are included in Appendix E of the Final EIS.

Comments

Ms. Cindy Barger
SBCT EIS Project Manager
U.S. Army Corps of Engineers, Honolulu District
Page 3
January 23, 2004

**L5-3
cont'd**

the proposed change in land use would have a less than significant impact. The discussion does not address the significance and suitability of the subject pasturelands with respect to the total pasture or rangeland on the island.

L5-4

- c) The discussion on the construction and use of the PTA Trail (pg. 8-28) requires clarification. *"PTA Trail construction would require approximately 132 acres (53 hectares) of land easements. The trail alignment is generally along undeveloped property boundaries, existing roads, and existing utility easements. Hence, trail construction and use is not expected to significantly affect land use. This would result in the land being more intensively used following the Proposed Action, with vehicle traffic between PTA and Kawaihae Harbor increasing in vehicle density from 40 to between 40 and 145 (an actual average increase of approximately 53 vehicles on the road at any given time)."*

- i. The discussion should reconcile the stated conclusion that the construction and use of the PTA Trail is not expected to significantly affect surround land use with the statement (pg. 8-78) *"After the Proposed Action is implemented, users of those plantation roads would use other roads to access their agricultural lands."*

- ii. Explain what is meant by an actual average increase of 53 vehicles on the road at any given time. The discussion does not make clear how often an average of 53 vehicles will be on the road between PTA and Kawaihae Harbor.

L5-5

- d) The discussion (pg. 8-28) on the use of the Integrated Training Area Management (ITAM) program to identify and mitigate potential impacts on the land and coordination between the Army and the National Resources Conservation Service (NRCS) in light of the objectives and guidelines of the Farmland Protection Policy Act (FPPA) does not adequately explain how ITAM will identify and mitigate potential impacts. Neither does the discussion demonstrate how coordination between the Army and the NRCS in light of the objectives and guidelines of the FPPA further identify and mitigate potential impacts.

L5-6

- e) The discussion does not support the proposed establishment of *"a cooperative relationship with the landowner to allow continued grazing at WPAA in conjunction with training on the land, subject to constraints posed by training"* (pg. 8-28) as a mitigative measure for the conversion of agricultural lands to military training lands.
- i. How is grazing on WPAA lands during periods when no training maneuvers are underway consistent with the proposed mitigation (pg. 8-52) of substantial adverse impact on air quality by re-vegetation of disturbed areas?

Responses

L5-4

The Army would consult with local land owners to provide for joint use of plantation roads after construction of the PTA Trail. According to Table 2-7, only four SBCT exercises per year would take place requiring the PTA Trail, the same as the current forces.

L5-5

The farmland conversion rating forms are included in Appendix E of the Final EIS.

L5-6

It is possible that cattle grazing would continue on the WPAA. If the Army decided to implement the proposed action, the Army would weigh the potential of continued cattle grazing on the proposed West PTA acquisition area based on the potential benefits to fire reduction, potential interference with ongoing Army training, and requests of local cattle ranchers. If the Army decided that cattle grazing were appropriate, cattle would be managed so as to avoid any overgrazing and any resulting significant soil erosion. In accordance with Army Regulations 350-4, the mandate of the ITAM program is to manage land for Army training and repair damage incurred by Army training. As part of this mandate, this would also include any related actions such as managing land for grazing or repairing damage caused by the cattle. Continued use of the WPAA for agricultural purposes, consistent with Army use, would result in a less than significant impact on the community.

Comments

Ms. Cindy Barger
SBCT EIS Project Manager
U.S. Army Corps of Engineers, Honolulu District
Page 4
January 23, 2004

**L5-6
cont'd**

- ii. What amount of suitable pasturage would be available for grazing during a given period of training inactivity?
- iii. How many non-training periods per year would the WPAA lands be available for grazing periods of sufficient duration to be economically viable to any local ranching interest?

3. Visual Resources

L5-7

- a) The EIS states (pg. 8-32) that the "*General Plan of Hawai'i designates no sensitive views at or near PTA (County of Hawai'i 1989).*" However, the GP lists the following locations as examples of natural beauty:
 - i. The scenic countryside around Waikii (TMK 6-7-01:003).
 - ii. The mauka & makai view plane from various locations along Queen Kaahumanu Hwy. in South Kohala and North Kona.
 - iii. The Mauna Kea State Park area (TMK 4-4-16:003).

L5-8

- b) The methodology employed to determine potential impacts on visual resources fails to consider impacts resulting from fugitive dust. It does not consider the potential degradation of view planes resulting from the estimated 2,039 tons per year of additional fugitive dust suspended in the atmosphere (pg. 8-50 & 8-53) as a result of training exercises and wind erosion of WPAA lands and the extended use of PTA facilities.

L5-9

- c) The impacts on visual resources resulting from fugitive dust emissions generated from the use of helicopters and other aircraft that may be used in concert with training maneuvers in the WPAA should be discussed.

L5-10

- d) The discussion regarding increased artificial light pollution (pg. 8-41) resulting from the new facilities and increased training activities is inadequate and should include the following:
 - i. Current artificial light levels and the increased light levels anticipated from the proposed project in comparison to artificial light levels acceptable to observatory operations on Mauna Kea.
 - ii. Documentation to support the assertion that ongoing night training use of flares and light emitting munitions and explosives is not detrimental to observatory operations.

Responses

L5-7

Text has been revised. Please see Section 8.3 - Visual Resources.

L5-8

As discussed in Sections 4.5, 5.5, 6.5, 7.5, and 8.5, the Army is developing mitigation techniques in consultation with the USEPA to reduce fugitive dust emissions to a less than significant level. This would negate any visual impacts from fugitive dust.

L5-9

As discussed in Sections 4.5, 5.5, 6.5, 7.5, and 8.5, the Army is developing mitigation techniques in consultation with the USEPA to reduce fugitive dust emissions to a less than significant level. This would negate any visual impacts from fugitive dust.

L5-10

Under the Proposed Action, non-training lighting, such as for the ammunition storage area and cantonment, would use low sodium vapor lighting and would mostly be used during the day. It would also be properly oriented and shielded to illuminate specified areas. The use of nighttime lighting devices, such as flares, during training would increase. The use of these devices is not expected to increase dramatically because training with night vision goggles would be conducted in training areas. The increased use of lighting devices for training would mostly be in the WPAA and not in Army areas closest to, for example, nearby observatories, which require dark surroundings during nighttime operations. The Army has not received complaints regarding nighttime light and glare from nearby observatories. Visual impacts would be less than significant with respect to altering nighttime light and glare.

L5-11

Projected training schedules for PTA indicate that the limited frequency of use that the PTA Trail would receive, and the low level of traffic on Saddle Road (currently approximately 400 vpd) would result in no significant impacts on visual resources by the military traffic on PTA Trail. See Chapter 8.3 for an analysis of traffic and dust on visual resources.

Comments

Ms. Cindy Barger
SBCT EIS Project Manager
U.S. Army Corps of Engineers, Honolulu District
Page 5
January 23, 2004

L5-10
cont'd

- iii. A realistic evaluation on the likelihood that nighttime training exercises will be conducted during periods of full moon in order to minimize the impact of an increase in the overall light pollution from additional night training.

L5-11

- e) A discussion should be included on the potential adverse impacts to view planes resulting from the use of the PTA Trail and WPAA that would affect the proposed realignment corridors for Saddle Road and the Waimea-Kawaihae Road. Such impacts should include the potential mauka and makai views from the current and/or realigned corridors resulting from the significant increase in airborne fugitive dust from vehicular convoys, training maneuvers, and wind erosion.

L5-12

- f) Overall cumulative impacts are stated as less than significant *"because the proposed project and the cumulative projects listed above (Table 9-1, pages 9-3 through 9-5) would be spread out over a large area and would not be confined to one region in particular."* This seems to be saying that the adverse visual impacts are not significant because they are spread out over a greater area of Oahu and Hawaii. However, the greater the area adversely impacted actually increases the significance of the impact.

4. Air Quality

L5-13

- a) No effective measures are proposed for mitigation of the significant adverse impact on the air quality, and resulting health hazards, due to the increase in fugitive PM₁₀ (inhalable particulate matter) emissions resulting from the increased off-road vehicular maneuvers and wind erosion in the PTA and WPAA (pg. 8-51).

L5-14

- b) The discussion on air quality impacts either dismisses or ignores the impacts from the additional PM₁₀ emissions resulting from increased ordnance firing and vehicular convoys on the PTA Trail. The cumulative impacts (pg. 8-51) should consider the fugitive dust from these activities since they would typically be conducted immediately prior to, during, and after other training activities and the typically ever-present wind erosion processes.

L5-15

- c) The impacts on air quality resulting from fugitive dust emissions created by the use of helicopters and other aircraft that may be used in concert with training maneuvers in the WPAA should be discussed.

L5-16

- d) The basis for emissions from wildfires (80 acres being burned per year) may be faulty if the potential causes of wildfires include only tracers, flares, and pyrotechnics (pg. 8-56). This discussion should substantiate the assumption of 80 acres being burned per year in calculating the estimated emissions resulting from wildfires.

Responses

L5-12

Normally, the larger the ROI, the less likely that an impact is cumulatively significant. For example, conversion of 20 hectares of land from agricultural to military use could be significant if the ROI is only the northwest corner of SBMR. However, if the ROI is the island of O'ahu, that same land conversion would probably not be significant due to the fact that the impact is a small percentage of the total land of O'ahu.

L5-13

As noted in the Final EIS, the Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM₁₀ conditions. The monitoring of ambient PM₁₀ concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards.

L5-14

The DEIS estimates PM₁₀ emissions from all vehicle travel activities, including convoy traffic on military vehicle trails. Emission quantities produced by ordnance firing are too small to have measurable impacts away from the actual firing location or detonation location.

L5-15

Low level helicopter and aircraft flights are not a significant source of fugitive dust. Helicopter landings on unpaved and unvegetated areas can be a brief and very localized source of fugitive dust, but would not be a significant contributor to overall fugitive dust generation at Army facilities in Hawai'i. Since the Proposed Action would not have a significant effect on overall flight operations by the Aviation Brigade, there would be little or no net increase in fugitive dust emissions associated with helicopter operations. The DEIS analyses focused on those activities most likely to change and most likely to contribute large quantities of fugitive dust under the Proposed Action.

Comments

Ms. Cindy Barger
SBCT EIS Project Manager
U.S. Army Corps of Engineers, Honolulu District
Page 6
January 23, 2004

- | | |
|-----------------|--|
| L5-17 | e) A discussion should be included on the potential adverse impacts, if any, on the observatory operations on Mauna Kea, Mauna Loa, and Haleakala resulting from the significant increase in the volume of fugitive dust that will be suspended in the atmosphere. |
| L5-18 | <p>f) Potential mitigation of fugitive dust resulting from off-road military vehicle use and wind erosion of devegetated areas includes the use of gravel, paving, spraying of water, the application of dust control treatments to unpaved roads, and rotating and reseeded on maneuver areas (pages 8-52 & 8-53). Issues not discussed with respect to these proposed measures include:</p> <ul style="list-style-type: none"> i. The quantities of synthetic dust control chemicals that would be required for effective dust control and the environmental impacts resulting from their use. ii. The amount of water that is anticipated for use in dust control measures and the impact on the water supply. iii. Reconciliation of germination time required for reseeded of maneuver training areas between repeated training events and the proposed use of WPAA lands for grazing and recreational hunting during the relatively infrequent gaps in training operations. |
| 5. Noise | |
| L5-19 | a) The noise buffers (pg. 8-70) around Waikii Ranch and Kilohana Girl Scout Camp (KGSC) being proposed as a mitigative measure for the significant impact resulting from increased training activities (40-60 events annually with some lasting more than one day) in WPAA and/or artillery firing in training areas 15 and 16 (see Fig. 8-2) are not adequately supported by the discussion. |
| L5-20 | b) The discussion does not mention the possible use of helicopters in connection with training maneuvers in WPAA and potential noise impacts on Waikii Ranch and KGSC. |
| L5-21 | c) The discussion should identify the nearest occupied dwellings to the PTA firing points, PTA Trail and WPAA that will be most impacted by noise associated with the proposed vehicular convoys and military training exercises. |
| L5-22 | d) The discussion on noise levels (pg. 8-70 and Fig. 8-17) does not account for the topographical variations between potential noise pollution sources on the PTA Trail, WPAA and PTA and impacted surrounding properties. In particular the discussion should address the difference in the distance sound travels from a low elevation to a |

Responses

L5-16

The evaluation of emissions from wildfires was based on historical records for the number and size of wildfires at different installations.

L5-17

Given the elevation differences between PTA and the Mauna Kea observatories and the feasibility of controlling fugitive dust from vehicle travel on unpaved roads, no significant impact on observatory operations is expected. Predominant wind directions are downslope, away from the observatories. A discussion of impacts on the observatories has been added to Section 8.3 - Visual.

L5-18

The discussion of dust control chemicals has been expanded in the Final EIS. The frequency and quantity of dust control chemical applications would be determined by actual experience and monitoring changes in dust generation in response to changing weather conditions. As noted in the expanded discussion in Section 5.5 of the Final EIS, the recommended dust control chemicals could be mixed with either fresh water or sea water. Where alternative water sources are available, potable water supplies would not have to be used. The feasibility of any revegetation program would be determined in the context of the Army's established NRMP and ITAM programs. It is unlikely that any revegetation programs could be implemented for dust control purposes at SBER or KTA. Until actual use patterns at WPAA are assessed, it is premature to speculate on the feasibility or effectiveness of revegetation programs for that area. Management programs to control dust from off-road maneuver areas at SBER and KTA are likely to focus on scheduling of maneuver activities for periods when there is adequate surface moisture to control dust generation. Management programs to control dust from the WPAA are likely to focus on dispersing vehicle activity over a large enough area to avoid significant damage to vegetation cover.

L5-19

The Final EIS has a revised discussion of noise impacts from training activities in WPAA, and recommends somewhat larger buffer zones than discussed in the DEIS. Final decisions on noise buffer zone issues may be made as part of the ENMP.

Comments

Ms. Cindy Barger
SBCT EIS Project Manager
U.S. Army Corps of Engineers, Honolulu District
Page 7
January 23, 2004

- L5-22 cont'd** | higher elevation as compared to across the same elevation or from a higher to lower elevation.
- L5-23** | e) A proposed noise mitigation measure (pg. 8-65) includes improved notification of surrounding communities of scheduled training exercises, which would thereby reduce the number of complaints. This does not mitigate the adverse impact of the noise pollution being created, but may only reduce the number of complaint calls.
- L5-24** | f) The first sentence of the first paragraph on page 8-65 does not make any sense.
- 6. Traffic**
- L5-25** | a) Under the proposed action (pg. 8-78), *"troops will be transported from Kawaihae Harbor to PTA by Strykers or trucks up to one brigade level plus support vehicles. There would be up to 10 trucks and 24 Strykers per trip."* This statement indicates a maximum convoy size of 34 vehicles. However, the level-of-service (LOS) analysis (pages 8-78 & 8-79) identifies a maximum number of vehicles per convoy at twenty four vehicles.
- L5-26** | b) The discussion (pg. 8-79) does not include reference to the effect that operation of the military vehicle trail crossing may have on the proposed Waimea-Kawaihae Road to the south of the existing Kawaihae Road.
- L5-27** | c) Potential traffic impacts resulting from the PTA Trail intersection with the proposed W-3 realignment of the Saddle Road should be discussed and assessed.
- L5-28** | d) Potential traffic impacts resulting from the PTA Trail intersection with the proposed realignment of the Waimea-Kawaihae Road (DOT Proj. No. 19D-01-79) should be discussed and assessed.
- 7. Water Resources**
- L5-29** | a) The discussion on the quality of surface and ground water in the PTA and WPAA concludes that no significant effect is expected from the increased amount of explosives residue in soils due to the lack of perennial streams and surface water bodies in the project area and due to the depth of the groundwater (pg. 8-89). Additional discussion should include:
- i. The potential for explosive residue build up in the soil over long dry periods that may be carried to the near shore waters by seasonal heavy rains?

Responses

Artillery firing points are far enough from Waiki'i Ranch and Kilohana Girl Scout camp so that noise buffer zones are not a relevant mitigation measure. The noise contours presented in Figure 8-14 account for firing activity patterns at all artillery firing points.

L5-20

Noise impact discussions regarding training activities at WPAA have been expanded in the Final EIS to include current estimates of helicopter flight activity at WPAA as well as additional information on small arms firing noise. As noted in the DEIS and the revised discussion in the Final EIS, potentially significant noise impacts from such training activities can be mitigated to a less than significant level. The Army acknowledges that local residents may not agree with the criteria the Army uses to determine acceptable noise levels.

L5-21

Topography is accounted for in the modeling of noise from heavy weapons use. The modeling of noise from vehicle operations deals with distances that are too short to have significant terrain effects unless there are abrupt terrain features that act as noise barriers. Terrain features have little effect on noise propagation from in-flight aircraft unless the flight path is below the elevation of a terrain feature that acts as a noise barrier. In general, ground absorption of noise is increased and noise levels are reduced when the noise propagates up slope from lower elevations. Terrain features that block line of sight to the noise source act as partial barriers to noise propagation. When line of sight is not blocked, ground absorption of noise is reduced when the noise propagates down slope from a source at a higher elevation. Figure 2-6 in the DEIS shows the location of vehicle maneuver areas, the PTA Trail alignment, and artillery firing point locations at PTA. Figure 8-2 also shows the locations of artillery firing points and the upper section of the PTA Trail. Artillery firing points at PTA are located at distances of 3 to 14 miles from the Waiki'i Ranch boundary, with most firing points more than 6 miles from the closest part of Waiki'i Ranch. The closest point on the PTA Trail to Waiki'i Ranch is about 1.25 miles from the southeast corner of the Ranch boundary.

L5-22

The munitions noise modeling accounts for topographical features and their affects on noise. The resulting contours found in the EIS reflect this. The noise analysis for the vehicle trail and WPAA training use a straight line analysis from the point of origin for the noise source. Any differences due to purely elevation are considered insignificant for modeling. They would result

Comments

Ms. Cindy Barger

U.S. Army Corps of Engineers, Honolulu District
Page 8
January 23, 2004

- L5-30** | ii. The possible petrochemical pollution of water resources resulting from the accumulation of spilled and leaked materials from vehicles engaged in the much-increased vehicular activity on PTA Trail, WPAA and PTA.
- L5-31** | **8. Human Health and Safety Hazards**
- a) The discussion should identify specific measures and assurances that the significant impact resulting from elevated levels of munitions byproduct contamination, such as lead and RDX (cyclotrimethylenetrinitramine) (pages 4-77 & 4-78) will be mitigated when and if any range is closed and transferred out of DoD control. In view of the military's poor track record in cleaning up air, soil & water contamination resulting from use of munitions and cleaning up of unexploded ordnance, and the dangers these types of contamination present to the environment and citizenry, such discussion is considered critical by the County of Hawaii.
- L5-32** | b) Additional live-fire ranges and the increased transport of hazardous and combustible materials over the PTA Trail presents a significant wildfire risk (pg. 8-192). An expanded discussion should also include potential for additional risk possible mitigation for wildfires resulting from increased mounted and unmounted maneuvers in PTA and WPAA.
- L5-33** | **9. Public Services and Utilities**
- a) Adverse impacts affecting police, fire and emergency medical services are listed as less than significant (pg. 8-213) without any apparent justification.
- L5-34** | b) The additional long-term demand on City of Hilo (*sic*) potable water resources is identified as less than significant without justification (pg.8-210).
- L5-35** | c) The discussion on potable water consumption (pg. 8-210) indicates that water consumption on PTA ranges from 10,000 gallons per day to 250,000 gallons per day, depending on camp occupancy, and that average consumption is 100,000 gallons per day. In view of the discontinuation of the use of spring water (pg. 8-210) as a source of potable water at PTA all potable water must now be trucked in to supply the two 670,000 gallon storage reservoirs and the three 10,000 gallon distribution reservoirs. Based on these capacities, the camp occupancy could operate at full capacity for less than six days without compromising fire reserves before the number of 5,000-gallon truck deliveries of water would have to be tripled.
- L5-36** | d) A discussion should be included on the impacts on public roadways resulting from use of up to 14 trucks (pg. 8-210) daily to transport potable water from Waimea to PTA.

Responses

in no discernable difference. The discussion in Section 8.6 - Noise does describe impacts on the nearest noise receptors, including dwellings and public areas, such as the Girl Scout camp.

L5-23

This fact is noted in the DEIS. But as is clear from several public comments received on the DEIS, there is a concern about inadequate information and inadequate complaint handling procedures.

L5-24

Text has been corrected to add missing word at end of sentence; corrected text reads:

"... both of which share fence boundaries with the WPAA."

L5-25

The maximum convoy size would be 24 vehicles, including up to 10 trucks or 24 Strykers.

L5-26

The proposed Waimea-Kawaihae Road project is discussed in Chapter 9 - Cumulative Impacts. At the present time there are no plans for completion of this project or funds allocated. If the Army decides to implement the proposed action, the Army would coordinate with FHA to have crossing go under the road if practicable versus across grade, thereby minimizing any impact to traffic along the new road.

L5-27

The new Saddle Road alignment is proposed through the southern portion of the West PTA Acquisition Area. The U.S. Department of Transportation, Federal Highway Administration (FHA), could not provide a firm construction date at this time for this section of the new Saddle Road. If the Army decides to implement the proposed action, the Army will coordinate all road crossings with the FHA to minimize impacts to traffic along the new Saddle Road. Phase III of the Saddle Road realignment (which is from PTA West) has not yet been designed. Upon a favorable Record of Decision (ROD), the Army would purchase the Keamuku and own the land bordering both sides of this section to Saddle Road. The Army would request that the road design be

Comments

L5-37

e) The discussion should include the potential impacts on the County of Hawaii water supply system resulting from the proposed addition of a new water line from the existing water main on Kawaihae Road to the tactical vehicle wash site (pg. 8-213).

L5-38

f) A discussion on the potential impacts on traffic resulting from the construction of a new water line from Kawaihae Road to the tactical vehicle wash site should be included (pg. 8-213).

L5-39

g) The discussion (pg. 8-214) on "minor long-term adverse effects" from the proposed action with regards to solid waste management should identify what landfill will realize a reduced useful life. The discussion does not specify the "minimal increase in solid waste" expected as a result of increases in training and does not identify the capacities of the existing waste collection and disposal systems stated to be adequate.

10. Cumulative Impacts

L5-40

a) Although less one mile from Kilohana GS Camp and within three miles of Waikii Ranch Subdivision, no discussion (pg. 9-16) is provided regarding the 1010 Land Acquisition Area (1010 LAA), consisting of 990 to 1,010 acres, to establish that *"the land to be acquired has no significant impact on the local community."* Furthermore, the proposed uses and activities in the 1010 LAA are not discussed in this DEIS and no reference is provided for the EIS in connection with this proposed land acquisition.

L5-41

b) The proposed new Waimea-Kawaihae Road (DOT Proj. No. 19D-01-79) project (Fig. 8-4) is not included in the discussion on Cumulative Impacts or is incorrectly identified on Figure 9-2.

L5-42

c) The repeated reference to consideration by the Army to establish a cooperative relationship with the landowner to allow continued grazing at WPAA in conjunction with training as a mitigative measure to further reduce the cumulative impacts of having agricultural lands converted to military training (pg. 9-21) requires reconciliation with the suggested training schedules, proposed re-vegetation efforts, proposed recreational hunting mitigative measures, and the questionable suitability of WPAA lands between training periods for grazing purposes.

L5-43

d) *"Overall, cumulative impacts would be less than significant because the proposed project and the cumulative projects listed above would be spread out over a large area and would not be confined to one region in particular. Consequently, any impacts on visual resources are more likely to be localized."* (pg. 9-23) On the contrary, the significance of the cumulative impacts is increased by their effect on a wider area of the State and the County of Hawaii in particular.

Responses

conductive to training needs, which would include a possible road crossing with traffic control devices and an appropriate number of troop underpasses (which has not been determined yet). Proper use of these two means of crossing the public road would not seriously hamper military training, as many realistic scenarios found in real world situations involve consideration of public roadways.

L5-28

Please refer to Chapter 9, Cumulative Impacts for a discussion on the Saddle Road Realignment Project. Also see Section 8.7 for traffic impacts.

L5-29

These impacts are unlikely due to the distance from the ocean, and the low concentrations of residues in the soils.

L5-30

Small spills of diesel fuel are unlikely to result in impacts on water resources. Compared to the impacts from spills and leaks from vehicles that occur frequently on streets in urban areas, and involve gasoline constituents, small spills of diesel fuel from large Army vehicles that are regularly maintained are not likely to significantly impact water resources. Diesel fuel is relatively immobile in soils and is rapidly biodegraded by organisms that occur naturally in soils. Large spills that occur due to ruptures in hydraulic lines or tanks, etc., will be cleaned up using standard remediation methods.

L5-31

The Army retains responsibility under CERCLA/SARA for cleanup of past contamination. However, the ranges and other areas that are the subject of this EIS are not scheduled for closure and therefore the impacts of closure are not addressed in the EIS. Impacts of closure actions would be subject to evaluation under NEPA if and when they occur in the future.

L5-32

Actually once the land is acquired WPAA the WFMP for PTA will be modified to included plans to reduce the potential for wildfires in the area included those from the trail. And we did evaluate the potential for a slight increase in wildfires and their impacts on Bio, Haz waste, Water Resources, and Geo sections for PTA.

Comments

**L5-43
cont'd**

It should also be noted that the impacts on visual resources discussed does not include those visual impacts resulting from airborne dust created by mounted training maneuvers, additional live-fire training, unpaved road construction and maintenance, aircraft operations in support of training maneuvers, and wind erosion of devegetated land areas.

L5-44

- e) The stated unlikelihood that PTA Trail and Saddle Road (realigned) construction activities would result in a cumulatively significant impact on visual resources partly because of the separation (pg. 9-24) is not consistent with the W-3 preferred alignment of Saddle Road and the PTA Trail through the WPAA (see Fig. 9-2).

L5-45

- f) The discussion on cumulative impacts to air quality (pg. 9-26 & 9-27) does not include any reference to the potential impacts resulting from the increased ozone precursor emissions and PM₁₀ emissions when combined with the ongoing volcanic gas emissions from Kilauea or likely further volcanic events.

L5-46

- g) The discussion (pg. 9-29 & 30) regarding the potential conflicts with right-of-way acquisitions needed for the Saddle Road realignment resulting from the expanded use of PTA combined with other local land acquisition and development projects talks about two impacts the Saddle Road project will have on the Proposed Action.

L5-47

- i) The first impact relates to the anticipated increase in traffic on Saddle Road *"will have no impact on the proposed military trail element of the project because the trail would not cross Saddle Road."* Additional discussion is required to reconcile this statement with the proposed alignment of the military trail and the preferred W-3 realignment for Saddle Road within the WPAA (see Fig 9-2), which clearly shows these two alignments having at least one intersection.
- ii) The second impact relates to the impact of right-of-way acquisition on the expansion of PTA. The discussion states that: *"While the road project may affect PTA expansion, SBCT project actions at PTA would not contribute to right-of-way impacts on Saddle Road."* Additional discussion should explain how the acquisition and use of the WPAA lands would not impact the right-of-way acquisition of the W-3 alignment of Saddle road.

L5-48

- iii) The preferred W-3 alignment for Saddle Road is located in the middle of the proposed WPAA 23,000-acre parcel. This DEIS fails to provide an adequate analysis or discussion on the potential impacts of the proposed project on the preferred W-3 realignment. Such discussion on the W-3 alignment should include, but not be limited to:

Responses

L5-33

Section 4.14.1 provides the factors considered for determining significant impacts to public services, which is an increase in demand beyond the capacity of the utility provider. Section 8.14.2 determines that there are less than significant impacts on the provision of public services because existing fire, police, and emergency services would be capable of handling any increase in training activities at PTA.

L5-34

Section 8.14.2 incorrectly identifies the tactical vehicle wash as requiring 13.5 million gallons of water/year. The vehicle wash would recycle used water, and would require only 500,000 gallons/year. The total requirement after the addition of the vehicle wash would be approximately 8,500 gallons per day, which is well within the range of water currently supplied by trucking in from Waimea.

L5-35

Public and firefighter safety is the first priority in every fire management activity. The Army will fully implement The Integrated Wildland Fire Management Plan (IWFMP) for Pohakoloa and O'ahu Training Areas as updated on October 2003. The Army will manage water resources at PTA to ensure that there is adequate water for troops training at PTA as well as appropriate fire response measures in accordance with the IWFMP. The plan is available upon request.

L5-36

The number of military vehicles using PTA Trail would be minimal. The maximum number of vehicles per convoy would be 24, and convoys would be sequenced at 15- to 30-minute intervals, so the maximum hourly volume would be 96 vehicles per hour. Convoys would be scheduled during non-peak traffic hours, thus reducing potential impacts on peak-hour traffic conditions. No mitigation would be required. Because military vehicles would use PTA Trail, there would be fewer military vehicles on public roadways that could adversely affect roadway segment operations. With the increase in the number of water trucks, the potential impact would still be less than significant.

**L5-48
cont'd**

- (1) Any economic impacts resulting from the possible need to reassess the completed studies and adopted realignment;
- (2) Possible impacts on visual resources, including mauka and makai view planes from the W-3 alignment;
- (3) Potential impacts from noise and dust resulting from maneuver activities in close proximity to a major public highway; and
- (4) Any impacts on traffic resulting from training maneuvers near or within sight of the W-3 alignment.

L5-49

- h) The potential increases in unexploded ordinance (UXO) from increased live-fire training activities on PTA combined with existing UXO on PTA, Waikoloa Maneuver Area, Nansay Sites and Pu'u Pa Maneuver Area presents a significant impact. (Pg. 9-46 & 9-47) Proper abatement and removal techniques under EPA and USARHAW guidelines are offered as mitigative measures, but their implementation is neither proposed or has historically been satisfactorily carried out.

L5-50

- i) The cumulative impacts from training in the WPAA (pg. 9-47) are considered less than significant because the area has been leased in the past to conduct training maneuvers without any discussion on the frequency or size of previous training events in the WPAA lands.

Should you have questions, please feel welcome to contact Larry Brown or Esther Imamura of my staff at 961-8288.

Sincerely,

CHRISTOPHER J. YUEN
Planning Director

LMB:pak/lmb/mad
P:\WP\WIN60\Larry\EA-EIS Comments\Barger-SBCT EIS crmts.doc

Responses

L5-37

The tactical vehicle wash would require the use of only approximately 500,000 gallons per year. The total requirement after the addition of the vehicle wash would be approximately 8,500 gallons per day, an amount insufficient to create a significant adverse impact on the County of Hawai'i water supply system.

L5-38

As noted in Section 8.7.2 and Table 8-15, the construction associated with the Proposed Action, which includes construction of a new water line, would generate additional traffic from worker vehicles and trucks. The construction traffic would be temporary and less than significant. To minimize traffic impacts to the surrounding community during construction, a construction traffic management program would be implemented. The program would stagger work hours to reduce impacts from construction workers during peak hours, would identify truck routes to limit truck traffic to major streets, and would designate parking for construction workers. No mitigation would be required.

L5-39

The EIS has determined that there would be no significant impacts to solid waste management from the implementation of the proposed action. PTA disposes of its solid waste through a solid waste management service that delivers the waste to County landfills and disposal areas. The County regulates the landfills and disposal areas to ensure that there is adequate capacity for all those that it services.

L5-40

Chapter 9 does include a discussion of the 1010 land acquisition project (project # 3) as well as the other land acquisitions proposed as part of SBCT. Figure 9-3 also identifies the location of the land acquisition projects, including the 1010 project, near PTA. The 1010 Land Acquisition Area would be used in the same manner as the WPAA. Since the 1010 Acquisition Area is further from Kilohana Girl Scout Camp and Waiki'i Ranch than is the WPAA, use of the 1010 Acquisition Area would have less impact than use of the WPAA. The discussion of impacts related to the WPAA adequately addresses impacts of use of the 1010 Acquisition Area.

Comments**Responses****L5-41**

Chapter 9, Table 9-2 (project #6) identifies project and the section discusses the possibility of work on the Waimea-Kawaihae Road. However, there are no proposals at this time that could assist in impact analysis.

L5-42

The WPAA acquisition is part of the project description. Impacts caused by this project component are discussed under the appropriate resource categories in Chapter 8. Comment issues could be addressed in prepared land management planning documents for WPAA.

L5-43

Normally, the larger the ROI, the less likely that an impact is cumulatively significant. For example, conversion of 20 hectares of land from agricultural to military use could be significant if the ROI is only the northwest corner of SBMR. However, if the ROI is the island of O'ahu, that same land conversion would probably not be significant due to the fact that the impact is a small percentage of the total land of O'ahu. Dust impacts on visual resources are discussed in the respective direct impact sections. For instance, such impacts are discussed in Section 5.3.4 under less than significant impacts to Proposed Action.

L5-44

The new Saddle Road alignment is proposed through the southwestern portion of the West PTA Acquisition Area. The U.S. Department of Transportation, Federal Highway Administration (FHA), confirmed that there are no scheduled funds and no scheduled construction date at this time for this section of the new Saddle Road. If the Army decides to implement the proposed action, the Army would coordinate with FHA to reduce the number of crossings of the new Saddle Road and where practicable have crossing go under the road versus across grade, thereby minimizing any impact to traffic along the new Saddle Road. If the Army decides to implement the proposed action, the Army would coordinate with FHA to limit training activities likely to disturb traffic in proximity to Saddle Road during high traffic periods. WPAA acquisition is part of the project description and impacts caused by this project component are discussed under the appropriate resource categories in Chapter 8.

Comments**Responses****L5-45**

Volcanic gas emissions are not ozone precursors. The dominant emissions are acidic compounds or their precursors (sulfur dioxide, hydrogen sulfide, hydrogen chloride, hydrogen fluoride, etc.). Other major components of volcanic gas emissions include water vapor, carbon dioxide, carbon monoxide, and hydrogen gas. The atmospheric chemistry of these compounds would result in ozone scavenging and a competing atmospheric reaction process that would generate acid deposition products rather than ozone and photochemical smog products. Volcanic eruptions are also a source of PM10 emissions, including volcanic ash and condensed metals vaporized from magma and lava. High concentrations of PM10 emissions are produced by explosive eruptions. Explosive eruptions of Hawaiʻian volcanoes are infrequent, with the last significant explosive eruption being the 1790 eruption of Kilauea. Historical PM10 monitoring data from Hawaiʻi Island (at Captain Cook, Hilo, and Honokaʻa) do not show any PM10 levels close to the values of the federal and state PM10 standards (see Table 2 in Appendix G1). The proposed action will not contribute gases similar to those emitting from Kilauea volcano. Refer to Chapter 2, Section 2.3

L5-46

The new Saddle Road alignment is proposed through the southwestern portion of the West PTA Acquisition Area. The U.S. Department of Transportation, Federal Highway Administration (FHA), confirmed that there are no scheduled funds and no scheduled construction date at this time for this section of the new Saddle Road. If the Army decides to implement the proposed action, the Army would coordinate with FHA to reduce the number of crossings of the new Saddle Road and where practicable have crossing go under the road versus across grade, thereby minimizing any impact to traffic along the new Saddle Road. If the Army decides to implement the proposed action, the Army would coordinate with FHA to limit training activities likely to disturb traffic in proximity to Saddle Road during high traffic periods. WPAA acquisition is part of the project description and impacts caused by this project component are discussed under the appropriate resource categories in Chapter 8.

Comments**Responses****L5-47**

The new Saddle Road alignment is proposed through the southern portion of the West PTA Acquisition Area. The U.S. Department of Transportation, Federal Highway Administration (FHA), could not provide a firm construction date at this time for this section of the new Saddle Road. If the Army decides to implement the proposed action, the Army will coordinate all road crossings with the FHA to minimize impacts to traffic along the new Saddle Road. Actions taken to minimize impacts may include separate grade crossings. However, any impacts caused by the WPAA activities would be more than offset by the reduction in military convoy traffic on Saddle Road afforded by the construction of the PTA trail.

L5-48

The new Saddle Road alignment is proposed through the southwestern portion of the West PTA Acquisition Area. The U.S. Department of Transportation, Federal Highway Administration (FHA), confirmed that there are no scheduled funds and no scheduled construction date at this time for this section of the new Saddle Road. If the Army decides to implement the proposed action, the Army would coordinate with FHA to reduce the number of crossings of the new Saddle Road and where practicable have crossing go under the road versus across grade, thereby minimizing any impact to traffic along the new Saddle Road. If the Army decides to implement the proposed action, the Army would coordinate with FHA to limit training activities likely to disturb traffic in proximity to Saddle Road during high traffic periods. WPAA acquisition is part of the project description and impacts caused by this project component are discussed under the appropriate resource categories in Chapter 8.

L5-49

As discussed in Section 8.12, if the Army decides to implement the proposed action the following mitigation measure would be implemented. Prior to initiation of any construction activities, USARHAW will employ qualified professionals to perform UXO clearance of the proposed construction area, remove all UXO encountered to ensure the safety of the site, and document UXO surveys and removal actions in full accordance with applicable laws, regulations, and guidance. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closer (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDS) program.

Responses

L5-50

As noted in the Draft EIS (Chapter 8, page 8-19), the WPAA has in the past been used four or five times a year for maneuver training exercises. The Draft EIS (page 8-28) notes that the Proposed Action and RLA Alternative would result in the WPAA being used 40 to 60 times per year, with some use events lasting more than one day. The direct impacts of training in WPAA are discussed in Chapter 8. Chapter 9 considers the combination of these direct effects with other actions proposed by the Army and other entities.

ATTN: CEPOH-PP-E
Fort Shafter, HI 96858-5440

Dear Ms. Barger

N1-1

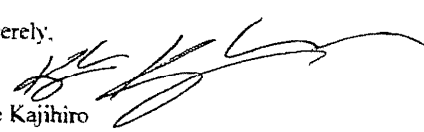

I am writing to request an extension of the comment period for the Draft EIS for Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawai'i to a minimum of 90 days.

The document is lengthy, complex and technical. The present 45 day comment period is inadequate for meaningful public participation. My conversations with many people in the community have confirmed this general sentiment.

We need more time to review the source documents from which findings and conclusions are drawn in the DEIS.

Thank you very much.

Sincerely,

Kyle Kajihira
Program Director

Responses

N1-1

The public comment period was extended to 90 days and closed on January 3, 2004.

Comments

Letter N2

The Stryker is an experimental 20-ton armored combat vehicle that the Army wants to deploy at six locations including Hawai'i. **The Army wants to station 296 Strykers in Hawai'i.** Here are some impacts taken from the Draft Environmental Impact Statement (DEIS) for the Stryker Brigade and other sources:

- The military controls around 200,000 acres of land in Hawai'i. The military already controls nearly 1/4 of the island of O'ahu.
- The Army wants to **acquire 25,663 acres of land**, an area nearly the size of the entire island of Kaho'olawe, including **23,000 acres at Pohakuloa** on Hawai'i island, and **1,400 acres at Honouliuli** on O'ahu. This would be a 12.8% increase in military land holdings, the biggest military expansion since World War II.
- The Army Stryker brigade would increase the **percentage of military-controlled land in Hawai'i from 10.8 % to 11.4 %.**
- Army expansion will have a **significant impact on Hawaiian cultural sites and practices.**
- **Live ammunition use would increase by 25%.** There will be an overall **significant increase in Unexploded Ordnance hazards.** Live-fire training would take place in Kahuku where no live fire was allowed in the past.
- Increased live fire training will **elevate the already alarming levels of toxic chemicals released**, such as:
 - **RDX**, an explosive compound, affects the **central nervous system and may cause cancer.**
 - **TNT**, an explosive compound, is a **carcinogen and also causes genetic mutations.**
 - **HMX**, an explosive compound, **damages the central nervous system and liver.**
 - **Nitroglycerine**, an explosive compound, affects the **blood and circulatory system.**
 - **Arsenic**, a poisonous metal and **Lead**, a poison that **affects the nervous system.**

Responses

N2-1

Most of the compounds released by munitions use on military training ranges would be present as metal fragments, metal particles, or solid residues of various energetic materials. Small quantities of these materials would be released into the air during munitions firing and detonations. Some of the airborne releases would be carried by the wind beyond military installation boundaries, but the concentrations of these compounds would be too low to have any significant health effects. Weathering, corrosion, and leaching of munitions residues present on military training ranges would result in the slow migration of small quantities of various compounds from surface layers of soil into deeper soil layers, with soluble compounds slowly leaching into groundwater bodies. However, there are no indications that the weathering and leaching process is causing any significant contamination of groundwater resources.

N2-1

Where do these hazardous chemicals go when the bombs explode? What are the health impacts of these contaminants in our community?

Comments

- N2-2**
- The **military is the largest polluter in Hawai'i**, with over 1,000 military contamination sites and many that have not yet been identified. *What is the cumulative impact of all of this military contamination on the health, cultural survival and quality of life of our communities? How much total contamination and unexploded munitions have been released into our 'āina over the years?*

- Army vehicle **miles in maneuver will increase 300% overall, and 700% on Hawai'i island.**

- Dust emissions would increase by 7 million pounds per year to a total of 13.4 million pounds per year.** How does this contribute to our disproportionately high levels of respiratory ailments such as asthma?

- N2-3**
- Fires will be a major threat** to endangered species, cultural sites and human health and safety. The Army relies on the same fire control plan that failed miserably in Mākua in July. *How will smoke and toxins released by wild fires affect the health of affected communities?*

- N2-4**
- Significant impacts on endangered species.** *In the long run, how many species will be lost or severely diminished due to increased training, fires and alien species introductions?*

- N2-5**
- Why does the DEIS not consider impacts of the C-17 cargo aircraft?*

- THE PROCESS IS INVALID:** Opponents of the Stryker Brigade were excluded from participating in two of the Stryker EIS meetings, and meeting locations are not accessible. Army regulations on NEPA state in part 651 of title 32 of the Code of Federal Regulations, Appendix E, (a) "EISs will: ... (4) Serve as a means to assess environmental impacts of proposed military actions, rather than justifying decisions." However Senator Inouye's press release June 26, 2003 stated: "Senator Inouye has been assured that one of the six Stryker Brigades will be based in Hawaii, and Schofield Barracks will be building new facilities, adding personnel, and increasing its land area to accommodate this unit."

For more information contact: AFSC Hawai'i at (808) 988-6266, email: afschawaii@afsc.org, or visit our website at www.afschawaii.org or Malu 'Āina (808) 966-7622.

Responses

N2-2

Chapter 3 of the EIS describes the affected environment for the proposed action's region of influence.

Cumulative impacts on health, cultural resources and socio-economics are addressed in Chapter 9. However, quantification of soil contaminants and UXO released over the past several decades is not available. The EIS does state in Section 9.5.2 that there would be a significant cumulative impact regarding UXO. The analysis in the EIS has been revised with an expanded discussion of UXO.

N2-3

Most wildfires caused by military training activities are relatively small, and generate correspondingly small quantities of smoke with little potential for health impacts to off-post locations. Chapter 4.5 discusses the impacts of air borne contaminants. The Army has determined that the impacts to air quality from wildfires would be less than significant.

N2-4

Consultation between USFWS and Army has detailed measures that will serve to stabilize over 30 sensitive species in the ROIs on O'ahu and on the island of Hawai'i. Individual impacts to species are described in sections 4.10, 5.10, 6.10, 7.10, and 8.10.

N2-5

The EIS does acknowledge C-130 aircraft flights into and out of Wheeler AAF, and addresses the potential for impacts to aviation safety. The C-17 will not fly into WAAF but will fly into and out of Bradshaw Army Airfield and the impacts for PTA are considered in Section 8.4 - Airspace Use. The impacts of basing of C-17s at Hickam Air Force Base is a separate action and the NEPA document was prepared by the US Air Force for that project.

Re: Draft Environmental Impact Statement
 Transformation of the 2nd Brigade,
 25th Infantry Division (L) to a Stryker
 Brigade Combat Team in Hawaii

Dear Ms. Barger:

Aloha and thank you for this opportunity to submit comments on the subject Draft Environmental Impact Statement (DEIS). I am Ronald G. Nishihara, AIA of Castle & Cooke Homes Hawaii, Inc. (CCHHI), which is acting as an authorized agent on behalf of Dole Food Company Hawaii (Dole).

Our position is that the transformation of the 2nd Brigade to a Stryker brigade will have generally positive impacts on the state and we are supportive. However we do have some concerns with the routing of the Helemano and Dillingham Trails since they will impact agricultural operations of both Dole and its lessees.

Comment #1: We take exception to the Army's position that our farm vehicles will not be able to use the trails that will be constructed over our existing plantation roads.

Specific DEIS citations:

- "A perpetual easement of 55 acres (22 hectares) would be acquired for the Dillingham Trail. The road would be constructed on private plantation roads owned by Dole Food Co., Inc., and other private landowners. After the Proposed Action is implemented, users of those plantation roads would use other roads to access agricultural lands." [page 6-48]
- "A perpetual easement of 27 acres (11 hectares) would be acquired for the Helemano Trail and an easement for Drum Road (also known as Kahuku Trail) upgrade to KTA. Helemano Trail is shown in Figure 2-7 in Chapter 2. The roads are proposed on private plantation roads. If the Proposed Action were implemented, Dole Food Co., Inc. would use other roads to access its agricultural lands." [page 7-50]

N4-1

If the proposed project is selected and the Army decides to acquire this easement, it will be a joint use road, accessible by both the property owner and the Army. The Army will work with the property owners on a notification process to minimize potential interference with regular farming practices. This information has been added to Section 6.7.

Page 2

N4-1
cont'd

Specific concerns:

- The plantation roads that are being considered for the Army's trails are some of the most critical to the operations of Dole and its lessees. In most cases, they are the widest and most efficient of the plantation roads. The taking of the primary plantation roads by the Army would create great economic hardship and inefficiency.
- Some equipment (such as our harvesting conveyor belt) cannot be moved on public streets because of their slow speed. In some cases, the main plantation road is the only access to certain fields for these pieces of equipment. Entire fields may become unusable for pineapple cultivation if the Army takes the main plantation roads.
- In the cases of some parcels, the plantation roads split the parcel. If access across the Stryker trail is not allowed, portions of these parcels will be landlocked and inaccessible.

Comment #2: We take exception to the finding that there will be "less than significant impact" to agricultural activities if the transformation plan proceeds as outlined in the DEIS.

Specific DEIS citations:

- "Helemano Trail and Dillingham Trail would be constructed along agricultural roads or undeveloped land. Trail construction and use is not expected to significantly affect land use. Therefore, impacts from conversion of agricultural land to training land for the construction and use of military vehicle trails is a less than significant impact." [page 4-8]
- "All military vehicle trails would be made available for public use during state and national emergencies." [page 4-41]
- "The Proposed Action would also involve the acquisition of up to 1,400 acres of land, of which approximately 600 acres are currently under cultivation for pineapples. Some portions of the land acquired would no longer be useable for pineapple production. The military would use this area as rangeland. Economic effects could include reducing crop production and decreasing taxes paid to local and state government entities by land owners. Some employment could be affected, but the impact would likely be minor, given the size of the parcel and the minimal role agricultural production plays in the ROI [Region of Influence] economy. For example, agriculture accounts for only 0.5 percent of employment and only 0.4 percent of earnings in Honolulu County, and 1.7 percent of employment and 0.8 percent of earnings statewide (BEA 2002a). Since World War II, the role of the pineapple industry in the state economy has declined in place of tourism and defense." [page 4-95]

N4-2

Responses

N4-2

The Dillingham military vehicle trail alignment shown in the EIS is the Army's preferred alignment. If the Army decides to implement the proposed action, the Army will coordinate with the property owners over the location of the proposed alignment. If the coordination results in a change in alignment which results in environmental impacts not analyzed in the EIS, the Army will conduct all appropriate NEPA, ESA and NHPA consultations prior to a final decision on a new alignment. If the proposed project is selected and the Army decides to acquire this easement, it will be a joint use road, accessible by both the property owner and the Army. The Army will work with the property owners on a notification process to minimize potential interference with regular farming practices. The farmland conversion rating forms are included in Appendix E of the Final EIS. The Army has committed to mitigating dust from vehicle traffic on unpaved roads through a combination of dust control chemical applications and/or the use of washed gravel for surfacing military vehicle trails. In addition, the Army would implement a Dust and Soils Management and Monitoring Plan that would include ambient air quality monitoring of PM10 conditions. The monitoring of ambient PM10 concentrations would help guide the development and implementation of an adaptive management program to manage training area lands and modify training procedures as necessary to ensure compliance with federal air quality standards. The Final EIS concludes that the potentially significant impacts from fugitive dust can be mitigated to a level that is less than significant.

Comments

Ms. Cindy Barger
November 18, 2003
Page 3

N4-2
cont'd

- “According to the LOS [Level of Service] analysis, both state highway crossings would operate at LOS C under worst-case conditions. Convoy traffic would experience delays because they would yield to traffic along the state highways. Because the convoys would yield to through traffic, there would be no impact on LOS on public highways. The identified impact would be less than significant, and no mitigation would be necessary.” [page 6-49]
- Vehicle travel on unpaved areas at DMR and along the Dillingham Trail would increase by an estimated percent under the Proposed Action. The resulting PM₁₀ emissions would be approximately 537 tons (487 metric tons) per year, an increase of about 211 tons (191 metric tons) per year compared to the No Action conditions. Approximately 32 percent of the net increase in fugitive PM₁₀ emissions would be associated with vehicle travel on unpaved roads, while the remaining 68 percent represents potential emissions from off-road vehicle maneuvering activity.” [page 6-34]

Specific concerns:

- The concerns raised in Comment #1 also apply to this comment.
- We are concerned about the possibility of the roads being made available for public use during times of state or national emergency. Having public traffic traversing through the middle of our fields will be very disruptive to our farm operations. There will also be a tremendous increase in potential liability if two-way traffic is allowed on the 15-foot wide road, especially if the traffic is a mix of civilian vehicles, farm vehicles and Stryker or Stryker-related vehicles.
- While we do not necessarily dispute the facts in the bullet point above regarding the contribution of pineapple to Hawaii's economy, the statement underlines that fact that it is very difficult to compete in a global economy with a commodity crop. Despite the tenuous nature of large scale farming, Dole recently invested \$4 million to change the variety of pineapple it grows in Hawaii in an effort to better compete in the global market. Any challenges to agriculture caused by the Army Transformation will only exacerbate the existing challenges facing large-scale farming. Should the challenges be the “straw that breaks the camel's back”, and one of the two large companies shuts down its pineapple production, the impact on the rural landscape would be dramatic.
- Approximately 98% of Dole's Hawaii operations are in pineapple cultivation employing between 250 to 300 people. While this may be a small number of people relative to the island's population, the pineapple plantations remain a nostalgic icon in the minds of many local residents. Losing pineapple cultivation on Oahu will be another bitter pill for the residents to take.
- The DEIS also does not address the impact on our smaller diversified farmers. Larry Jeffs' farm on TMK 6-8-002:005 and 6-8-002:009 is one of the most successful diversified agricultural operations in the state. The Stryker trail cuts through the

Thank you for your comment. Your comment has been considered and incorporated into the administrative record. The overall impacts from the Proposed Action on agricultural production and economy are discussed in Section 4.2 and 4.13.

N4-4

Thank you for your comment. Your comment has been considered and incorporated into the administrative record. The overall impacts from the Proposed Action on agricultural production and economy are discussed in Section 4.2 and 4.13.

N4-5

Future property values are based on several factors that fall outside of the purview of the Army action. It would be speculative in nature for the Army to assume either positive or negative impacts to adjacent property values. If the Army decides to implement the proposed action, the Army will implement mitigation measures to help keep the proposed action to less than significant levels of impact where practicable.

Comments

N4-5 | lands he leases from Dole (see Figure 6-6 on page 6-13). The trail will not only
cont'd | greatly impact his operations, it will lower the value of the parcels.

- N4-6** |
- The LOS analysis that was done only considered vehicular traffic on the public streets. No analysis was done on the backlog of vehicular traffic that will occur on private property, especially near the Dole packing plant. As summarized in the attached Exhibit A, Dole is in the processes of shifting from in-field packing to centralized packing in the packing plant. \$2.2 million will be spent to execute this conversion, which will be completed by April, 2004. Once the conversion is completed, we anticipate that one truck will be arriving at the packing plant to unload every twelve minutes. The exact routing of the Dillingham and Heleman Trails is not clear in the DEIS and we will be in a better position to comment if we could review a site plan of the proposed trails relative to the fields and structures. Vehicular congestion around the packing plant will create hazardous conditions because of the frequency of the vehicle arrivals.
 - Currently, the pineapple crops along the sides of the plantation roads are damaged as a result of being coated by fugitive dust. Generally, the majority of this fruit is either lost or must be used for fresh-cut product as opposed to fresh whole fruit. The increase in fugitive dust could result in further crop damage and lost revenue for Dole.
- N4-7** |
- The added fugitive dust will also negatively impact Castle & Cooke's Dole Plantation. Dole Plantation is an agricultural tourism operation, which receives worldwide publicity because it's the home to the world's largest maze. An average of 2,500 visitors per day enjoy the outdoor attractions at Dole Plantation.

In conclusion, despite the challenges of local large-scale agriculture competing in a global market, Dole has invested over \$6.2 million in the past year to remain competitive. In addition, the success of diversified agriculture has increased dramatically in the past few years. We ask for your kokua in working with our lessees and us to minimize the impact on our operations. To this end, we look forward to working cooperatively with the US Army to insure the viability of agriculture in Hawaii, responsible stewardship of the land, and the successful transformation of the 2nd Brigade into a Stryker Brigade Combat Team.

God Bless America!

Ronald G. Nishihara, AIA
Project Manager-Special Projects

Responses

N4-6

In the Final EIS, the Army has expanded the discussion in Chapter 9 on the cumulative impacts to land use from the conversion of agricultural lands and on socioeconomic impacts. The Army determined the cumulative effect on the loss and conversion of agricultural land from past, present, and reasonably foreseeable actions is significant.

N4-7

Based on EPA guidance, we have conducted a more detailed air quality analysis incorporating mitigation measures into the air quality modeling to reduce the impacts from dust to levels within EPA standards for the Clean Air Act. To ensure dust remains within these levels, if the Army decides to implement the proposed action, the Army will develop an SBCT Off Road Maneuver Dust and Soils Management and Monitoring Plan for the training area. The plan will determine how training will occur in order to keep fugitive dust emissions below CAA standards for PM10 and soil erosion and compaction to a minimum. The Army will monitor the impacts of off road maneuver training activities to ensure that emissions stay within the acceptable ranges as predicted and environmental problems do not result from excessive soil erosion or compaction. The plan will also define contingency measures to mitigate the impacts of off road maneuver training activities which exceed the acceptable ranges for dust emissions or soil compaction.

HONOLULU ADVERTISER 10/25/03 \$2.2M upgrade planned at Dole packaging plant

By Sean Hao
ADVERTISER STAFF WRITER

Dole Food Company Inc. said yesterday that it will spend about \$2.2 million upgrading its pineapple packing plant in Central O'ahu. The goal is to increase efficiency and the level of quality of packed pineapple, said Brian Orlopp, general manager for Dole's Hawai'i operations.

The upgrade, which involves acquiring new equipment, comes amid growth in pineapple sales in Hawai'i.

After falling 5 percent in 2001, farm-level sales of pineapple rebounded 4 percent last year to \$100.6 million. The gains were a result of a greater mix of sales from higher-value fresh pineapple products.

The industry is shifting production to increasingly popular, extra-sweet pineapples. Maui Land & Pineapple Co. now is shifting all of its Hawai'i production to its new premium Hawaiian Gold variety, while Dole is shifting production to its comparable Premium Select brand.

"We've got a lot of resources here and we want to make a go of it the best we can in Hawai'i," Orlopp said.

The Dole factory upgrade will have no impact on the company's employment level, which ranges between 250 to 300 people in Hawai'i, Orlopp said.

The company's packing plant is on Kamehameha

Highway, across from the Dole Plantation Store.

In addition to the Pineapple Express Train, the Pineapple Garden Maze and the Pineapple Garden Tour, the store plans to open a restaurant. The company closed its Hawai'i cannery in the early 1990s.

Dole, which generated \$4.4 billion in sales last year, typically has between 3,000 and 4,000 acres of pineapple planted at any time. Earlier this year Dole was taken private by David Murdock in a \$2.5 billion deal, which propelled the billionaire into position as one of Hawai'i's biggest private landowners with more than 123,000 acres in the Islands.

Re: Written Testimony supporting the Army Transformation

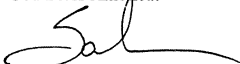

Dear Ms. Barger,

I am Harry A. Saunders, III, President of Castle & Cooke Homes Hawaii, Inc., which is acting as an authorized agent of Dole Food Company, Inc. (Dole) with regard to its lands on the North Shore of Oahu. Both the Helemano and Dillingham Trails are proposed to be located on Dole-owned lands.

While this may pose a minor inconvenience for our plantation operations, we understand and appreciate the importance of a well-trained military. Any sacrifice we make is small compared to the sacrifices of the men and women in our armed forces.

We are writing in support of the Army Transformation and look forward to working cooperatively with the US Army.

God Bless America!

Harry A. Saunders, III
President

**The Chamber of
Commerce of Hawaii**

Since 1850

**Letter
N6**

November 14, 2003

Ms. Cindy Barger
U.S Corps of Engineers, Honolulu District
Bldg 230, CEPOH-PP-E
Ft. Shafter, HI 96858-5440

Dear Ms. Barger:

The Chamber of Commerce of Hawaii submits written testimony in favor of the decision to proceed with transformation and designating Hawaii as one of six locations for the initial positioning a Stryker Brigade Combat Team (SBCT).

N6-1

The Chamber is well aware of the U.S. Defense Department's security plans for the Asia Pacific region. The forward presence of a strong military force in the region has been very successful in deterring war and quelling internal strife in unstable nations. This has enabled the region to enjoy unprecedented peace and stability, which, in turn, has provided economic security within the region and facilitated the growth of a thriving global economy. We are well aware that a war or any uncontrolled internal strife within a nation could disrupt the economies of the nations in the region.

Moreover, we strongly advocate a policy of deterrence as it provides for peaceful means to settle disputes and avoids the needless loss of lives and property.

We believe that the positioning of a SBCT in Hawaii will add greater visibility in the U.S. policy of deterrence and provides a means by which the U.S. can respond quickly to protect the U.S. homeland and nations in the region and the lives of U.S. citizens serving abroad.

N6-2

We do, however, believe that the EIS should clearly state that the Makua Military Reservation would still be needed to train U.S. combat forces in Hawaii. It has been stated publicly by the Army, and implied in the EIS, that Makua may not be needed once the training facilities on Schofield Barracks are upgraded to handle dismounted CALFEXs. We understand that the Marines, National Guard, and Reserve forces will have a need for the training facilities at Makua.

We appreciate the opportunity to provide testimony on this EIS.

Sincerely,

Jim Tollefson
President & CEO

Responses

N6-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

N6-2

As stated in Chapter 1, SBCT training requirements are not dependent on the use of the Makua Military Reservation (MMR). While MMR is an integral part of USARHAW training capabilities and historically used by other services, SBCT units could perform dismounted CALFEX training at other ranges. SBCT may use MMR if the range were available only after completion of the Makua EIS and ROD. The Makua EIS will analyze the potential environmental impacts associated with dismounted CALFEXs for both Current Force and SBCT; therefore, this SBCT EIS does not analyze training impacts of SBCT at MMR.

Re: Draft Environmental Impact Statement Transformation of the 2nd
 Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in
 Hawai'i

Dear Ms. Barger:

Aloha. The Conservation Council for Hawai'i offers the following comments on the Department of the Army's Draft Environmental Impact Statement Transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawai'i, dated October 2003 (DEIS). CCH is a science-based community organization dedicated to preserving biodiversity and restoring the integrity of native Hawaiian ecosystems from the top of the mountains to the coral reefs for the ecological, social, cultural, and economic well-being of Hawai'i. We were lead plaintiff in legal actions to compel the listing and designation of critical habitat for over 250 endangered Hawaiian plants and animals, including species found on Army-controlled lands. We also participated in a working group convened by the Army to address species conservation issues at the Pohakuloa Training Area. We are concerned about the proposed expansion of Army training activities in Hawai'i in light of the Army's history of species conservation in the islands. The Army has violated laws enacted to protect human health and safety, native species and ecosystems, and cultural resources, and has yet to fully mitigate the impacts of its past and ongoing activities. Any decision to increase Army training activities and land under Army control must be carefully considered within the context of past and ongoing Army actions.

General Comments

N7-1

The DEIS is deficient in justifying the need to establish a Stryker Brigade in Hawai'i, as opposed to more appropriate training areas to accommodate what is, essentially, an urban-warfare capacity. The Army must identify and assess all reasonable alternatives to proposed actions that will avoid or minimize adverse effects of these actions on the quality of the human environment. 40 CFR 1500.2(e). The DEIS pays short thrift to this critical alternatives analysis required by the National Environmental Policy Act.

Responses

N7-1

The decision to transform in Hawai'i was analyzed in the Final Programmatic EIS completed on March 8, 2002. The Record of Decision for this EIS was signed on April 11, 2002. All the factors considered for transforming in Hawai'i are included in that Final Programmatic EIS. The Stryker Brigade is not intended solely as an urban-warfare force. Transformation will allow it to better operate under those conditions but will be expected to operate in all battle situations. The discussion regarding why transformation is to take place in Hawai'i can be found in Chapter 1 – Purpose, Need, and Scope of this EIS. However, options of transforming in Hawai'i and training elsewhere are discussed in the EIS. Please see Section 2.6 in the EIS.

Comments

CCH comments Stryker Brigade DEIS
January 3, 2004
Page 2

N7-2

At its core, NEPA requires federal agencies to take a hard look at all of the alternatives to a proposed action before a decision is made. Despite this clear mandate from Congress, the Army has turned NEPA on its head by announcing its decision to bring the Stryker Brigade to Hawai'i while the public comment period for the DEIS is still open. The law is clear that environmental impact statements "shall serve as the means of assessing the environmental impact of proposed agency actions, rather than justifying decisions already made." 40 CFR § 1502.2(g). If a decision has already been made to bring the Stryker Brigade to Hawai'i, by way of this letter, we request a copy of the index of documents supporting the Record of Decision and a description of how this decision was made in relation to the pending DEIS.

N7-3

Furthermore, the Army is now suggesting modifications to the proposed action, including increased firepower and size of the Brigade and/or vehicles. If this is the case, NEPA requires the Army to supplement the DEIS and analyze the impacts of the proposed modifications. We request a description of any and all modifications to the proposed action and an explanation as to why these modifications were not included in the DEIS as an alternative. We also urge the Army to comply with NEPA by supplementing the DEIS so that any recent modifications to the proposed action are publicly disclosed and properly analyzed.

N7-4

Hawai'i is the endangered species capital of the U. S. Approximately one-third of the nation's listed threatened and endangered species are unique to these islands. Army training and associated activities in Hawai'i occur on extremely sensitive public-trust lands that support rare and endangered species, as well as special and unique cultural features. Military training has contributed to the imperiled status of native species on Army-controlled lands, and the proposed action has serious consequences for those species and their habitats that remain. Adverse impacts of Army training in Hawai'i include:

- recurring fires caused by live-fire training activities, subsequent invasion and displacement of native species by introduced fire-tolerant grasses and other invasive species, and increased fire fuel loads as grasses become established;
- large populations of uncontrolled ungulates (especially goats and sheep) in the absence of adequate public hunting as a control and Army removal of these animals from impact zones, subsequent loss of native vegetation, erosion, alien weed invasions, and loss of seed source for regeneration of native plants;
- rats, which are flushed out of vegetation during fires and which feed on native tree and land snails, seeds, fruits, and bark of native plants;
- trampling of native vegetation and soil compaction from foot and vehicular traffic;
- introduction of alien weeds via imported soil, gravel, and other ground covers and from landscaping, vehicles, and troops;
- controlled burns that go out of control and destroy endangered species and native vegetation; and
- contamination of soil, water, and air by dust, emissions, fire retardants, and other pollutants.

Responses

N7-2

The decision to transform in Hawai'i was analyzed in the Final Programmatic EIS completed on March 8, 2002. The Record of Decision for this EIS was signed on April 11, 2002. All the factors considered for transforming in Hawai'i are included in that Final Programmatic EIS. The discussion regarding why transformation is to take place in Hawai'i can be found in Chapter 1 – Purpose, Need, and Scope of this EIS. However, options of transforming in Hawai'i and training elsewhere are discussed in the EIS. Please see Section 2.6 in the EIS. Details on the PEIS and contacts for information can be found on the following website http://notes.tetrattech-ffx.com/army_transformation_peis/final_peis.htm or by writing to Headquarters, Department of the Army ATTN: ODCSOPS (DAMO-FMF), 400 Army Pentagon Washington, DC 20310-0400.

N7-3

After the publication of the Draft EIS, the Army announced plans for an enhancement package for SBCTs. The enhancements include an aviation task force, an increase from twelve to eighteen 155mm howitzers in the direct support artillery battalion, and improvements to command, control, communications, computer, and intelligence (C4I) assets. The announcements indicated that the aviation task force would include Comanche helicopters when the aircraft were ready for fielding. In February 2004, the Army determined that no further testing or fielding of Comanches would occur and canceled the Comanche program. The SBCT aviation task force will come from existing 25th ID(L) aviation brigade assets and will result in minor changes to training, primarily some increased aviation training over WPAA in support of units training in that area. The FEIS has analyzed the impacts of the increased aviation training over WPAA and those impacts are minimal. The Draft EIS analyzed the impacts of twelve 155mm howitzers, a change from the eighteen 105mm howitzers currently in the direct support artillery battalion for 2nd brigade. The addition of another six 155mm howitzers was analyzed in the FEIS and resulted in minimal changes to noise impacts and no change in the overall determination of effect. The C4I improvements are not expected to have any impacts on the environment. Overall, the Army has determined that the enhancements are within the original scope of the proposed action as described in the Draft EIS, are minor in nature, and do not require a supplemental Draft EIS.

Comments

CCH comments Stryker Brigade DEIS
January 3, 2004
Page 3

N7-5 The DEIS is deficient in identifying and evaluating the cumulative impacts of the proposed action to rare and endangered species, their habitats, and native ecosystems, as well as cultural sites and public-trust lands. NEPA regulations define "cumulative impact" as the impact that results from the "incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions . . . taking place over time." 40 CFR § 1508.7. Determining the cumulative impacts of the proposed action should be one of the most rigorous analyses of this process.

N7-6 We also question the qualifications of Tetra Tech to prepare the DEIS. We understand that Tetra Tech's experience is in environmental monitoring and clean up, not in preparing NEPA documents. Was there a special reason why this company was chosen?

Schofield Barracks and Makua Mitigation Plan

N7-7 The Army must comply with the federal Endangered Species Act and other laws as they relate to training and resource protection. Schofield Barracks provides habitat for dozens of rare and endangered species. As recently as 10 years ago, fires started by military training were a regular occurrence at Schofield Barracks. What is the Army's recent record for fire prevention and control at Schofield? Has the Army completed formal consultation with the U. S. Fish and Wildlife Service for existing/ongoing live-fire training and associated activities at Schofield, as required by the Endangered Species Act? If so, what was the result of the consultation? What, specifically, is the Army required to do to mitigate adverse impacts to rare and endangered species and their habitat? How does the proposed action affect any existing mandates and conservation programs?

N7-8 Dozens of endangered plants, endangered kahuli tree snails, and endangered O'ahu 'elepaio are also found in and around the Makua Military Reservation. Endangered species populations and habitat at MMR have been destroyed or compromised by live-fire training and associated activities over the decades. A mitigation plan is required under Section 7 of the Endangered Species Act at MMR, so the Army may continue training there. Our understanding is that the mitigation plan has not been fully staffed or implemented yet, even though live-fire training and associated activities have resumed. What is the status of the mitigation plan, and why hasn't the Army implemented it yet? How are the Makua mitigation plan and proposed Stryker Brigade at Schofield Barracks related? Are any areas proposed for the Stryker Brigade at Schofield and elsewhere required for the Makua mitigation plan? What are the cumulative effects of the proposed Stryker Brigade on rare and endangered species and their habitats at Schofield Barracks, MMR, and other areas, regardless of whether the Army occupies those areas?

Responses

N7-4

The discussions in Sections 4.10 have been expanded to better discuss the impacts to biological resources. For some of the impact areas such as the impact of wildland fires on biological resources, the Army has changed the determination of effect to significant. Mitigation measures have been identified to substantially reduce the severity of the impact but not to less than significant levels.

N7-5

The cumulative impact analysis in Chapter 9 assesses the cumulative impact of among other resources, cultural and biological resources, including impacts to rare and endangered species, their habitats, and native ecosystems, as well as cultural sites and public-trust lands. Based on public comments and the final BOs issued by USFWS for this proposed action, Section 9.5.2 - Biological Resources section has been updated with a corrected determination of significant and unmitigable.

N7-6

Tetra Tech has prepared EISs, EAs, and other environmental analyses for federal, state, and local agencies around the country. Recent NEPA documents include the Salton Sea EIS, Gunnison Gorge Resources Management Plan and EIS, and management plans and associated documents for Naval Air Station Fallon, Naval Air Station China Lake, and other agencies. In accordance with federal regulations, Tetra Tech was selected as the contractor best suited to prepare the EIS out of several environmental firms because of their qualifications in developing NEPA documentation overall as well as specific experience in Hawai'i and on military projects.

N7-7

Consultation with USFWS has been completed and Biological Opinions released for Army Installations on O'ahu and Hawai'i. These documents detail extensive management directives for the Army to comply with the ESA. The Army has expanded the discussions on impacts to biological resources in sections 4.10, 5.10, 6.10, 7.10 and 8.10. In some of the cases such as the impact to biological resources from wildland fires, the Army has changed the determination to significant. Mitigation measures are proposed that will substantially reduce the impact but not to less than significant levels.

Pohakuloa Training Area

N7-9

Up until the proposed Stryker Brigade, the Army had been training at the Pohakuloa Training Area on Hawai'i for decades without ever having prepared an environmental impact statement for training and associated activities. Similarly, the Army only began formal consultation with the U.S. Fish and Wildlife Service, as required by Section 7 of the Endangered Species Act, after it proposed to bring the Stryker Brigade to Hawai'i. Prior to that, the Army had been consulting "informally" with the Service since 1997 at PTA while live-fire training was ongoing – a clear violation of the law.

N7-10

In addition, the Army has yet to honor the terms of its settlement agreement over a lawsuit filed by the late Ruth Leilani Stemmermann over a decade ago. By way of background, in 1989, Dr. Stemmermann, a Big Island botanist who studied the native ecosystems at PTA, sued the Army for failing to prepare an environmental impact statement for the Multi-Purpose Range Complex, a proposed live-fire training range in the southwestern portion of PTA. Dr. Stemmermann agreed to settle the lawsuit on appeal in 1990. According to the settlement agreement, the Army must:

- prepare an EIS to address the impacts associated with operating the MPRC, and cannot operate the range until an EIS has been completed;
- consider the "no use" or "no action" alternative for the MPRC, which includes use for purposes other than live-fire training; and
- to the extent feasible, undertake site restoration to permit the area to revert to its natural state, if the "no use" or "no action" alternative is adopted.

For several years, the Army had no plans to use the MPRC. Then in 1997, when it was reminded of the settlement agreement, the Army proposed to use the range for limited, non-live-fire training. A year later, the Army decided it would not use the range for any training purposes. In 1999, the Army said it would prepare an EIS for the use of the MPRC for conservation purposes as mitigation for training elsewhere at PTA. At a public meeting in September 2000, the Army announced that it needed to build another MPRC somewhere else, and that it was considering site restoration. To date, the Army has not prepared an EIS for the MPRC, and the site has not been restored.

The MPRC is located in Kipuka `Alala, a biologically rich and important area for native vegetation and wildlife. The best remaining dryland ecosystems in the Hawaiian islands are found in the western third of the PTA, including the MPRC. The site is dominated by old-growth, high-elevation naio, `ohi`a, and mamane dry forests, and other uncommon native ecosystems. The site provides habitat for several rare and endangered species, including the `ope`ape`a, nene, `io, `elepaio, honeycreepers, Hawaiian plants, and dozens of native land snails and insects.

Responses

N7-8

The results of ESA Section 7 consultation include development of an O'ahu Implementation Plan funded by the Army. The individual measures determined in Section 7 to substantially mitigate from Army actions are outlined in the biological resource sections of each chapter; 5.10, 6.10, 7.10, 8.10 though not to less than significant levels in all cases.

N7-9

Army activities at the Pōhakuloa Training Area began in the 1940s with the cantonment area constructed in 1955. Many of the Army actions in this area were either constructed and implemented before NEPA (1969) and therefore grandfathered in under the statute or have been covered under individual NEPA evaluations such as environmental assessments. The Biological Opinion issued by the USFWS in December 2003 covered ongoing actions under the current force and those proposed under SBCT.

N7-10

As discussed in Chapter 8, there is no SBCT training planned for the Multi Purpose Range Complex (MPRC).

Comments

CCH comments Stryker Brigade DEIS
January 3, 2004
Page 5

N7-10
cont'd

Construction of the 1,500-acre MPRC began in 1988 and was nearly complete in 1990. Features of the range include an elaborate network of access roads, moving and stationary armor and personnel targets, administration area, control tower, water towers, storage building, 18 miles of power line, 495 power poles, and softened sites, which were graded, cleared of vegetation, and covered with gravel or cinder.

The full extent of the destruction caused by MPRC will never be known because the Army did not allow its biological consultants to complete environmental surveys and analyses before construction began. Instead, hundreds of thousands of dollars were spent and extensive biological surveys were conducted only after the MPRC was constructed. The studies confirmed what Dr. Stemmermann and others knew all along: that the MPRC site is a biological treasure full of rare and endangered species and ecosystems, and that the range never should have been built at Kipuka `Alala.

In 1993, the U.S. Army Audit Agency issued a scathing report criticizing Army Support Command, Hawai'i for failing to obtain information from its environmental experts during the MPRC site selection process, failing to ensure that projects (including the MPRC) are reviewed by its environmental committee, and failing to ensure that recommendations made by outside organizations other than the military are adequately considered. Native species and ecosystems were undoubtedly destroyed when the MPRC was constructed, and, although the range has never been used, the ecological integrity of the area has been compromised by alien species.

What is the status of the settlement agreement with Dr. Stemmermann and the Army's use of the MPRC area? How will Kipuka `Alala and other sensitive areas at PTA be affected by the proposed Stryker Brigade, including cumulative effects on rare and endangered species and their habitats?

Mitigation for Past and Ongoing Actions

N7-11

Our review of the Army's environmental activities in Hawai'i indicates that the Makua mitigation plan is only half staffed, and that at a minimum, the existing environmental field staff of roughly 18 people and the current budget of approximately \$1-1.5 million for species/ecosystem conservation need to be doubled just to meet existing commitments and requirements for Army-controlled lands on O`ahu. If the Stryker Brigade is brought to O`ahu, at least three times the existing staff and budget would be needed to float existing staff and mandates and to try and mitigate the additional impacts of the Stryker Brigade, including resource-intensive surveys and weed control.

Responses

N7-11

Thank you for your comment. If the Army decides to implement the proposed action, the Army will ensure that the mitigation programs are adequately staffed as part of the commitment to mitigation. In accordance with federal hiring practices, the Army is required to be fair in all hiring practices - specifying only the specific requirements or training for a position. However, the Army is committed to working with the local communities and individuals throughout the implementation of any of the Army actions.

Comments

CCH comments Stryker Brigade DEIS
January 3, 2004
Page 6

**N7-11
cont'd**

On the Big Island, weeds and fire are the most significant threat to the survival of rare and endangered species at PTA. In addition to the existing environmental field staff of around 12 people, a field crew of at least 20 people to control weeds is needed for the next 3-5 years (possibly longer), and a tripling of the current budget for species/ecosystem conservation at PTA are needed to control existing weeds and implement existing projects.

A long-term commitment by the Army to fund species/ecosystem conservation is appropriate mitigation for past destruction and losses, and for ongoing training and associated activities, regardless of how long the Army occupies these lands. We recommend that technical review committees for each Army installation in Hawai'i be established to oversee the protection and management of natural and cultural resources. Concerned citizens, government agencies, and non-government organizations would be invited to participate as members. We also urge the Army to hire local biologists, cultural practitioners, and other experts to protect natural and cultural resources on Army-controlled lands.

N7-12

Finally, we were disappointed in the Army's exclusion of certain concerned citizens from meetings and field trips to PTA, and its treatment of citizens participating in recent public hearings on the DEIS. We hope that, in the future, the Army will treat everyone fairly and with respect, including those who do not agree with the Army's point of view.

Mahalo nui loa for the opportunity to comment on the DEIS. We look forward to your response.

Sincerely,

Marjorie Ziegler
Executive Director

c: Hawai'i Congressional Delegation
Office of Environmental Quality Control

Responses

N7-12

We thank you for your comment and understand your concern. It was not the intent of the Army to restrict the public through the format and location of the public meetings. Once the issue arose, we worked to correct the situation by working with the other facility locations to allow signs in the actual meeting rooms and provide tables for members of the public to display signs and information. In addition, we worked with the facilities and the City and County of Honolulu's prosecutor to have all charges dropped against the individuals involved in the situation. Through these measures and the extension of the public comment period, we believe we allowed opportunity for the public to comment either orally or in writing.

Subject: Comments - Draft Environmental Impact Statement (DEIS)

Transformation of the 2nd Brigade, 25th Infantry Division (L)
To a Stryker Brigade Combat Team in Hawaii

DMT Consultant Engineers has been contracted by the Hawaii State Department of Transportation (HDOT) to conduct engineering studies and prepare an Environmental Impact Statement (EIS) for the Saddle Road Extension Project, DP-HI-0200 (5) (Notice of Intent published in the Federal Register on July 13, 1999). The Saddle Road Extension is located in the South Kohala District of the Big Island and is a proposed highway connection between Mamalahoa Highway (SR 190) and the Queen Kaahumanu Highway (SR 19). The Saddle Road Extension will begin at the intersection of Waikoloa Beach Drive and the Queen Kaahumanu Highway and will end in the vicinity of the intersection of Mamalahoa Highway and the W-3 alignment of the proposed Saddle Road Improvement Project, Project No. HI A-AD-6 (1), as developed by the Federal Highways Administration (FHWA).

For the proposed Saddle Road Extension, preliminary engineering plans for three alternative alignments have been prepared and a significant portion of the associated environmental fieldwork has already been completed. Publication of the Draft Environmental Impact Statement (DEIS) is anticipated in late Summer of 2004.

Based on our experience with the project area, we would like to provide supplemental information to that stated on page 8-79 of the Transformation DEIS. The second paragraph states that one of the recommendations of the Hawaii Long Range Land Transportation Plan (LRLTP) is to:

N8-1

Realign the western section of the Saddle Road to the intersection with Mamalahoa Highway at Waikoloa Road

The DEIS goes on to state that this improvement may have impacts to the proposed action but that a schedule was not available at the time of publication. The Transformation EIS preparers should be aware that the proposed Saddle Road Improvements, Project No. HI A-AD-6(1) by FHWA has studied the realignment of the western section of the Saddle Road (W-3 Alignment)

N8-1

The new Saddle Road alignment is proposed through the southern portion of the West PTA Acquisition Area. The U.S. Department of Transportation, Federal Highway Administration (FHWA), could not provide a firm construction date at this time for this section of the new Saddle Road. If the Army decides to implement the proposed action, the Army will coordinate all road crossings with the FHWA to minimize impacts to traffic along the new Saddle Road.

Responses

Comments

N8-1
cont'd

and has selected a location for the intersection which is different from that indicated by the LRLTP (approximately three miles South of Waikoloa Road). In order to achieve an appropriate intersection location for both Saddle Road Projects, studies of the proposed Saddle Road Extension, Project No. DP-HI-0200 (5), have further indicated that the W-3 Alignment/Mamalahoa Highway intersection should be relocated to an area which is approximately 1.2 miles to the North of the original location proposed.

We believe that it may be prudent for your studies and for the location of your permanent facilities and operations to consider these latest revisions of the W-3 alignment. For your information, the proposed minimum right-of-way width to accommodate improvements along Saddle Road is 150 feet.

Should you have any questions or require any additional information please do not hesitate to call me at (808) 961-5527.

Sincerely,
Joel Nakamoto, P.E.

CLEAN UP, NOT BUILD UP NO MILITARY EXPANSION IN HAWAII

1. We oppose military expansion in Hawaii, including the build up and destruction of Hawaiian lands by military forces in Mākae, Pohakuloa, Honouliuli and Waikāne; the restriction of access to Nohii, Kāua'i and Keawe'ula, O'ahu; Navy testing of sonar and missile defense systems off of Kāua'i, and warfare-related research using high-tech computer and astronomy facilities on Māua, Kea and Haleakalā.
2. The military must clean up, restore and return military-controlled lands, including Kahaloawe, Pohakuloa, Mākae, Waikāne, Nohii, Mokapu, Lāhualāe, Wahiawa, Waimanalo/Bellows, Pu'uolo/Pearl Harbor, Kailua/Fort DeKussy and Kahuku.
3. End Hawaii's economic dependency on military spending by redirecting funds to clean up the environment and to develop environmentally sustainable, community-based economic alternatives.
4. The military must pay just compensation for its use of and damage to Hawaiian lands.

We are taking back our land and our lives from militarism. Our common security depends on having clean air, land and water, an economy that meets basic human needs and the perpetuation of our cultures.

STOP THE STRYKER INVASION

The Army wants to station a Stryker Brigade in Hawai'i - 291 20-ton armored attack vehicles. They will seize up to 24,400 of acres of land, damage cultural sites, kill endangered species, generate thousands of tons of dust, and contaminate our 'āina and threaten our health with bombs and hazardous chemicals. This would be the largest Army expansion in Hawai'i since World War II. The Army has released a draft environmental impact statement for the Stryker Brigade expansion and is taking questions and comments.

1. **PROTEST:** Attend one or more of the following public meeting to protest and testify against Army expansion. Demand that local, state and federal elected politicians oppose the Stryker invasion. Write letters to the editor in local newspapers, and call in to radio talk shows.
2. **TESTIFY:** Submit written questions and comments to: Cindy Barger, US Army Corps of Engineers - Honolulu, Bldg 230, Rm 306, ATTN: CEPOH-PP-E, Ft Shafter, HI 96858-5440. Tel: (808) 438-4812; Fax: (808) 438-7801; Email: SBCT_EIS@poh01.usace.army.mil. You can read the draft environmental impact statement on the website: www.sbcfeis.com. Deadline for comments is November 18, 2003, but we urge everyone to demand that the comment period be extended to at least 90 days.

RALLY at EACH site at 5:30 – 6:45 pm. ATTEND the PUBLIC MEETINGS at 7:00 pm:

28 Oct. 2003	Honolulu Country Club, 1690 Ala Pu'umalu St., Salt Lake
29 Oct. 2003	Helemanō Plantation, 64-1510 Kamehameha Hwy., Wahiawā
30 Oct. 2003	Makaha Resort Golf Club, 84-626 Makaha Valley Rd., Wai'anāe
04 Nov. 2003	Turtle Bay Resort, 57-091 Kamehameha Hwy., Kahuku
05 Nov. 2003	Waikōloa Beach Marriott, 69-275 Waikōloa Beach Dr., Waikōloa
06 Nov. 2003	Hilo Hawaiian Hotel, 71 Banyan Dr., Hilo

For more information and to get involved contact DMZ-Hawai'i / Aloha 'Āina c/o AFSC Hawai'i, (808) 988-6266 (O'ahu); Malu 'Āina, (808) 966-7622 (Hawai'i). Visit www.afschawaii.org and follow the demilitarization link.

STOP THE MILITARY LAND GRAB! CLEAN UP, NOT BUILD UP!

Re: Draft Environmental Impact Statement: Transformation of the 2nd Brigade,
25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawai'i

Dear Ms. Barger:

I submit these comments on behalf of Earthjustice, in response to the U.S. Army's request for public input on the draft environmental impact statement ("DEIS") for the transformation of the 2nd Brigade, 25th Infantry Division (L) to a Stryker Brigade Combat Team in Hawai'i.

N10-1

These comments necessarily will be brief because, frankly, the Army has failed to provide the public with adequate time to wade through the approximately 1500 pages of the DEIS' three volumes. Extending the comment period for 45 days from November 19, 2003, to January 3, 2004, did little to help the public comment thoughtfully on this massive and dense document. The DEIS is approximately five times the maximum length that the Army's regulations implementing the National Environmental Policy Act ("NEPA") state an EIS for a complex project should be, meriting a public comment period at least five times the minimum 45-day comment period required under the Army's regulations. See 32 C.F.R. § 651.40(b); *id.* § 651.45(e). Moreover, it is common knowledge that the period between Thanksgiving and New Year's is not the ideal time to seek considered input from anyone. If the Army truly wished to hear from the people of Hawai'i regarding their concerns about the potential environmental impacts associated with this project, it would have given them more time.

N10-2

Given the limited time to review the DEIS, we will focus our comments on two fundamental points. First, this DEIS fails completely to provide an adequate alternatives analysis, which courts have repeatedly declared is at the heart of the NEPA process. The DEIS clearly started from the assumption that transformation to a Stryker Brigade must happen here in Hawai'i, dismissing out-of-hand all alternatives that

Responses

N10-1

The public comment period was extended to 90 days and ended on January 3, 2004. According to NEPA regulations, the main text of a Final EIS should normally be no longer than 300 pages for proposals of unusual scope or complexity (40 CFR 1502.7). In practice, this recommended page limit is typically exceeded. The main text of this SBCT document is well over the suggested 300 pages in length, but the scope of the proposal, involving twenty-eight projects, acquisition of over 24,000 acres of land on two Hawaiian islands, and the comprehensive and complex evaluation of a multitude of resource impacts on the affected environment on O'ahu and Hawai'i necessitates an impact statement of this magnitude. For reviewers not electing to read the entire main text, an Executive Summary provides a comprehensive impact evaluation overview, including a mitigation matrix. Regarding time for EIS review, this is a large, comprehensive document requiring considerable time to thoroughly review. In view of this, the 45-day minimum comment period for draft environmental impact statements required by NEPA was extended to 90 days. Three months was considered an adequate period of time to review the document and provide written comments.

Comments

Earthjustice Comments on Transformation DEIS
December 31, 2003
Page 2

**N10-2
cont'd**

involve transformation elsewhere. See, e.g., DEIS at 2-45 to -46. That is completely inappropriate and unlawful. Neither the Army's programmatic EIS nor this DEIS compare the environmental impacts of transformation in Hawai'i versus the environmental impacts of transforming elsewhere. This renders the Army's NEPA process fundamentally flawed. The only way to remedy this defect is to prepare a new draft EIS for public review that contains a real alternatives analysis.

N10-3

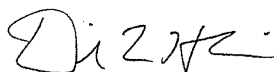

Second, it appears that, without waiting for the end of the public comment period, much less a final EIS, the Army has already committed itself to fielding a Stryker Brigade Combat Team in Hawai'i. Attached hereto is a Pentagon news release to that effect, dated December 17, 2003. This puts the cart before the horse. An EIS is supposed to "[s]erve as a means to assess environmental impacts of proposed military actions, rather than justifying decisions" already made. 32 C.F.R. Part 651, app. E, § (a)(4). Moreover, by announcing its decision in the middle of the public comment period, the Army has undoubtedly discouraged many Hawai'i residents concerned about transformation from submitting comments since, at this point, transformation is generally viewed as a done deal.

N10-4

I have attached a corrected version of the transcript of the comments I offered at the October 30, 2003 public hearing on the DEIS. Fortuitously, I happened upon the transcript while looking for your address on the DEIS website earlier today. I had not previously received any notification from the Army either that the transcript was available for review or that there is a January 9, 2004 deadline for making corrections thereto. The Army would do well to notify the public of such matters, especially if it expects people to submit corrections by a deadline.

Please feel free to contact me if you would like to discuss our concerns or if you have difficulty reading the corrections to my testimony.

Sincerely,

David L. Henkin
Staff Attorney

Responses

N10-2

As discussed in Section 1.6 of the FEIS, the ROD for the Programmatic EIS directed the 2nd Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawai'i to transform to an SBCT. The Commanding General of the 25th ID (L) is charged with deciding how best to achieve that directive and provide for military training, readiness, and facility requirements to meet SBCT transformation needs, while enabling the current forces to continue carrying out their missions and giving due consideration to environmental factors. This decision will be based on the results of this EIS, and on consideration of all relevant factors including mission, cost, technical factors, and environmental considerations. This EIS considers a reasonable range of alternatives including several alternatives that involve transforming and/or training on the U.S. mainland. As discussed in Section 2.6, the mainland alternatives were not analyzed in detail because they did not meet the purpose and need of the proposed action. (Complete details on the proposed action are presented in Chapter 2 and Appendix D.)

N10-3

Although Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2d Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2d Brigade, 25th ID (L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law.

N10-4

The suggested changes have been made to the transcript as requested.

IMMEDIATE RELEASE

No. 959-0
December 17, 2003

ADDITIONAL STRYKER BRIGADE ACQUISITIONS APPROVED

The Department of Defense approved plans for the Army to field six Stryker Brigade Combat Teams (SBCT). Secretary of Defense Donald Rumsfeld approved an Army enhancement plan on Dec. 8 that provides for the acquisition of Stryker Brigade Combat Teams (SBCT) 5 and 6. The Army's plan focused on enhancing the aviation, fire support, network, and sensor capability of SBCTs 5 and 6, and retrofitting brigades 1 through 4 with newer technology as it becomes available. The approval gives the Army permission to begin expending funds for the new brigades' acquisition and fielding.

Rumsfeld directed the Army to prepare the plan in a Dec. 2002. The memorandum approved SBCTs 1 through 4, but directed further study of SBCTs 5 and 6 before the Army would receive final approval to field them.

Additionally, the plan reviewed basing options for the brigades and the desirability of associating Stryker brigades with Air Force aerial expeditionary forces to facilitate development of joint doctrine, training, and deployment.

The fifth SBCT, scheduled for fielding in 2006, will be in the 2d Brigade, 25th Infantry Division (Light) at Schofield Barracks, Hawaii. The sixth SBCT, scheduled for fielding from 2008 - 2010, will be the 56th Brigade (Mechanized), 28th Infantry Division (Mechanized), of the Pennsylvania Army National Guard.

1 MR. DAVID HENKIN: Aloha kakou.
2 AUDIENCE: Aloha.
3 MR. DAVID HENKIN: My name is David Henkin.
4 I'm an attorney with Earth Justice. And I appreciate so
5 many people sticking around so long. I figured I'd go
6 towards the back because unlike the other speakers
7 tonight, I'm not from this part of the island, therefore
8 I do not have any -- I can't speak ^{as} ~~from~~ somebody from
9 this part of island.
10 But I can speak as a resident of Hawai'i
11 and someone who is very concerned with the proposals that
12 the military is currently putting out.
13 Because of my legal background I'd
14 primarily like to focus on some of the legal deficiencies
15 of the draft EIS because sometimes through public comment
16 there is a lack of -- or at least agencies sometimes say
17 they don't really know what you're referring to. They
18 don't quite get the point.
19 I'll be primarily referring to the
20 Department of Defense Department of Army's Environmental
21 Analysis of Army Actions Regulations at 32 CFR part 651.
22 But first I'd like to do something just to
23 give you a flavor of this EIS. I picked a random page of
24 acronyms just to give a flavor of what going through this
25 volume is like. I'll just read one of the pages:

1 ^{PC} "I3A, IAF, IA, ^{RII} ~~RAF, IF, IAV, IBCT, ICM,~~
 2 ~~IRMP, IDG, IDP, IFR, Initial ^{but} ~~Backs~~, INRAN, IOC, anyway,~~
 3 you get the idea. It's extremely dense reading. I'd like
 4 to refer to appendix E to part 150 -- or 651. ^{of the Army's NEPA}
 5 And it says that the "likely environmental ^{regulations.}
 6 impacts need to be written in simple, non-technical
 7 language for the lay reader." This document fails
 8 miserably on that account, which is why we would support
 9 the requests that have been made for additional time for
 10 people to go through this document.
 11 Those of us who were around in April of
 12 last year when the scoping process was happening, this is
 13 like deja vu all over again. That was another instance in
 14 which the Army took a look at its regulations and saw it
 15 had a minimum period of time that must be provided for
 16 ^{and is why} ~~scoping that~~ ^{was} initially offered to the public.
 17 It took a lot of community sticking
 18 together to insist on more time. And more time was
 19 eventually given. That same type of penny wise, pound
 20 foolish approach has been taken here. You have a ^{massive}
 21 document.
 22 I do think it has to be more than the 300
 23 pages that the regulations provide for complex projects
 24 because never before in this state have we seen a
 25 proposal, such a large proposal for an increased military

1 presence presented to the public for consideration.

2 So I don't think it can be made any
3 shorter. In fact, in many respects, I think in order to
4 respond to the concerns and some of the issues raised it
5 needs to be longer.

6 But given the impossibility of making it
7 shorter, given the impossibility of making it more
8 ~~in~~comprehensible because maybe I've been doing this too
9 long working with the military, ^{by} after a while other than
10 the acronyms, if they actually spelled out, everything out
11 in full this thing would be six times as long. ^u So maybe
12 there do need to be all these acronyms. Maybe it does
13 need to be this long.

14 Being five times longer than what a complex
15 EIS is supposed to be, written in military acronym speak ^u
16 it's absolutely impossible to expect anyone to provide
17 rational commentary on this in the time provided.

18 I ~~don't~~ ^{me} think 120 days that OHA has
19 requested is generous to the military. ~~And~~ ^{= much} a longer
20 period of time would be appropriate.

21 In fact, switching to another point here,
22 this document is a good starting place for the discussion
23 but it is not adequate as a draft Environmental Impact
24 Statement.

25 The most telling problem with the document

Comments

Responses

132

1 is the complete lack of adequate alternatives analysis.
2 I'd like to turn back the clock because some of the people
3 here -- in fact most of the community here was with us
4 back in April 2002 at the scoping session.
5 We all sat through, I believe, about a four
6 hour scoping session to try and educate the Army regarding
7 the concerns the community has that this proposal raised
8 up.

9 And quoting again from your regulations
10 having to do with scoping -- this is Section 651.50D. I'm
11 sorry. That was not the section I wanted to refer to.
12 ~~651.432-2~~ "Proper scoping identifies reasonable
13 alternatives and the information needed for their
14 evaluation." I'll emphasize this last point. "Thereby
15 increasing public confidence in the Army decision-making
16 process."

17 In other words, the reason why we sat
18 through four hours of discussion during the scoping
19 sessions, was, among other things, to identify a range of
20 alternatives, reasonable range of alternative that the
21 Army should consider.

22 William Aila and others have emphasized --
23 I would just refer the Army back -- there was a court
24 reporter present -- there was a transcript. And speaker
25 after speaker emphasized the need to think a little bit.

1 outside the box.

2 If we're going to be completely retooling

3 one of three brigades of this division -- if we are going

4 to be spending -- and the numbers I've heard range from

5 half a billion to 1 and a half billion dollars -- but any

6 ~~an~~ event, a substantial amount of money to create a new

7 fighting force, then you have to think about whether

8 forward deployment of this brigade in Hawaii'i makes any

9 sense in an era where we no longer send our troops to the

10 battlefield by ship.

11 Yes, maybe it made sense at one point that

12 this really was a forward deployment. But we have one of

13 brigades on the mainland in Washington, Washington State

14 that is.

15 Presumably they're going to be able to get

16 to the battlefield the way that these troops will get to

17 the battlefield which is by airplane.

18 The testimony that was offered at the

19 scoping session last April was, if you want to move troops

20 safely to the battlefield, do you want to fly them in an

21 airplane over open ocean until they hit Asia?

22 Or do you want them to fly from Washington

23 State over our allies in Canada, to Alaska, over to our

24 Asian allies in Northwestern Asia -- Northeastern Asia,

25 excuse me.

1 It's that type of analysis that's
2 completely lacking from this document. If you take a look
3 at the executive summary -- and many people, frankly,
4 aren't going to make it out of the executive summary -- it
5 talks about alternatives analyzed and it gives a statement
6 that's fairly accurate.

7 It says, "The alternatives analyzed must
8 reasonably meet the purpose of the need for the action.
9 Alternatives must also be practical and feasible. That is
10 they must be capable of being implemented by the Army or
11 another agency, be technically feasible and not require a
12 commitment of resources they cannot practically be
13 obtained." All of that is accurate and fair.

14 What do we get in terms of a document? We
15 get "doing nothing" which I think all of us can agree the
16 Army is unlikely to conclude that's what it should do.

17 "Doing the preferred alternative" which is
18 the full-blown transformation with all the land
19 acquisition.

20 And "doing that, minus a little bit."
21 Those are the alternatives that are given. This is a
22 fatally flawed document because it does not -- it does not
23 analyze a reasonable range of alternatives.

24 One of the major purposes of an
25 Environmental Impact Statement -- and I'm referring again

PACIFIC REPORTING SERVICES UNLIMITED, INC.

135

(2)(4)
1 to appendix E of your regulations, A-4. It says "EIS's
2 will serve as a means to assess environmental impacts of
3 proposed military actions rather than justifying
4 decisions."

5 Unfortunately, what we seem to have here is
6 the cart before the horse, a decision to do the
7 transformation in Hawai'i and then a document generated to
8 justify that decision. And that is simply not the way
9 that it's supposed to be done.

10 What you need to do is look at all
11 reasonable alternatives for accomplishing your goal. And
12 if you've determined that transformation through Stryker
13 Brigades is the goal and what you want to do, you actually
14 do need to do the hard work of considering your
15 alternatives. Different brigades in different locations
16 and what the relative advantages and disadvantages are.

17 If it's not in your programmatic EIS and if
18 it's not in this EIS, the question, quite simply, is where
19 is it?

20 NEPA requires nothing less than that
21 analysis so that you can make a decision based on all the
22 information rather than merely ratify a preordained
23 conclusion.

24 Now, this morning I read in the paper
25 something really disturbing. It had to do with the

PACIFIC REPORTING SERVICES UNLIMITED, INC.
(808) 524-PRSU

Comments

Responses

136

1 arrests. And an Army spokesperson -- I forget who it
2 was -- responded to a media inquiry about the arrests and
3 they said, "Well, these troublemakers basically represent
4 a vocal minority. The silent majority of people in
5 Hawai'i support the transformation."

6 Now, this was a shocking statement to me
7 because I thought the purpose of the public comment period
8 of the draft EIS was to solicit public input so that you
9 would know what we all thought about it and what our
10 concerns were with it, about it.

11 Apparently you've already come to the
12 conclusion this is what we all want. And, again, one is
13 left asking the question, is this all a show? Is this all
14 a sham?

15 I hope it's not. You've had a lot of
16 people taking time out of their lives, staying late in the
17 evening on a worknight when they have families at home
18 waiting for them to return.

19 You owe us nothing less than a full
20 alternatives analysis. You owe us nothing less than an
21 adequate opportunity to provide feedback on the draft EIS.

22 Now, given the total lack of alternatives
23 analysis in this document, it would do a disservice to the
24 process and it would undermine the basic values of the
25 National Environmental Policy Act to go from this document

137

1 to a final. But, fortunately, we have right here in this
2 community examples of situations where the Army, I think
3 quite appropriately, has recognized the deficiency of ~~the~~ ^{its}
4 NEPA documents and has gone back, taken another crack at
5 it. That's with the Makua documents which ended up in
6 court.

7 But what you really need to do is take
8 public comment on this and use this as an expanded scoping
9 period.

10 Because, again, if you'll go back to the
11 critique that I offered back in April 2002, during the
12 scoping process, we didn't have adequate information to
13 provide feedback on what you were proposing because it was
14 one huge black box.

15 At the time that we held those meetings we
16 had no idea precisely what you were proposing to do at
17 all. You failed completely to fulfill the minimum
18 requirements of your regulations Section ~~651-40~~ ^{651.50} where you
19 had to tell us really what you were thinking about doing.

20 Well, finally, in this document I feel that
21 we have a better sense of what you'd like to do. This now
22 provides a spring board for people to be able to provide
23 informed comments on what those concerns they have about
24 what really you propose to do.

25 It may have taken 18 months to actually

1 come up with that information which we were entitled to
2 back in 2002. But we're talking about a total overhaul, a
3 total transformation of the military as a fighting
4 machine. Perhaps that will take a little extra time.

5 But I would respectfully submit ~~it~~ *that the Army need*
6 go completely back to the drawing board. But to truly

7 look back at the scoping comments that were given to you a
8 year and a half ago, analyze those alternatives, use this
9 time as an opportunity for people to point out some of the
10 gaps in analysis in this draft and come back with
11 something that really tells us what the alternatives are,
12 really tells us what the impacts are so that, hopefully,
13 you can make an informed decision based on public input,
14 and feedback rather than simply ratifying a decision that
15 you've made and expect us to just sort of play along with
16 the game.

17 I thank you for your time. And I hope to
18 have an opportunity to talk on a true draft EIS.

19 (Applause).

20 MR. CHANG: Thank you, Mr. Henkin. You
21 guys were counting. I did not miscount. But since I
22 mentioned that, there were a few -- there are a couple
23 more people who would like to provide testimony. So next
24 we have Vince Dodge followed by Andrew Cabebe.

25 MR. VINCE DODGE: Aloha kakou.

*THE ESTATE OF JAMES CAMPBELL*Letter
N11

October 22, 2003

Ms. Cindy Barger
 SBCT EIS Project Manager
 U.S. Army Corps of Engineers
 Honolulu District
 Bldg 230, Room 306 ATTN: CEPOH-PP-E
 Ft. Shafter, HI 96858-5440

Dear Ms. Barger:

Comments Re Draft EIS Transformation of the Second Brigade ("Draft EIS")

We are pleased to offer these comments on the Draft EIS.

Overall, we are very supportive of the Army's efforts to improve its ability to respond quickly and efficiently and we appreciate the effort that went into the Draft. We are also grateful for your continuing efforts with our tenants, most notably the Nature Conservancy, in resolving any remaining issues.

N11-1

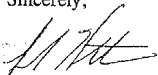

Specifically, we support the Army's preferred alternative regarding the 1400-acre South Range land acquisition. The addition of these lands appears to be an important feature of the transformation process on Oahu. Likewise, we support your plans to expand use of the Kahuku Training area.

N11-2

We have reviewed your efforts aimed at assessing the potential impact of the transformation process and your suggested mitigation measures. Given your conclusion that the transformation process will impact the environment, responsible mitigation of those impacts is very important to us. We look forward to your implementation of the proposed mitigation measures and ask that you carefully review, monitor, and revise the measures periodically, when necessary.

Thank you very much for your consideration. Please contact me directly at 674-3232 should you have any questions or require further information about our comments.

Sincerely,

Bert L. Hatton
 Manager, Agriculture/
 Natural Resources

Responses

N11-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

N11-2

Mitigation measures likely to occur are outlined in the Executive Summary. These proposed mitigation measures were included for public comment. The Army reviewed the measures based on public comments and the benefits of each measure to reduce impacts. The Army has listed those mitigation measures that are high priority and those that are unlikely to occur because of limited resource, unfeasible or there are similar measures already in place. The ROD will indicate which mitigation measures will be implemented.

IN MINISTRY SINCE 1888

December 29, 2003

Cindy Barger
U.S. Army Corps of Engineers - Honolulu
Bldg. 230, Room 306
Fort Shafter, HI 96858-5440

ATTN: CEPOH-PP-E

Dear Ms. Barger:

The Commission on Church and Society (Commission) of Harris United Methodist Church is grateful for the opportunity to provide testimony on the Army Draft Environmental Impact Statement for the Stryker Brigade in Hawai'i. We have read information about the experimental 20-ton armored combat vehicle, called the Stryker, and the potential impact - environmental, human, and cultural - which 296 of them being stationed and used for training in Hawai'i would have.

N12-1

The Commission opposes the stationing of a Stryker Brigade in Hawai'i. Especially here on O'ahu, we are very aware of how much land is already off-limits to island residents and used exclusively for U.S. military and their personnel. **We find it troubling that the U.S. Army intends to expand its land use to include some 25,663 acres on the islands of O'ahu and Hawai'i,** lands which are now safe for living creatures, while returning the island of Kaho'olawe, which had been used for military training, much of which remains unsafe for humans to even traverse. Live-fire training at Makua, Kahuku, and Pohakuloa will only exacerbate existing damage. An island eco-system is uniquely interdependent, therefore, taking away significant number of acres, not for preservation or conservation purposes, will definitely affect the quality of life of island residents and other life forms.

As United Methodists we are guided by the Social Principles of The United Methodist Church, a denomination of some 9,000,000 members. Paragraph 165C of these Social Principles state that *"We believe war is incompatible with the teachings and example of Christ. We therefore reject war as a usual instrument of national foreign policy and insist that the first moral duty of all nations is to resolve by peaceful means every dispute that arises between or among them, that human values must outweigh military claims as governments determine their priorities, that the militarization of society must be challenged and stopped, that the manufacture, sale and deployment of armaments must be reduced and controlled and that the production, possession, or use of nuclear weapons be condemned. Consequently, we endorse general and complete disarmament under strict and effective international control."*

As Christians, our greatest commandment is to love God and love our neighbors as ourselves. While we support our chaplains who are present to minister to the needs of those who are in the Armed Services, we nonetheless are guided by our belief that it is mutual respect and concern for justice rather than war-making which will bring the peace that all humankind longs for. Thank you for this opportunity to express our thoughts.

Respectfully,

Delores Glover
Delores Glover, chair
for the Church & Society Commission

Responses

N12-1

We share and understand your concern on this issue. Our soldiers and their families live and work on our installations. As summarized in Section 4.12, the Army proposes mitigation measures to include UXO clearance activities prior to construction and during training activities to reduce the overall UXO accumulation and potential risk to human health and safety through the life of the project. This issue has the highest level of attention at the Department of Army and it is addressed by a centrally managed program that involves the identification, investigation, evaluation, and, if needed, remediation of potential sites. This program, called the Installation Restoration Program, is coordinated with the state and the US EPA to insure compliance with all laws and regulations. It is not, however, possible to estimate cost or time required related to a specific site until the evaluation phase has been completed. The Army is committed to cleaning up existing sites in accordance with applicable laws regulations. In addition, if the Army chooses to relinquish ownership of the land as a result of a Base Realignment and Closure (BRAC), the Army will clean up unexploded ordnance left on the lands in accordance with all applicable laws and regulations, including but not limited to the implementation of the Formerly Used Defense Site (FUDs) program.

Responses

HCC / PTA MEETING
Tuesday, October 14, 2003
Meeting notes

In attendance:

HCC: Dickie Nelson, Curtis Tyler, Norman Gonsalves, Clarence Ching, Kepa Maly, Hannah Springer, Heidi Guth

PTA: Fred Clarke, Mike Egami, Bob McElroy, Laurie Lucking, Bill Godsby, Christine Hansen

[illegible]

Proposed Agenda:

Pule

Introductions

Commander's Welcome

DEIS discussion

Public Meetings

Presiding: Dickie

1. Meeting commenced at 09:10
2. Pule offered by Hannah
3. Lt. Col. Clarke welcomed all, expressed his appreciation for HCC commitment and looked forward to today's dialogue.
4. **General Comments:**
 - PTA Transformation project will impact West Hawaii communities more than the East Side of Hawaii island.
 - Will need more community meetings. Venue options suggested were Kailua Kona's Kealakehe High School Cafeteria and Kahilu Hall in Waimea.
 - Suggest a *workshop format* for the meetings.
 - Impacted communities identified as Waikaloa and Waikii.

N13-1

- HCC: Feel current method of informing Hawaiian groups inadequate. HCC feel PTA should host a meeting that will allow for Q& A format.
- Hawaiian groups identified:

GROUP / ORGANIZATION		CONTACT INFO	
• Hawaiian Homestead Associations			
• Oiwi Lokahi		Ed Stevens	329-9255
• Waimea		Kanani Kapuniai	885-8336
• Kawaihae		Maydean Bowman	889-6962
• Kahu Mauna		Ed Stevens	329-9255
• West Hawaii Hawaiian Civic Clubs		Mabel Tolentino	887-9320
• Kupuna Council o Keawe		Norman Gonsalves	
• Kahu o Kahiku		Norman Gonsalves	
• Royal Order of Kamehameha (Hamakua)		Norman Gonsalves	
• Royal Order of Kamehameha (Kona)		Curtis Tyler	327-3666
• Hunters Association		???????	

PTA (Mike Egami) to coordinate with group / association leader to recommend a maximum of three representatives to participate in the Q / A format. Mike stated that funding and personnel availability will determine if this activity can be achieved.

- The Archeological Draft document will be available in December (two months).

N13-1

The community outreach plan included members of Cultural groups, Focus groups, Community Support Groups and Public Sessions. This outreach plan ensured a balanced coverage of all concerned community groups both on O'ahu and the Big Island. Moreover, we held two comprehensive scoping meetings and two comprehensive public meetings on the Big Island to ensure the public was aware of our proposals and had various opportunities to be a part of the process and provide input in the form of comments, suggestions and ideas.

N13-2

Please refer to the discussion on Section 3.11, entitled, "Regulatory Framework for Native Hawaiian Cultural Landscapes."

Comments

- Earth Justice and the Sierra Club is seeking an extension.

5. DRAFT EIS DISCUSSION:

Comments recorded below were random and not in any particular priority.

- N13-2** | • HCC: Cultural Landscape is hinted but meaningful descriptive language is missing.
- PTA: "Cultural landscape information not complete; Programmatic Agreement (PA) will enhance greater meaning of the landscape (native traditions, folklore, land history)...the PA is seen as a dynamic on-going dialogue."
- N13-3** | • HCC: Hawaii Island Burial Council, a concurring body re PTA project, is not listed in the draft PA on page 2.
- HCC: Cultural Landscapes – these intangibles are very important and should be included in the final EIS document (traditional / cultural properties).
- N13-4** | • PTA: "Cultural landscape material received from public meetings and cultural resources. The material was considered lengthy. The military decided to edit for "brevity" purposes.
- HCC: All agreed strongly the edited material must be re-inserted into the final EIS document!
- N13-5** | • HCC: Hawaiian culture is not uniform. Hawaii Island is unique to its properties / history/ lore's.
- HCC: Impact statements should indicate how it affects the Hawaiian cultural resources.
- N13-6** | • HCC: DEIS page 8-52, "Additional Mitigation 1: "Use of synthetic dust chemicals...what impact will this have on Hawaiian fauna"
- PTA: "A record of spraying an area is documented and filed. All unusual situations are also documented."
 - OHA:
 - "There should be more alternatives for a project of this magnitude".
 - Mitigation's listed, as "possibilities" should be stated for clarification.
 - There is a lack of cumulative impact statements. OHA can provide case law (history) to Dr. Lucking
- N13-7** | • HCC: DEIS page 8-165 lists site#19528 as a "Transportation Trail".
- HCC suggest this be listed as the *Na Ohule Elua Trail*. HCC wants this trail accessible to Hawaiians.
 - PTA states that portions of the trail are non-distinguishable in the field as well as from arial reconnaissance.
- N13-8** | • HCC: DEIS page 8-16: "Continue current public access policies and procedures from 2002 to 2006...". What happens after year 2006?
- PTA: "There is a five year review and evaluation period to determine continuity of policy"
 - HCC: EIS should have a footnote for clarification.
- N13-9** | • HCC: DEIS does not specifically state who is the final authority for project.
- PTA: "The Record of Decision (ROD) constitutes *accountability*."
- N13-10** | • HCC: How does PTA deal with underground resources?
- PTA: " PTA activities (maneuver zones) avoid lava tubes and blisters.
- N13-11** | • HCC: The UXO contractor should meet with the impacted communities to educate / orient them on the process as well as safety precautions. Local resources may also assist ux0 contractor with local knowledge of terrain/ terrain history.
- N13-12** | • HCC: Cultural background for place names eliminated from the DEIS. Reinstate this information! In this regard, it is important to be careful of Hawaiian name spellings. A misspelled word or phrase could alter the intended meaning.
- PTA: PTA will host HCC on site visits following the DEIS activity.

Responses

N13-3

The Hawai'i Island Burial Council is listed in the Final PA.

N13-4

Tables found in IARII's report that include a large amount of this information will be included in the Cultural Resources Appendix.

N13-5

The analysis of Native Hawaiian culture for each specific region is derived from individuals or groups specific to that region.

N13-6

Additional discussion of dust control chemicals has been added to Sections 5.5 and 8.5 of the Final EIS. The recommended dust control chemicals (calcium chloride and/or magnesium chloride) are considered virtually non-toxic. Toxic concentrations for these salts are similar to those for common table salt. Only direct spills of the concentrated chloride solutions would pose any environmental risks. The maritime climate of Hawai'i creates a high natural exposure to chloride salts, suggesting that most native vegetation and fauna have a reasonable tolerance for exposure to chloride salts. The dust control chemicals would be applied directly to road and parking lot surfaces that do not support vegetation growth.

N13-7

This change has been made. The Army will take the access request into consideration.

N13-8

The text has been revised.

N13-9

Chapter 1 has been updated to reflect the final decision process for the EIS. Following completion of the Final EIS, the U.S. Department of the Army (DA) will select an alternative from those proposed in the Final EIS. Under the National Environmental Policy Act (NEPA), that decision does not become final until the DA certifies the Record of Decision (ROD) on the Final EIS. The ROD certifies the adequacy of the project's environmental review process and itemizes the Army's commitments to mitigate project impacts. Issuance of the ROD is a prerequisite to execution of federal funding for project construction. The ROD is anticipated in June 2004.

Comments

N13-13

- HCC: Group feels it needs another meeting to cover issues yet discussed.
- PTA: Agree to reconvene on Monday, October 27 at 09:00 at PTA.
- PTA: Will convene the community meeting in the evening of the 27th of October.
 - In preparation for the 10/27 meeting, HCC participants are asked to review PA (page 4) "Consultation with Native Hawaiians." In addition, DEIS page 3-3, "Ceded Lands" definition – HCC suggest that language be replaced with the Apology Bill (public law 103150).

EVALUATION OF TODAY'S MEETING

POSITIVE

Candid
Flexible
Adequate time allotted
Presenter
Curtis is o.k!
Purpose of meeting met
Great input from OHA

NEED ADJUSTMENTS

Colonel Clarke needs more practice on his Hawaiian Pronunciation beginning with POHAKULOA

Any errors / omissions noted will be corrected at our 10/27 meeting.

Meeting concluded at 2:00pm

Dickie

PS: Col. Clarke, a big mahalo for the pizza lunch and not MREs!

Responses

N13-10

This "comment" is a question that was asked in a public meeting of October 14, 2003, attended by representatives of PTA. Based on the response reported by the commenter, the answer given by the PTA representatives was that "PTA activities (maneuver zones) avoid lava tubes and blisters." This suggests that the comment was more specifically about lava tubes as an underground resource. Text has been added to Section 8.9 discussing lava tubes at PTA.

N13-11

The community outreach plan included members of Cultural groups, Focus groups, Community Support Groups and Public Sessions. This outreach plan ensured a balanced coverage of all concerned community groups both on O'ahu and the Big Island. Moreover, we held two comprehensive scoping meetings and two comprehensive public meetings on the Big Island to ensure the public was aware of our proposals and had various opportunities to be a part of the process and provide input in the form of comments, suggestions and ideas.

N13-12

Tables found in IARIP's report that include a large amount of this information will be included in the Cultural Resources Appendix.

N13-13

We thank you for your comment and your comment has been considered and included into the administrative record for this process. Hawai'i was adopted as a territory of the U.S. Government in 1900 and was granted admission into the Union in 1959 via Pub L 86-3, 73 Stat 4 when the people of Hawai'i petitioned the U.S. Congress for statehood and adopted by vote in the election held on November 7, 1950 the Act of the Territorial Legislature of Hawai'i entitled "An Act to provide for a constitutional convention, the adoption of a State constitution, and the forwarding of the same to the Congress of the United States, and appropriating money therefore", approved May 20, 1949 (Act 334, Session Laws of Hawai'i, 1949). We understand that some individuals do not agree with or support the formal annexation of Hawai'i in 1898. However, issues of statehood and Hawaiian Sovereignty are outside of the scope of the NEPA process.

website: www.hiedb.orgRe: ARMY TRANSFORMATION TO A STRYKER BRIGADE COMBAT TEAM IN HAWAII
Public Hearing Thursday, Nov. 6, Hilo Hawaiian Hotel, 5:30PM/7:00PM meeting

To Whom It May Concern:

My name is Paula Helfrich and I am President of the Hawaii Island Economic Development Board.

HIEDB has participated in numerous public dialogues and hearings on Saddle Road realignment and the Mauna Kea Science Reserve since 1994. Both issues involve cultural and environmental matters discussed in the referenced draft EIS under consideration for the Pohakuloa Training Area.

In general, HIEDB has supported the US Army's training and readiness mission at PTA, and found them to be good neighbors. The Army Environmental Center at PTA has established an excellent track record in identifying and protecting the area's natural resources and endangered species. In recent years, expanded fire controls and rescue crews have provided important public safety services. We applaud the mention of establishing a Mauna Kea Environmental Center for public education as part of the draft EIS, and recent designation of a community partnership for the area. We note that the actual construction projects under consideration for this EIS at Pohakuloa are limited to a realignment of the existing tank trail, two ranges and five modest projects such as an aircraft parking apron at Bradshaw Air Field, a wash rack and a consolidated control building. A proposed land acquisition is also discussed, either as a purchase or continued lease arrangement. In terms of socio-economic impact, these are relatively minor projects as noted in Appendix L as an EIFS model, and under Table 9-2 (14) Cumulative Projects on Hawaii.

The complexity and breadth of this draft EIS covers a much larger scope, far beyond impacts at the Pohakuloa Training Area. HIEDB's comments are related only to the PTA components of this draft EIS. As such, we have found it extremely difficult to evaluate the relatively minor socio-economic impact noted against anticipated costs in environmental and/or cultural impact.

Responses

N14-1

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

N14-2

Project-specific costs relating to Army expenses on construction, mitigation, and O&M are not generally discussed in NEPA documents except where such financial issues relate to feasibility.

Responses

Comments

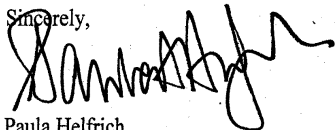

N14-2
cont'd

As has been requested at numerous public hearings (most recently at a meeting with Gen. Jacoby on July 16, 2003), we recommend that the Final EIS document RELATING TO THE POHAKULOA PROJECTS contain specific and quantifiable information on estimated costs of proposed construction, estimates of expanded mitigation costs, annual operations estimates for the PTA base operation, any expanded training costs, and especially annual maintenance and operations cost estimates for mitigation, environmental control and cultural preservation in the PTA site.

We believe that a great deal of misunderstanding may have been inadvertently fostered by a tendency to overstatement during the technical development of the EIS procedure. In any event we need to focus on impact, challenge and opportunities on Hawaii Island.

We look forward to reviewing this information. Thank you for your consideration of these comments.

Sincerely,

Paula Helfrich
President

Dear Ms. Barger:

**Re: Army Transformation to a
Stryker Brigade Combat Team in Hawaii**

N15-1

Thank you for the opportunity to comment on the October 2003 draft EIS of the Army Transformation to a Stryker Brigade Combat Team in Hawaii. HECO contacted Clifford Takano and Lynette Kwock of the USACE, Fort Shafter on October 31, 2003 to discuss the impact of the proposed Stryker Brigade Motor Pool at Schofield. As a result of that discussion, relocation of the existing 46kv line (Wahiawa-Mikilua) will not be requested at this time.

Our point of contact for this project, and the originator of these comments, is Paul Nakagawa (543-7062) Lead Engineer. I suggest that your staff and consultants deal directly with Paul to coordinate HECO's continuing input, especially during the design phase of this project, as there may be other impacts to HECO's facilities that were not identified in the DEIS.

The DEIS has been forwarded to Clyde Nagata, Manager, Engineering Department, Hawaii Electric Light Company. Comments by HELCO on the Pohakuloa Training Center will be submitted shortly.

Sincerely,

Kirk S. Tomita
Senior Environmental Scientist

Letter N16

SBCT EIS Project Manager
Attention: Cindy S. Barger
U.S. Army Corps of Engineers Honolulu District
Bldg 230, Rm. 306 ATTN: CEPOH-PP-E
Ft. Shafter, HI 96858-5440

Gentlemen:

Subject: Transformation To Stryker Brigade Combat Team Draft EIS
Pohakuloa Training Area, Island of Hawaii

Thank you for the opportunity to comment on the subject Draft EIS of October 2003. We will be commenting on Pohakuloa Training Area on the Island of Hawaii and our parent company, Hawaiian Electric Company Inc. will be commenting on the other areas.

We do not have any objections to the proposed Stryker Brigade Combat Team facilities at the Pohakuloa Training Area; however, have the following comments:

- | | |
|--------------|---|
| N16-1 | 1. Section 8.14.2, Page 8-214, Electricity - The unit for energy is Kilowatt-Hours (kWH) thus, "1,498.2 kW" should be "1,498.2 kWH". |
| N16-2 | 2. Section 8.14.2, Page 8-215, Electricity - Similarly, "43.2 kW" and "89.2 kW" should be "43.2 kWH" and "89.2 kWH", respectively. The sentence, "The average daily energy demand of the tactical vehicle wash would be approximately 89.2 kW" should read, "The average daily energy demand of the ammunition storage area would be approximately 89.2 kWH". The average daily energy demand of the tactical vehicle wash was already stated on Page 8-214. |
| N16-3 | 3. Electrical line easements will be required along the P3/P4 Pohakuloa to Kawaihae Trail to provide electrical service to the properties bisected by this roadway. |
| N16-4 | 4. The subject area is currently served by our Pohakuloa 2,500 KVA electrical substation, which has adequate capacity to serve the proposed facilities. The existing dual 12,470-volt circuits from the substation feed a primary switchgear at the Pohakuloa Training Area. |
| N16-5 | 5. Additional 12,470-volt distribution line extensions may be required to serve the proposed facilities along with transformers and other associated secondary equipment. Line easements will be required if these line extensions will be owned and maintained by HELCO. |
| N16-6 | 6. HELCO's current system peak load is 183,500 KW and our total generation system capability is 233,700 KW. Our reserve margin is 27% and has adequate generation to serve the project. In addition, HELCO has been given approval to recommence construction of its Keahole Generation Expansion project, CT4 and CT5. This expansion will add 39,800 KW of generation capacity in 2004. |

Responses

N16-1

Change made.

N16-2

Change made.

N16-3

Comment has been considered; Section 8.14.2 has been revised to reflect this new information. The section now includes the following: "Electrical line easements may be required along the PTA Trail to maintain continued electrical service to the properties bisected by this roadway. The Army would consult with HELCO in order to make these arrangements prior to construction."

N16-4

Comment has been considered and added to sections 8.14.1 and 8.14.2.

N16-5

The Army will coordinate with HELCO to provide service to the new facilities.

N16-6

Comment has been considered; Section 8.14.1 has been revised to reflect this new information.

N16-7

7. We strongly recommend that energy efficient and conservation features suitable to reduce the peak electrical demand are part of the development's plans. We recommend that this development take full advantage of waste heat recovery equipment to recycle and reuse the waste heat rejected by air conditioning and refrigeration equipment. If this equipment is incorporated in the development's original design, the amount of energy required will be substantially reduced.

N16-8

8. The project consultants and engineers are urged to contact HELCO's Engineering Department as soon as practicable to open a service request to insure timely procurement of long lead equipment.

Should you have any questions, please contact me at (808) 969-0321 or Hal Kamigaki at (808) 969-0322.

Sincerely,

Clyde H. Nagata, P.E.
Manager, Engineering Department

Responses

N16-7

The EIS has determined that there is no significant impact to public services by the implementation of the proposed action. The Army designs all of its projects, including those in this proposed action, in accordance with Executive Order 13123 "Greening the Government through Efficient Energy Management" (June 2001), Executive Order 13101 "Greening the Government through Waste Prevention, Recycling, and Federal Acquisition" (September 1998), and Department of the Army Engineering Technical Letter 1110-3-491 "Sustainable Design for Military Facilities" (May 2001) and the U.S. Army Corps of Engineers Sustainable Project Rating Tool (SPiRiT). These documents and tools provide design guidelines and standards for sustainable development - addressing water resources, energy and atmospheric resources, indoor environmental quality, material and other resources.

N16-8

We thank you for your comment and participation in this public process. Your comment has been considered and has been included as part of the administrative record for this process.

Subject: Comments To Stryker Brigade In Hawai'i

Aloha,

As President of the Hawaiian Womens Patriotic League and due to the illegal U.S. occupation of our lands and country, the independent Kingdom of Hawai'i it is our duty to address this issue meanwhile, until this issue is politically resolved by the proper authorities. At the bottom of this issue is land. (see: "Hawaiiankingdom.org" for more facts and documented evidences).

N17-1

Land for us is a gift from God and a very sacred place that we get our food from, raise our children on and make decisions according to Hawaiian law on Hawaiian land for everyone to understand that it is not "owned" but to use and that is how it was for thousands of years of evolution. However, it was usurped illegally and due to U.S. occupation the lives of most Hawaiians have been worse off and continues to go down hill.

Our goals are simple. The title to the lands in Hawai'i continue to remain in the Hawaiian Kingdom and secured to the Hawaiian people as it was written in the laws of the Hawaiian Kingdom which states: in Sec. 6, Chapter II, Title 1, Civil Code of the Hawaiian Islands; "The laws are obligtory upon all persons, whether subjects of this Kingdom, or citizens or subjects of any foreign State, while within the limits of this kingdom...The property of all such persons, while such property is within the territorial jurisdiction of this kindom, is also subject to the laws."

We would like to get your comments on our statement in writing.

Me Kealoha Pumehana

R. Kawehi Kanui

Subject: Stryker Training Area

My name is Alan Mefford and I represent Hawaii Offroad Association on the Big Island. This is a statewide association representing the interests of off highway vehicle enthusiasts.

We have the greatest military force in the world today because of it's professionalism and constant training.

These brave, dedicated men and women risk and give their lives to protect our freedom and way of life; more personally, to protect my freedom and way of life. Giving a small piece of our State for the Stryker Force training just doesn't seem like a big deal. You have my full support and thanks for what you do. May God bless you all and keep you safe.

**RESPONSE TO DRAFT ENVIRONMENTAL IMPACT STATEMENT
ARMY TRANSFORMATION, STRYKER VEHICLES, HAWAII**

From: Patricia L. Patterson, Hui Malama o Makua

Second Presentation, First Written, Following Presentation at Makaha Resort

- N19-1** A. Even though the Pentagon has approved and Congressman Neill Abercrombie has announced the siting of a Striker Brigade in Hawaii, I strongly believe it should not happen. I also question Abercrombie's assertion that this will result in \$10 million for Hawaii.
Most of that \$10 million will probably go directly to the Mainland developers like Actus Le'nd Lease, which got the 50-year contract for military housing rent receipts—with very little "trickle-down" money or permanent, well-paying jobs for Hawaii's civilian residents.
- N19-2** B. ES.9.2. Both "short-term" and "long-term" damage to cultural resources in the future are mentioned. Please define "short-term cultural damage". Isn't this the material that should be described in ES.9.3?
- N19-3** I do applaud your plan to use solar power. However, you have a long way to go in using natural energy sources. Both Kahuku and Pohakuloa have great proven potential for windpower. Please address that.
- N19-4** C. Page ES-50, ES.9.3. This is an inadequate consideration of resources that future generations would not be able to reverse. No reference is made to cultural, archeological damage or to high usage of water and imported oil to make electricity for the primary facilities or for all the extra people, nor of the gasoline, oil and other fluids just to operate and maintain the Stryker.
- N19-5** D. Figure D-5. SUBJECT: PRECIOUS WATER. This map shows current one-million-gallon water-storage tanks plus proposed one-million-gallon tank. Already in November 2003, Honolulu Board of Water Supply has announced the need to find additional water resources for the current population of Oahu. We can't live here long, any of us or the fauna and flora if you bring the Stryker Brigade here.
- N19-6** Tom Whitehead prepared the "Geology and Water Resources" portion of the DEIS. His schooling includes Arizona and California. What is his experience, if any, that qualifies him to evaluate water resources in Hawaii—and where do I find his detailed report?
- N19-7** E. Page ES-52, Table ES-21.10. What are those "synthetic dust control chemicals"? Have they been used at other military installations? What have been the results in ongoing human, plant and animal health?

Responses

N19-1

Although Department of Defense, Department of the Army, and Congressional representatives have issued statements that the 2d Brigade, 25th ID(L) will transform to a Stryker Brigade, these statements refer to programmatic level decisions necessary to continue the planning, funding and assessment processes for the proposed transformation efforts and set the conditions for implementing an action once a final decision has been made. The final decision on whether the 2d Brigade, 25th ID (L) will transform to an SBCT will be made by the appropriate local commander, subject to environmental assessment and other appropriate reviews and compliance with applicable federal law. The Department of the Army issued a Programmatic EIS for Army Transformation in 2001, and issued its Record of Decision to implement Army Transformation on April 11, 2002. In that ROD, Lieutenant General David McKiernan confirmed a series of previously announced conversions of 6 brigades to interim brigade combat teams, "subject to appropriate evaluation of potential environmental effects in accordance with the National Environmental Policy Act" (ROD, page 11). The Department of the Army will make a decision whether or not to transform the 2d Brigade, 25th ID(L) in Hawai'i only after a full consideration of all the environmental impacts identified and analyzed under NEPA, weighed equally with considerations of strategic importance, military training and readiness, technical considerations, economic and fiscal considerations, and other considerations mandated by law or policy.

N19-2

Chapters 4.11, 5.11, 6.11, 7.11, 8.11, and 9 discuss the impacts of this project on cultural impacts in greater detail.

N19-3

The Army designs all of its projects, including those in this proposed action, in accordance with Executive Order 13123 "Greening the Government through Efficient Energy Management" (June 2001), Executive Order 13101 "Greening the Government through Waste Prevention, Recycling, and Federal Acquisition" (September 1998), and Department of the Army Engineering Technical Letter 1110-3-491 "Sustainable Design for Military Facilities" (May 2001) and the U.S. Army Corps of Engineers Sustainable Project Rating Tool (SPiRiT). These documents and tools provide design guidelines and standards for sustainable development - addressing water resources, energy and atmospheric resources, indoor environmental quality, material and other resources
